Lumbago.—J. T——, aged forty-nine, had suffered from lumbago for a week. Pain also from knee to ankle.—Feb. 25th: Ordered exalgine in three-grain doses, to be taken every three hours.—27th: States that he is a little better. Ordered exalgine in six-grain doses every four hours. 2 P.M.: Took first dose. About 3.30 had considerable relief from the pain in the back and leg. 6 P.M.: Six grains of exalgine prescribed. Still more relief followed this dose. 10 P.M.: Six grains of the drug ordered.—28th: In the morning of this date the pain in the back was quite abolished.—March 2nd: Has not recurred. This patient stated that after the second dose of six grains he felt slightly giddy, and had an inclination to vomit. These feelings passed away in about half an hour, and did not recur when the third six-grain dose was taken.

Intercostal neuralgia.—A. R——, aged eighty, had acute pain for a week in the right shoulder and along the right side of the chest, greatly aggravated by coughing. Has slight bronchial catarrh.—Feb. 24th, 6.30 P.M.: Ordered four grains of exalgine; half an hour after he felt a "genial glow of warmth" all over the body. 8 P.M: Pain easier. 10 P.M.: Four grains of exalgine given.—25th, 1 A.M.: He stated that he was greatly relieved, and felt quite comfortable. 10 A.M.: Four grains of the drug given; slept most of the forenoon. 1 P.M.: He stated that he was almost quite free from pain, even when he coughed. 6.30 P.M.: Four grains of exalgine given.—26th: Free from pain and able to move his right arm freely, which he could not do for a week previously.

J. J——, aged seventy, complained of pulmonary catarrh and severe pain on the right side of the thorax. Was first treated by three grains of sulphate of quinine and ten grains of antipyrin every six hours. This treatment was continued for three days. The patient stated that he experienced no relief.—Feb. 26th: Ordered exalgine in four-grain doses every four hours. After the first three doses the pain subsided and did not return. On the 28th he was able to return to his duties.

Otitis media.—J. M——, aged twenty-five, complained of pain in the left temporal region. He had otorrhœa, with ear-ache and buzzing. The pain had lasted for six days, being intermittent for half an hour or so during the day and constant at night, hindering sleep. Temperature normal; bowels regular; pulse 80 per minute.—Nov. 6th: Twelve grains of antipyrin were ordered every four hours. The buzzing in the ear ceased. No effect on the pain was produced.—9th: Ordered four grains of the drug every five hours. At 9 P.M. the first dose was taken. If any effect took place, it appeared to be an increase of the pain.—10th, 2 A.M.: Four grains of exalgine given. Two hours afterwards the pain was considerably lessened. The patient slept from 5 A.M. to 7 A.M., when he was awakened by the pain. From 7.30 A.M. to 9 A.M. the pain was as severe as ever. 9 A.M.: Four grains of exalgine were given. No great relief was experienced. 1 P.M: Another four grains of exalgine were ordered. About 2 P.M. the pain was very much less, especially if the patient kept quiet in bed. Movement renewed it, but it was not so severe. 6 P.M.: Four grains of exalgine were administered. Shortly after this fifth four-grain dose there was distinct relief to the whole pained part. 12 P.M.: Four grains of exalgine given. When this dose was taken there was very slight pain. He fell asleep shortly after taking the drug, and slept till 6 A.M. He awoke without pain, and stated that it was the only sleep he had obtained for a week.—11th, 7 A.M.: Four grains of exalgine taken; no recurrence of the pain. 12 A.M.: Four grains of exalgine taken; still free from pain. When seen a few days later the pain had not recurred.

Sciatica.—The drug was tried in three cases. In one case the result was satisfactory; the pain was relieved after two days' treatment, four grains being given every four hours. The second case yielded unreliable results; the patient's statements could hardly be credited. The third patient did not experience any relief from the drug.

Tubercular disease of the prostate.—This patient suffered very severe pain. Exalgine failed to be of any service.

Locomotor ataxy.—This patient complained greatly of lightning pains, as well as of what he defined as "gnawing pains" in his thighs and legs. He was treated with four-grain doses of exalgine. He thus wrote regarding its action:—"I have invariably allowed several hours to pass before having recourse to the exalgine, by which time I was, in every instance, in a high state of fever, skin hot and dry, while suffering at the same time from an oppressive sense of suffocation and from heart palpitation. On the first occasion of my taking the exalgine powders I used six of them before I had full relief from the pain. In each of the subsequent attacks I never used more than three, one every three hours. Results shortly after taking the first powder: My temperature was lowered to normal, a gentle refreshing perspiration took place, the sensation of suffocation entirely left me, and in from five to eight hours I was entirely relieved of pain." This patient has frequently used exalgine as above, and like results have always followed.

Rheumatoid arthritis.—A. T——, aged thirty-four. In addition to the pain of the joints, this patient had suffered lumbar pain. The pain had continued for ten days. He was unable to get out of bed or dress himself without assistance, and when he tried to go upstairs had to be helped. He obstinately refused to stay in bed.—March 3rd, 1892: Six-grain doses of exalgine were ordered. 6.30 P.M.: Six grains of exalgine given. 8.30 P.M.: Considerable diminution of the pain. 10 P.M.: Six grains of exalgine ordered. Pain still more diminished.—4th, 2 A.M.: Six grains of exalgine taken. Pain still less. 6 A.M.: Pain less. 8.30 A.M: "I had little pain, dressed without help, and felt ever so much better—indeed almost well." He added: "I noticed that, although the joints were nearly as much swollen as before, the pains had entirely gone." The exalgine was continued for two days longer, and on March 12th he had had no recurrence of acute pain. Another case of long-standing character gave only indefinite results. The patient stated that she was "somewhat better, but no very marked improvement."

Following the admirable plan of Professor Frazer, a table is drawn out in which the results of the various observations are summarised:—

Disease.	No. of observations.	Successful cases.	Unsuccessful or doubtful cases.
Toothache	7	3	—
Headaches	35	28	—
Neuralgia (facial)	20	12	3
Sciatica	3	1	2
Lumbago	7	5	2
Intercostal neuralgia	3	3	—
Locomotor ataxy	8	1	—
Biliary calculi	2	—	2
Rheumatoid arthritis	2	1	1
Otitis media	1	1	—
Tubercular disease of prostate	4	—	1
Totals	92	55	11

In all, records of ninety-two observations were kept, and sixty-six patients were treated with the drug. In fifty-five cases the action of exalgine was successful in relieving the pain, while eleven cases yielded results that were unsuccessful or doubtful. The benefit of exalgine was most marked in cases of nervous headache, facial neuralgia, intercostal neuralgia, and lumbago. Although the pain-subduing action of the drug may be feeble, it has given in certain cases excellent results. Further observations will

Digitized by Google

at last fix its full value as an analgesic, and possibly justify the hope that it may take a valuable, if restricted, place in the group of those bodies which relieve suffering.

Aberdeen.

THE USE OF EXALGINE IN GRAVES' DISEASE, AND THE POISONOUS DOSE OF EXALGINE.

By T. CHURTON, M.D.,
PHYSICIAN TO THE LEEDS GENERAL INFIRMARY.

THE poisonous dose of exalgine seems to vary greatly for different persons. A woman aged twenty-eight, of fair complexion, having typical Graves' disease, had, after some months, extreme exophthalmos and congestion of both conjunctivæ, with ulceration of the left cornea. Leeches, lotions, &c., gave very little relief. At length, the pain becoming severe, exalgine was tried, half a grain dissolved in five minims of spirit of wine, and a tablespoonful of water, every half hour for three times when pain was present. Next day not only was the patient free from pain, but the congestion had entirely disappeared; the eyes had changed from flaming red to perfectly white. During the next month, to satisfy myself and several critical observers as to the influence of exalgine, experiments were made; all the other drugs and appliances were tested in turn. The result was always the same: when exalgine was given, the eyes were white; when it was omitted, they became red and painful within a day, no matter what other drugs were given or lotions applied. As upon trial being made it seemed that the good effect was less marked when the whole dose of a grain and a half was given at one moment than when it was given in divided doses—half a grain every quarter of an hour for three times,—it was ordered to be taken regularly in this manner every four hours from a bottle kept for the occasional use of other persons as well as of herself. By a mistake of the transcriber of an old and damaged label, "gr. i. in ℥i." became "gr. i. in ℥i." This prescription being dispensed, the mixture contained eighty grains in ten ounces—of this there is no doubt; inquiries and testing by comparative evaporations established the fact. On a Thursday at 4.30 P.M. the patient had her ordinary dose of half a grain; a second dose at 4.45; at 5 the new mixture was begun. She merely remarked that this dose felt hot, but complained no further. This 4-grain dose was repeated at the following times: Thursday, 10 P.M., 10.15 P.M., and 10.30 P.M., or twelve grains in all within half an hour. Friday at 3 A.M. and 3.15 A.M. (she begged to be excused the third dose on account of pain and burning in the stomach); 7 A.M., 7.15 A.M., and the third dose after breakfast at 8.15 A.M.; at 1 P.M. one dose only; she declined the others on account of gastric pain; no other bad effect from forty grains of the drug given in twenty hours was observed. At 10 A.M. on Friday the complaint of pain led to the pulse being again counted, and it was found to be 144; it had never previously exceeded 136; its usual rate was between 100 and 120. Respiration rate 32 (above average). Temperature unaltered—98° to 99°. I saw the patient at 5 P.M. on this day (Friday), and suspected nothing until she complained of the pungent taste of the medicine and of the pain which it gave her. On the following day she felt much better in every way; the eyes were much less prominent, and the corneæ could now be covered by the eyelids. Pulse 120; respiration 26; morning temperature 98·4°; evening 99°.

Another woman having toothache, but otherwise healthy, had taken on Thursday, at 5.15 P.M., an ounce of the mixture—that is, eight grains of exalgine; at 5.30 a second ounce, and at 5.45 a third, or twenty-four grains in half an hour. This woman is about twenty-eight years of age, 5 ft. 5 in. in height, 9 st. in weight, has very fair hair and complexion, is very intelligent, of quiet, pleasant disposition, has a large head with relatively rather small face, and grey eyes. She states that after the second dose she felt dazed, but even after the third she was able to go out to call upon a friend half a mile away, though walking unsteadily and with difficulty, and fearing to speak lest she should say foolish things. On her return in an hour she felt giddy and stupid, but could do her work. On going to bed at 10 o'clock she instantly fell asleep; awoke at 7 A.M. on Friday with dry mouth and frontal headache; no toothache; was better after breakfast, but the mouth still felt dry on Saturday evening.

Of the quality of the exalgine used there is no doubt. It has been found effective in cases of neuralgia, headache of (probably) cerebellar glioma, "lightning" pains of tabes (two cases), gouty arthritis, &c. The patient with Graves' disease resumed the use of the drug after a week's interval, and for three days she had three grains every four hours; then, for a week, four grains and a half every four hours. After an interval of four days she took three grains in one dose every four hours for ten days; afterwards, as she could not be kept longer under daily observation, the quantity was reduced to three grains three times a day. The corneal ulcer healed, and the pain and congestion were held in check by these doses, which were given in the hope of hastening the improvement of the original disease; they effected little if anything apparently in this way, but no discomfort of any kind was caused by them. Exalgine does not seem to be in any sense a "cumulative" drug. I have, however, heard of a case in which very alarming symptoms were produced by a single dose of five grains.

Leeds.

HERNIA INTO THE FORAMEN OF WINSLOW; LAPAROTOMY; RECOVERY.

By ARTHUR NEVE, F.R.C.S. EDIN.,
KASHMIR MISSION HOSPITAL.

THERE are few rarer surgical maladies than hernia into the foramen of Winslow, and the few recorded cases have been verified by post-mortem examinations. This case, therefore, in its fortunate result is unique. The patient came under our observation on the seventh day of the obstruction, was watched closely for twenty days, during which intussusception was considered the most probable cause. On account of continued symptoms and progressive emaciation an operation was performed on Jan. 1st, at which a hernia into the foramen of Winslow was discovered, though reduction could not be effected. Forty-eight hours later a large enema was given for recurrent spasmodic pain, and from that time onwards all symptoms were relieved, and the tumour was found to have disappeared. Rapid and complete convalescence then set in. Such is the *résumé* of an interesting cases which is worth relating in further detail.

R——, aged seventeen years, a Mohammedan Kashmiri, came to the Mission Hospital on Dec. 10th, complaining of acute pain and absolute constipation of seven days' standing. It had begun with an attack of vomiting. Before that he was quite well, and had not suffered from constipation. The cause of the attack was unknown. From that day (Friday) he had taken no solid food. A native doctor had administered purgative medicines, but only blood had passed. He had vomited once or twice, and brought up water only. The pain came on in fearful spasms. His appearance bore out the history. His face was pinched and sallow; eyes anxious-looking; he walked stooping, with abdominal muscles contracted; temperature normal; the pulse was small and thready. On examining the abdomen, it was seen to be flaccid and somewhat retracted, except in the lower part of the epigastric region, especially to the right of the middle line, where there was a distinct prominence. This was found to be of an irregular oval shape, about five inches long; part felt solid, and part was tympanitic. Dulness extended into the right hypochondriac region. A large enema (four pints) was given, and the patient was suspended by the heels and well shaken. By careful percussion it then appeared that there was no obstruction below the transverse colon. About an ounce of shreddy fæces came away with the fluid. From the general shape and position of the tumour and the symptoms, the tentative diagnosis of intussusception was adopted, and operation was postponed. The swelling became less tense after the enema had been returned. It could not be moved downwards or laterally, but could be pushed a little upwards.

Daily large enemata were given, and morphia to relieve the pain. The patient's usual attitude was sitting crouched

Digitized by Google

forwards, but on any sudden access of pain he would suddenly yell and fling himself down as if in a fit. He was kept on small quantities of soup and milk. Once or twice he vomited. On two or three occasions enemata brought away fæcal lumps, which showed that obstruction was not absolute, blood was also passed in small quantities. The region to the right of the umbilicus was occasionally very tympanitic; by pressure with the hand a loud gurgling could be produced in the tumour, and this also caused spasmodic pain. On Dec. 15th the tumour appeared to be higher up than formerly, and to occupy the whole epigastric region. An elongated irregular sausage-shaped portion could sometimes be distinctly defined. Emaciation was rapidly setting in. Pain was somewhat less frequent. Matters continued thus for nearly three weeks. Operation seemed to offer little prospect of permanent relief. We could not willingly condemn the patient to an artificial anus. But as the friends of the patient wished to remove him unless active treatment was undertaken, we resolved to operate.

On Jan. 1st, assisted by Dr. E. F. Neve, a three-inch incision was made in the right semilunar line above the umbilicus but below the tumour, and a small portion of omentum drawn on one side. The distended ascending colon bulged into the wound on the right. On the left from below upwards were coils of small intestine, an empty portion of transverse colon, and then the stomach, empty, pushed forwards by the tumour, and somewhat twisted on itself. Following up the distended colon, it was found to pass through a ring lying to the right of the middle line behind the stomach. This ring admitted two fingers; its front boundary was formed of a rounded, smooth, but hard cord, passing from behind the stomach up towards the liver. The flaccid portion of transverse colon coming from the left side could be traced to the same opening. In separating the coils about this some slight adhesions were separated and flakes of lymph seen, and the surface of the bowel was much injected. Inside the ring the finger could detect more coils of bowel. Traction on either portion of bowel (the flaccid or the distended) gave a cord-like feeling, as if there were adhesions beyond the ring and none could be withdrawn. It seemed impossible to do more. Taxis could not be satisfactorily applied, for the stomach was much bulged forwards and the epigastric space narrow; and as Treves drily remarks, "even modern abdominal surgery has not proved that the hepatic artery, the portal vein, and the bile duct can be divided simultaneously with impunity." The constricting ring could not be incised. Traction had failed. We could only hope that the handling would not lead to acute obstruction, and proceed to close the wound.

On the second night after the operation the patient had a prolonged spasmodic pain, for which a large enema was given, and relief obtained. Twenty-four hours later, for the first time he passed a motion spontaneously. It was somewhat thinner. Next day he was sitting up in bed. On the seventh day after the operation the wound was dressed and stitches removed; there was some suppuration in connexion with them. On the tenth another enema was given on account of some uneasiness. The wound having healed, the abdomen was carefully examined. No trace of a tumour could be found. The epigastric region was soft and free from tenderness. Daily motions, somewhat thin, were passed. On the thirteenth the patient began to take his ordinary rice and meat diet, and was rapidly fattening. He remained quite free from any abnormal symptoms, walked about, ate well, and was discharged cured on the twenty-sixth day after the operation.

Remarks.—It would have been much better to have operated as soon as the patient had been two or three days under observation. The alleviation of the symptoms was but deceptive. Considering the extreme rarity of the condition actually present, and the comparative frequency of intussusception, the doubt about diagnosis is not to be wondered at. The chief diagnostic points appear to be (1) the position of the tumour in the epigastric region, higher than the normal position of the colon; (2) changes in its size, consistence, &c., depending on the amount of flatus and passage of fæcal matter, &c.; (3) the colicky pains, due to the same causes. If the hernia were small, no tumour might be perceptible. Diagnosis would then be impossible. If, on the other hand, the hernia were strangulated, probably symptoms of general peritonitis would mask the local condition. It is in cases of chronic obstruction—such as that recorded by Majoli (quoted by Treves[1]), or the present case—that an accurate diagnosis might possibly be effected. The chief lesson is the great value of exploratory operations in cases of obstruction of the bowels. Although the *modus operandi* of the cure in this patient is not very clear, yet he undoubtedly owes his life to the operation performed.

Srinagar, Kashmir.

NOTE ON AFRICAN FEVER.

BY T. HEAZLE PARKE, HON. D.C.L., HON. F.R.C.S.I.

MY earlier experiences with the Emin Pasha Relief Expedition impressed me very strongly with the value of the prophylactic use of quinine in warding off the infection of African malaria. The advice of Mr. Stanley, based upon his unique experiences of the hygienic conditions of the "Dark Continent," was most useful to me, as indeed it was at all stages of our journey. For a period of about ten days before entering the mouth of the Congo, each of the white officers of the expedition took about four grains of quinine twice a day; and the results were as satisfactory as could well have been anticipated, for although this precautionary measure was relaxed on commencing the ascent of the great river, we had but a couple of cases of slight intermittent fever till we reached Stanley Pool. This was a distance of 350 miles through one of the most unhealthy regions of Africa, and occupied our time from March 18th till April 22nd, 1887. No other body of white men had previously traversed the same space with the same degree of immunity. The Belgian officers who were stationed at Stanley Pool expressed the greatest surprise at our hygienic good fortune. They had lost several of their original party from the deadly attacks of the native fever before they had succeeded in reaching their station. They congratulated us warmly on escape, and agreed with me that our success must have been due to the efficiency of the prophylactic precaution which had been taken. Perhaps the sharpest febrile attack experienced during this part of the journey was my own, which commenced on April 18th and lasted for a week. It followed a "ducking" which I received in crossing a tributary of the Congo. I had tried to escape a wetting by riding my donkey through the water, but the animal slipped accidentally and completely submerged me. This was but the first of a long series of experiences, in which I found that every wetting in equatorial Africa—whether that of an accidental bath, like the one just referred to, or received in quietly wading a stream or swamp, or exposure to a drenching tropical shower—meant a subsequent attack of intermittent fever. Another lesson soon learnt, and for which I was still less prepared, was the fact that our donkeys after each corresponding drenching developed febrile symptoms exactly corresponding to those of their human fellow-travellers. After wading or swimming a stream of considerable size each of our poor quadrupeds became sick and dispirited, with drooping ears and "staring" coat, rapid arterial pulsation, and high internal temperature. These phenomena recurred with monotonous regularity. The white officers of the expedition fared similarly. Each immersion was followed by fever; so was each exposure to a chilling breeze, during or soon after active perspiration. So was direct and prolonged exposure to a very hot sun if the head and spine were not sufficiently protected. All such pronounced oscillations of the external temperature were followed by the phenomena of suspension of the functions of the heat-regulating mechanism. A well-defined series of premonitory symptoms ushered in each attack, so that each of us soon learned by observation the indication of the "intermittent" which was commencing to affect his neighbour. These were not at all unlike the well-known phenomena of alcoholic intoxication. The individual became flushed and talkative, and impatient of contradiction; the eyes were prominent, staring, and glistening; the movement of the limbs was less restrained, so that the dress soon presented signs of more or less disarrangement, and the hair became dishevelled, and presented a "staring" appearance more or less comparable to that of sickening animals. The temperature was rapidly running up all this time, its ascent usually preceding, indeed, any observable symptoms of illness. With the eleva-

[1] THE LANCET, vol. ii. 1888, p. 701.

Digitized by Google

tion of temperature the malaise increased, being usually, but not always, proportional to the degree of fever heat. The muscular pains, especially in the lumbar region, were often very severe. In the legs (calves) they often assumed an intolerable cramping character. The lumbar pains in bad cases came on with startling rapidity, the patient feeling pretty much as if he had been suddenly struck across the "small of the back" with a heavy stick. This phenomenon has often been observed in connexion with the onset of very malignant fevers—e.g., yellow fever and dengue. Pain in the temporal regions was also an early and often a very distressing symptom. It was also one of the most persistent, as it sometimes continued for even one or two days after the temperature had descended to the normal.

I should mention that at the very commencement of an attack, before the rise of internal temperature had come to affect appreciably the cutaneous surface, the face always presented a sallow appearance; this was soon replaced by the flushing already referred to. Very often there was no initial shivering (*cold stage*). Respiration quickened with the increased cardiac action; the latter was strong and thumping; often very violent. Gastro-intestinal derangement appeared simultaneously with the thermal and circulatory symptoms, and progressed with them. Constipation was always marked; flatulent distension of the abdomen always appeared, accompanied by borborygmi and eructations; vomiting appeared early, and the retching was often very persistent. When the latter movement succeeded in bringing up a large quantity of biliary matter (as it often did) in the early stage, great relief was always experienced. A whitish fur coated the tongue during the whole time of the febrile attack; when the pyrexia disappeared, this disappeared—very gradually, as a rule—from the tip and edges towards the base and septum. The defervescence was usually accompanied by profuse diaphoresis (*sweating stage*), but this, like the initial stage of shivering, was often absent. When absent it was, however, an almost infallible indication of a recurrence of the fever after a very variable period of apyrexia. When all these classic stages of ague were present, the first was always the shortest, and the second the longest. With the initial stage of the fever there was always a great determination of the blood to the abdominal viscera, even when no definite rigor was noticeable. Coincident with this was, of course, the enlargement of the spleen, which varied greatly in individual cases. There was also congestive enlargement of the liver, sometimes accompanied by great tenderness. The increased flow of blood to the kidneys, with consequent increase of tension, was evidenced by a greatly increased flow of urine, of diminished specific gravity. In the very severe cases the renal secretion towards the end of a paroxysm became deeply tinged with bile. The mental faculties were always decidedly stimulated in the early period of an attack. Ideas flowed freely and rapidly through the mind, and the affected person always became talkative and argumentative, some even aggressively so. Any perceptible deterioration of temper among the members of Mr. Stanley's staff made his companions at once suspect a commencing attack of African fever. This made the sympathetic or philosophical ones more lenient and forbearing than perhaps they otherwise would have been.

Another feature of our African fever for which my previous experience had not quite prepared me was that, excepting in the cases where the cramps were very severe, muscular activity was fairly well preserved, at least till recurring attacks had weakened the patient's whole system. There was not one of the officers of the Relief Expedition who did not over and over again go through a hard day's work, including laborious marching over very difficult ground and constant attention to a number of worrying duties, while his temperature was all the time above 105° or 106° F. And such exertion did not appear to have any subsequent effect on the convalescence—indeed, all our worst cases of fever occurred while we occupied standing camps and were not constantly on the move. As a rule, the prostrating effects of fever were very manifest in those cases only in which the subsidences of temperature did not reach the normal standard—where, in other words, the fever assumed the remittent type. In the worst instances even the remissions became comparatively indistinct: the temperature chart presented features approximating to that of continued fever. In such cases all the powers of the system became rapidly exhausted, the patient's frame would be found at the end of two or three days to have shrivelled, even to what looked like almost half its original bulk. All physical and mental energy was found to have disappeared. The spleen would be found enormously enlarged, the mechanical inconvenience of this condition manifesting itself in a very distressing feeling of tightness about the chest, which sometimes amounted to a positive sense of suffocation. There were often severe shooting pains felt along the course of the large nerves, especially of the lower extremity (the anterior crural and the great sciatic), and when the fever had subsided great soreness of the muscles was complained of. This gradually passed away, but muscular weakness was often very marked for a considerable number of days after a bad attack, the patient feeling incapable of any very active physical exertion and very shaky on his legs when he attempted to walk, or even stand. In many of the febrile attacks brought on by chills, wettings, &c., the pyrexia exhausted itself in a single paroxysm. The temperature was normal on the following morning, and remained so. I have already referred to the fact that the patient in very many instances *worked hard during the paroxysm;* and I had ample opportunities of observing what was at first an unexpected fact—that such exertion did not in the least prolong the paroxysm, or in the least degree retard the progress of the subsequent convalescence.

When we had escaped from the depths of the primeval forest of Central Africa and emerged on the open plains towards the Albert Nyanza Lake, I had fondly hoped that the free and fresh air which we were allowed to breathe under a clear and open sky would carry with it comparative immunity from the previously persistent fever. But in this expectation I was bitterly disappointed. Malarial symptoms were even more prevalent and more continuous on the shores of the great Albert Lake than they had been in the untrodden pathways of the forest. Even Emin Pasha himself, who had but a few times suffered from intermittent fever during his thirteen years' residence in equatorial Africa, and who had come to regard his own physique as "fever-proof," was over and over again attacked by the fever (and severely, too) during our prolonged sojourn on the lake shore.

At Nsabé (2400 feet above the sea) we then ascended to the summit of the surrounding range of hills and occupied a camp at "Kavallis" on the plateau about 2500 feet above the level of the lake, and the heavy work done by our carriers in conveying the baggage of the lazy Egyptians from the lake shore (where they were deposited by the steamers) up to our camp, toasted by the sweltering heat of the sun as they laboured in the ascent, and chilled by the lake breezes on their return, furnished me with a larger number of fever cases than I had previously had to deal with at any stage of our journey. As we descended from the Central African plateau, after passing the skirts of the Ruwenzori range, the number of fever cases rapidly increased. As we passed through Ankori, which abounds in precipitous hills and swampy ravines, not a single member of our caravan was there who did not suffer from the fever, most of them several times, a considerable proportion scores of times. Even the lazy members of our Egyptian contingent, whose chronically enlarged spleens were looked on by Emin Pasha as an index of immunity, suffered as regularly and as acutely as the original members of the expedition while we gradually descended from the Central African plateau on our way from the Albert Nyanza to the eastern coast. The Pasha, who has been long accustomed to look upon himself as "fever proof," was completely disillusionised during the journey. A considerable portion of this latter part of our African transit was through a very chilly country, whose valleys were richly furnished with swampy ravines, and as our stock of quinine was entirely inadequate to carry out the careful prophylactic measures which would have been desirable under the circumstances, the amount of fever which I was called upon to treat became most distressingly great. I must, however, add that all my experience goes to show that when African residents are in a position in which due hygienic precautions can be properly maintained, and the already well-known preventive measures fully carried out, the attacks of the otherwise formidable enemy can be well kept within control, and this fact was evident to each of the white officers of the expedition.

It is hardly necessary to refer to the fact that although a great deal of the most skilful research has been expended in the investigation of the morbid anatomy of intermittent

Digitized by Google

fevers, and very much light has been thrown on the changes presented by the tissues and fluids of the organism during the various stages of their development and progress, we are still far from having arrived at any degree of certainty regarding the connexion between the micro-organisms which have been discovered in the circulation and the pathogenesis of disease whose phenomena appear to be accompanied by their presence. Why it is that a couple of hours' unshaded exposure to a vertical sun, a single hour's chill, the swimming of a river, the wading of a swamp, and the quiet inhalation of the vapours arising from a quantity of the rank and moist decomposing vegetable products of the soil, were all rapidly followed by similar trains of symptoms in ourselves and our quadrupeds, is a question which has not, I think, been definitely solved by the results of bacteriological investigation up to the present date.

ANÆSTHETICS A NECESSARY PART OF THE CURRICULUM.

A PLEA FOR MORE SYSTEMATIC TEACHING.[1]

BY J. FREDK W. SILK, M.D. LOND. &c.,

ASSISTANT ANÆSTHETIST TO GUY'S HOSPITAL, AND ANÆSTHETIST TO THE DENTAL SCHOOL; ANÆSTHETIST TO THE ROYAL FREE HOSPITAL.

As a general rule the discussions which follow the reading of papers on Anæsthetics resolve themselves into personal expressions of opinion on the part of the individual speakers as to which drug is universally applicable in all cases and under all conditions, or, as it is usually put, "which is the best anæsthetic"; and it almost seems to be lost sight of that there are many other problems connected with the subject which are well worthy of attention. As I am not by any means convinced of the advantage of constantly discussing a subject from the same point of view, it occurred to me that it might possibly be of interest if I entered upon an aspect of the question in which I have myself always been greatly interested, and which has been occupying my mind more particularly during the last few months in connexion with certain alterations now pending at Guy's Hospital. I allude to what I would term the "Systematic Teaching of Anæsthetics." I propose, then, to discuss very briefly—(*A*) the nature and character of the instruction in anæsthetics at present offered to the student; (*B*) some reasons for thinking that this instruction should be improved upon; (*C*) a brief indication of the direction in which it is both possible and desirable to make this improvement.

A. THE NATURE AND CHARACTER OF THE INSTRUCTION IN ANÆSTHETICS AT PRESENT OFFERED TO THE STUDENT.

It may, I think, be assumed at the outset that at every medical school in the United Kingdom where lectures on surgery are delivered some allusion is made in the course of those lectures to the subject of anæsthetics. I think, too, that it may be assumed that at every hospital attended by students the respective surgeons occasionally direct attention clinically to their administration. But this can hardly be called "systematic teaching." With these general exceptions it does not appear, if one may judge from the prospectuses issued by the respective medical schools, that any special instruction in anæsthetics is afforded in Scotland, Ireland, or the provinces. In some instances, it is true, anæsthetists are attached to the several hospitals, but it would seem that their duties are, if I may use the term, functional rather than academic—limited, that is, to the mere administration, and not concerned with the teaching. In the metropolitan schools things are a little better; in London there are, including the Women's School, twelve medical schools, and these twelve schools are responsible for the education of between 40 and 50 per cent. of all the students registered at the Medical Council. To eleven out of these twelve schools special anæsthetists are attached; at the twelfth an "administrator of anæsthetics" is included among the appointments open to the student immediately after he has become qualified; and at one school, in addition to the anæsthetist to the hospital, there are two junior appointments open to students, the holders of which are qualified and resident in the hospital. In nine out of these eleven schools it is definitely stated in the prospectuses that instruction in anæsthetics is given; but the actual amount of instruction afforded varies considerably, and, of course, it is almost as impossible as it would be invidious to estimate the exact value of the instruction given in the several instances. In some few schools, for example, lectures and demonstrations are given; in some the teaching appears to be limited to instruction simply, and this, of course, may mean almost anything. At some schools, too, the teaching is not included in the general course of study, but an extra fee is charged, and at some a certificate of instruction is required before the student can hold any or certain of the resident appointments. However, assuming that the instruction given at these nine hospitals is the best and most systematic possible, and that all the students attached to the respective hospitals sought for and obtained it, that would, after all, represent but 76 per cent. of the London students alone. As a matter of fact, however, at six of the largest of these nine hospitals an average of about 51 per cent. attend the classes and lectures. Assuming, then, that a similar percentage of students attend at the remaining three schools, which I very much doubt, this means that of all the London students only 35 per cent. are instructed in any special manner. This percentage, too, be it remembered, applies merely to the London schools, and it would be reduced to under 18 per cent. if we took into account the students of Scotland, Ireland, and the provinces; and a still greater reduction would be required if we were to attempt to estimate the quality as well as the quantity of the instruction given; but the figures as they stand are quite sufficient for my present purpose. It results almost as a necessary corollary from this that many students must obtain almost their first experience in administering anæsthetics after they have qualified, and after they have gone beyond the reach of supervision and instruction.

B. REASONS FOR THINKING THAT THIS INSTRUCTION SHOULD BE IMPROVED UPON.

I now propose to give some of the reasons which have led me to think that this amount of instruction is inadequate, and might advantageously be improved upon.

1. *Improvements in surgery.*—Generally speaking, the art of surgery may be said to have improved precisely in proportion to the certainty with which we can foretell results; the possibility, however remote, of the death or subsequent illness of a patient as the direct result of the anæsthetic introduces an element of doubt which I think we ought to attempt to remove, and I think that if we taught anæsthetics more systematically, not only would the standard of average skill in administering them be raised, but we should soon get to know more about the subject. Again, of the many causes to which the improvements in surgery may be assigned two at least stand out with particular prominence. First, the actual introduction of artificial anæsthesia in the modern acceptation of the term. Secondly, the elaborate attention paid to details. Nowadays a surgical operation is a much more complicated and deliberate proceeding than formerly, and even if it be denied that the induction of anæsthesia is absolutely essential for all operations, it may, on the other hand, assuredly be asserted that without it many of the tedious and prolonged operations of modern surgery would be impossible. Further, no details are now considered too minute or too trivial to receive the most anxious consideration and thought from the operating surgeon, who usually takes care too that those who assist him shall be well trained in his methods. Now I would claim for the administration of anæsthetics that it is in itself one of the essential details of every surgical operation, and as such should be taught with as much care as is nearly every other detail.

2 *Increase in the number of administrations.*—It is of course impossible to give more than the vaguest guesses at the actual number of administrations, but they must obviously be enormous. Let each of us, for instance, try to recall the number of administrations he has himself conducted in private; let us, further, bear in mind the enormous amount of work done in this direction at the various hospitals throughout the country (including, of course, that increasingly important

[1] A paper read before the Thames Valley Branch of the British Medical Association on Wednesday, March 16th, 1892.

Digitized by Google

item, the dental hospitals); and let us also remember that anæsthetisation is not only possible, but is freely practised on both sexes and at all ages. Bearing all these facts in mind, we can appreciate the difficulty, or even the utter impossibility, of forming anything like an accurate estimate, and can understand that the numbers, if they could be arrived at, would very likely prove to be very large indeed. Without going so far as to contrast these numbers with the actual number of childbirths, yet I think that a very fair fractional comparison might be made; we might say, for instance, that the number of anæsthetisations is a tenth, or a twentieth, or even a hundredth of the number of childbirths. Parturition, too, is a natural process, and in the majority of cases quite normal; on the other hand, anæsthetisation is essentially an unnatural process, and cannot therefore in the same sense ever be termed normal. A precisely similar comparison might be made in respect to other branches of our art. I merely choose that of obstetrics as the one with which we are all probably most familiar. But with whichever branch the comparison is made, I venture to say that the relative amount of instruction afforded will bear no comparison either as to quantity or quality.

3. *Importance of the subject.*—All the reasons which I am now giving for improvement in teaching bear, of course, upon the importance of the subject; but under this particular head I wish to insist upon the desirability of directing the student's attention very emphatically to the responsibility he assumes when he undertakes to induce anæsthesia. The time has happily passed when the dispenser, the half-trained nurse, or even the coachman, would be considered competent to administer anæsthetics; but I think that even now the duties are sometimes undertaken in too light-hearted and casual a manner. Without any desire to over-estimate its importance, I think that it cannot be insisted on too frequently or too strongly that in every case the administration of the anæsthetic requires the sole and undivided attention of one individual, to which axiom I should myself be inclined to add that it is of advantage if that individual has nothing whatever to do with the general treatment, past or future, of the case.

4. *Improvements in the methods of administration and in our knowledge of the subject.*—As has happened in all other branches of medical science, increased knowledge has led to the introduction of great improvements in the methods employed, which of necessity tend to become more and more complicated and delicate. A piece of rag and a bottle no longer constitute the sole armamentaria of the anæsthetist, but cones, face-pieces, inhalers, &c., of varying degrees of complexity, have been introduced, all of which require a certain amount of skill in their manipulation, and with which it is highly desirable that the student should become familiar. Our knowledge, too, of the alterations in the physiological state induced by the anæsthetic has undoubtedly increased, and would increase still further under the stimulus of systematic teaching.

5. *The complicated nature of the process.*—Apart from mere manipulation, there are several points connected with the administration of anæsthetics which call for careful study and anxious attention, and it is to the consideration of these points, I believe, rather than in futile efforts to select (whether by physiological, clinical, or statistical observations) a universal anæsthetic, that the greatest good is likely to result. For instance, the preparation that the patient should undergo prior to the operation; the best time for operating; the after treatment of the effects of the anæsthetic, such as the sickness &c., are all points upon which the anæsthetist will occasionally be asked to express an opinion. More frequently, however, he will be called upon to exercise his judgment in the choice of the particular anæsthetic to be used, having due regard to the idiosyncrasy of the patient, his sex and age, his previous history and present physical condition, and the nature and probable duration of the operation; the anæsthetist will also be called upon to select the particular method or methods to be employed, and to change, if need be, during the course of the anæsthetisation the particular drug with which narcosis was originally induced; to watch for and promptly treat any emergencies that may arise, and to warn the operating surgeon if the condition of the patient becomes such as to render further proceedings unadvisable. Upon all such points as these there is something to be said, something to be taught, and further information would rapidly accrue if the teaching, and with it of necessity the study of the subject, were undertaken in a more systematic manner.

6. *The attendant difficulties and dangers.*—I now come to the consideration of what is perhaps the most important of all the reasons which I am now advancing—viz., the difficulties and dangers connected with the process of anæsthetisation. We cannot but admit that the process is essentially an unnatural one, and as such patients who submit themselves to it cannot but run a certain amount of risk; and we know, further, that a good many deaths can be ascribed directly to the administration of one or other anæsthetic. Our duty, both to our patients and to ourselves, urges us to look these facts fully in the face, and, by adopting every possible precaution, attempt to minimise, even if we cannot entirely overcome, these dangers. I trust that others have been as fortunate as myself in never having gone through the agony of being present at an actual death from an anæsthetic; on the other hand, but few anæsthetists, I expect, but can recall more than one case in which "their hearts have been in their mouths," and the patient's life has hung by a mere thread. Those of us who have read the records of the fatal cases cannot but have been struck by the varied and, in some instances, almost absurd means of resuscitation adopted—generally, too, without success. Systematic teaching would at least afford us help at this, one of the most critical periods of our professional career; it would teach us, at any rate, what to do under such circumstances, and, what to my mind is much more important, it would teach us what to avoid doing, for I believe that, like "meddlesome midwifery," fussy anæsthetisation is essentially bad.

With regard to the actual death-rate, I fancy that I have observed in some quarters a tendency to treat this matter a little too lightly—to try, for instance, to explain the matter away by saying that, after all, considering the number of administrations, the deaths are really remarkably few, and, in fact, that on the whole it is safer to take an anæsthetic than to make a railway journey, or, as I believe one newspaper put it, safer than drinking a glass of whisky. All this may be perfectly true, and yet I venture to think that this is not the way in which a profession whose object is to *save* life should approach this subject. I do not in any way wish to over-estimate the dangers; but at the same time I think that, if we hope to overcome or mitigate them, we ought to have as accurate a knowledge as possible of the actual extent of those dangers. The following table,

Death-rate from Anæsthetics in England alone (from the Reports of the Registrar-General, 1881 to 1890).

—	1881.	1882.	1883.	1884.	1885.	1886.	1887.	1888.	1889.	1890.

Totals ..	28	31	31	34	25	28	39	33	36	42

Note.—This table refers *to England alone;* the figures relating to Scotland and Ireland do not appear to be published under a separate head. Prior to 1884 there seems to have been much irregularity in the method of classification.

which I have taken from the reports of the Registrar-General for the ten years 1881–1890, shows that the dangers are very real dangers, and do not exist simply in the imaginations of anæsthetists. Gloss it over as we will, explain it as we like, argue about it logically or illogically as we choose, we cannot at any rate get over the fact that the number of deaths that occur during the administration of anæsthetics is not only numerous, but increasing. The returns for 1891 have not yet been published, but in going through the papers with a view to forming an estimate as to what the number was likely to be, I obtained some results which are at least interesting, and which, to my mind, have a very particular bearing upon the question of the teaching of anæsthetics. Judging from the table, I think that we may anticipate that the death-rate

Digitized by Google

in England alone for 1891 will be a little under or a little over fifty: of these I have been able to find, either in THE LANCET or the *British Medical Journal*, records of forty cases; of these forty cases, sufficient details are given in thirty-seven to enable me to say that twenty-seven occurred in hospitals or public institutions of some sort, and the remaining ten in private practice. Again, I have been able to ascertain the names and professional standing of the administrators in twenty-six instances, and I find that in by far the majority of cases the administrators have been comparatively young men—in fact, the average standing in the whole twenty-six cases was only four years and a half, and in sixteen it was less than two years and a half; this comparatively low average is of course largely due to the number of cases that are reported from hospitals, but as a matter of fact the same remarks apply equally to the much smaller number reported from private practice. Then, again, in these twenty-six cases I have been able to ascertain the particular medical school at which the administrators received their professional training, and arranging these schools into three groups, according to whether, in my opinion at least, the anæsthetic teaching was *nil*, very slight, or fair, I find that in these twenty-six instances the administrators had received no systematic instruction in seventeen cases, very little, if any, in five, and fair instruction in only four. In the same way in the previous year, 1890, ten cases are sufficiently fully reported; and, adopting precisely the same classification of the schools, six cases would come under the head of *nil*, two as very slight, and two as fair. With regard to other years, I may perhaps say that I have gone very carefully through the papers up to 1881, and find that precisely the same principle holds good throughout; but the actual figures are too small to make it worth while to tabulate them, as I at first intended. The question as to the professional standing of the administrators is of course a personal one, and obviously I cannot give you chapter and verse for my statements, and for a similar reason too I cannot well disclose the system of classification of the schools that I have adopted; and on these points, therefore, I must be contented if my deductions are accepted as matters of opinion; but I may perhaps claim for them that they should rank as the opinions of one who has gone very carefully into the subject. But however that may be, of this there can be no doubt whatever, that the greatest number of deaths occur in the practice of young administrators; that is, at just that period of their professional career when teaching is most likely to be of service and to stand in the place of that experience which they gain subsequently. Practical instruction during his student days, under the direct supervision and guidance of someone qualified to teach the subject, would furnish a man with a fund of information of far greater real value than would be obtained from the experience gained from many hundreds of cases without such teaching. Under the present arrangements, as I have endeavoured to show, such instruction falls to the lot of but a very small percentage; and my contention is that, if not compulsory, such instruction should at least be possible for all.

These are the chief reasons I would advance for the improvements I suggest; other arguments might readily be adduced—such, for instance, as that the habits of close attention and accurate observation entailed in the proper administration of anæsthetics render the study of the subject a not unworthy adjunct to any system of medical education. I think, however, that I have said sufficient to justify my conclusions.

C. A BRIEF INDICATION OF THE DIRECTION IN WHICH IT IS POSSIBLE TO MAKE THIS IMPROVEMENT.

An outline of the plan I would suggest is this: In the first place, candidates for the various degrees and diplomas should be required to produce evidence of proper instruction in the subject; this might well take the form of a certificate of having attended a definite course of lectures and demonstrations, and of having personally administered in a certain number of cases. This is, I think, the least that can be done by the examining bodies. In the second place, I think that at the hospitals the system of teaching anæsthetics should be the same as that adopted in respect to medicine, surgery, and other branches—that is, that after attending the classes the student should be appointed "clerk to the anæsthetist," when, under the direct supervision and guidance of his teacher, he should administer to the necessary number of cases, and should keep whatever notes and records it may be thought advisable. Finally, in the large hospitals especially, it would be of advantage to appoint resident anæsthetists to take charge of the administrations in the absence of the honorary officer. Some such plan as this would, I think, do much to place the teaching of anæsthetics upon a proper basis and that, too, without dislocating existing arrangements, and, if generally adopted, I feel sure that good results would follow.

Weymouth-street, W.

NOTES ON SOME HYSTERICAL CASES.[1]

BY JAMES KERR, M.A., M.D. CANTAB.

THE following three cases illustrate certain diagnostic points, and also call attention to a method of treatment seldom practised.

M. G——, aged thirty, came to the out-patient room of the infirmary complaining of fits, to which she had been subject some time. She was aware of their oncoming. A fit began by movements of the right hand and arm, then involved the muscles which draw the head over and towards the right; she then either lost consciousness or the fit passed off. She voluntarily added that sometimes after a fit she could see treble (triplopia) with the right eye for a considerable time. There was no period of aphasia or stupor after these attacks. She was made an in-patient and watched. There was no surface anæsthesia, but pharyngeal insensitiveness was noted; no further eye symptoms. She had fits as described; and although such attacks as hysterical manifestations are rare, yet, having regard to the pharyngeal insensitiveness, the transient monocular triplopia, and her general behaviour, hysteria was diagnosed, and she was discharged after a time unrelieved.

The next case, A. P——, aged thirty, came here seven weeks after her confinement complaining of gradual loss of power in the left hand during the three weeks preceding. Although she had no lead line, yet she was very sallow and anæmic; so iodide of potassium was given. A week later she was worse, and was ordered to be an in-patient. Some days later she was admitted, and on examination in the ward, surface and deep anæsthesia were found from two inches above the left elbow-joint to the finger-tips. There was also a rigid, semi-flexed position of the hand and arm. She had pharyngeal insensitiveness, but never noticed polyopia. Further examination of the eyes was deferred, and never accomplished. The diagnosis of hysterical contracture having been made, she was told that the doctor would return in a short time, and would cure her. This was accomplished after the usual ward visit by asking her to touch the top of her head with the left hand. This, of course, she could not do; so the wrist, being firmly held, was suddenly and forcibly raised and bent over the left shoulder. The patient screamed with pain, she said. So it was asserted, that if she had pain the sensation would return which she could feel in the finger-tips. The attention being drawn by stroking the hand and arm and pinching the fingers, in a very short time she began to feel in the fingers. The passive movements being repeated, and assertions made that she was regaining motor power, she was soon able to voluntarily extend the joints when passively flexed, and by a repetition of the manœuvres she had in the course of less than half an hour considerable motor power, and sensation enough to localise touch correctly. In the evening, after some little ebullition of temper, the condition recurred; but, by repeating the treatment, to which was added the assertion that the disease had no real existence, and could not recur, she was relieved, and the following day discharged. The contracture never recurred.

The next is the most interesting case, as it occurred in a powerful and intelligent man, J. T——, aged twenty-nine, a sign painter, of good history except that in 1889 he had a slight shock, being thrown on the floor by a sudden movement whilst working in a railway van, and later in that year he slipped in the street and sprained his thumb, which remained stiff for six weeks. On July 6th, 1891,

[1] A paper read at the Bradford Medico-Chirurgical Society on Jan. 12th, 1892.

Digitized by Google

whilst at work on a ladder, the rung broke, and he fell four and a half feet, bumping his head, and the back of his right shoulder; he was stunned, and, being picked up and taken to the infirmary, recovered consciousness on the way. He was after a few hours' detention made an out-patient, and attended as such during most of the month, complaining much of his head and of pain in the right biceps. He got such attacks of dizziness that he took to his bed and came under my care. He seemed on the verge of madness. The following note was taken on Aug. 1st: "The patient sits, preserving the same attitude, almost expressionless, but irrational and excited when drawn into conversation, complete loss of voluntary power in right hand and arm, thumb turned in, rigid, semi-flexed in position of contracture, which persists during sleep, right hand feels colder, but is really the same temperature (97·6° F.) as the left. There is superficial and deep anæsthesia of hand and arm, save a hyperæsthetic patch over the biceps, no glossy skin, no nutritional changes, lively reaction of all muscles to faradism. Over the rest of the surface to the right of the median line the perversion of sensation described as 'allochiria,' that is, that a touch on the right side is accurately referred to the corresponding point on the left side. There appears to be a negative sensory image of the right side projected on the left. This holds good only with respect to common sensation. The temperature sense is abolished on the right, and the muscular sense is also absent on the right side. There are no reflexes save the light pupil reflex elicited on the right side; the right eye cannot discern the fingers at the distance of a foot, the right ear only hears a watch on contact. On the left side there is a marked diminution quantitatively but no change qualitatively in the various functions. The left plantar reflex was decidedly lively compared with the other reflexes. The patient stands steadily, with eyes shut, the optic fundus is normal in both eyes, and the pharynx anæsthetic." The diagnosis of traumato-hysterical contracture having been made, and as for a month past medical treatment had been unavailing, it was resolved to try simple suggestion, which was ineffective. So the patient was hypnotised by the Nancy method. At the first sitting involuntary closure of the eyes was obtained; next, catalepsy and forced movements; and by the fourth time such phenomena as post-hypnotic negative hallucinations could be induced. He was sensible of the improvement in motor power; by suggestion partial transfer of symptoms was effected. By the eleventh sitting sensation in the hand was definitely re-established and motor power considerably regained, but fine tremor asserted itself on his attempting to write; this tremor could be nearly abolished by hypnotic suggestion, but reappeared post-hypnotically. Careful examination of the right eye showed considerable amblyopia—only central vision, in fact; at six inches distance he only saw the middle third of a match, and saw three images; when brought nearer the eye the match seemed immense (macropsy), "like a telegraph timber," he said; when some distance off it appeared "about a quarter the size it ought to" (micropsy). The field of vision of the left eye was also somewhat contracted; attention was paid to the sight in suggestions, and the increase in the field of vision was very apparent during the next three sittings. By the fifteenth sitting he was nearly well, and the last time I saw him there was but slight weakness in the right-hand grasp, the ocular symptoms persisted, but he was otherwise well, and forty days after beginning suggestive treatment he was at work as an "artist," which he has continued since. Charcot says that in these cases "without doubt the paralysis, already perhaps of long standing, may persist for months or years; nevertheless the cure ought to take place sooner or later, and our efforts ought to hasten the occurrence." The diagnosis of hysteria is probably made more often than the disease occurs; it is most important to make, not a negative, but a positive diagnosis, not merely to exclude other causes, but to find some definite evidence of lowered cortical activity, for that is the basis of hysterical symptoms. The emotional exaltation is merely a symptom of want of self-control, of lowered cortical activity; but, next to globus, probably one of the most frequent symptoms is pharyngeal insensitiveness, and then diminution of the visual fields is a fairly common one, the accommodation disturbance, monocular polyopia, and so forth being not so common. The polyopia is due to the action of the separate sectors of which the lens is built, the division being sometimes seen by a three-rayed star, with the lowest leg vertical, to be seen in eyes otherwise apparently healthy. This varying action of the sectors is compensated normally by accommodation, which in two of these hysterical cases was thrown out of order. The macropsy occurs in myosis, and micropsy in mydriasis; but why they should occur simultaneously in the same eye is not very evident. False impressions are formed from the difficulty in altering the accommodation either by contraction or dilatation of the iris.

Of allochiria, the rarest symptom of all described, which is known chiefly in connexion with cases of locomotor ataxia, no explanation has as yet been given. It seems to point to a dual action of the two hemispheres in every nervous act. In connexion with hypnotism it seems better not to look for hystero-genetic zones. One case reported by Charcot had the first fit produced thus, and passed into a convulsive habit. Another useful rule for the patients' benefit is always to insist on suggesting that no one else can hypnotise them.

Bradford.

NOTE ON A CASE OF APOPLEXY TREATED SUCCESSFULLY BY VENESECTION.

BY W. H. RUSSELL FORSBROOK, M.D. LOND.

I THINK it well to record the following case as showing the value of venesection in an apparently hopeless condition.

The patient is aged forty-seven, a stout, plethoric, and muscular individual, with a specific history. He was said to have had an attack of left-sided hemiplegia about twenty years ago, with loss of speech, from which he recovered, except for a slight dragging of the left leg. In spite of this he indulged in hunting, shooting, and in every way lived a hard and active life. Between this time and 1881 he more than once lost his speech and memory for a few hours, and on one occasion was found in his garden unconscious. In October, 1881, he had two attacks of epilepsy within a few minutes of each other, without any warning except that he complained of feeling sick an hour before the first fit. Two days later he was about again as usual, although his medical advisers considered him in a precarious state of health, and from this time he has always been more or less an invalid. In the following December, when out driving, he again lost his speech, but recovered it in a few hours. In March, 1892, his wife, having left him in bed in his usual state, found on her return in half an hour that he had again lost his speech, that he could not swallow, that he was unable to protrude his tongue, and that his mouth was drawn to one side. It was afterwards found that his left arm and leg were again paralysed. For ten days his life was despaired of, and for many weeks he was very ill. He has, however, gradually regained the use of his arm and leg, and has become able to swallow fairly well, but his speech, though better, has remained difficult and unintelligible since this attack. During this illness he expressed his thoughts and wishes in writing, but his handwriting was changed, and has never been so good since. Latterly he has not walked so well; in fact, he has only taken carriage exercise, but has eaten and slept well. The above history is taken from notes made by the patient's wife.

On Feb. 8th of this year, at about 6 P.M., the patient was sitting in his chair asleep, when suddenly his eyelids were noticed to twitch, and he turned his head and eyes to the right side and threw up his arms. His face was slightly convulsed. When seen, about ten minutes later, he was lying outstretched and motionless on the floor of the room in which he had been sitting. He had bitten his tongue; his face was turgid and livid; his pupils were equal and rather contracted; his lips, ears, and finger-tips very purple. There was deep stertor, and all power of motion and sensation was lost; he was almost pulseless, and the cardiac sounds were feeble. As a fatal issue seemed to be directly imminent, I suggested to the patient's wife that her husband should be bled, as offering the best chance of relieving the immediate symptoms. She consented, and Mr. Pearce Gould was called in. He arrived at 7.15, when the case was explained to him, and after examining the patient he agreed that it would be judicious to bleed, although the case seemed hopeless. Mr. Pearce Gould then bled the patient to a pint from the left arm. Before

Digitized by Google

the blood had ceased to flow the effect was very marked in the patient's face and hands, which regained their normal colour, and the pupils, which had become widely dilated during the bleeding, alternately contracted and dilated. At the same time the radial pulse became better, and the stertor not so deep; there was some slight movement of the left leg, and as he was apparently doing well we left him at 8 P.M. When I saw the patient again, at 9.30 P.M., he was still lying on his back in the same place, but was quite conscious and could move all his limbs, and did not appear to know anything of what had happened. From this time to the present moment he has been in much the same state as before the attack, except that he has seemed a little more feeble. He expresses himself as feeling quite well, and had it not been that he was accidentally burnt with carbolic acid he would have been taking his usual daily drive.

State of patient on Feb. 16th, 1892.—Patient is well nourished, emotional, and there is no apparent muscular atrophy. His gait is unsteady, but not ataxic, and he drags his left leg slightly. His pupils are equal and react well, and his discs are clear and fairly defined; but there is dissociation of movement of the upper lids, the left sometimes moving later than the right. The lower lip hangs down a little more on the left than on the right side, but he can readily raise it, so as to bring it in contact with the upper one. There is little or no dribbling of saliva at the present time, although this was the case for a long time after the attack in March, 1882. His tongue is broad, thin, and flabby; he can protrude it beyond the lips, but the right half is pushed out slightly further than the left. There is little or no relaxation of the palate, which acts fairly well. The power of swallowing is not bad, but he is obliged to have all solid food minced. There is some slight delay in the approximation of the vocal cords. His articulation is thick and slurred, although there are a few short words, besides "yes" and "no," which he can pronounce distinctly, such as "right," "all," &c. To a stranger his speech generally is quite unintelligible, but his wife, by getting him to repeat his words singly, can understand him. He has a rather troublesome cough, but does not seem able to expectorate. There are a few moist sounds to be heard at bases. There is no marked increase in the heart's area; its impulse is not to be felt, but its sounds are clear though not of good quality. Pulse 70, small, regular, and compressible. There is frequent desire to micturate, although there is often great delay in the act; but there is no stricture, and the urine contains neither albumen nor sugar. The knee-jerks are apparently exaggerated, but there is no ankle-clonus.

Remarks.—There can be little doubt that the attack above detailed as occurring on Feb. 8th, 1892, was an example of so-called congestive apoplexy arising in an individual probably suffering either from post-hemiplegic epilepsy, or from one of those rare cases of pseudo-bulbar paralysis in which, although there were two distinct attacks of hemiplegia, the same side of the body was affected on each occasion.

Buckingham Palace-road, S.W.

INFLUENZA AND THE MIDDLE EAR.

BY J. WALKER DOWNIE, M.B.,

FELLOW AND EXAMINER IN AURAL SURGERY FOR THE FELLOWSHIP OF THE FACULTY OF PHYSICIANS AND SURGEONS; SURGEON OF THE THROAT AND NOSE DEPARTMENT, WESTERN INFIRMARY, ETC.

IN THE LANCET of March 5th is printed a short communication by me in which I took exception to a statement made by Sir William Dalby, "that those with healthy ears have little to dread from influenza" as far as the lining membrane of the middle ear is concerned. The opinion expressed was based on my experience of cases occurring in this locality, a locality which has in a great measure escaped influenza in its very general, severe, and rapidly debilitating form. There has been a large number of cases of influenza in our large community; but, compared with many other districts, the proportion of cases to the population has been, I take it, small, and of very severe cases very small. This notwithstanding, there have been many cases of aural mischief accompanying and following influenza, and in patients who have never previously suffered from aural affections, as well as in those who have suffered from middle-ear disease at some more or less remote period. The communication made by me has called forth remarks confirmatory of my views by Mr. W. R. H. Stewart and Dr. Hugh Jones, both of whom I know as careful observers. The former in London and the latter in Dolgelly (Wales) have been in the midst of influenza in its more virulent form, and have come to the same conclusion as myself—viz., that middle-ear mischief—and of a very severe type—is met with closely associated with influenza in those who formerly had healthy ears. Several aurists have elsewhere reported cases of otitis media following influenza, and notably Dr. Loewenburg, whose paper, "L'Otite Grippale, observée à Paris en 1891," is well known to the majority of specialists. Here I should wish to give notes of two cases which have quite recently come under my observation, as examples of this "influenzal otitis," as they illustrate the two conditions under discussion. Both patients were adults. In one case, after years of quiescence, the middle ear became acutely inflamed; and in the other it appeared suddenly in a patient who at no time previously had had any aural complaint of any description.

CASE 1.—J. F——, aged sixty-four, a mill-worker from Paisley, applied to the dispensary on account of acute pain in the right ear and over the right side of his head. His temperature was 100·4°; pulse 116. On examining the tongue, which was very foul, he complained of inability to open the mouth to any extent on account of pain and stiffness of the right jaw. He stated that between twelve and fourteen years ago he had discharge from the right ear. It appeared then to result from a cold, was very painful until discharge appeared, and under simple medication was healed within a week; apparently an acute catarrhal otitis media. Neither ear has given him any trouble whatever since that time, and he has always considered his hearing to be very good. Five months ago he had a severe attack of influenza. At the end of three weeks, and while still confined to bed, the right ear suddenly became very painful. His medical adviser syringed the meatus with warm water, by which means the pain was relieved, and it continued free from pain till three weeks ago. There was no discharge then, nor has there been any since. Three weeks ago the right ear again became painful; the use of the syringe with warm water gave temporary relief only, and the parts around the ear became painful. As time passed the mastoid region became swollen, and here the pain was most acute, and from this it radiated all over the right side of the head. On examination the right meatus was completely closed about half an inch from its outer extremity by swelling of its walls, and it was perfectly dry. The auricle was unduly prominent, and directed forwards from the swelling over the mastoid. The skin over the mastoid was bright-red and œdematous, and on palpation there appeared to be deep fluctuation, though not very marked. One-half of the head was shaved, and under chloroform an incision was made over the mastoid, and when the periosteum was incised a small quantity of pus escaped. The tissues over the mastoid were fully half an inch in thickness, and the periosteum was separated up from the bone over a considerable area. It was a periostitis in a man debilitated by a severe attack of a peculiarly depressing ailment beginning in a middle ear, which had previously been inflamed, spreading along the periosteum of the bony meatus to the surface of the mastoid. The incision and evacuation of the pent-up pus gave immediate relief.

CASE 2.—Mrs. M——, aged forty, complained of discharge from her left ear of some three weeks' duration. Two months ago she had been suddenly seized with influenza. She was under medical supervision from the first. By the end of the first week the more acute symptoms had passed away, but she was greatly depressed and very weak, and was consequently kept in bed. At the end of the fifth week, and while apparently progressing favourably, her left ear became suddenly painful. Hot applications were made, soothing instillations applied, but all to little purpose. What sleep she obtained was by the help of nepenthe, but she had little relief from the pain till the third day, when the membrane ruptured, or, as she put it, when it "broke." Blood-stained discharge appeared, and the pain abated. When I saw her the discharge had continued for three weeks. It was purulent and foul-smelling. A watch was only heard on contact. On clearing out the meatus there was a large

Digitized by Google

circular perforation behind and below the handle of the malleus brought into view. Previous to the attack of influenza she had considered her hearing to be perfect, and she had never, as far as she was aware, at any time had any affection of the ears. The right membrane was normal. Under treatment the inflammation of the middle ear was reduced, and the discharge ceased within three weeks. Hearing improved to nearly half the normal distance, but the circular perforation remained.

Here we had an acute catarrhal otitis media going on to suppuration and perforation of the membrane, unassociated with a catarrhal state elsewhere. It occurred in a patient whose ears had previously been perfectly healthy, but whose general health had become markedly depressed as a consequence of influenza. These two cases are types of a series of cases of acute middle-ear trouble occurring in adults which have come under my care within the past two years, and as such I think they may be of interest.

SNAKE-BITES.

By R. P. BANERJIE, B.A., G.B.M.S.L.,
MEDICAL OFFICER, PACHBADRA SALT LINES, RAJPOOTANA, INDIA.

DURING the year 1891-92 seven cases of snake-bite were treated at the North India Salt Revenue Hospital at Pachbadra, and the cases recovered. The following is a short description of each case, with the mode of treatment adopted.

CASE 1.—B——, a Hindoo male aged thirty years, a sepoy of Erinpura Irregular Force, bitten by a snake (echis carinata) on the dorsum of the left foot over the site of the middle cuneiform bone. The two punctures were distinct, edges ecchymosed, and the wound bleeding. Soon after the bite was inflicted the bitten leg became heavy and a sort of low stupor crept on, and the sepoy became drowsy and felt difficulty of breathing. The part above the next joint was tightly ligatured, and the puncture cauterised with burning charcoal. All this was done before the man was brought into the hospital. The punctures were now scarified, and some blood was extracted by cupping, and internally stimulants were exhibited every fifteen minutes, and a hypodermic injection was given of a 2 per cent. solution of permanganate of potassium every ten minutes. Notwithstanding this treatment the case took a bad turn; the stupor began to deepen, so the hypodermic injection of sulphate of strychnine was preferred to the permanganate of potassium; ten minims of which were injected every ten minutes until the entire quantity amounting to one grain and a half had been used, when twitching of the muscles of the face came on, but the stupor now began to fade away fast. The man complained of intense thirst, as if his mouth and tongue were parched, though apparently this was a delusion. Stupor soon passed off, and was replaced by hæmorrhage from the mucous surfaces; even old scars of wounds began to ooze out blood. All these gradually abated, leaving the patient exhausted and weak, but he completely recovered within four days, and was able to do his work, and was sent to his headquarters.

CASE 2.—S. H——, a Mussulman boy aged twelve years, while searching after some books in the hut, was bitten by echis carinata on the right ankle, just below the inner malleolus. This boy was brought in at 8 A.M. on Aug. 5th, 1891. A tight ligature was applied to the leg above the injury, punctures, which were distinct, laid open, some blood drawn out, punctures cauterised, and solution of strychnine injected into both arms at intervals of ten minutes. In this case a quarter of a grain produced the required symptoms. Bleeding from the mucous membrane was slight; no stupor was present. The boy recovered on the third day, when he was discharged all right.

CASE 3.—N. K——, a Mussulman Custom pera aged thirty-five years, was bitten by an echis carinata on the left ankle just above the outer malleolus. He was brought into the hospital on Aug. 9th, 1891. A ligature was applied in the leg affected, the wound scarified, blood let out, and the wound cauterised. The man was in a state of semi-stupor. Ammonia mixture was given by the mouth every twenty minutes, but this apparently did not do much good. Strychnine solution was injected subcutaneously in the arms, aggregating one grain and three-quarters of strychnine, when the characteristic symptoms of the drug were produced, and the man recovered and was discharged cured on Aug. 12th, 1892.

CASE 4.—J——, a Hindoo female aged forty, strong built, was bitten by a bungarus cœruleus in the left thigh. The part round the puncture was cyanotic and the punctures were distinct. The patient was half unconscious, but could answer questions if loudly put to him. Solution of strychnine was injected into the arms every ten minutes until twitching of the muscles of the face was observed. In all she took three grains in four days. The patient was admitted on Sept. 3rd, 1891, and was discharged cured on the 7th.

CASE 5.—A. B——, a Hindoo lady aged sixty-seven, was bitten by a bungarus cœruleus on the night of Sept. 10th, 1891, with apparently the symptoms of Case 4. The puncture was inflicted on the dorsum of the left foot and above the big toe. A hypodermic injection of solution of sulphate of strychnine was made. The patient took half a grain to produce the symptoms. On the third day she recovered, and was discharged.

CASE 6.—M——, a sweeper aged thirty-five, male, was bitten by an echis carinata on the left leg, just below the knee-joint. In this case a ligature was applied at once, consequently the system was not much affected by the poison. However, subsequently there was much bleeding from the mucous surfaces. Strychnine injection was tried as before, the bleeding stopped, and the man recovered and was discharged after four days. The man was brought in on Sept. 14th, 1891.

CASE 7.—R——, a Hindoo male aged fifty-five, stout built, a Custom jemador, was bitten on the dorsum of the right foot just over the base of the inner cuneiform bone. The punctures were distinct, the site around was ecchymosed, and the man was in a stupor-like state. He complained of severe headache and tightness of the chest. He was brought to the hospital on March 28th, 1892, at 9 A.M., one hour after the infliction of the puncture. A tight ligature was used, and blood let out from the punctures; but in this case a remedy tried by the late Dr. Dymock of Bombay, used by him in echis bites, was suggested by the district magistrate, and this officer supplied some herbs (Pagostemon parvifolius), and this herb was ordered to be chewed in from two to four drachm doses. Apparently it produced no good results, and probably because the herb was dry and had lost much of its potency. So the strychnine had again to be resorted to, and the man recovered well. The leg bitten was inflamed, but soon improved under the influence of warm fomentations only. This man took four grains of sulphate of strychnine to effect a cure.

Observations.—In connexion with all these cases the following facts were noticed:—1. The punctures were usually well directed and deep. 2. The edges, almost without any exception, were ecchymosed. 3. Bleeding from the puncture in every case was invariably present. 4. Bleeding from the mouth, nose, and sometimes from the ears, chemosis of the conjunctivæ and urethra, and bloody urine were invariably present in many cases. 5. The blood was thin and did not coagulate: colour, however, was bright, like an arterial blood. 6. Stupor and unconsciousness were not constant symptoms; some showed more tendency to them, while others had no such symptoms at all. 7. After cure having been effected, for some time the patients showed signs of irritability of temper, and were more sensitive to extremes of temperature, and occasionally epistaxis was present.

Remarks.—During the year over 760 snakes have been killed. Of these, vipers are the most common; and of these echis is the most common of all, and most venomous. Other varieties are rarely seen. Three varieties of echis have been seen. In one the undulated lateral marks are interrupted and not continuous. In the second variety there exist alternate black and white square dots over the dorsal ridge. The third variety hardly differ from the second one, but this has a pale-yellow colour, while others have a greyish or earthy colour. These snakes are most virulent in the early summer months. In my hands certainly in viperine poisoning strychnine has proved useful, and I hope those who have better opportunities of performing experiments will extend their investigations still further.

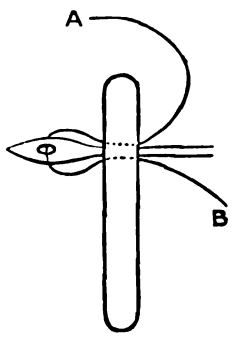
ON A METHOD OF LIGATURING THE PEDICLE IN OVARIOTOMY.

BY ROBERT SANDERSON, M.B. OXON.,
SURGEON TO THE WEST-STREET HOSPITAL FOR WOMEN, BRIGHTON.

MR. SKENE KEITH'S article in THE LANCET of April 30th prompts me to give a brief account of a method of ligaturing the pedicle in ovariotomy which appears to me to avoid the disadvantages which have been pointed out by him in treating broad pedicles by pre-existing methods. Supposing that

FIG. 1.



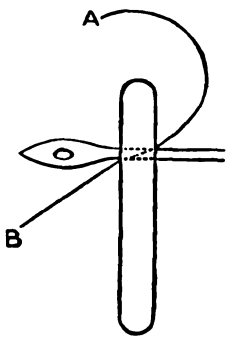


FIG. 2.

the pedicle is broad enough to necessitate ligature in three divisions, the operator, having armed his needle with a silk twist two feet and a half long by its middle, transfixes the pedicle on the side furthest from him, as in Fig. 1, the end A being held by an assistant until wanted. Before withdrawing the needle he disarms it entirely of the silk by drawing the end B right through the puncture in the pedicle (Fig. 2), and threads the needle afresh with the end A (Fig. 3), after carrying it round the margin of the pedicle. He now withdraws the needle, carrying A with it, as in

FIG. 3.

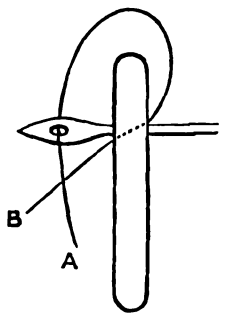

FIG. 4.

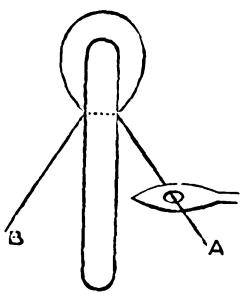

FIG. 5.

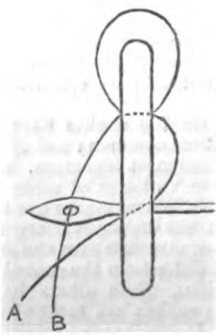

FIG. 6.

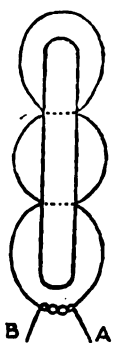

Fig. 4. He again transfixes the pedicle, still armed with A, frees the needle of A, after pulling A through; and then again threads the needle with B (Fig. 5) before withdrawing it, the procedure being identical with that of the first puncture, except that A is read for B and *vice versâ*.

The two ends are then firmly tied in the usual manner round the margin of the pedicle nearest the operator, care being taken to carry one end of the silk twice over its fellow in tying the first half of the knot (Fig. 6). It at first sight may be argued that the loop furthest from the knot would not be pulled tight enough to be safe. I can only say that in practice this is not so, but that, owing to the freedom with which the silk plays through the fresh juicy tissues, the pedicle is drawn neatly and tightly up to the final knot, making a very satisfactory and effectual ligature; so much so that I doubt whether a second ligature sunk into the groove of the first is really necessary, although I have used it in practice. In the other method of ligaturing a broad pedicle in three separate segments, and interlocking the threads of each segment with its fellow—forming a chain or series of three links,—Mr. Skene Keith points out that each link drags upon the next one, and there is some risk of loosening the knot; whereas, if the links are not interlocked before tying (as Mr. Skene Keith recommends), there will possibly be some vertical splitting of the tissues of the pedicle, as has been pointed out by Mr. Alban Doran and others. In the method described above both these disadvantages are avoided, and although the method may appear confusing on paper, it is not really so when once mastered, and has the advantage of being equally applicable to a narrow pedicle, where only one transfixion is required. It might be called the figure-of-8 ligature.

Brighton.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

DIPHTHERIA FROM FAULTY DRAINAGE.

BY PHILIP FRANCIS HARVEY, M.D.,
MAJOR, MEDICAL DEPARTMENT, U.S. ARMY.

MR. MALLINS' note in THE LANCET of March 12th, 1892, reporting an unequivocal case of diphtheria originating from defective drainage induces me to add to the record another case of like nature occurring in my own practice some years ago, and which originated *de novo* at an isolated military post in a new brick building. The location of the post was high and dry on a plateau between the confluence of the Mississippi and Minnesota rivers. The headquarters of the military department were located there.

The case was that of an officer, who had been very much in his quarters for some weeks preparing for an inspecting tour, and had not been exposed to any then known source of contagion. He requested me to attend him for what he thought was an attack of tonsillitis, a disease to which he was subject. I early recognised a difference between the disease from which he was suffering and that which he supposed it to be, and although the case was peculiar in not presenting a false membrane on any of the visible parts of the throat, I suspected diphtheria, and at once sent his little daughter to a neighbour's house, and cautioned his wife to avoid using any of the spoons, cups, &c., used by her husband. Treatment for diphtheria was commenced early, but owing to the unusual features presented by the case I took counsel of two excellent physicians older than myself. They could not see their way clear to any other view than that of a non-septic inflammatory trouble. My own opinion was unhappily confirmed the following day by a long strip of pseudo-membrane, tubular in places and conforming to the size of the trachea, which was coughed up by the patient. A careful examination of this fully convinced me of the specific character of the disease. About this time evidences of local paralysis became apparent, and signs of cardiac failure aroused my solicitude.

The case proved to be very malignant, and terminated fatally by heart paralysis after about eight days' progress. One week later the patient's wife was attacked with diphtheria, which presented characteristic symptoms. She had been kept under strict surveillance, and her throat examined every day. On the appearance of the first suspicious spot

Digitized by Google

of passive hyperæmia the tonsil was freely swabbed with pure tincture of the chloride of iron, and afterwards with nitrate of silver solution, according to Klebs' recommendation, to destroy the local contagion. Nevertheless the disease progressed unfavourably, and terminated fatally one week later. The exact nature of the disease no longer admitting of a doubt, it became a question of considerable interest to determine its etiology. The house occupied by the patients was perfectly new, built of brick, and provided with modern improvements. A thorough sanitary inspection was made, and a faulty drain was found in the basement, with some leakage of sewage into the earth at that point. Here, then, was the explanation of the origin of the disease, and a demonstration of how rapidly the diphtheritic poison may be formed under circumstances favouring its evolution, as the cases occurred in January and the premises were first occupied the preceding November.

Fort Keogh, Montana.

PHTHISICAL CAVITY CAUSING ABSCESS IN THE BREAST.

By E. R. ROUSE, M.R.C.S., L.R.C.P. LOND,
ASSISTANT MEDICAL OFFICER, COLNEY HATCH ASYLUM.

F. R——, aged forty-one, a male patient admitted into this asylum in 1886, suffering from mania with delusions, the latter being very persistent. He was a man of poor physique and with physical signs of advanced tuberculosis of both lungs, as indicated by cavities at both apices. In April last year our attention was called to a large abscess in the left breast, which was supposed then to have been caused by the patient himself, who was continually striking his chest, owing to a delusion The abscess was opened, and a thick curdy pus was let out. Patients, I may add, with delusions of a fixed kind, very often have organic disease, which no doubt accounts to a certain extent for the delusions from which they suffer. This pus continued to discharge until his death, and the sinus which remained never properly closed in spite of numerous attempts to make it do so; he recently died from exhaustion. On post-mortem examination, the sinus in the breast was found to communicate directly through the second intercostal space with a large cavity in the apex of the left lung, so that the pus evacuated from the abscess in the breast came directly from the lung; the latter was firmly adherent to the chest wall in the entire upper lobe, and, in fact, could not be separated from it; the rest of the lung was filled with deposits of tubercle, as was also the right lung, and the intestines were studded with numerous ulcers also tuberculous in nature.

In this case I might have been induced to explore further, as the symptoms pointed to necrosis of the ribs, which were, however, quite natural. My colleague, Mr. Cecil Beadles, tells me he saw an abscess of the breast in a woman, which was opened in the usual way, but continued to discharge for some time, as in the above case; and the sinus also in that case never closed. On post-mortem examination the lung was found to be actinomycotic, and the sinus in that case communicated directly through the chest wall with a cavity in the lung. I think the rarity of the case worthy of record, as I have never heard of a similar one; nor does such a case, as far as I am able to gather, appear in any of the works on Medicine or Surgery.

EUCALYPTUS GLOBULUS IN INFLUENZA.

By HARRY BENJAFIELD, M.B.

Some few months ago I wrote a short article in THE LANCET on our experience of eucalyptus globulus in general [illegible]. Since then we have experienced a severe epidemic of influenza, with many cases of lung complications, and to these I have used eucalyptus globulus largely, and with the best results. Especially marked are its effects in [illegible] which threaten bronchitis and pneumonia. [illegible] typical cases of this attack [illegible] after [illegible] I found [illegible] nostrils [illegible] respiration [illegible]; rales with harsh breathing in the lungs. I ordered, several times a day, inhalations of eucalyptus globulus by getting steam from a steam kettle, in which I put a teaspoonful of the extract, and, throwing a sheet over the cot, put the child in an atmosphere of the steam. In older cases I put an umbrella over them with a sheet thrown over it; but in every case it is necessary to get heat enough under the kettle to vapourise the oil, which is not done at all effectually by the boiling water in an ordinary inhaler. In nearly every case the relief was most marked, and many cases recovered which I am satisfied would have died without it. When the temperature ran high I gave a warm pack every night, sprinkling the sheet with eucalyptus globulus, or a warm bath, to induce perspiration, putting eucalyptus in the water. Inhalations of it night and morning, either with steam spray or vapouriser, have proved most beneficial in chronic bronchitis, and especially in bronchitis with tubercular diathesis; but in these cases I am very careful to use only eucalyptus globulus, which is very superior in its effects to amygdalina, or any of the other eucalypti, and the Tasmanian eucalyptus globulus, or blue gum, is very different from the blue gums of Australia

Hobart, Australia.

A CASE OF DOUBLE UTERUS.

By F. N. WILLIAMS, L.S.A., F.L.S.,
DISTRICT MEDICAL OFFICER FOR BRENTFORD.

THE following record of an unusual case may be interesting and perhaps instructive. On the 25th ult. I was called to Mrs. E——, a primipara aged twenty-two. I found that labour had scarcely begun, so I called at intervals of two hours through the day. Towards evening, as the membranes were ruptured and the pains were slight, I decided to apply the forceps to the presenting head. The insertion of each blade was attended with considerable difficulty—in fact, each had to be withdrawn once on account of an apparent obstruction in the way of their progress. When traction was attempted, some evident obstruction barred the downward progress of the shoulders, and, suspecting the cause might be the presence of a second fœtus, I considered further force at present contra-indicated. I therefore withdrew the forceps again and tried combined internal and external manipulation. By this means I somewhat altered the relative position, and essayed the application of the forceps again, this time without difficulty, and delivered without any trouble. On examination, a second head presented itself, but enclosed in membranes. My left hand was firmly pressed upon the lower part of the abdomen, and in a few minutes I found, on further examination, the placenta slipping down between the presenting head and the vaginal wall, and forthwith emerged from the vulva, without my so much as touching the cord. After applying a temporary binder and waiting an hour, during which interval there were only the faintest indications of pains and at no time a distended condition of the membranes, I gave a dose of ergot with the hope of encouraging the progress of the second fœtus; I applied the forceps again, and delivered in the usual way without difficulty. After digital examination I withdrew my fingers downwards, and they passed, as it were, over the saddle of a partition, and followed the cord into another and similar cavity. I therefore concluded that it was a case of double uterus. The evident difference in maturity and size of the two fœtuses (both male) was also a point of interest. The first weighed 7 lb. 3 oz.; and the second, in which there was some difficulty in rupturing the membranes on account of the relatively small quantity of amniotic fluid, weighed 6 lb. 6 oz., and was certainly not fully developed.

Brentford.

PUBLIC BATHS, ISLINGTON.—On Saturday the Lord Mayor, accompanied by Mr. Alderman Sheriff Tyler, inaugurated the first of the public baths in Islington, which the local vestry has decided to erect. The building is in the Caledonian-road, and provides for the poorest and most densely populated divisions of the parish. The cost of the site, buildings, and fittings has been between £17,000 and £18,000. There are two large swimming baths, forty-two private baths for men, and sixteen for women. In addition there is a laundry establishment and the necessary steam machinery.

Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Procemium.

METROPOLITAN HOSPITAL.

CASE OF COMPOUND DEPRESSED FRACTURE OF THE SKULL, WITH REPLANTATION OF BONE; RECOVERY; REMARKS.

(Under the care of Mr. WALSHAM.)

THIS case of compound depressed fracture of the skull offers a very great contrast as regards treatment to the method of procedure which is usually practised for these injuries, and it is obvious from the description that the number of patients in whom it can be carried out with safety is a limited one. A surgeon would not feel justified in carrying out the procedures given below in full detail without he felt perfectly satisfied as to his power to make the wound and adjacent parts thoroughly aseptic and keep them so afterwards. There are two points to which attention is drawn in the remarks—the replantation of bone and the suturing of the dura mater. There is another which should be noticed, in our opinion, and that is the entire closure of the wound on the completion of the operation. With regard to the first point, the replantation of the bone after elevation in compound comminuted fracture of the skull, there are not many cases recorded in which it has been practised. Mr. J. H. Morgan[1] showed a child aged three years to the Fellows of the Medical Society on Jan. 25th last, on whom he had operated for this injury, complicated with wound of the brain. Separated pieces of bone were replaced, and only one minute crumb of bone afterwards came away. Mr. W. H. Battle[2] also showed a girl aged five before the same Society on March 21st, on whom he had been called to operate. Elevation to their normal level of depressed fragments of the skull had been performed from an opening made with a quarter-inch trephine, and the crown of bone thus removed was afterwards replaced. The result had been a perfect success. We have, therefore, these three cases, the extent of replacement being different in each—fragments separated by the injury, fragments of a separated piece which had been cut smaller, replacement of trephine crown without removal of depressed fragments from the wound, all, however, presenting one thing in common—the youth of the patient and the healthy vascular character of the bone. The cases in which, after operation for exploration of the brain, the crown of bone has been replaced, either in bulk or in fragments, have been complicated by wound of the membranes and, possibly, of the brain substance; but as there has been a perfect control of the wound from the first, the risk of extension of septic inflammation to them from the wound is very much less than in the cases where there has been a possible infection of deep wounds; therefore a wound of the dura mater is more serious, and it is a question whether it should not be the rule to use a drainage-tube in the large majority of such cases. Complete closure of the wound after the replacement of the damaged bone, the pericranium having been readjusted and sutured over the fragments, will, in a successful case, yield the ideal result both at the time and subsequently, for there will be no weak point in the cranial vault. In two of the cases (including this one) the edges of the wound were excised, and this, whilst adding nothing to the risk, diminishes the danger of infection, for they are so often bruised, and the dirt is inseparable by any other method. For the notes of the case we are indebted to Mr. C. F. Marshall, house surgeon.

E. R——, aged eight years, was admitted into the above hospital on March 31st, suffering from a compound depressed fracture of the skull. On admission the child was concussed, but there were no signs of cerebral compression. The pupils were equal and reacted to light. Temperature 99·6°. Situated about an inch behind the external angular process of the left side of the frontal bone was a wound about two inches long, leading to a depressed fracture of the frontal bone. The depressed bone was driven into the dura mater, but there was no laceration of brain substance. There was not much hæmorrhage, as the meningeal arteries had escaped uninjured. About two hours after admission Mr. Walsham operated. The scalp, having been shaved, was rendered thoroughly aseptic by washing with soap and water, turpentine, and perchloride of mercury lotion. The wound was washed out with a 1 in 3000 solution of perchloride of mercury. The depressed portion of bone, about the size of a penny piece, was raised by an elevator, the trephine not being found necessary. The portion of skull raised consisted of two pieces—one of which was attached to the periosteum, the other quite unattached. The piece attached to the periosteum was replaced and fixed by a silk suture; the loose piece of bone was cut into several pieces and placed in warm carbolic lotion (1 in 40) while the operation was proceeding. A small wound was found in the dura mater, and this was closed by a fine silk suture, which did not, however, completely prevent the escape of cerebro-spinal fluid. The dura mater and brain were otherwise uninjured, and there was no accumulation of blood. Several pieces of the detached bone were now replaced, with their edges slightly overlapping. The edges of the wound were refreshed and sutured with silk, but no drainage-tube was used. The wound was dressed with sal alembroth, gauze, and wool. The stitches were removed on the twelfth day and the wound was found to have healed by primary union, except at one spot where a small sinus was left; this, however, was firmly healed on the twenty-eighth day. The child made a perfect recovery, without a bad symptom of any kind.

Remarks by Mr. MARSHALL.—The two points of interest attaching to this case are the suture of the dura mater and the replantation of bone. The suture of the dura mater gave rise to no irritation of any kind, and doubtless tended to prevent the escape of cerebro-spinal fluid into the wound. The replanted portions of bone all lived and became attached, and when the patient left the hospital the skull beneath the scar was quite firm. The healing of the wound by first intention was no doubt aided by paring away the edges of the wound, although these were not apparently bruised. The thorough irrigation after the sutures were inserted and the subsequent firm compression rendered drainage unnecessary.

LIVERPOOL NORTHERN HOSPITAL.

TWO CASES OF STAB-WOUND, WITH PECULIAR FEATURES.

(Under the care of Mr. PUZEY.)

THESE cases are of somewhat unusual character in this country, and contribute to the clinical records of this department of surgery. It will be seen from the account of the cases that the patients were placed in a favourable condition, surgically speaking, from the first by the careful attention of the ambulance surgeon before they were sent to the hospital, and therefore many of the dangers of septic infection in transit were avoided. They did not present the difficulties with regard to the question of operation which are frequently presented by stab-wound of the abdomen, as to whether operative interference shall be undertaken or not, for protrusion of abdominal contents existed, and that required to be remedied. It is fortunate there was no wound of the intestinal tract. The wound of the chest and abdomen of Case 2 resembles much that is occasionally seen when operation for empyema has been performed low down on the left side, where the diaphragm is adherent and incision has been carried through, the muscular diaphragm having greatly resembled thickened pleura until complete penetration and the appearance of omentum made it evident that the surgeon was below the purulent collection.

CASE 1. *Stab in left loin, with protrusion of colon.*—J. T. K——, labourer, aged twenty-two, was admitted into the Northern Hospital late on the night of March 2nd, 1891, having been stabbed in a street row. When first seen by the ambulance surgeon he was lying back in a chair, only partly sensible, with a small wound in the left loin, through which a piece of intestine was protruding; there was no hæmorrhage. Temporary wet antiseptic dressing was ap-

[1] THE LANCET, vol. i. 1892, p. 255. [2] Ibid., p. 624.

Digitized by Google

plied, and the man was brought in the ambulance carriage to the hospital. On admission he was found to be somewhat under the influence of drink; the pulse was fairly good, and there was little collapse. A piece of large bowel, about the size of a cricket-ball, was bulging through a small wound just below the eleventh rib, on the left side. The patient was put under chloroform and the wound enlarged backwards (towards the spine), and the bowel, which was found to be unwounded, was then replaced. No communication with the peritoneal cavity was found, so that apparently the stab might be considered to have practically resulted in a lumbar colotomy (or rather the first stage of it) performed at a blow. The divided muscular structures were brought together by buried catgut sutures, and the skin wound by silver ones, the wound having first been thoroughly dusted over with iodoform and boracic acid. Dry antiseptic dressings were applied. Next day there was considerable local abdominal tenderness, and the temperature ran up to 101·4°. Ten minims of tincture of opium, every four hours, and ice were prescribed. The patient to have no food of any description. On March 4th the temperature was falling, and the abdominal tenderness had nearly disappeared. On the following day the temperature was normal, and the man seemed quite well. There was very slight discharge from the wound, which required an occasional change of dressings until March 21st, when it was soundly healed. There was no after trouble about the bowels, and the man left the hospital perfectly well on April 3rd.

CASE 2. *Stab in the left side penetrating the pleural cavity and diaphragm, with protrusion of omentum through chest wall.*—L. S——, a girl aged eighteen, was admitted at the same time as the preceeding case, having, as it was alleged, been wounded by the same assailant, with the same knife. The ambulance surgeon had applied antiseptic dressings before bringing her to the hospital. On admission she was found to have a wound about an inch long, in the eighth intercostal space of the left side of her chest. Though this was hanging down a piece of omentum about six inches long, and about the thickness of two fingers; it completely plugged the wound. The patient having been anæsthetised, the wound was freely enlarged in a backward direction; air of course passed freely and noisily in and out of the pleural cavity, which contained some blood; the lung was somewhat collapsed, but was apparently unwounded. The opening in the diaphragm, through which the omentum had escaped, was found, and with some difficulty was brought up nearly to the level of the chest wound. Here it was held by hooks whilst the omentum (after being thoroughly cleansed, and then dusted over with iodoform and boracic acid) was pushed back into the abdominal cavity. The wound in the diaphragm was then closed with two chromicised catgut sutures, and the muscle allowed to drop back. The pleural cavity was then washed out with boracic lotion to cleanse it from the blood-clot; a drainage-tube was laid in it and the wound stitched up after it had been thoroughly dusted with iodoform and boracic acid. Gauze soaked in carbolic glycerine was applied over the drainage-tube, otherwise the antiseptic dressings were dry. As in the preceding case, the next day there was a rise of temperature, with quick pulse and other pyrexial symptoms, with considerable pain and tenderness about the left side of the abdomen, so that appearances generally were unfavourable. Nothing but opium and ice was allowed, and the following day all unpleasant symptoms had disappeared. The wound healed without suppuration, and the drainage-tube was removed on the third day after the injury. The temperature at this time was normal, but about the eighth day after admission it began to rise at night, and this rise increased slightly each day until the 12th (temperature 100·8°), when it was evident that there was a collection of fluid in the chest. Aspiration was performed by Dr. Mothersole, senior house surgeon, and thirty ounces of serum, slightly turbid and deeply blood-stained, were drawn off. After this the temperature at once dropped to the normal, and the girl left the hospital on April 7th quite well, with perfect respiration throughout the chest.

Remarks by Mr. PUZEY.—In the first of these cases there is very little calling for remark; the narrow escape from a perforating wound of the colon, or from what might have been a fatal wound of the intestine in the peritoneal cavity, being obvious. With regard to the second case, however, there seems to me to be several interesting points. That a knife should (*a*) pass through the pleural cavity without wounding the lung, (*b*) should penetrate the diaphragm without wounding the spleen, stomach, or colon, and (*c*) should bring back with it a long piece of great omentum, appears about as unlikely a freak as could be imagined. As regards the treatment of the protruding omentum, it would have been easier to tie it as far up as possible, cut it off, and push back the stump through the diaphragm, and if it had been ragged or dirty I should have done so; but feeling certain that it was quite (surgically) clean, I thought it better to return it whole for several reasons, amongst which one was that the freshly cut stump of omentum may form an awkward adhesion to some peritoneal surface. To return it whole, it was found necessary to hook up, and to put on the stretch the hole in the diaphragm; and in doing this and in the subsequent stitching of the slit in that muscle I received valuable help from my colleague, Mr. George Hamilton. With regard to the after course of this case there is not much to say, except that the collection of fluid in the chest probably occurred through too early removal of the drainage-tube. It is rather remarkable that these two patients should have passed through such a similar experience. Not only were they wounded by the same person and with the same knife, but almost in the same region of the body, and each had a narrow escape of fatal injury. Both of them on the following day looked as if they were "in for" peritonitis, but both of them on the day after that seemed quite well, the alarming symptoms in each case having been probably due to excessive reaction from the double shock of injury and the anæsthetics, combined with digestive disturbances due to alcohol. Absolute starvation, with ice only and opium, was the only internal treatment for three or four days.

Medical Societies.

ROYAL MEDICAL & CHIRURGICAL SOCIETY.

Changes in the Blood in the course of Rheumatic Attacks.—The Distinctions to be drawn between Rheumatoid Arthritis and Rheumatic Arthritis.

AN ordinary meeting of this Society was held on May 24th, the President, Sir Andrew Clark, in the chair.

Dr. ARCHIBALD GARROD read a second communication on the Changes in the Blood in the course of Rheumatic Attacks, dealing especially with the variations in the number of the white corpuscles and the character of the fibrin network in simple slide preparations of the blood. M. Hayem stated that the white corpuscles were always increased in number during acute rheumatic attacks, but Drs. Maragliano and Castellino arrived at a different result, and maintained that the leucocytosis was only apparent, the number of red corpuscles being much diminished. The author's observations on this point agreed entirely with those of M. Hayem. In every case of acute rheumatism examined there was a distinct increase of white corpuscles, although there was never any extreme degree of leucocytosis. The highest number observed was nearly 20,000 white corpuscles per cubic millimetre. According to recent observers, the average number in healthy blood was between 6000 and 7000 per cubic millimetre. In order to exclude the effects of food the successive countings were performed as nearly as possible at the same hour in each case. It was found that the increase of white corpuscles was closely related to the amount of febrile disturbance. In subacute cases, and when there were conspicuous local manifestations without any considerable rise of temperature, the increase was only trifling. The increase of white corpuscles took place with great rapidity, and in a very early stage of the attack. When a relapse or recrudescence occurred a fresh increase of leucocytes was observed. The fall during convalescence might be equally rapid; but, on the other hand, it might be very gradual, the number of white corpuscles remaining high for some time after the temperature had fallen. The counting of the white corpuscles was done with a Thoma-Zeiss hæmocytometer, with a special pipette diluting only ten or twenty times. A 0·30 per cent. solution of acetic acid was employed for the dilution. In each observation fifty microscopic fields of known area were counted, the total area corresponding to 490·8 squares of Gowers' hæmocytometer. The number of blood platelets was usually increased during the period of convalescence.

Digitized by Google

No noteworthy changes in the form or size of the red corpuscles were observed. The coarseness of the fibrin network in simple slide preparations of the blood of rheumatic patients was regarded by M. Hayem as affording an important diagnostic sign. The value of this test was discussed, and the opinion was expressed that it could only be of service in a very limited number of cases.—The PRESIDENT considered that the paper was one of exceptional value from its suggestiveness.—Dr. WILLIAM HUNTER referred to the importance of calculating the percentage of leucocytes to blood platelets, as well as of giving the absolute number of the former per cubic millimetre, the reason being that perspiration would, of course, alter the proportion between the corpuscles and serum, and therefore in every observation it should be recorded whether the patient was sweating at the time. The increase of leucocytes in acute rheumatism was interesting in its bearing on the question whether the disease were infectious or constitutional. If it were the former, then increase of leucocytes was to be expected, for such increase was usually directly proportional to the intensity of the infective process. This was especially to be observed in pneumonia, and he believed that there was a direct causal relation between the two, and this was important in view of Metchnikoff's recent researches.—Dr. HABERSHON said he had been working at a similar subject, and in that connexion had occasion to investigate the condition of the blood in rheumatic fever; he had observed a distinct leucocytosis in that disease. He had found that in animals in which the blood was concentrated the leucocytes were apparently in excess, but on calculating the proportionate number to the red discs, it was found that the ratio was a normal one. In many other conditions, such as suppuration and the malignant forms of diabetes, there was a large excess of leucocytes. Injection of toxins and many other substances would also produce leucocytosis, and it was a question whether their migration into the blood in rheumatic fever was with the view to combat a microbic enemy.—Dr. GARROD agreed that it was important to keep count of the red corpuscles, and he had always estimated them as well as the white ones. The diminution which he had observed did not represent the whole diminution if diaphoresis had been at work. The occurrence of leucocytosis in such a purely non-suppurative disease was of great interest.

Mr. HUGH LANE then gave an account of some further observations in reference to the Distinctions to be drawn between Rheumatoid Arthritis and Rheumatic Arthritis. In referring to the disease rheumatoid arthritis, which he had previously shown to consist of two separate and distinct diseases, rheumatic and rheumatoid arthritis, he first briefly recapitulated the distinctions he had already drawn between these conditions—namely, that chronic rheumatic arthritis was an arthritis of rheumatic origin, while chronic rheumatoid arthritis was a constitutional disease of debility, invariably having a history of phthisis or gout, or both. Rheumatic arthritis was characterised by the occurrence of subacute attacks, thereby revealing the existence of rheumatism and declaring its connexion with the arthritis, and to these subacute attacks the subsequent distinctive deformities were due. It exhibited no marked neuroses, had no relation to osteo-arthritis, was more confined to the joints, and more a local than a constitutional disease; the heart was often affected; the reflexes were increased, especially late in the disease; muscular atrophy, if present, was a later symptom, resulting from sheer want of use of joint; the joints exhibited typical deformity, with no effusion, but presenting the appearance of a solid enlargement of joint area. On the other hand, rheumatoid arthritis was a constitutional disease with many neuroses; a peculiar anæmia and muscular atrophy were early and constant symptoms; reflexes were normal or subnormal; the pulse was rapid, hard, and characteristic; and the joint areas presented typical fusiform swellings, which developed later into the mushroom-shaped condition of osteo-arthritis. The speaker then described his subsequent researches, which all tended to strengthen his opinion of the correctness of the distinction already drawn, and, moreover, treatment accentuated its importance. He found that the manner of onset in both diseases differed considerably; and further observations showed conclusively the value in diagnosis of the wasting of the muscles in the ball of the thumb, which he considered might safely be extended to the whole of the interossei. Climate appeared to exert more influence in rheumatic than in rheumatoid arthritis. The anæmia was more pronounced in the latter; and, furthermore, while young and old, rich and poor, might all suffer from rheumatoid arthritis, in rheumatic the young seldom did, and the rich claimed more exemption. He related further observations concerning the neural elements, the standard, so to speak, of rheumatoid arthritis. Migraine and various other symptoms peculiar to the disease—perverted taste, deafness, &c.—all in conjunction with the symptoms previously noted, went a long way, in his opinion, in establishing chronic rheumatoid arthritis as a disease separate from chronic rheumatic arthritis.—Sir ALFRED GARROD said that it was now thirty-two years since he had shown that there was a large class of cases which owed their origin to neither gout nor true rheumatism, and to which he gave the term "rheumatoid arthritis"; there was no uric acid in the blood, but the joints were injured from the very earliest stage by ulceration of the cartilages leading to absorption. Among causes, any debilitating affection, such as mental depression, appeared to be active. Mr. Lane wished to separate the rheumatic cases from the rheumatoid group, but he still believed that an attack of typical rheumatoid arthritis could be started by acute rheumatism. He asked the author if he had demonstrated pathological changes to substantiate his conclusions.—Dr. ORD said that his experience differed from that of the author, but this was perhaps because they approached the subject from different points of view. They were all engaged in investigating the affection called chronic multi-articular arthritis. The term "chronic rheumatic arthritis" could be well applied to a limited number of cases in which chronic arthritis followed on acute rheumatism; it occurred in people rather under than over forty. There might be bony outgrowth around the joint without much change in the synovial membrane, and it tended towards fibrous ankylosis. They were not, as a rule, the subjects of rheumatic relapses. The wasting of the muscles was usually out of proportion to the disease of the joints, and was the work of trophic nerves, as was also the disease of the joints. In many instances wasting of muscles had been the first sign. In several cases he had found evidence of central nervous changes, the symptoms pointing to lesion of the anterior cornua of the cord. In many cases of steadily progressive osteo-arthritis there were inflammatory exacerbations. He had noticed as causes prolonged exertion, exposure to cold, and emotional disturbances, often in relation to the menstrual periods; the onset was often towards the climacteric. Clinically, he had noticed symmetrical enlargements of the distal articulations of a chronic inflammatory nature which developed during the menstrual period, lasted through it, and ceased shortly afterwards—ceasing at the menopause, but recurring in the presence of great mental distress. It was easy to conceive that the uterine hyperæmia disturbed the circulation in the cord with consequent reflex irritation of the joints. It was often associated with a general condition of poor nourishment. In using descriptive terms it was important to assume as little as possible, and he considered that "chronic osteo-arthritis" was a better term than "rheumatic arthritis."—The PRESIDENT asked the author if in those cases in which struma had been present he had ever found tubercle bacilli in the joint lesions.—Mr. LANE, in reply, maintained that there was no direct connexion between true rheumatoid arthritis and rheumatism, nor was there any actual connexion with gout, but there was frequently a strong hereditary history of the latter, as there often was with struma and consumption. The joint cases which he had seen presented two great divisions—a large majority of them seemed to be the results of rheumatism attacking the joints, and they presented no enlargement of the articulation; there was usually no fluid present, and they tended towards a firm ankylosis. In rheumatoid arthritis the joint felt spongy, as if containing fluid, and the ankylosis was not so firm, suggesting rather an inter-locking of exostoses. In the hand deformity there was an "ulnar tendency" in rheumatoid disease, but a "twisting up" in rheumatic arthritis. The rheumatoid cases were not subject to relapses or subacute attacks. He quoted the case of a sempstress whose joints always became swollen and painful towards the end of the week, but after the Sunday's rest the trouble subsided. The advantage of the distinction was in the treatment, the rheumatoid variety improving with tonics, cod-liver oil, and fresh air, while they became worse under anti-rheumatic treatment. The first effect of the waters was invigorating and good for both classes of cases, but it was the medicinal treatment which was especially beneficial]

OBSTETRICAL SOCIETY OF LONDON.

The Relative Position of Craniotomy and Cæsarean Section.

A MEETING was held on Wednesday, May 4th, Dr. J. Watt Black, President, in the chair.

A paper was read by Dr. Lewers on Six Cases of Craniotomy, with remarks on the relative position of Craniotomy and Cæsarean Section. Four of the cases, as will be seen by reference to the annexed table, might be described as neglected cases, the patients having been many hours in labour before the operation was undertaken, and in two cases delivery was only effected with great difficulty. All the cases recovered. Reference was made to Dr. Donald's paper, "Methods of Craniotomy," in which eighteen cases of craniotomy, all of which also recovered, were recorded. Taking these cases in conjunction with his own, the author argued that the mortality of craniotomy was extremely small, and therefore concluded that while Cæsarean section, in spite of all modern improvements, still remained a very dangerous operation, it should not be undertaken as a matter of election, but restricted entirely, or almost entirely, to cases where no other method of delivery was possible.

Dr. HORROCKS agreed with the author that general statistics comparing the two operations were valueless. In the Guy's Lying-in Charity the number of cases of craniotomy collated by Dr. Galabin from 1865 to 1875 was 1 in 1310, or 0·07 per cent.; from 1875 to 1885, collected by himself, the number was 1 in 1074, or 0·07 per cent. During the last-mentioned decennial period twenty-four cases required perforation. Of these, four mothers died: two from rupture of the uterus, one from rupture of vagina into rectum owing to atresia, and one suppurative peritonitis, after prolonged efforts at delivery had been otherwise made. He thought therefore that, excluding such cases as these, where death would probably ensue whether craniotomy or Cæsarean section was performed, it must be admitted that craniotomy as at present performed had a much lower maternal mortality than had Cæsarean section performed under similar conditions, even in the most successful hands. But he did not think this fact should prevent us from offering to a patient the alternatives. As a matter of fact, the mortality after Cæsarean section was a diminishing one, and no doubt, like all other operations, would improve more and more with increasing experience. He must confess to an increasing aversion to perforation of a living child's head. The certain death of the child, on the one hand, and the almost certain safety of it on the other, must be taken into consideration; and if the mother, father, and friends were willing to take the extra risk involved, he considered Cæsarean section quite justifiable. He mentioned a case of great pelvic contraction where the alternatives were placed before the parents. They would not consent to any extra risk, and, moreover, were glad not to have a living child; hence craniotomy was performed, and the mother made a good recovery.

Dr. LEITH NAPIER thought the question raised by the author deserved notice. Dr. Lewers erred in suggesting that the mortality of craniotomy was *nil*, and that of Cæsarean section "very much higher than reported." Taking large numbers of cases, the maternal mortality after craniotomy was 6·6 per cent. in the hands of the best operators; it was about 8·8 per cent. in Cæsarean section, and the infantile mortality practically *nil*. It might be averred that this splendid result was not likely to be reached by the majority of operators. But if we referred to an article in the *New York Medical Journal* for Aug. 29th, 1885, we find that Dafeilhay, as cited by Lusk, gave statistics showing 81 per cent. of women saved. In another series of sixty-one operations in rural districts there were

DR LEWERS' SIX CASES OF CRANIOTOMY.

No.	Name and age.	Previous pregnancies.	Date of operation.	Measurements of pelvis.	Method of operation.	Number of hours in labour before admission.	Convalescence.
1	A. T., 22		Jan. 27th, 1886.	Sp. il. ..... = 10½ in. Cr. il. ..... = 10½ in. Conj. ext. .... = 5¾ in. Conj. vera.... = 2⅜ in.	Turning done before I saw the case. Perforation of after-coming head and cephalotripsy. Delivery very difficult.	48	Rapid recovery. Temperature normal after 10th day.
2	A. L. C., 21	1. Labour on that occasion said to have been rapid; child lived six months.	Jan 9th, 1886.	Sp. il. ..... = 8½ in. Cr. il. ..... = 9½ in. Conj. ext. .... = 6½ in. Conj. vera .. = 2½–2⅜ in.	Cephalotripsy; easy.	At least 41	Slow recovery. More or less fever for 29 days after delivery, but prognosis never really unfavourable.
3	S. J., 25	No note.	May 13th, 1886.	Sp. il. ..... = 8¾ in. Cr. il. ..... = 10½ in. Conj. ext. .... = 7 in. Conj. vera.... = 3⅜ in.	Cephalotripsy; fairly easy.	28	Slow recovery. Persistent subinvolution, accompanied by more or less fever, till uterus curetted June 24th; then involution rapid.
4	E. H., 27	0	Jan. 8th, 1888.	Sp. il. ..... = 11 in. Cr. il. ..... = 11 in. Conj. ext. .... = 5½ in. Conj. vera.... = 2⅜ in.	Amputation of prolapsed arm; cephalotripsy; some portions of cranium removed with craniotomy forceps. Delivery very difficult.	18	*Patient* very ill for 3 weeks. Had an attack of pneumonia. Ultimate recovery complete.
5	A. C., 24	0	Nov. 16th, 1888.	Sp. il. ..... = 10½ in. Cr. il. ..... = 10⅝ in. Conj. ext. .... = 5⅞ in. Conj. vera.... = 2½ in.	Cephalotripsy; easy.	About 12 hours.	Rapid recovery. More or less feverish for 6 days after delivery. Highest temp. = 102°.
6	A. C. Same patient as in No. 5.	1	March 3rd, 1890.	As in No. 5.	Cephalotripsy. The cranioclast and craniotomy forceps also used.	No note, but had not been very long in labour.	Rapid recovery. Highest temp. = 100·4°.

Dr. JOHN PHILLIPS said he had written a paper on the same subject,[1] but although on similar lines, his conclusions were different. His own cases of craniotomy (sixteen) all recovered. Twelve were for contracted pelvis, of which four could be included under the same category as those related by the author. His experience was that cephalotripsy was a very difficult operation, especially after repeated attempts had been made by others to deliver with forceps. The author had not alluded to statistics of large numbers of craniotomies; for example, Determann of Berlin performed the operation 239 times in 22,051 cases, with a mortality of 12·8 per cent. up to 1882, and 9·4 per cent. from 1882 to 1887. Other statistics from Leipsic give the mortality as 8 per cent. He thought these figures were of great value, and he would like to ask the author how he proposed to deal with the cases he had related in the event of a second pregnancy. For his own part he considered that, having once performed craniotomy on any patient, and warned her of the risk she incurred by again becoming pregnant, he would only repeat the operation under protest, or decline altogether.

[1] Brit. Med. Jour., June 1st, 1889.

Digitized by Google

more than 78 per cent. of recoveries. There could be no doubt that craniotomy must, except under special circumstances—such as ante-operation, infantile death, &c.—be regarded as a most undesirable procedure, and little less doubt that Cæsarean section would be generally preferred in the near future. He would not now enter on his personal experience of craniotomy, which, however, had been sufficient to enable him to speak with some confidence in stating that he had performed this ghastly operation much oftener in the past than he hoped to do in the future, with his more recent knowledge of Cæsarean section.

Dr. CHAMPNEYS said that in a subject so large as that before the meeting only a few points could be discussed; there was, for instance, no time to speak of the very important relation of the induction of premature labour to Cæsarean section. In a pelvis susceptible of the former treatment in a subsequent labour it was plainly our duty to perforate even a living child on the first occasion. It must, however, be borne in mind that the statistics of Prof. Belluzzi showed that few children grew up who were delivered through a pelvis of less than three inches. A point in favour of Cæsarean section which had not yet been referred to was the opportunity it afforded of sterilising the patient. The mortality of simple craniotomy was probably *nil*; the plunging of a perforator into the head of a child should not be a risk to the mother. The dangers of craniotomy were principally two. The first consisted not in the operation, but in the futile efforts at delivery by forceps which often preceded it. This explained the paradox that the maternal mortality was greater in slight than in great contractions of the pelvis, for in the latter no such attempts were made. The second consisted not in perforation, but in extraction. At the time of perforation the os was often pretty large, but as soon as the head collapsed a little it shrank up again. It was then too small to apply the cephalotribe, especially high up in the pelvis, and delivery had to be effected by removing the vault of the skull piecemeal, followed by cephalotripsy as a rule, the cervix being almost always severely lacerated in the process.

Dr. DUNCAN thought that, notwithstanding the great advances made in surgery recently, we are not in a position to dogmatise on the comparative merits and risks of Cæsarean section and craniotomy. Until recently Cæsarean section had *not* had a fair chance in this country, being only performed a few times, and as a *dernier ressort*; but the statistics of Leopold (which could not be disputed) showed that the mortality of the operation was only 8 or 9 per cent. It was very doubtful whether craniotomy had a less mortality; the cases quoted by the author were too few on which to base an opinion. It was exceedingly important to bear in mind two facts not mentioned in the paper—the first was that, whereas in one operation all the children were saved, in the other they were necessarily destroyed, and although the life of the mother should be our first consideration, still that of the child must not be forgotten. At any rate, the mother should have the position fully explained, so that she may choose whether she would run a little more risk in order to have her child saved. The second fact to which he wished to allude was that many women after craniotomy were left more or less crippled from lacerations and pelvic inflammations; whereas nothing of the kind was seen after Cæsarean section. An important advantage of the latter operation was, as had been already mentioned, the opportunity it gave of placing the woman in a condition that she could not again conceive. He feared that, in spite of the lessened mortality after Cæsarean section, the general practitioner would still have to resort to craniotomy in preference to the other; but he thought the time had arrived when we ought to completely revise the teaching and practice of delivering a woman by craniotomy in all, except the most severe, degrees of contracted pelves.

Dr. HERBERT SPENCER thought that such small pelves (four of which had a conjugate of two inches and a half or less) as those given in the paper were very rare. At University College Hospital there had not been one pelvis with a conjugate of two inches and a half in over 10,000 labours. In such a case he would prefer Cæsarean section as equally or less dangerous to the mother than craniotomy. He asked whether Dr. Lewers had included in his paper all the cases of craniotomy which had occurred at the London Hospital in more than five years, or only those performed by himself. Judging from the experience at this hospital, Dr. Spencer thought it could not be that craniotomy had only twice been necessary in pelves measuring over two inches and a half in the conjugate. At University College Hospital craniotomy had been performed for contracted pelvis eleven times in 10,000 labours, always with success to the mother; the pelves had mostly varied between three inches and a quarter and two inches and three-quarters in the conjugate, and in such cases he considered craniotomy had a very slight if any maternal mortality, and was in this respect greatly superior to Cæsarean section. Much had been said of Leopold's results in Cæsarean section, but that operator's results in craniotomy were much better (seventy-one cases without a death). Admitting the principle that the child might be sacrificed in the interest of the mother, he would, in any individual case of labour with a mature living child, adopt that method of delivery which gave the best chance to the mother, and would prefer craniotomy in all the ordinary cases of contracted pelves, and Cæsarean section in those extreme cases which were very rare.

Dr. HANDFIELD JONES thought that if Cæsarean section were to be employed more frequently, and practitioners were to be taught that they ought to do that operation in cases in which they had hitherto performed craniotomy, then it would be necessary to consider whether the Porro operation would not be safer in the hands of men unaccustomed to abdominal surgery rather than the Sanger-Cæsarean section. Certainly the risks of hæmorrhage, the complication of uterine atony, and the difficulties of suture of the uterus were avoided in the Porro operation. He asked whether the case of delayed involution quoted in the paper was not one of metritis dessicans, and asked if the author had examined the sloughs microscopically for muscular tissue.

Dr. CULLINGWORTH considered the series of cases reported by Dr. Lewers an unsuitable basis upon which to raise a discussion on the relative merits of craniotomy and Cæsarean section. With the exception perhaps of Case 6, which was not Dr. Lewers' at all, all the cases had been subjected, before Dr. Lewers saw them, to long and repeated efforts at delivery; in all of them presumably (though the point was not alluded to in the paper) the child was dead. In such cases as these no one would for a moment entertain even the thought of Cæsarean section. Obviously craniotomy was not only the right thing to do, but the only thing to do. It was when one was consulted by a patient before labour set in, the child being alive and the pelvic deformity considerable, that the real difficulty occurred of deciding what advice to give. The question was entirely one of degree. Probably—and if a vote were taken all obstetricians would agree that the patient should be advised to undergo Cæsarean section if the conjugate were two and a quarter inches or under—the majority would most likely give that advice where the conjugate did not exceed two and a half inches; whilst a large minority would, he thought, be disposed to recommend it if the contraction were even as considerable as two inches and three-quarters. He himself would be found in the last-named category. With regard to the hesitation shown by British practitioners in advising their patients to submit to Cæsarean section, it was a state of things that would exist until a larger number of successful cases had been reported. The late Dr. Matthews Duncan, in a discussion in that Society in 1887 on a paper of his (Dr. Cullingworth's), had put this very forcibly. He said: "It was to Germany that we must look for the guidance of experience; to such wonderful successes as those of Sanger, Leopold, Crede, and Gusserow. It was such successes alone that should, and would, lead us in this great practical question. ..... No amount of eloquence about the abolition of craniotomy—and there had been much of such talk—would help forward that much-to-be-desired result. Nothing but success in some alternative operation, such as Cæsarean section—success like that of Sanger and Leopold—would be convincing eloquence or do the least good." He (Dr. Cullingworth) could not help thinking it a matter for regret that any words should be used in reference to this subject, which would have a tendency to discourage in this country Cæsarean section in suitable cases.

Dr. RUTHERFOORD thought the author of the paper was hardly justified by the cases he brought forward in coming to the conclusion that Cæsarean section should be an operation undertaken as a necessity and not as one of election. In five out of the six cases the circumstances and surroundings were most unfavourable before craniotomy was per-

Digitized by Google

formed. There had been a want of antiseptics, prolonged interference with the uterus had been carried out, and in all there had been repeated attempts to deliver with forceps. In spite of these, successful results had been obtained, and he believed similarly successful results might be obtained were Cæsarean section made an operation of election, with the advantage that a living child would be brought into the world.

Dr. LEWERS, in reply, said it was important to keep in view the fact, however we explain it, that the mortality of Cæsarean section in London performed by operators of acknowledged competence was still very high—from 20 to 50 per cent., and even in some cases higher. This was a matter of common knowledge, and it appeared clearly also in the course of the discussion on Cæsarean section at the last meeting of the Society. This being so, it would obviously be wrong to advise patients to undergo the operation on the ground that some operators in Germany, and Cameron in Glasgow, have a mortality of 9 or 10 per cent. It was said that, in order to get such results, the operation must be done more frequently. Granting this, for the sake of argument, contracted pelves were not sufficiently common in London to give all the London obstetricians many cases each. The cases of craniotomy, in his paper and others to which he had referred, showed the mortality to be very low, and Leopold's statistics brought out the same thing, as he had had seventy-one craniotomies, with two deaths, both cases of eclampsia, against a mortality of about 9 per cent. for Cæsarean section. He entirely agreed with Dr. Champneys that in each case the risk of Cæsarean section and craniotomy respectively should be put plainly before the patient and her friends, and that if they decided for craniotomy it was our duty to perform it, even time after time. We had no right to compel a patient, or even to urge her, to take a very dangerous path of retreat from a painful position, when an almost certainly safe one lay open to her.

The following specimens were shown:—

Mr. ALBAN DORAN: Papilloma of Ovary.

Dr. CULLINGWORTH: Tubal Gestation with Apoplexy of the Ovum.

Dr. LEITH NAPIER: (1) Four Months' Fœtus with Unruptured Amnial Sac; (2) Multiple Myo-fibromata removed by Hysterectomy.

EPIDEMIOLOGICAL SOCIETY.

ON April 20th Inspector-General Lawson read a paper on Cholera in Ships at Sea, and their Connexion with Manifestations of the same Disease on Land. It was first pointed out that the increase of cholera nostras, and the sporadic cases of malignant cholera, which precede and accompany the more concentrated portion of the manifestation, are, epidemiologically speaking, the effect of the general influences determining the occurrence of the disease, and require to be considered when these are being investigated. From 1871 to 1880 222 ships left Calcutta with coolies for Mauritius, Natal, and the West Indies, carrying 129,527 of them. Cholera appeared in thirty-two of these vessels, with 14,572 on board, being 14·3 per cent. of the ships, and of these passengers 181, or 12·3 per 1000, died of that disease. In vol. iv. (new series) of the Transactions, p. 114, is a table giving the names of these vessels, the numbers embarked in each, with the date, and the deaths from cholera among the emigrants each day after embarkation up to the 20th, and after the 20th in one season. From this it will be seen that the first death in any ship did not occur on the fifth or sixth days, nor on the seventeenth, eighteenth, nineteenth, or twentieth days, while in eight instances the first death was after the twentieth day. The deaths up to the sixth day (eighteen in number) being within the incubation period, may be referred to the land; that from the seventh to the twentieth—amounting to 106, and still more those after the twentieth to fifty-seventh—are due to influences the ships were exposed to. Furthermore, sailing ships from Calcutta for Mauritius, or westward, follow the same course—viz., along the 90° meridian E. as far as 5° or 16° S., where they meet the S.E. trade, while smaller than go westward; their latitude on this line on the seventh day is about 15° N.; on the twenty-first day about the Equator and onwards; but as the longitudes are not given their positions south of the Equator, though now deviating materially from the general track, are not defined. Other records, however, show that vessels have reached Mauritius, or had cases in its immediate vicinity. In the ten years the mortality fell mostly on 1872–73–74, during which there were forty-five, forty-nine, and fifty deaths respectively, while in the remaining seven years there were forty-two only. During this period the deaths from cholera in the central provinces in Hindustan, Berar, and the Bombay and Madras Presidencies, which had been at the moderate rate of 32,039 in 1872, fell to 1467 in 1873, and to 366 only in 1874, but in 1875, when the ships almost ceased to suffer, the deaths from cholera in the same districts rose to 179,410. It is to be remarked, too, that the occurrence of the disease among the ships was accompanied by an unusual frequency and severity of it in Burmah, along the Malay Peninsula, and in the islands of the Eastern Archipelago. The cholera epidemics in Mauritius have generally been preceded by a high death-rate from that disease in the Malay Peninsula and the Eastern Archipelago. This was the case in 1819 and 1856, and in subsequent extension, in connexion with them, there have been outbreaks of choleraic diarrhœa and sporadic malignant cases, occasionally proving fatal, at both Natal and the Cape Colony. Coming now to the Atlantic, the cases of the vessels *Scranton* and *New York*, carrying emigrants from Havre to New Orleans and New York respectively, are most important. On Nov. 25th, 1848, when the *Scranton* had been twenty-six days at sea, and the *New York* sixteen, they both had a warm wind from the south-east, and cholera appeared in the *New York*, and the following day in the *Scranton*. It continued in each vessel until she reached her destination. The question here arose, How were these ships affected with cholera after being so long at sea? The *New York* had had a very cold wind from the northward on the 23rd and 24th, and there was a general unpacking of baggage to obtain warmer clothing, and, it was said, some that had been soiled by choleraic discharges in Germany had been taken out and worn by several individuals, and that these were the first attacked in the *New York*. The same explanation was given for the *Scranton*, though at the time she was far south of the *New York*, and had had no cold weather nor unpacking of warm clothing. The hot wind experienced by the *Scranton* came from the desert in North Africa along the Mediterranean coasts, where cholera had been prevalent from Egypt westward, and the choleraic influence, carried by it from that locality, had reached both ships the same day, though 1000 miles apart in the Western Atlantic. The *New York* reached her destination on Dec. 1st, having lost seven passengers from cholera, and with many sick. The *Scranton* arrived at New Orleans on Dec. 11th, having lost thirteen from cholera, but with very few remaining sick of it. Though embracing New York and New Orleans, the influence of this wave was experienced much more to the south, for in June, 1849, sporadic cases occurred at Barranquilla, at the mouth of the river Magdalena, in New Granada, and in July cholera became epidemic over the coast from Santa Monta to Carthagena, and ascended the Magdalena to Bozeta, nearly 500 miles from the sea and 8000 feet above it. In Jamaica, also, in August and September, there was an unusual number of sporadic cases among the troops and civilians in Kingston and its vicinity, followed by an epidemic in October, 1850. The cholera epidemic of Brazil in 1855 was accompanied by an outbreak at Jago, the southernmost of the Cape de Verde Islands, and that year an emigrant ship, the *Franzisca*, from Hamburg for Rio Janeiro, in October contracted the disease at sea when in the latitude of Madeira, and carried it to her destination. In 1866, again, before cholera had appeared at Liverpool, four steamers with emigrants for America left that port—viz., the *England*, on March 28th, the *Virginia*, on May 4th, the *Union*, on May 12th, and the *Peruvian*, about the same date. There was no sickness in any of these ships on sailing; but, on reaching a point close to 49° N. 29° W., cholera commenced in each, and many deaths ensued. There were about this time several other ships carrying troops to the Cape and India which were affected during their passage southwards, for which reference must be made to the detailed paper in the Society's Transactions.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.

Calcification of Spleen —Obstructed Gall-duct.—Cervical Dysmenorrhœa.

A MEETING of this Society was held on Friday, May 6th, Dr. Chas. Wells, President, in the chair.

Dr. A. CLEMOW showed a specimen of Calcification of Spleen of an Indian native, aged forty-one, who had suffered from repeated attacks. The capsule was thickly crusted with hard calcareous deposit.

Mr. W. P. MALLAM exhibited a Liver with a large stone in the common gall-duct, and read notes of the clinical history of the case in a woman aged fifty-three.—Mr. HOWSE gave details of the operation, and reviewed the progress of hepatic surgery.—Drs. C. W. CHAPMAN and C. H. BENNETT made remarks.

Dr. HANDFIELD-JONES read a paper on a Clinical Study of the Causation and Treatment of Cervical Dysmenorrhœa. In bringing before the Society the results of a careful study of several hundred cases of dysmenorrhœa, the author pointed out that, while many cases came under the head of "neuralgic" and others of "inflammatory" dysmenorrhœa, there yet remained a large group to which the term "cervical" was most applicable. Numerous cases were quoted to show that uterine retraction did occur in the onset of each menstrual epoch, and that dilatation of the internal os was always present. Though this opening up of the os internum was normally performed without pain—as in the analogous case of labour—yet it was clear that conditions frequently existed which rendered this dilatation painful, and thus gave rise to menstrual suffering. Cases were brought forward to show how uterine displacement, fibroid change, spasm, and hyperæsthesia of nerve endings would all play a part in this process.—A discussion followed, in which the President, Drs Leith Napier, Travers, Rutherford, Schacht, and Mr. R. W. Lloyd joined.

MANCHESTER PATHOLOGICAL SOCIETY.

WEDNESDAY, MAY 11TH.

T. C. RAILTON, M.D., M.R.C.P., President, in the chair.

Equine Tuberculosis.—Mr. J. B WOLSTENHOLME showed and described specimens, and Dr. KELYNACK exhibited microscopical preparations, from a case of Equine Tuberculosis. The horse was eighteen years old, and up to a year ago was in robust health. Acute symptoms appeared only during the last fortnight, but the animal had wasted considerably during the last six months. At the necropsy the spleen was found much enlarged, and presented several large tumour masses of firm consistency. The mesenteric glands were also greatly enlarged, and in parts caseous. The lungs were in a condition of miliary tuberculosis. Microscopically, characteristic tubercular structure was well seen, and abundant tubercle bacilli found in lung, spleen, and glands.

Bovine Suppurative Pericarditis.—Mr. WOLSTENHOLME also exhibited the Heart and Pericardium of a Cow with Acute Suppurative Pericarditis, resulting from the penetration of a piece of wire, which, having been swallowed, had passed from the stomach, through the diaphragm, into the pericardium. Another fragment of wire was found projecting partially through the diaphragm.

Abnormality of Bladder.—Mr. WOLSTENHOLME further showed the Urinary Bladder of a Horse with two large lateral diverticulæ.

Brain Tumours.—Mr. G. H. COOKE exhibited two specimens of Multiple Tumours of the Brain: 1. The first, from a boy of five years and three-quarters, presented numerous caseous nodules in Broca's convolution. There was also tubercular meningitis. With the exception of slight retraction of the head, irregular respiration, and occasional shrill cry, all symptoms of tubercular meningitis were absent. There was no sign of motor irritation except a peculiar masticatory movement, which persisted till death; neither was there any aphasia. 2 In the second case there were caseous nodules in the left lenticular nucleus, which pressed on and pushed upwards the internal capsule, and extended into the caudate nucleus. A small nodule, limited to the posterior part of the right optic thalamus, and slightly pressing on the posterior part of the posterior limb of the internal capsule, was also present. The patient, a boy of two, had presented a distinct spastic condition of the right leg and both arms, tremor of a disseminated sclerosis type in the arms, palsy of the left side of the face; and, shortly before death, intermittent movement of the head and eyes towards the right side.

Eye Specimens.—Dr. THOMAS HARRIS showed for Mr. Edward Roberts Macroscopic and Microscopic Sections of Glioma of the Retina and Sarcoma of the Choroid prepared by the celloidin method.

Specimens.—Dr. NATHAN RAW exhibited preparations (1) from a case of Acute Necrosis of the Humerus, which was unaccompanied by suppuration; and (2) a specimen of Aneurysm of the Aorta.

Card Specimens.—Dr. KELYNACK: (1) Chronic Duodenal Ulcer, causing Pyloric Stenosis; (2) Tubercular Ulceration of Intestines, with Perforation of Jejunum; (3) Carcinoma of Ascending Colon. Dr. COLLEY MARCH: Osteo-Chondroma of Rib. Mr. WOLSTENHOLME: Bovine Tuberculosis.

NOTTINGHAM MEDICO-CHIRURGICAL SOCIETY.

WEDNESDAY, MAY 18TH.

Mr. ANDERSON, President, in the chair.

The Operative Treatment of Fæcal Fistula —The President introduced this subject and showed the case of a boy on whom he had recently operated for the relief of this condition. The patient, who was eight years old, was admitted into the Nottingham General Hospital in October, 1890, under the care of Dr. Handford, with the following history:—For six months he had been suffering from pain in the bottom of the abdomen, which came on worse at intervals, but was always present to some extent. For some time before admission his mother noticed that his abdomen was swollen and that he was losing flesh rapidly. His bowels were opened regularly. There was no diarrhœa and no history of tuberculosis. On examination of the abdomen a swelling was found occupying the lower part of the right umbilical, hypogastric, and inguinal regions. It had a solid feel and was painful on pressure. There was dulness on percussion over it, but the extent of the dulness could not easily be made out, as percussion gave considerable pain. The heart and lungs were normal; the urine acid and free from albumen. On November 1st the umbilicus had begun to bulge and the pain in the abdomen had increased. On the 9th the protrusion at the umbilicus, which had increased in size, burst, discharging feculent pus. On February 1st, 1891, his condition was as follows:—Several sinuses had formed, and the skin sloughed over an area of about one inch to one inch and a half. The discharge of pus soon ceased, and only fæces came away. This feculent discharge continued without intermission up to the time of operation. About this time the actual cautery was applied to the part in the hope of causing some contraction, but without much result. On August 15th he left the hospital. Early in April of this year he was again admitted. There was at the umbilicus a well-marked fæcal fistula through which a considerable portion of the intestinal contents were discharged. The skin around the opening was reddened, and scattered round it were warty and fleshy growths, the larger ones close to the opening being the size of a cherry stone. They surrounded the fistula for a distance of one inch and a half, the skin here being in a most unhealthy condition, which was not to be wondered at, as it was bathed all day in a poultice of fæces. Of late his health had been falling off and he was losing flesh. An irregular swelling, caused by the matting together of intestines, could be felt in the vicinity of the opening. The operation was performed on April 8th. The skin having been thoroughly cleansed and the opening stuffed with wool, an incision was made commencing about one inch and a half above the fistula, and extending to the same distance below it. It was elliptical in form and enclosed the area of unhealthy skin. The abdominal parietes having been divided, the peritoneum was carefully opened at the upper part of the wound, and the central portion of skin and abdominal wall, which was enclosed in the incision, were separated all round, care being required on account of the coils of intestine which were adherent to the parietal

Digitized by Google

peritoneum in the immediate neighbourhood of the wound. The central piece was drawn well out of the wound, whilst the other portions of bowel were exposed and separated from each other. Numerous old and firm adhesions were found binding neighbouring coils together, as well as to the parietal peritoneum. After the adhesions were freed and the loops of bowel replaced it was seen that the opening, which was the size of a threepenny piece, was in the cæcum. The appendix was normal. The external opening, the skin, the portion of the abdominal wall included in the incision, and the track were then cut off and the hole in the cæcum closed by Lembert's sutures. The parts were washed and replaced and the wound closed in the usual way. Two days later the wound was dressed. It was quite dry and healing satisfactorily. Temperature normal. Since the operation he had been fed by means of nutrient enemata. The next day food was given by the mouth. On April 15th, a week after the operation, the wound was healed and all the sutures were removed. There had been no symptoms of any kind. He was put on solid diet. On May 7th he got up. Since the operation he has gained flesh considerably and is now in good health.—Dr. HANDFORD gave the medical history of the case, and commented on the boy's state of malnutrition owing to escape of fæces from the fistula. He thought the origin of the condition might have been a suppurating mesenteric gland. He had seen three similar cases, all of which recovered without operation.

Gouty Deposit in Conjunctiva.—Mr. T. D. PRYCE showed a case of this affecting the right eye. The patient, a man aged seventy, was a publican and had previously been a post-boy. He also showed numerous tophi in the auricles and small joints of the hands.

Reviews and Notices of Books.

Microscopical Observations on the Hæmatozoon of Malaria. By Surgeon P. HEHIR, M.D., F.R.C.S. Edin.

THE author of this monograph is lecturer on pathology and clinical medicine in the Nizam's Medical School at Hyderabad, and has had experience of malarial fevers and their resulting cachexia not only there but in Burmah, where his attention was first specially attracted to the condition of the blood by the presence of certain peculiar moving bodies he discovered in that fluid obtained from sepoys returning from Wonthoo to Mandalay. At that time, early in 1887, he was studying Laveran's investigations into the micro-organisms found in the blood of people suffering from malarial poisoning, but he could not advance much in these inquiries for lack of opportunity. On becoming settled at Hyderabad he resumed his task, chiefly with the view of verifying or refuting the observations made by Laveran, Marchiafava, Celli, Councilman, Sternberg, Osler, Vandyke Carter, and Camillo Golgi, with whose labours he appears to have been well acquainted. After describing the method of investigation adopted, the precautions necessary in the examination of the blood, the instruments employed, and the nature and method of registration of cases, he proceeds to deal with the enumeration, description, and peculiarities of the various parasitic forms met with. These were eight in number, including phagocytes, and appear to have been noticed in the blood of the whole of the fifty cases he laboriously and sedulously examined and recorded. The micro-organisms were merely varieties, it would seem, of one polymorphic hæmatozoon, and the most frequent and constant of them was a simple spheroidal organism, this being present in all stages of the disease, and in every slide examined, the number varying from two or three to thirty or forty in the field of a D D objective lens; they were often met with in large numbers, even during the intermission of fever. They were developed within, and distinct from, the red blood-corpuscles. There were also present small amœboid organisms, provided with flagella for rapidly vibratile processes. These might be absent from the blood for days together, and then be found by the hundred, as occurred in 18 per cent. of the cases; they might be entirely absent in one field and be seen in crowds in the adjacent one, though they were always more abundant in the pyrexial period of malarial poisoning than in the apyrexial. Even when fever was present, a whole drop might not contain visible amœboid bodies, whereas a second drop from another part of the patient would have them in multitudes, so partial was their distribution. They appeared to be identical with Laveran's "mobile filamentary bodies," and it was noted that quinine has a powerful influence in preventing spore formation and the development of the organism itself. In developing, it was ascertained that segmentation of the spores takes place a short time before the onset of the pyrexial attack, and continues during the earlier stage of the ague. Laveran's "corpuscles" are the same as the simple spheroidal organism of Dr. Hehir, who also distinguished that authority's "crescentic bodies" in the blood he examined. But the most peculiar of the forms he noticed was the hæmatomonas malariæ stellata, a spherical body with from three to six well-marked cilia-like processes. The whole of the polymorphous varieties of the hæmatozoon are carefully and clearly described by the author, and the descriptions should be of much service to other observers. The mode of destruction of the parasite by phagocytes is very interesting; and, as Dr. Hehir remarks, "In malarial blood, phagocytes are often very industrious scavengers, clearing the blood of all stray particles and other foreign agents met with. ..... The rapidity with which they eat up the organisms sometimes prevents the process being properly studied." The notes of one observation are as follows: "The phagocyte at first advanced towards its victim, and then for about ten seconds appeared inactive, barely touching its prey, and almost suggesting that it had come to make friends with the unwary parasite, reminding one of the spider and the fly. That portion of the parasite in contact with the leucocyte was apparently stationary, whilst the free part was making efforts to set itself free, but gradually its movements became imperceptible. The phagocyte continued to entangle its prey until, within the space of a minute, it completely incorporated the amœboid parasite within its protoplasmic web, whence there was no exit."

The development of the hæmatomonas malariæ is lucidly treated, and is presumed to convey an explanation of many of the phenomena presented in malarial diseases, and particularly in regard to the various types of pyrexia resulting from malarial poisoning, accounting, in fact, for the rapidity with which symptoms of malarial poisoning in one form or other rapidly develop in persons inhabiting localities in which the poison is in abundance or in a concentrated form—that is, where malaria spores abound,—and the slower, less severe, and less general manifestation of symptoms in cases infected by air or water containing spores in fewer numbers. Dr. Hehir remarks that it is no unusual circumstance to find that patients sometimes suffer from malarial fever weeks after their visit to malarial localities. The interval between the time of infection and first appearance of symptoms may be assumed to be the period of incubation, during which several generations of the organism have carried out their life history, each generation producing a multiplied progeny. When a number of the organisms sufficient to affect the system have sprung into existence, the earliest manifestation of the malarial disease arises. In ague the attack occurs at the birth of each succeeding generation of the organism, the intervals during which the development of the mature forms of the parasite is taking place being apyrexial, thus accounting for the periodicity of malarial fevers.

The author rightly insists on the diagnostic importance of the hæmatozoon of malaria, and especially its presence

chronic malarial poisoning; and in a section he deals with the clinical value and relations of the discovery of Laveran, while in the last portion of his important work he inquires into the use of quinine in malarial disease, and states that he has repeatedly proved by irrigation experiments that the drug effects the disappearance or disintegration of both the free amœboid bodies and their spores, which are present as pigment granules.

Dr. Hehir has rendered good service to medicine in publishing an account of the results of his investigations into the pathology of malarial poisoning, which, he asserts, holds the unenviable position of killing more human beings than any other malady enumerated in the nomenclature of diseases. It is earnestly to be hoped that his efforts to give us a full knowledge of the cause of such a grave disorder will be well seconded by those who have the opportunity of studying it; certainly he has advanced our acquaintance with it very considerably, and has in doing so earned our special thanks. It would be curious—and perhaps important—to ascertain whether the "plasmodium malariæ," as the Italians have designated the micro-organism, is found in mammals in the malarial parts of India or Burmah. Pigeons, of all the domesticated animals, alone have been observed to harbour this hæmatozoon.

Studio Etiologico e Clinico delle Malattie Febbrili più Comuni a Massaua. Per ALESSANDRO PASQUALE Roma. 1891.

OF malaria, as of the poor, Italy may say "it is always with us," and certainly the superabundance of her literature on the subject testifies that she has not neglected her opportunities of studying it. Of late years Tommasi-Crudeli, Golgi, Marchiafava, and Celli have distinguished themselves in special monographs on its etiology, nature, and cure, and other investigators have followed up these with a diligence and inductive power which give a very favourable impression of the young Italian school. The occupation of the Red Sea littoral—whatever may be thought of its wisdom from the colonial or strategic point of view—has been fruitful in occasions for the further prosecution of researches into fevers (malarial and other), and Dr. Pasquale's monograph affords gratifying earnest of what Italy may yet contribute to our knowledge of one of the chief drawbacks to European settlement on the "Dark Continent." At first Massowah acquired an evil repute among Italians for endemic fever, which, in the absence of clinical experience, got the name of malaria, and no doubt the geographical description of the place seemed to countenance the assumption that the name was rightly applied. Quinine was administered on a heroic scale, but the clinical response to it was negative, or worse, and with the abandonment of the drug came more penetrating scrutiny into the etiology and nature of the fever, till the notion gained ground that the malady in question was due to an "*infectio sui generis*," the result of a pathogenic agent peculiar to Massowah. At this point Dr. Pasquale was officially commissioned to intervene, and, after prolonged and elaborate investigation, he compiled a report on the novel infection. Eighty-five was the number of the cases under his care, and the most minute attention was bestowed on these, not only as to their temperature, but as to the respiratory apparatus, the alimentary tract, and in a special manner as to the spleen. The fæces, the urine, and the blood were also chemically examined, and, where indicated, bacteriology was invoked to add precision to the diagnosis. The results are, after careful exposition, summed up in the monograph before us, and may be tabulated as follows:—1. Massowah is not a seat of palustral infection, though malaria may be evoked in its climate when already existing as a cachexia due to previous attacks. 2. There is no fever infection *sui generis*, such as the "climatic remittent," which some classifiers have called it. 3. There are febrile maladies which might be confounded with common continued fevers (such as those arising from typhoid infection), principally of the so-called "abortive" and minor types. We cannot summarise the data on which Dr. Pasquale grounds his exclusion of malaria from the fevers encountered at Massowah, any more than the findings which make him reject the assumption of "climatic remittents, while rather disposed to admit them under the category of "abortive" typhoidal febriculæ. Our purpose will have been amply served if we have drawn the attention of our readers to this very interesting and instructive monograph—the work of a pathologist and clinician of acute and independent mind, from whom the profession may look for yet further light on the imperfectly explored subject of African fevers.

Methods and Formulæ used in the Preparation of Animal and Vegetable Tissues for Microscopical Examination. By PETER WYATT SQUIRE. London: J. & A. Churchill.

THIS little volume consists of ninety pages, and embraces all the manipulation required for the preparation of microscopic sections, from the fixing and hardening of the tissue to the final mounting in balsam or glycerine. The volume does not include, however, the cutting of sections, the author evidently being of opinion that the mode of doing this cannot be learnt from a book. For purposes of reference the work will be found most valuable. All the best methods of microscopical technique which are scattered amongst the many larger text-books now published are here given a place. All the descriptions are brief and concise, so that no time is lost in finding what one seeks. Much new matter is, in addition, to be found which is not given in other works: for instance, Victoria blue is a stain but little known, yet it is one of the best for demonstrating elastic tissue, and in the book now under consideration full directions are given for the preparation of the solution and the method of using it. Very useful hints are also given in the preparation of hæmatoxylin and carmine specimens, which are founded on the personal experience of the author. In the later chapters of the book the methods of staining bacteria are fully described; not only are the general methods considered, but also the special. The action of the aniline dyes takes the first place; then follow Gram's, Löffler's and Kühne's processes; and next come the various methods of staining the bacilli of tubercle, leprosy, anthrax, glanders, syphilis, &c. As will be seen from the above remarks, this little book is a valuable addition to the literature on laboratory work. Although animal tissues occupy the larger portion of the book, vegetable tissues are also referred to, so that whatever branch the observer may be studying he will always find the formulæ and methods required. It will be especially useful to those who have already obtained a fair knowledge of the use of the microscope, but require a handy volume to which to turn for any particular stain or other reagent. The formulæ have been worked out very carefully, and we cordially recommend the *brochure* to the notice of all those engaged in laboratory work, whether for the purposes of study or of research.

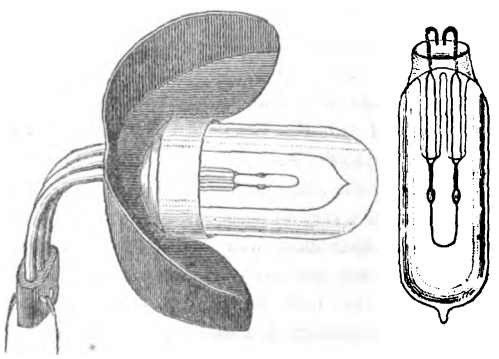
OUR LIBRARY TABLE.

A Manual of the Dental Laboratory. By CHARLES HUNTER. London: Baillière, Tindall, and Cox. 1892.—This little book deals with the mechanical part of dentistry in so far as it is performed in the workroom. Commencing with the construction, ventilation, lighting, and heating of the laboratory, Mr. Hunter takes a common-sense view of its requirements, and the same with regard to the tools and appliances needed. If the

Digitized by Google

young practitioner buys all the things recommended in some dental manuals, he will doubtless find himself much in the same position as the amateur photographer who purchases a so-called "complete set of apparatus," half of which he finds out too late to be useless. Mr. Hunter gives a good many hints for surmounting difficulties which often occur in practice, and many of which the student during his apprenticeship may not have encountered; his remarks, without being novel, are thoroughly practical. With regard to the more recent developments of prosthetic dentistry—such as bridge work, gold crowns, &c.,—Mr. Hunter appears only to write from the experience of others, and therefore this part is of comparatively less value.

Cocoa: all about it. By HISTORICUS. London: Sampson Low, Marston, and Co. 1892.—We took this book up under the impression that the title was simply "All about it"; but, on closer inspection of the yellow shilling-novel style of cover, the phrase is seen to be preceded by the word "cocoa," which is almost obscured in a maze of design intended to represent the plant itself. The work, however, deals with an interesting, and to an extent a scientific, subject. Thus, the history and cultivation of the cocoa plant, the uses of cocoa, the composition of cocoa, its manufacture, its value as a food, and its adulteration are discussed by one evidently having practical acquaintance with the subject. Some very interesting statistics are given of the manufacture of cocoa as carried on at the model works of Messrs. Cadbury and Co. at Bourneville. We are pleased to note here that amongst other things attention to the health and well-being of the persons employed in the factories receives due and careful consideration. Although the adulteration of cocoa is alluded to, especially in connexion with the work done at the instance of THE LANCET Commission, no simple scheme for the analysis of cocoa or for the chemical detection of adulterants is given. The estimation of fat and the detection of alkali are subjects which, we think, might well have been added. An appendix is devoted to an account of the cultivation of vanilla.



How to Use the Aneroid Barometer. By EDWARD WHYMPER. London: John Murray. 1891.—Mr. Edward Whymper is both an able author and an experienced traveller, and any subject which has received investigation at his hands will be certain to claim attention. In the *brochure* before us he gives the comparisons made with the aneroid and the mercurial barometer in the field and in the workshop, while the use of the aneroid in the determination of altitudes is fully described. He has, in fact, endeavoured to explain "some points in the behaviour of aneroids which have been puzzling and have seemed contradictory and anomalous." His object has therefore been "to render it possible for the ever-increasing number of those who employ these instruments in the field to use them with more confidence and certainty." All those concerned in this subject, therefore, and especially research travellers, will mark the important observations he has made with especial interest. The investigations have extended over eleven years, and the comparisons of the aneroid with the mercurial barometer were made at great elevations in the equatorial regions of South America.

Coca and Cocaine. By WILLIAM MARTINDALE, F.C.S. Second Edition. London: H. K. Lewis. 1892.—An interesting and well-nigh exhaustive account of the alkaloid cocaine and the plant from which it is derived is contained in the pages of this small volume. The early history of the coca plant is of particular interest. It appears that so far back as 1532 the natives of the West Indies were known to delight in chewing the leaves of the coca plant along with a compound they kept in little calabashes—a sort of earth resembling, as probably it was, lime. On being asked why they did this, the reply was that it made them insensible to hunger, and it added also to their strength and vigour. It is curious to observe how instinct has led the natives to chew the leaves with lime or, what is the same thing, calcined oyster shells, by which process, of course, the alkaloid is liberated from its natural combination. The botanical history of the plant, the use of coca as a restorative, the pharmaceutical preparations, medical uses, and references, the alkaloid and its salts, and the uses of cocaine are the subjects subsequently and fully described. The final chapter gives notes and references on cocaine that have appeared from time to time in THE LANCET and in other medical journals.

New Invention.

APPARATUS FOR EXAMINING THE CAVITIES OF THE FACE BY ELECTRIC LIGHT.

THE diagram illustrates a specially devised and constructed arrangement for examining the cavities of the face by electric light. The lamp is a new pattern, made by Edison and Swan, equal to five-candle power; it is mounted on the same plan as the smaller covered lamps I have used for three years or so for the purpose, but is ten times as strong as they are. The glass covering protects the mouth from undue heat or risk from accident to the lamp. Mounted in a vulcanite tray, it has free communication with the external air by the tubes, which go through the vulcanite, and carry the wiry socket; in this way it is kept

The drawing of the mounted apparatus is slightly reduced; that of the lamp is full size.

sufficiently cool for all practical purposes. The chief object of the vulcanite tray is to prevent as much as possible the light escaping from the mouth through the teeth and lips into the soft tissues of the face, and interfering with the direct light through the antra, which passes with a red glow from the nostrils and from immediately under the orbits. The effect, in cases of suspected disease, is so decisive that it seems impossible to make a mistake in diagnosis, for if any obstruction exists, the darkness on that side of the face is so strong a contrast to the light on the other side that the patient observes the red glow in the one eye and not in the other. Of course, if there is no obstruction, the light is equally visible on both sides. It is necessary to conduct the experiment in a perfectly dark room, otherwise no effect will be observed. The teeth should be well closed over the lantern on the vulcanite tray, and the lips tightly drawn over the front flange, thus leaving, outside the mouth, only the metal tubes to supply the air and carry the electric wires. The current is taken from that supplying the house, but is reduced by a resistance coil from 100 volts to the necessary power.

THE LANCET.

LONDON: SATURDAY, MAY 28, 1892.

FOUR seats on the Council of the Royal College of Surgeons of England will have to be filled at the election which will take place on July 7th. The vacancies will be created by the decease of Mr. BERKELEY HILL and the fulfilment of their terms of office by Mr. DURHAM, Mr. LAWSON, and Mr. THOMAS SMITH. The three members of Council thus retiring in rotation were elected together in 1884, and have enjoyed their full term of eight years on the the Council, but Mr. THOMAS SMITH was first elected in 1880 as a substitute member for four years. Mr. BERKELEY HILL was elected in company with Mr. ALLINGHAM in 1884 as a substitute member, and both went out again in 1886. Mr. ALLINGHAM retired, not finding the position of a reformer on a Conservative Council agreeable; but Mr. BERKELEY HILL stood again, and was re-elected for the full term of eight years, of which six have expired, leaving two only for his fortunate or unfortunate successor. Of the three retiring members of Council Messrs. SMITH and DURHAM are expected to stand again, but Mr. LAWSON, so far as the College is concerned, is desirous of enjoying the *otium cum dignitate*, and has expressed his intention not to offer himself for re-election. He, if not an ardent reformer, is by no means opposed to advancing with the times, and his retirement will not be of any advantage to the advocates of the claims of the Fellows. Mr. THOMAS SMITH has done good service to the Fellows, and ought to be supported by all sections of the constituency. With Mr. DURHAM'S opinions we are not very well acquainted.

It will be seen that there will be two absolute vacancies on the Council, and possibly a third; but as the third is quite uncertain it had better be disregarded. For these vacancies we understand that the new candidates will be at least three in number. It is currently reported that Mr. WARRINGTON HAWARD and Mr. JEREMIAH MCCARTHY have been selected by those who are satisfied with the existing *régime*, whilst Mr. JOHN TWEEDY has accepted the invitation of the committee of the Fellows' Association to stand upon the platform for which the Association has been so long and so consistently contending, and which is strongly supported by several members of the present Council of the College. Mr. TWEEDY would have had Mr. LAWSON TAIT for a colleague in the battle if that gentleman had adhered to his expressed intention to come forward again. No sooner, however, had the Committee of the Fellows' Association paid him the compliment of asking him to stand as one of their candidates, than most unexpectedly he declares that he will not offer himself again in July. The announcement has occasioned considerable surprise amongst those who have loyally supported him year by year on the invitation of the Association of Fellows, and the more surprise because the reason assigned for his sudden retirement is curiously illogical. In previous years Mr. LAWSON TAIT has said that he would not come forward unless backed by the Association. The Association has backed him, and has nearly succeeded in carrying him into the Council. He was supported because he adopted their platform in the most frank and apparently satisfactory manner. It was believed that he would be a strong man on the Council, and would materially help to secure for the Fellows of the College that position in the Corporation which would be alike honourable to them and advantageous to the College. But whilst coquetting with the Fellows Association Mr. LAWSON TAIT seems to have bestowed all his real affection upon the Members of the College, and to have been endeavouring to advance their cause through the agency of the Association of Fellows. He has been a leading spirit in the unfortunate policy which the Committee of the Association of Members has pursued in the prosecution of the action STEELE *v.* SAVORY. He now, however, declares that, owing to circumstances which we need not recapitulate, the Members' Association is not worth fighting for, and, as he cannot fight for the Members, he will not fight for the Fellows. His position of course is unsound, and would appear to be wanting in loyalty to the Association of Fellows and to the Fellows generally. All who take an intelligent view of the present state of College politics recognise, however greatly they may regret the circumstances, as we do ourselves, that for the time being it is impossible to obtain for the Members any increase in their privileges, that the Council is favourably inclined to the Fellows, and that the best policy, even in the interests of the Members, is first to settle the proper position of the Fellows in relation to the Council and the Corporation. This being so, the great desideratum for the moment is to elect into the Council candidates who are prepared to support those points of reform which are feasible and lie almost within the grasp of the Fellows of the College. The Association of Fellows cannot have a better candidate than Mr. TWEEDY, who possesses a stability and a tact the want of which is apt to counteract the most brilliant qualities.

THOUGH it would be difficult to exaggerate the extreme hardship to the practitioner involved in such a case as that of COGHILL *v.* BONAPARTE, it is not without some lessons alike to the public and the profession. Dr. JOHNSON moralised on the unhappy lot of the physician—as a melancholy attendance on misery, a mean submission to peevishness, and a total interruption to pleasure. But even his observant eye did not seem to perceive that the physician had worse duties to face than attendance on the peevish or the miserable. It is equally a medical man's business to attend the vicious tainted with foul diseases (that have been often communicated with fatal effect to the unfortunate doctor through an unnoticed abrasion of the skin), and to advise the unprincipled person who will take away his reputation rather than pay a bill. The medical man cannot evade such duties. We must not libel human nature by saying that their performance constitutes a large proportion of medical work. But we must insist that they are by no means infrequent. And it requires a very good Samaritan indeed to undertake the treatment of such people, with all the risks it involves, with all the unspeak-

Digitized by Google

able loathing of their code of morals, and with the chance of a lawsuit to enforce the payment of hard-earned remuneration. The law courts give frequent illustrations of these grievances of medical practice, compared with which those in Dr. JOHNSON'S Hat are trivial; but there has seldom been a worse case in point than that which occupied Mr. Justice HAWKINS and a jury for two days in the Queen's Bench Division. Thanks are due to the press in this instance for using a very large discretion in the publication of particulars, for only those who were in court can form any estimate of the base though groundless charges that had been made against the ill-used plaintiff. But enough has been published to excite the sympathy of the profession and the public with any self-respecting medical man who, by the mere accident of his profession, has fallen among such characters, and has had to attend them for months with such civility as he could command. The action took the simple shape of a medical man, Dr. COGHILL, suing the defendant—M. CLOVIS BONAPARTE—for attendance on himself for alcoholism, and on a lady who passed for his wife for what Mr. R. T. REID, Q.C., very euphemistically described as "grave specific disorder of a highly contagious nature." The bill had been sent in, but not paid. The defendant was impecunious, and conceived the idea not only of not paying the doctor's bill, but of making the doctor pay large damages by threatening an action for divorce against the woman who he maintained was not his wife, in which the plaintiff was to be made co-respondent. This worthy defendant was yet more ingenious and cruel. He drew such a picture to his so-called wife of an imaginary action that was to be commenced by Dr. COGHILL, and that was only to be averted by money, that he got her to make what purported to be a confession of disgusting actions involving the plaintiff, and to part with all her jewels, whereupon he went through a marriage service with another lady. Such were the persons in whose hands Dr. COGHILL'S reputation seemed to rest a week ago. Fortunately, Dr. JOHNSON'S description of the attitude of the medical man towards evils again fails—there was no "mean submission" to infamy at such hands, but a sturdy, manly determination to expose a conspiracy of slander which for filthiness and malignity has perhaps never been equalled in the history of the profession. And the exposure was completely accomplished, thanks to the honest and honourable reputation of Dr. COGHILL, and to the ability with which his counsel exposed the successive steps of the audacious scheme by which his patients thought to enrich themselves at the cost of Dr. COGHILL'S ruin. His triumph was as complete as the disclosure of their infamy. At an early stage of the case an attempt seemed to be made to keep Mrs. CLOVIS BONAPARTE out of the court. And we regret to say that the medical certificate in support of this attempt called forth very uncomplimentary remarks from the judge. Medical certificates that are to affect the action of courts of the course of law should be written with extreme care, and we are bound to admit that the medical gentleman who gave the certificate in this case did not [illegible] strength of assertion which should have [illegible] matter of such importance. He [illegible] Mr. Justice HAWKINS said he would never again receive a medical certificate unless it were accompanied by affidavits. No doubt the gentleman thought Mrs. CLOVIS BONAPARTE was more fit to be in bed than in a court. But, in giving such a certificate, a medical man is bound to take all facts into consideration. He could not say the presence of the witness would be dangerous to life. In these circumstances he was scarcely entitled to give medical sanction to her absence, which might have been fatal to one of the most important actions that ever was tried. We will not lay too much stress on the disparagement of medical certificates. But such certificates should not be forthcoming in circumstances of such extreme gravity, unless they can be strongly justified, and unless the presence of the patient decidedly involves danger to life. Fortunately, the witness came and disclosed her nature, her power of lying, of imagining, of swearing falsely, and all the edifice of slander that have been built upon it. The counsel for the defendant seemed as shocked as everybody else at the disclosure, and by the instruction of his client withdrew all imputation on Dr. COGHILL. The jury hastened to express their sympathy, and so did the judge. A verdict followed for the plaintiff for the amount claimed, £81 15*s*. Dr. COGHILL deserves the thanks as well as the sympathy of the profession. Every medical man is liable every day to accidents similar to this, though as a rule not quite so grave. But they are not the less awful to encounter, and those who meet them bravely and effectually do much to support the honour and dignity of a profession which must tend the bad as well as the good and those who can asperse the characters as well as those who can reward the services of its members.

A PHYSICIAN and a medical teacher in a leading metropolitan school does admirable service when he leaves for a moment the bedside and study of individual cases, and summons his class to consider the health bearings of the civilisation in the midst of which we are living. This is what Dr. VIVIAN POORE has been doing in the admirable lecture on the Concentration of Population in Cities, published in the last two numbers of THE LANCET. When a hospital physician of clinical reputation and industry bids us consider for an hour the bearings of the steadily increasing tendency of population to leave the country and to concentrate in towns our attention is naturally arrested; and as he marshals his facts before us, we are bound to admit that he is stating a problem demanding the serious attention not only of medical men, but of statesmen. We cannot too warmly recommend all public men, all those who have the power by word, or pen, or law, or example to influence public opinion and the movement of population, to read this extremely interesting lecture. For, after all, it is to statesmen that we must largely look for help in diffusing population. It is to be hoped that the development of local government will have some effect in this direction. Anything which supplies men with fresh [illegible] local interest, and local importance tends [illegible] to fix them in their locality. The centripetal [illegible] of the population is appalling. Should [illegible] and more overgrown and the country [illegible]

deserted. It is the same in the United States. Life is lived in a crowd, and in a hurry, and, in London at all events, too often in a fog. In 1801 Dr. POORE tells us that London contained one-eleventh of the entire population of England and Wales, whereas at the last census it was found to contain about one-seventh of the entire population. It is the same, and perhaps worse, in the United States. Half a century since the urban population of the United States was only 8·5 per cent. of the whole, while to-day it constitutes 29 per cent. of the whole. The rate at which American cities grow is "appalling." Chicago, with 1,200,000 inhabitants, having doubled itself in ten years, has beaten the record. One great feature of Dr. POORE'S address is his unsparing criticism of new forms of overcrowding in cities, among classes of men who would be the last to think that they were breaking sanitary laws. We have been apt to associate this folly with the unfortunate occupants of cellars in Liverpool or of what are known in sanitary literature as the "ticketed houses" of Glasgow. Dr. RUSSELL, in an address a few years ago to the Glasgow Philosophical Society, showed that 75,000 people in Glasgow live in "ticketed houses"—that is, houses which had once been of a higher class, but which are now let out in tenements with an average of air space for each inmate of 334 cubic feet. The Glasgow Police Act confers a discretionary power on the authorities to affix tin plates to such houses stating their cubic capacity and the number of inmates allowed. A system of night inspection is maintained over such houses. As regards the sublet houses of Liverpool, the details of overcrowding even within the last year or two would make good reading, and much valuable information on this subject has been obtained by various LANCET Sanitary Commissions. The sanitary and moral scandals of such overcrowding are scarcely likely to be repeated in "houses with every modern improvement." But a very superficial study of Dr. POORE'S lecture will show us what a tendency there is in fashionable circles to revert to bad types of houses, and how especially the high-storeyed houses of Edinburgh, with their successive flats, are being imitated in London flats and in the huge hotels, which outvie one another in size, and in which the unfortunate inmate is lost in a crowd, and is known rather by the number of his room than by personal recognition. Chicago here again "beats the record" with a building, "The Masonic Temple," of twenty storeys, and a street of eighteen miles in length. The old English prejudices were in favour of a self-contained house, and such houses were the envy of Scotch sanitarians, who knew the tendency of the flat system to circulate disease and bad air—a tendency powerfully helped, Dr. POORE points out, by the costly lift system, which drives the air up and down among the various floors. It is perhaps too soon yet to estimate the value of this flat system on sanitary grounds, but it cannot be dissociated from the similar system of Scotch and continental towns, and must be regarded as retrograde. No mechanical appliances or inventions in sanitary science are likely to make up to human beings for the loss of cubic space and free ventilation or to counteract the disadvantages of being "cabined, cribbed, confined" in a joint building with twenty or thirty other families. Dr. POORE gives, as other writers have lately done, an unsatisfactory account of the sanitary condition of the chief towns in the United States. In Chicago the zymotic death-rate for 1890 was not much less than double that of London, the typhoid fever death-rate was nearly five times that ever recorded in London, and so was the death-rate from diphtheria. In New York, in spite of a splendid water-supply and a complete system of sewerage, the density of population averages 65 persons to an acre, and in 1890 the deaths exceeded the births by 980. Dr. POORE'S reflections on the facilities given to speculative builders and rich companies to plant small towns in the line of main sewers, and very largely at the expense of the whole body of ratepayers, deserve much attention. It is amazing that such builders should have so much in their power, and the bodies which represent the ratepayers *so little*; but the tendency of legislation is to correct this evil.

Some may think that Dr. POORE has not fully admitted the achievements of modern sanitary work and is a little conservative in his view of the respective merits of town and country; but his general contention is undeniable that, if the condition of human beings is to be improved, it is not to be done by packing them as thickly as they can be packed for ratepaying and trading purposes, but by giving them room to breathe and to preserve a certain self-respect. Dr. POORE utters a strong note of warning against concentration of population in cities. Even grand open spaces, which are a redeeming feature of the age, and which ought to be *more* and more jealously preserved, ought not to be regarded as superseding the necessity for "curtilage," or that space about even a poor man's house which is essential to life, health, and morals.

ON the 23rd inst., at Melbourne, FREDERICK DEEMING suffered the extreme penalty of the law for his crimes, after having with unparalleled effrontery exhausted every scheme, dodge, and trick to interrupt the course of justice in his case. He sought, after the sentence of death was pronounced upon him, to briefly prolong his miserable existence by an appeal to the Judicial Committee of the Privy Council in the mother country. The Lord Chancellor stated that their lordships had not the smallest doubt that this was not a case in which they ought to grant leave to appeal, and pointed out how very serious and grave a misfortune it would be if such an application should be successful. For in that case it would be easy for any person in any of the distant colonies to stay execution, and to interpose a very long delay between the delivery of a verdict and the execution of a sentence, by simply sending over such materials as would form the subject of argument. The medical testimony given at the trial was of two kinds, the definite and the indefinite. The definite evidence was to the effect that the prisoner was sane, and that the tokens of insanity submitted to them by him were not genuine, and that he was in fact feigning insanity with the view of escaping the punishment due to his crimes. The indefinite evidence consisted of historical memoranda which, if true, pointed to hereditary and congenital predisposition to insanity, and to "fits" and certain morbid eccentricities which characterised some portions of the prisoner's early career; and it involved references to head injuries and syphilis in the prisoner, who, it was alleged, suffered from

Digitized by Google

"instinctive criminality"; and therefore his case demanded protracted investigation and the application of further tests. The phrase "instinctive criminality" is not one that commends itself to us as likely to carry weight in a court of law; and if it has any meaning at all in relation to the question of responsibility for criminal acts, we think that it ought not to be made use of as a vague substitute where the word "insanity" cannot be got at without straining. A medical inquiry into the mental condition of an alleged criminal consists substantially of an inquiry as to the sanity or insanity of the individual—first, at the time the examination is made; and, secondly, at the time the alleged criminal act was committed. After these two subjects have been investigated, it is then permissible and desirable to deal with the historical evidence of predisposition to insanity and of actual attacks of insanity in the individual. Leaving out of consideration cases of shamming, it is always a matter of misfortune for the prisoner if his insanity is based only upon historical evidence, metaphysical phrase, and lengthy descriptions of conduct, if precise statements of fact are omitted, and if an opinion as to his actual mental condition at the time he committed the act, or at the time the examination is being conducted, is not given. Besides, it does not follow that because a man's mother or father was insane or because a man was once an inmate of an asylum that every criminal act which he commits later in life should be referable only to a condition of mind implying insanity, and therefore irresponsibility. Pre-existing insanity in the individual or in his parents is satisfactory only in support of an opinion already formed that the individual is now insane or was insane at the time he committed the act in question. It is much to be regretted that the indefinite evidence given by medical men on behalf of DEEMING, and given we doubt not in all good faith, became necessarily detached from precise statements of fact as to the prisoner's sanity, insanity, or imposture, and consequently assumed too much of the character of special pleading. A medical man under such circumstances should have the courage of his opinions, and after his actual examinations of the man, for which every facility is always given, he should testify either that so far as he has been able to form an opinion the man is sane or insane, adding in the case of imposture that certain signs which might be taken to indicate insanity are assumed and not real.

SIR RICHARD QUAIN, President of the General Medical Council, is to be congratulated upon the address with which he introduced the business of the May session on Tuesday last. His graceful reference to the result of the late election of direct representatives was marked by considerable tact, while his genial welcome of Dr. ANGUS FRASER and Dr. GEORGE HARE PHILIPSON in no way detracted from the regret associated with the resignation of Dr. STRUTHERS and the death of Dr. HEATH, whom they respectively replace. The deaths of two former members of the Council, Sir JAMES RANKEN REMNANT and Sir GEORGE PAGET, were also alluded to in feeling terms, and it was distinctly a happy thought [illegible] that a copy of the latter, placed at the right [illegible] desk, formed "an enduring record of the esteem and affection" with which he was regarded by the Council.

Leaving the past and turning to matters more immediately concerning the recent and future actions of the General Medical Council, Sir RICHARD QUAIN spoke of the Bill intended to regulate medical practice in France, more particularly as it affected the practice of foreign medical men in that country, and he explained the various bearings of its provisions. Coming next to the legal question at issue between the General Medical Council and the Royal College of Physicians of London, he naturally, while giving bare record of facts, spoke with commendable restraint. The neatness with which the Executive Committee eluded the threat of an injunction restraining the publication of the Medical Register by omitting a "table of qualifications," is distinctly noteworthy, even though for the present, on the President's showing, the Register appears in an anomalous form, having no indication of the grounds for admission or rejection. Hitherto "penal cases" have mostly been held over until November, but, in the absence of pressing educational questions, which are ordinarily supposed to consume the May session, the President referred to the injustice and hardship attendant on delay, and six cases are therefore in process of investigation.

Almost the first business after the address was an example of the kind of difficulty into which the Council so frequently places itself. After academic discussions, definite courses of action are at length decided upon, and then it is suddenly suggested that inquiry should be made as to the legality of the step it is proposed to take. The Education Committee had proposed to withdraw the recognition of the Council from the Arts Examination of the Society of Apothecaries of London. Upon data supplied by the Council a legal opinion had been given; upon data supplied by the Apothecaries' Society another opinion had been furnished, and the representative of the Apothecaries' Society thereupon felt justified in calling into question the extreme impolicy and unwisdom of the proposal of the Education Committee. The argument wandered from England to Scotland, and thence to Ireland, and then back again, and was finally postponed for later consideration. Equally desultory was the conversation upon the certificates to be required from candidates presenting themselves for examination in chemistry and materia medica. Although it was intended that this should be discussed as an "abstract question," the somewhat ancient story was revived of the pupil whose certificates on these subjects had been signed by the coachman; but, even on inquiry, no further details were afforded, and the speaker "threw himself on the mercy of the court he was addressing." The court scarcely knew what to do with him, and ultimately referred the matter to the Examination Committee, in the hope of extracting accurate information upon which action might possibly be taken. Matters connected with the visitation and inspection of examinations were discussed, and it was decided that interim reports should be printed for the "confidential" information of members of the Council and of the bodies to which the reports had reference. A formal inquiry came from the Royal University of Ireland as to the meaning of the words

"twelve months must elapse" between one examination and another, and it was explained that to some candidates this might mean an actual period of eighteen months or so; after six members of the Council had spoken, it was decided gravely that when they said twelve months a period of twelve calendar months was intended. A storm, on a small scale, was raised about an honorary degree in hygiene conferred by the University of Durham. A formal motion was passed in the end declaring that the Council had no power to interfere with the right of any university to confer honorary degrees. This final discussion of the first day was interesting for the lucidity of Dr. PHILIPSON'S first speech in defence of the University of Durham, and also for the strange way in which political questions were dragged in by a subsequent speaker. It is certainly entertaining to find members of the General Medical Council taking the floor against a "mere shuffling, Parliamentary, House of Commons negative," and upbraiding a member of the other House for "shirking the question, as parliamentary men did." It is really a pity that another motion was not drafted, declaring that "the Council has no power to interfere with the right" of any of its members to enter Parliament or to possess political views.

Annotations.

"Ne quid nimis"

THE QUEEN'S BIRTHDAY HONOURS FOR MEDICAL MEN.

IT cannot be said that honours to the medical profession have been bestowed with a lavish hand in the birthday *Gazette* of this year as far as the members of the naval and military medical services are concerned. To those whose meritorious work have received recognition in this respect we offer our best congratulations. The list includes Dr. Frederick Bateman of Norwich, who has received the honour of knighthood. He graduated at Aberdeen in 1850, and became a Fellow of the Royal College of Physicians, London, in 1876. He is Justice of the Peace for the county of Norfolk, and he is one of the few in this country who possess the Fellowship of the French Academy. Dr. George Johnson, F.R.S., has also been granted a knighthood. He is one of the Physicians Extraordinary to Her Majesty. He graduated in the London University in 1844, became a Fellow of the Royal Society, and is one of the best-known and most respected members of our profession. In a special memoir he triumphantly vindicated the claim of Harvey against the attacks of the Italians, who endeavoured to give the credit of Harvey's discovery to Cesalpino. We congratulate such a scholarly and accomplished physician on this recognition of his merits. No medical officer of the public services has had the honour of being made a Knight Commander of the Order of the Bath or of other orders in this birthday *Gazette*. Fleet-Surgeon Edward Elphinstone Mahon, R.N., is created a C.B. Surgeon-Major-General William Roche Rice, M.D., Surgeon-General and Sanitary Commissioner with the Government of India; and Surgeon-Major Scott Robertson, Bengal Establishment, Agency Surgeon, Gilgit, are appointed Companions of the Star of India.

THE GRESHAM CHARTER.

THE members of the new Royal Commission appointed to consider the formation of a Teaching University for London met on Saturday last to consider their mode of procedure. Earl Cowper was in the chair. We understand that it was decided to take the evidence of those witnesses in the first place who objected to the Charter, and that such evidence would be heard with closed doors. Professors Thorpe and Rücker, on the part of the Royal College of Science at South Kensington, will be the first witnesses, and will give evidence to-day (Saturday). On Friday, the 20th inst., the annual committee of Convocation of the University of London passed a strong resolution deprecating the omission of a direct representative of Convocation from the Commission, and urging that Convocation should be represented by the appointment of its chairman. As the Commission has already begun its sittings and is about to hear evidence, it seems impossible to place new members on it at this stage. It should be noticed that Mr. Anstie, Q.C., and Sir William Savory are members of Convocation, but are evidently considered not sufficiently representative of the views of that body. Mr. J. Leybourne Goddard (not Leybourne, as erroneously printed last week) is the secretary of this, as of the former Royal Commission.

CHOLERA IN INDIA.

THERE appears to be a good deal of cholera in India at the present time. Cases of the disease have manifested themselves at many places widely separated from one another. It is reported to be of a virulent type at Ferozepore. Several deaths from cholera have occurred among Europeans at Delhi.

FALSE CERTIFICATES OF STILLBIRTH.

ANOTHER instance of the loose system which prevails in this country with regard to the burial of newly born infants, whether stillborn or deceased, was shown at an inquest held on the 14th inst. at Ashton-in-Makerfield (midway between St. Helens and Wigan) by Mr. Brighouse, the county coroner. The circumstances reported to that gentleman respecting the birth, death, and burial of this infant—a male—were such that he had ordered the body to be exhumed and a post-mortem examination of it to be made. From the evidence given at the inquest, it appeared that the mother of the infant gave birth to it in a gipsy van on the market ground of Ashton, on the night of the 9th inst. Mr. Hannah saw her soon after and found her crying and very much depressed. He told them that under the circumstances he could not give a certificate, but advised them to go to Mrs. Speakman (a midwife who had been in attendance, but had left to go to another case), and afterwards to the registrar. It is clear from this that he expected them to register both the birth and death. Unfortunately, the midwife—an elderly woman, who gave her evidence after being cautioned by the coroner—induced her daughter to make out a certificate of stillbirth, though she admitted that the child was born alive, but she also knew it would not live. Upon this false certificate being handed to the sexton of St. John's church by Mrs. Speakman herself, who brought the body, it was buried. On making a post-mortem examination Mr. Hannah found distinct signs that the child had lived, though only a short time—perhaps a quarter of an hour. He was of opinion that hæmorrhage had caused collapse, though it is not clear from the report whether the hæmorrhage was maternal or fœtal, or what was the exact reason why Mr. Hannah did not feel justified in giving a certificate of death. Probably this can be ex-

THE GRESHAM CHARTER.

THE members of the new Royal Commission upon the Constitution of the Corporation of London met on Saturday last to consider their scheme. Lord Cowper was in the chair. We understand that it was decided to take the evidence of those witnesses only who objected to the Charter, and that the evidence would be heard in open court. Professor Thorold Rogers will be the first witness, and will give evidence on Saturday. On Friday, the 3rd inst., the members of the Corporation of the City of London passed a resolution appointing the committee of the Corporation from the Commission, and the Corporation should be represented by the mover and the chairman. As the Commission has already adjourned, it is about to hear evidence, it seems rather late to appoint new members on it at this stage. It is believed that Mr. Arnold, Q.C., and Sir William Harcourt, members of Convocation, but are certainly not sufficiently representative of the new City party. Mr. J. Lepoerme Goddard, not Leyton Buzzard, as recently printed last week in the secretary of the former Royal Commission.

CHOLERA IN INDIA.

THERE appears to be a good deal of cholera in India at the present time. Cases of the disease have occurred at many places widely separated from each other. It is reported to be of a virulent character. Several deaths from cholera have occurred among Europeans at Delhi.

FALSE CERTIFICATES OF STILLBIRTH.

AN OTHER instance of the loose system which prevails in this country with regard to the burial of infants, whether stillborn or deceased, was given at an inquest held on the 14th inst. at Ashton-in-Makerfield, by Mr. Baxter, deputy coroner between St. Helens and Wigan, by Mr. Baxter, deputy coroner. The circumstances reported were as follows: The birth, death, and burial of the child in question were such that he had ordered the body to be exhumed and a post-mortem examination of it to be made. From the evidence given at the inquest it appeared that the mother of the infant gave birth to a child on the market ground of Ashton, on the 5th inst. Mr. Hannah saw her soon after the birth, and very much depressed. She was crying and very much depressed. He was under the circumstances he could not give a certificate, but advised them to go to Mr. Speakman, the midwife who had been in attendance, but he refused to do so. He afterwards to the registrar, but he refused to do so. He afterwards to the registrar, but he refused to do so. He afterwards to the registrar

in matters of sport, and where endurance is required. Still, these are well-proportioned men with a due correlation of height, weight, and chest measurements. As it is at present, a certain number of undesirable military candidates, whose studious habits have rather tended to develop and exaggerate their physical defects than otherwise, start with a great advantage over their more desirable competitors. Competitive examinations are, after all, rather a test of mental aptitude than of mental power. Enterprise and energy are ordinarily the concomitants of vigorous health and strength; and for the army the possessor of superior physical qualifications should reap some advantage from them. Candidates might be roughly classified and arranged in groups, and a certain number of marks accorded to the different physical standards of the classes in which they were placed at the preliminary physical examination.

TERRITORIAL MONOPOLIES OF QUALIFICATION.

THIS question still rages in some quarters. The present field of battle is at Hastings. At a meeting of the governors of the Hastings and Sussex Hospitals on May 30th they will consider whether they ought to repeal the present rule restricting appointments on the physicians' staff to diplomates of the London College. The unpleasant part of this controversy is that it is essentially a professional one. The lay governors are necessarily unacquainted with the facts of the case, and take the views of their honorary medical officers as authoritative. In the discussions statements were made to the disparagement of diplomas and degrees of great medical authorities in Scotland and Ireland. We have never failed to point out that there is no legal authority charged with the duty of impartially deciding the comparative merits of, say, the membership of the London, Edinburgh, and Irish Colleges of Physicians respectively, or of the English, Scotch, and Irish degrees. This is to be regretted, and doubtless the authorities in the different divisions of the kingdom could, if they pleased, in any one year procure legislation to enable the Medical Council or some other body to do this. But, meantime, these monopolies are unworthy of a liberal profession, and contrary to the spirit of the age and of the Medical Acts. We at least would like to see it assumed, till the contrary is shown with accuracy, that the diploma of a College or the degree of a University in one part of the kingdom is equal to the corresponding diploma or degree in another. On the other hand, we should like to see our Irish and Scotch friends begin by liberalising the rules of their own hospitals before displaying such an eager missionary anxiety about the laws of our English charities.

HIGHLAND SCHOOLS.

THE Highlander, occupied principally in fishing and agricultural pursuits, leads a simple, healthy life. In Ross and Cromarty, a district measuring sixty-seven by fifty-eight miles, and possessing a population of 78,638 inhabitants, the death-rate is estimated at 16·5 per 1000. This does not prove, however, that the sanitary condition of the population is good. On the contrary, there is great want of personal cleanliness, bad housing, carelessness as to purity of water-supply and ignorance as to proper clothing, removal of nuisances, nursing, ventilation, disinfection, and the isolation of the sick. Dr. William Bruce, medical officer of health, reports to the Ross and Cromarty County Council very unfavourably as to the condition of these two counties, and is especially severe with regard to the schools. The cubic space allowed for pupils is generally, he thinks, insufficient, and no care is taken to compensate for this want of space by efficient ventilation, constant scrubbing, and general cleanliness. Many of the schools have not even a proper supply of drinking-water, and one school is mentioned where there are 200 pupils and there is no water within a quarter of a mile. Very few schools are provided with lavatories, and where these exist they are generally out of order. In the rare instances, water-closets are provided; but these likewise are allowed to get out of order, nor is there such a thing as a proper urinal with flush and drain. The privies are badly planned and ill kept, a nuisance is created, and abominable odours result. In choosing school sites no care has been taken to select a spot in the neighbourhood of a good well. As there are no proper methods for draining away slop water, and as the privies are badly built and leak, it is not surprising to learn that a great deal of the water consumed in the county is actually impure, and that the remainder may be contaminated at any moment. Most of the wells are merely receptacles for surface water. They should, in any case, be surrounded by solid masonry, so that no water could enter except that which has filtered down to a considerable depth. Dr. Bruce remarks that where lessons or lectures on elementary hygiene have been given, they have been well attended and appreciated. Also where lavatories, towels, and other such conveniences are provided at schools the pupils have readily availed themselves of these opportunities to keep themselves clean. All that is required is a good example from the teachers and the intervention of the authorities to see that proper sanitary conveniences are provided. Doubtless this will be done when sufficient public attention has been drawn to the question. The Ross and Cromarty County Council, enlightened by the report of their medical officer of health, have now an excellent opportunity of rendering great service by effecting very urgent and yet easy sanitary reforms.

PROFESSOR MOSSO ON THE EDUCATION OF WOMEN.

IT is the physical education of women rather than the mental to which the Turinese physiologist gave prominence in the lecture he lately delivered before the Queen of Italy in the Collegio Romano. The former must precede the latter to some considerable extent before the higher culture to which the girl has, in her proper sphere an indefeasible claim, can be safely begun and efficiently prosecuted. The physical substratum of the female organism must be strengthened even earlier in life than in the less precocious case of the boy, if the "*mens sana in corpore sano*"—the grand aim of all education—is to be secured for her. At this stage of his exposition Professor Mosso gave some wholesome warnings—hardly less required in England than in Italy—against the mode or kind of physical exercises still in favour. All such demands on muscular activity should be practised in the fresh air—in wet weather under spacious sheds open from side to side and from end to end—if they are not to be made worse than useless. Games—he hinted not obscurely at golf—are preferable to the quasi-military exercises hitherto enforced in girls' schools, particularly abroad; and he counselled a return to the orchestral movements of female youth in ancient Greece, by which such noble types of womanhood were attained as are still seen in the Venus of Milo, the Medicean Venus, and the fine Amazon developments on view at the Naples Museum. The craniological test will show that in these cases muscular development and grace were not purchased at the expense of cerebral form—their healthier, more symmetrical bodies involving no disproportionate diminution or premature arrest of brain. Subject to a physical education which in no case omits the possibility of her having ere long to undergo the maternal ordeal—the condition precedent of healthy progeny and normal race-reproduction—woman, in

Professor Mosso's opinion, has her sphere of mental activity not less marked, not less imperative, than man, though in her case it is the moral rather than the purely intellectual side that must come most largely into play. Given a girlhood so developed and invigorated by bodily exercise normally pursued—a girlhood in which anæmic, neurotic, or musculo-degenerative perversions, fatal to sound maternity, are guarded against, there is no limit to be placed on the mental education or professional acquisition that must fit her for her beneficent part in the social organism. Where eccentric aspiration may induce her to attempt the work of the male sex, experience rather than antecedent prohibition will put the more effective veto, her success in such a line, when attained at all, being of so exceptional a kind as to yield no incentive to imitation. The truth is, education, as opened up to woman, is in its initial and tentative stage, when all manner of vagaries are to be expected—vagaries, when not artificially encouraged, best left to cure themselves. Within the next generation experience will have taught its salutary, irrefragable lessons, and we shall find woman concentrating her energies and her newly acquired culture on paths she is best fitted to tread, leaving man to those in which nature and Providence have prescribed him his proper work.

SEASON AND SICKNESS IN INDIA.

WE have repeatedly adverted to the lamentable drain which our possession of India entails on the young manhood of this country. The amount of sickness and loss of life among young officers and soldiers soon after their arrival in India from typhoid fever alone is really very serious. Notwithstanding our acquaintance with the etiology and causes of that disease, the progressive development of sanitary work in India, and the discovery by Eberth, Gaffky, and others of the bacillus with which it is associated and alleged to be attributable, we do not see any improvement as regards the prevalence and fatality of typhoid fever in India; the reverse would appear to be the fact, if we may depend upon statistical evidence. Young men leave this country in apparently perfect health and with every prospect of an average length of life before them, and yet within a few months after their arrival in India we often read the record of their death in the obituary columns of a newspaper, or intelligence is received by their distressed and anxious relatives of their serious illness. There is no need to enter now into any minute discussion about the causes of typhoid fever in India. One thing seems pretty clear. The constitution of a young and growing man is exposed to a remarkable change by being suddenly translated to a perfectly new environment—from a temperate to a tropical climate; and it is surely a matter of experience and common sense that we may intensify or diminish the prejudicial effect of such a change by taking care that new arrivals in India shall disembark there, as far as practicable, at the beginning of the cold season, and not at the commencement of the hot one. The constitution has a far better chance of accommodating itself to the change of climate and environment if the fresh arrival does not begin his Indian career with the beginning of the hot season. We can understand, of course, that in the case of war or circumstances of urgency or necessity officers and men must go when and where they are required; but in times of peace it seems a needless—we might say cruel—experiment to land young men in India for the first time at the beginning of the hot weather. As regards the chances of preserving the health, it makes all the difference whether a young man arrives in India with the winter before him or not. As far as considerations of health are concerned, the last troopship of the season generally leaves England too late; and officers should certainly not proceed to India at a later date than is considered safe for the men. We wish that we could believe this was never the case. The hygienic and medical requirements of men coming from India are the exact reverse of those going out to that country. In the former case the winter risks of this climate have to be avoided, and advantage has to be taken of the beneficial effects of the cold weather in India; consequently the nearer the time of arrival of troops and invalids in England is to the summer the better; whereas the nearer their arrival is in India to that season the worse and more trying it is to the health.

HORSE-RACING AND MEDICAL CHARITIES.

WE are close upon the Derby Day, the great carnival of horse-racing, when fortunes will be lost and won by the devotees of "the national pastime." It is not our present intention to moralise over an institution which we fear is a necessary evil, and one that is bound up in human nature in general, and in that of Englishmen in particular; but we would seek to realise the saying, "out of evil good shall come." We are going to make an appeal to the fortunate few in the interest of the many who are "down in their luck." It is not meet that thousands and tens of thousands of pounds of "unearned increment" should carry no responsibility as a set-off to a great privilege. It is true that here and there we meet with a Duke of Portland and a Baron Hirsch, who out of their winnings are ready to extend a helping hand to the submerged tenth so largely represented by the pauper patients of our general hospitals; but instances of this kind are so few and far between that they shine as bright particular stars in the blank general darkness around. Some fifteen years ago the late Mr. Bond, in his time a well-known bookmaker, gave £1500, or 2½ per cent. of his year's winnings, to Mr. Wakley, Surgeon to the Royal Free Hospital, to distribute as he pleased among the hospitals of London. Will not some of his fraternity copy his example of munificence? Mr. Bond, who was an ardent admirer of the founder of THE LANCET, suggested a tax on betting similar to that which now obtains in France, and from which the Paris hospitals have received £32,000. We fear there is no chance of such a compulsory system being acceptable, or even enforced, in this country, and for that reason we urge the more strongly the claims to voluntary offerings. We plead the cause of the suffering poor in the hope and expectation that our appeal will not be made in vain. The publisher of THE LANCET will be pleased to receive any such donations in aid of the general hospitals of London.

THE NEUROLOGICAL SOCIETY.

THE meeting of the Neurological Society on Thursday, the 18th inst., was devoted to the exhibition of pathological specimens. Among the exhibits were two specimens of syringomyelia: one by Dr. Ferrier and another by Dr. James Taylor. In the first there was extensive tumour growth along the line of the central canal, invading the grey matter along a large portion of the cord. In Dr. Taylor's case there was but a slight amount of new growth, but the central canal, from the third ventricle down to the lumbar enlargement, was very greatly distended, disorganising the surrounding grey matter. Both cases showed the symptoms usually associated with these pathological conditions—viz., comparatively little motor paralysis, and little, if any, blunting of tactile sensibility, but almost entire loss of painful and thermal sensibility—to such an extent that five years before death, when no other symptoms had appeared, Dr. Taylor's patient was severely burnt on the arm without suffering any pain at the time or during the healing process. Another specimen of great interest was one exhibited by

Digitized by Google

Dr. Savill of a brain containing a tumour of the posterior part of the gyrus fornicatus. One of the most prominent symptoms during the life of the patient was anæsthesia of the opposite arm. It will be remembered that Professors Horsley and Schäfer, from their experiments on monkeys, localised the function of common sensation in this gyrus; but this is one of the few occasions on which the view has been supported by pathological observations on man.

DRAINAGE AT SURBITON.

THE Surbiton local journals contain numerous letters on the subject of house drainage in that district. An inhabitant of Surbiton has written to the Local Government Board stating that in the case of his own house the by-laws of the authority were not carried out; the drain pipes were not cemented or jointed in any way, whereas one of the by-laws requires that every drain shall be laid in a bed of good concrete (which was entirely omitted); and that in more than one case other house drains had not been connected with the sewer. The publication of this letter has called forth a voluminous correspondence, and the local authority, after hearing the statement of its surveyor, has passed a resolution of confidence in him. Whatever may be the facts as to Surbiton, there is no doubt that there is a vast amount of carelessness in the construction of house drainage in many districts, and no sufficient precautions are taken to ensure that drains are properly laid, efficiently jointed, or that they are tested with water before being passed by the local authority. The result is that these defects are only discovered after some case of illness have occurred. It is often the practice of builders to erect houses with indifferent material and with carelessly laid drains, and to sell them immediately they are completed, and thus the purchasers, who have taken no pains to learn their condition before acquiring them, are obliged to incur considerable expenditure in making good these defects. It is to be hoped that the residents of Surbiton will without delay, and before illness occurs, have their drains carefully tested by competent persons.

SYPHILIS AND GENERAL PARALYSIS.

IN the last number of the *Journal of Mental Science* Dr. Jacobson of Copenhagen considers the vexed and debated question of the connexion between syphilis and general paralysis of the insane. As is well known, there are some who maintain that there is, besides the classical general paralysis, a general paralysis of syphilitic origin differing in several minor details, whilst there are others who maintain that there is no general paralysis without antecedent syphilis. The most widely accepted theory is possibly one which occupies a position midway between these by assigning to syphilis a prominent position as a factor in the production of general paralysis, while not regarding it as altogether a *sine quâ non*. Statistical information on such a point is open to many fallacies, chief among them probably being the personal equation of the observer. Rieger has tried, by taking the statistics of ten different observers, to eliminate as much as possible this source of error, and he finds that among 1000 non-paralytics thirty-nine had been syphilitic, while among 1000 general paralytics 399 had been syphilitic and 601 non-syphilitic—or, in other words, that people who have had syphilis have a chance of acquiring general paralysis sixteen or seventeen times greater than that of people who have never suffered from syphilis. Such figures would seem to establish an undoubted connexion between the two diseases, and the probability of this is rendered still greater by the consideration of what obtains in a disease having many affinities to general paralysis—viz., locomotor ataxy, 80 or 90 per cent. of the victims of which, according to Erb and Fournier, have had syphilis. An interesting point in this connexion also is the comparative rarity of general paralysis among the Russian Jews and a corresponding rarity of syphilis among the same class. Dr. Jacobson's own statistics are from the large Danish asylum at St. Hans, and he has included in them all the cases of general paralysis occurring in women in that asylum in the last twenty-seven years. He has investigated the records of 116 cases of general paralysis in women, and amongst those he finds that syphilis was acknowledged in thirty-seven cases, or 32 per cent., and was most likely present in thirteen others, or 11 per cent.—a total of 43 per cent.; while in a certain additional number there was a less strong presumption of syphilis. According to this classification, therefore, Dr. Jacobson found that, in about half the cases of general paralysis occurring in women, syphilis had been present, while in a certain additional number there was a possibility of this from the fact that the patients had led a more or less impure life morally. As to other antecedents, an alcoholic history was found in twenty-seven, but in only thirteen of those did it exist apart from syphilis; whilst as to heredity as a factor, it was found in twelve cases out of forty-three—a somewhat large proportion, it seems to us. After such figures and the consideration of other statistics, there appears to be little room to doubt that a very close connexion exists between syphilis and general paralysis, and we venture to predict that in the future this connexion will be found to become closer than many now think it is. Dr. Jacobson's paper is a valuable contribution towards the elucidation of a difficult and most interesting point.

THE LONDON BUILDING ACTS.

THE London County Council has prepared a report showing the amendments of the Building Acts which it deems to be necessary, and has been impressed with the importance of insuring adequate provision of open space about houses. It has urged, as the result of the recommendation of its Building Act Committee, that no dwelling should be erected in future to a greater height than would rise above an angle of forty-five degrees measured from the boundary of the open space in its rear. The Council does not propose that this requirement should apply to houses erected on old foundations, but preserves for these the right to build to the same height as they have attained at the present time; and again, it does not require that when buildings front on narrow streets they shall be set back so as to make the street wider. To this extent the proposals of the Council fall short of the requirements of the by-laws which urban authorities, such as Manchester, Liverpool, and Birmingham, and many other towns, have adopted, and as a result the chairman of the Public Health Committee, Mr. R. Melvill Beachcroft, has called attention to their deficiency in a carefully prepared memorandum. The subject is one of immense moment to London, and the London community is indebted to Mr. Beachcroft for claiming that the Building Acts of the metropolis should be placed at least on the same level as those of smaller towns. Whatever the requirements of the latter may be as to open space, those of London are still greater, and it would be unfortunate if the expected Building Act should not make most ample provision for the open space required about houses. Mr. Beachcroft recognises in his memorandum that cases of exceptional hardship would inevitably arise through the application of these principles; but the urgent necessity for thus restricting the height of buildings, and the fact that this method of providing open space is now in actual operation throughout the country, afford reason for not dealing less stringently with the subject in London, where the need for open space is much greater. Another argument is put

Digitized by Google

forward in this memorandum which will appeal strongly to the ratepayers. London has spent two millions of money in clearing unhealthy areas, and yet lacks the provisions which in other towns must eventually bring about those improvements without cost to the ratepayers. There is, therefore, every reason for the Council and for Parliament to accept the recommendations of the chairman of the Public Health Committee, and we feel some satisfaction that it is not too late to incorporate them in the Bill which, it is expected, the Government will shortly introduce. It is believed by Mr. Beachcroft that the desired object can be best attained by the Council being endowed with a power of making by-laws as to open space about houses similar to that exercised by urban authorities throughout England and Wales Upon this point we have no opinion to offer except that the recognition of the need for open space is distinctly growing, and by-laws can be more readily modified than Acts of Parliament, and, further, we do not believe that any community will ever make the mistake of demanding less open space in the future than it has required in the past. If we are to criticise the model by-laws of the Local Government Board, which are cited as those which are deserving of imitation, we may say that they fail to regulate the height of buildings above thirty-five feet, or, in other words, to provide open space proportionate to any increase of height above this limit; and again, the setting back of houses to increase the width of streets is evidently dictated more by the exigencies of traffic than the requirements of health; but they embody important principles which London might do well to accept, and we would gladly see the metropolis not backward in appreciating their importance.

SCHOOL LIFE AFLOAT.

LORD TWEEDDALE, as the Lord High Commissioner at the General Assembly of the Church of Scotland, includes in his vice-regal duties an active interest in many local concerns besides the ecclesiastical. He has countenanced by his presence not a few of the educational and hygienic undertakings of the Scottish capital, and has found them in each case improving upon their past, and giving the most gratifying earnest for the future. His visit to the training-ship *Caledonia*, lying off Queensferry, was perhaps the most impressive of the series, and will, we hope, have the effect of drawing public attention to an institution which might, both from the hygienic and educational point of view, be extended with much utility to every estuary of the British shores. The *Caledonia* is a very favourable specimen of what may be provided for the development, bodily and mental, of our youth at the most critical period of their lives. Taken as its young inmates are from our great cities—from an atmosphere as injurious to physical as to moral growth—they are subjected to health conditions under which their bodily frames develop normally and vigorously, laying the first lines of a muscular and neural energy which cannot fail to stand them in good stead throughout the trials of adolescence and manhood. Inured at so early and impressionable an age to a life of open-air exercise and salutary, semi-military discipline, they form habits of endurance, of self-denial, of enterprise and pluck, which fit them for the hardiest and most useful forms of service under the British flag—for careers not necessarily naval or combatant, but, on the contrary, industrial and commercial, such as our ever-extending colonies, with their vast and steadily developing civilisation, tend more and more to open up. The evidence brought before Lord Tweeddale and his party of educational experts on board the *Caledonia* pointed unmistakably to a direction in which the enervating, emasculating influences of life "in populous city pent" might, in great measure, be neutralised or replaced by others of a really invigorating and renovating kind. Seaside homes are multiplying abroad for the youth of the great populous centres, and are already found to be wholesome and truly economical substitutes for the reformatories and other semi-monastic institutions for the reclamation of juvenile offenders. Why not begin a stage earlier, ask the continental Howards, and, by timely discipline and instruction under the healthiest and happiest of conditions, train up a young population for manly and breadwinning lives, before mind and body have contracted the insanitary poison, material and moral, with which the street Arab is so prematurely brought into contact? With such opportunities as our vast seaboard presents, the establishment of training ships at the chief estuaries would, according to these reformers, become the speediest of *faits accomplis*—to the relief of the overstocked penitentiary and the lightening of the work of the city missionary and the social reformer. Not that ships like the *Caledonia* are intended for or frequented by a quasi-criminal class. On the contrary, they are educational institutions in the strictest and most salutary sense, and parents who, with or without assistance, can place their boys under such influences are really giving them a better chance of success in life than if they sent them to some crowded school. Lord Tweeddale's experience, shared as it was by so many whose opinion in educational and hygienic matters is authoritative, ought to react for good in favour of the training-ship movement, and add to our rapidly increasing and perennially called for counter-actives to the evil effects of city temptations and conditions that latest and not least efficacious one embodied in "school-life afloat."

PROGNOSIS IN ALCOHOLISM.

THIS was the subject of an address by Dr. Thomas Barlow at the closing meeting of the Islington Medical Society. Dr. Barlow took a more favourable view of the prognosis of such cases than is commonly taken, and, indeed, expressed strong disapproval of the mood of pessimism in which such cases are generally regarded. He based his argument largely on cases of alcoholic neuritis as seen more frequently in women than men. After describing the grave lesions in the nerve structure in such cases, and emphasising the fact that the healthy structure often returns, and with it the lost function, he proceeded to argue that the lesions of cirrhosis even should not be regarded as incurable. Striking cases of recovery were given by Dr. Barlow, Dr. Stokes, Mr. Teale, and others. The great points in the treatment of such cases were three: first, the entire abandonment of the irritant causing the disease—i.e., alcohol; secondly, good feeding and fresh air; and, thirdly, the action of time.

SAVING FROM DROWNING

THE Life-Saving Society was established but a year ago, and yet it has already been instrumental in spreading considerable knowledge in the art of saving life from drowning. Dr. Wm. Collingridge, medical officer of health for the port of London, is the prime instigator of this useful movement. At the St. George's Swimming Baths, Buckingham Palace road, he gathered a select and numerous audience last Wednesday evening, and there explained what was the object held in view. His purport, while encouraging the healthy exercise of swimming, was to give object lessons in the art of saving life. A person might be an excellent swimmer, yet there was great danger of his being drowned whilst grappling with someone struggling in the water. Then, again, even if the drowning person be brought to shore, it is necessary to know how to induce artificial

respiration, otherwise the risk and the trouble taken often proved unavailing to save life. The Society worked gratuitously to spread knowledge in this respect; but they found it very difficult to move the enormous mass of inertia, and to awaken enthusiasm on such a question. They did not attempt to teach anything new; they only sought to spread in all directions, even in the School Board schools, a knowledge of well-ascertained facts. These facts were then illustrated by teams of trained swimmers, who first went through their drill on shore, and then repeated the same in the water. This consisted of various methods of catching hold of, and conveying to shore, persons who were quiet and passive and those who struggled violently. Ingenious methods were shown by which a swimmer could disengage himself if held by the wrists, if clutched round the neck, or if he were grasped round the body and arms. In every case, the rescuer swam on his back and only with his legs. His arms were devoted entirely to holding the drowning subject, whom it is necessary also to throw on his back. The treatment on shore, so as to restore breathing, was also practically illustrated, and thus a series of very instructive object lessons were given which the audience loudly applauded. If the simple facts which were demonstrated during this enjoyable *soirée* were more generally known, undoubtedly, not only would more lives be saved, but those brave persons who attempt to rescue the drowning would incur less risk of sacrificing their own lives.

MISSILES FROM RAILWAY CARRIAGES.

THERE is hardly less of pathos than remonstrance in a notice recently issued by the London and North-Western Railway Company. The custom of throwing empty bottles from the windows of trains in motion is among the most familiar usages of the travelling public. The company desire that this careless habit shall be discontinued. They even prefer that any empty bottles should be left in the carriages. The reasons for this protest which comes in good time at the beginning of the tourist season are not far to seek. Railway *employés* have in many cases incurred serious injury from such missiles thus cast at random on the line. These men may well complain that their sensibilities and their safety are too little regarded by some of those in whose interest they labour. To them the traveller owes in no small degree the very ease of his journey, and he often repays the debt with an act which testifies that characteristic forgetfulness of other men's convenience which marks the most ordinary quality of human nature. It is therefore to be hoped and expected that every reasonable person who may be called upon to travel by rail will give to the remonstrance above mentioned, and to the important fact that it has been rendered necessary by injuries actually inflicted, as above stated, that careful attention which it clearly demands.

THE SOCIETY FOR THE RELIEF OF WIDOWS AND ORPHANS OF MEDICAL MEN.

CONSTANT regret is expressed that the admirable Society for the Relief of the Widows and Orphans of Medical Men is not joined by a larger number of practitioners within the postal district of London. Many a case of hardship and distress has to be made the subject of a pitiful appeal to the profession that might, by a little forethought and the smallest amount of self-denial on the part of the practitioner, have been honourably provided for. The numbers of the Society at the end of last year, so far from being larger, were less by five than in the previous year. Under these circumstances it is not surprising that Dr. Glover should, at the annual meeting, have proposed the following resolution, which was carried by the casting vote of the President:—"That the directors be requested to consult an actuary, and to request from him suggestions for increasing the membership and usefulness of the Society, and to report to a future meeting."

SIR WALTER FOSTER.

LAST week Sir Walter Foster resigned his position as Professor of Medicine in Queen's College, Birmingham, and was appointed by the Council of the College Emeritus Professor of Medicine, in recognition of his long service in the Birmingham Medical School. Sir Walter Foster has been teaching continuously since 1860, and for the last twenty-four years has filled the position of Professor of Medicine—a period unequalled in the annals of the College as regards the chair of Medicine.

GREAT MORTALITY AMONG HORSES IN RUSSIA.

THE terrible famine which has prevailed in Russia since last autumn, and produced such dreadful results among the human population, has been also very disastrous to horses. In the British consul's report on trade and commerce in Taganrog, just issued from the Foreign Office, in reference to the effect of the famine, mention is made that up to last January it was estimated that 500,000 horses had died in the province of Samara alone. From a calculation it was believed that of a million of horses no more than 400,000 would be alive at the end of last month, and these would be in such an exhausted condition as to be useless for heavy agricultural labour. This is, indeed, a serious matter, not only presently, but prospectively, as it will require many years to replace these animals, and agriculture will accordingly suffer, even if the seasons should prove propitious. We do not hear that the starving peasants availed themselves of the flesh of the horses as food, and it might be inferred that they did not, but, like our soldiers in the Crimea, preferred to perish rather than consume such food. The French at Metz and in Paris in 1870–71 were not so "nice."

THE RECENT SANITARY CONFERENCE AT VENICE.

WE learn that Dr. Thorne Thorne, medical officer to the Local Government Board, is associated with Mr. Phipps of the British Embassy as technical delegate on the part of Great Britain in connexion with the Sanitary Conference now sitting at the Foreign Office in Paris, in addition to M. Barère and Drs. Brouardel and Proust, who represent France; Count de Keuffstein represents the Austro-Hungarian Government.

THE OPTIONAL ADOPTION OF SANITARY ACTS.

A PARLIAMENTARY return has just been published setting forth the names and the population of the sanitary districts of England and Wales which have notified to the Local Government Board on or before March 31st last that they had adopted the Infectious Diseases Notification Act, the Infectious Disease Prevention Act, 1890, and the Public Health Acts Amendment Act of 1890. In some instances diseases have been added to those specified in the first of these three Acts, and notification of these additional diseases rendered obligatory. We find that the Infectious Diseases Notification Act has been adopted up to the end of March in 622 urban sanitary districts, in 408 rural, and in 21 port districts. This grand total of 1051 districts comprises a population of 15,902,343, to which London, with 4,231,431, can be added, and fifty towns, with 3,878,625 inhabitants, which have notification under local Acts. It thus appears that the system is in force for 24,012,399 persons out of the 29,001,018 inhabitants of England and Wales. In seventy-two instances sanitary

Digitized by Google

authorities have availed themselves of the latitude given by the Act to increase the number of diseases for which notification is compulsory. In seventy-one districts measles is added to the list; in seventeen, whooping-cough; in four, rötheln or German measles; and in two, chicken-pox. Five of the authorities subsequently, however, revoked the addition of measles. The Infectious Diseases (Prevention) Act has been applied to 374 urban and 154 rural districts, and the Act is also in force in London. Thus the population affected amounts to 15,384,780. The Public Health Acts Amendment Act (1890) has been in part or wholly adopted by 498 urban and 146 rural authorities, making a total of 644 sanitary authorities, representing 13,747,305 people.

THE OWNERSHIP OF AMPUTATED LIMBS.

A SINGULAR case has recently been tried before his Honour Judge Jones in the Bolton County-court. The plaintiff, Ellis Housley, sued the junior house surgeon at the Bolton Infirmary for £10, the value of one of the arms of his son, who had been injured in an accident at his work. The limb was amputated at the infirmary, and after the operation the plaintiff asked for the arm, but the house surgeon refused to allow him to take it away. A day or two later the boy died, and the father again demanded his son's arm along with the body for burial. It was argued for the plaintiff that he had a right to the limb, whilst for the defendant that there was no cause of action. His Honour said the plaintiff had no property in his son or his son's body, and even a guardian was only a guardian during lifetime and not of the dead body, and there was no obligation to bury. After further argument the solicitor for the plaintiff stated that if his Honour was against him on the common law, he could go no further, and there was a verdict for the defendant, with costs.

THE METROPOLITAN HOSPITALS INQUIRY.

THE Select Committee of the House of Lords on the metropolitan hospitals do not intend to take further advantage of the power granted them this session to examine more witnesses. They met on Monday, and again on Thursday, and resumed consideration of their report, which is now in a forward state.

PROFESSOR STRUTHERS.

FEW medical teachers have earned a better claim to the gratitude of a larger number of pupils than ex-Professor John Struthers, who has just been presented by some of the most distinguished of their number with his portrait, admirably executed by his fellow townsman, Sir George Reid. The ceremony took place in London, in the residence of his old friend and fellow-student, Sir Andrew Clark, who worthily filled the part of spokesman on the occasion. Professor Struthers made an eloquent and impressive acknowledgment of the testimonial, with characteristic modesty resting his claim to posthumous remembrance less on his own solid and, in some respect, unique merits than on the artistic *chef-d'œuvre* of which he has been made the subject. The good work he has done, however, is embodied in records whose "colours never crack and never need restoration." Not only by such masterly monographs as that on "the clavicle" has he widened the area of anatomical science, but by enlightened reforms, particularly in the standards of professional graduation, he has connected his name with some of the most salutary and productive legislation of the nineteenth century. What he achieved in the memorable years that preceded and followed the epoch-making innovations of 1858 was worthily [illegible] to the official work of the General Medical Council, where he "crowned the edifice" of a career which will long be remembered as among the most honourable and exemplary ever followed out by his compatriots.

NEW METHOD OF EXAMINING SPECIMENS OF BLOOD.

A METHOD of making permanent preparations of blood has recently been described by Dr. R. Muir in the *Journal of Anatomy*, which promises to be of great use in clinical investigation. The specimens thus prepared can be preserved indefinitely, and compared with others obtained from the same patient at subsequent periods. The method is quite simple. The films are prepared on cover-glasses in the usual way, and, before they have time to dry, are placed in a saturated aqueous solution of corrosive sublimate (to which a little common salt may be added) for half an hour. The corrosive sublimate is then washed away with a three-quarter per cent. solution of common salt, and the film is further hardened by a few minutes' immersion in methylated spirit, and then absolute alcohol. The specimen can then be stained by the ordinary reagents, very good results being given by double staining with eosine and hæmatoxyline, the red corpuscles being stained by the eosine, while the nuclei of the leucocytes are prominently revealed by the hæmatoxyline.

STUDIES IN THE GROWTH OF THE JAWS.

IN the museum of the Royal College of Surgeons there is a series of models of the same mouth, beginning at the age of four and continuing up to the age of twenty-one, prepared by the late Mr. Merryweather, an attentive study of which led Mr. Charles S. Tomes to read a paper on the Growth of the Jaws before the Odontological Society. This series affords a means of checking various more or less theoretical conclusions, as to the methods of growth of the jaws, which have been drawn from the study of separate dried specimens, these conclusions themselves having a very direct and practical bearing upon the subject of the treatment of irregularities. Sir John Tomes pointed out in the first edition of his "Dental Surgery" that in the region of the jaws occupied by the twenty temporary teeth very little growth or change subsequently takes place; so that it comes to pass that the incisors, canines, and bicuspids ultimately occupy an arch which hardly differs either in size or shape from that occupied by their predecessors, he having arrived at this generalisation from the measurement of a large number of children's jaws. Mr. Charles Tomes points out that there are several possibilities of fallacies in such averages; thus, it is difficult to be certain that the children and adults belonged to the same grade of society, as the former would be probably gathered in some institution; also it is possible that the children giving the smallest measurements were puny and stunted, and that few of them would survive to be represented amongst the adults. And therefore, notwithstanding the concurrence of all the evidence thus accumulated, the record of what actually happened during the growth of one individual is well worth the trouble of close examination. In order to check the older observations, which were principally based upon measurements of the lower jaw, Mr. Charles Tomes devoted his attention chiefly to the upper. Taking the thirty models of the series mentioned, he found that in the region occupied by the temporary teeth, there was from the age of four up to fifteen only a very slight gain in the length—not quite a millimetre—whilst in width there was about the same. Up to this time the course of nature had not been interfered with; but the mouth being somewhat crowded at the age of fifteen, the first upper bicuspid on the left side was [illegible]

result that at sixteen and a half the length of the left side had fallen two and a half millimetres; but what is very remarkable, the right measurement (no tooth having been extracted) had also fallen more than a millimetre, and that diminution proved to be permanent, as at twenty-one the measurements were the same. Examination of the lower jaw led to the same inferences—namely, that there is no increase whatever in the portion of the jaw occupied by the temporary teeth. It seems clear, from the examination of the jaws of anthropoid apes, that in the matter of the absence of growth in the anterior region of the jaw man stands alone, the orang differing from him more than the chimpanzee, and the gorilla still more, gaining no less than fourteen millimetres upon an original measurement of thirty-three, and that the growth corresponds with the periods of obliteration of their inter-maxillary sutures, and it seems a fair inference that these two facts are related as cause and effect. Mr. Charles Tomes remarks that it would be very interesting to ascertain if the progoathism of the African races can be due to the inter-maxillary suture remaining open to a later date than in European races. Referring again to the series of models in the museum of the Royal College of Surgeons, he makes the interesting observation that, after the age of twelve, there is an inequality between the length of the two sides, although the same teeth had been shed and retained upon the two sides, and anyone looking at the mouth a few years later would have certainly attributed it, without the least hesitation, to the extraction of the tooth on that side; yet such a verdict would be quite wrong, and shows that in the study of irregularities a too mechanical view of their origin is to be deprecated.

EFFECT OF BITTERS ON GASTRIC MOVEMENTS.

DR. PAUL TERRAY of Buda-Pesth has published an account of some investigations he has recently made, with the view of determining the effect of various bitters on the movements of the stomach. For this purpose he employed the stomachs of dogs taken from the body immediately after the animal had been killed by severance of the cervical spinal cord. Both orifices of the stomach were then tied and the organ was immersed in a bath of water, which was at the temperature of the living body and contained in solution 0·75 per cent. of common salt. Where no drug had been introduced the automatic movements continued for about three-quarters of an hour, after which time signs of death began to appear in star-shaped contractions; and in another half hour mechanical stimuli ceased to produce any response, irritability being subsequently lost, first to cold water, then to the galvanic current, and lastly to hot water. When the animal was kept on a restricted diet for two days, and a quarter of an hour before being killed a dose was introduced into the stomach of some bitter which acts on the peripheral automatic centres of the stomach, the movements were stronger, more rapid, and more persistent—the most powerful drug being gentian, and after that cetrarin and condurangin; then came taraxacum, quinine, and lastly quassia. The irritability of the stomach to mechanical stimuli was increased by gentian, taraxacum, quassia, strychnine, and columbine. Small doses of absinthin diminished the irritability, and large doses arrested it altogether. Columbine and strychnine increased the irritability until persistent general contractions were induced. Picrotoxin produced no effect on the contractions, while cetrarin not only set up increased movements in the stomach, but produced a similar effect upon the intestinal movements. From a therapeutic point of view, therefore, it appears that in atonic conditions and moderate dilatation bitters may be given with advantage. Certarin, it may be well to remark, acts as an aperient in addition to its effect upon the stomach.

FOREIGN UNIVERSITY INTELLIGENCE.

Bonn.—Dr. Albert Peters has been recognised as *privat-docent* in Ophthalmology.

Buda-Pesth.—Dr. P. Haberern has been recognised as *privat docent* in the Surgery of Bones and Joints, Dr. G. Direr in Gynæcological Operations, Dr. J. Bársony in Obstetrical Operations, and Dr. H. Rothmann in Odontology.

Granada.—Dr. Don A. Perales y Gutierrez has been transferred from the chair of Midwifery to that of Diseases of Children.

Innsbruck.—Dr. Heryng of Warsaw, who has been offered the Professorship of Laryngology, has declined to migrate.

Madrid.—Dr. Don Redondo y Carranceja, Professor of Clinical Medicine in Valladolid, has been appointed to the chair of Medical Pathology.

New York (Bellevue Hospital Medical College).—Dr. Alexander Smith has been appointed Professor of Medicine, in succession to Dr. Janeway, resigned; Dr. H. M. Biggs has been appointed to the chair of Materia Medica, vacated by Dr. Smith.

Utrecht—Dr. Gutteling has been recognised as *privat-docent* in Dermatology and Syphilis.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Dr. Paul Lannegrace, Professor of Physiology at Montpellier.—Dr. Carlet, Professor of Natural History at Grenoble.—Dr. Josef Oellacher, Professor of Histology and Embryology at the University of Innsbruck, of Pneumonia, at Botzen, where he had gone to spend the Easter vacation. He was in his fiftieth year.—Dr. Ivan Alexêevich Efremovski, Professor of Surgery in Warsaw, at the age of fifty-three. He had taken part in the ambulance work in the Franco-German War, and had written papers on wounds of the knee and resection of the shoulder and elbow.—Dr. J. J. Zedershtedt, formerly Professor of Special Pathology and Therapeutics in the University of Kazan, at an advanced age.

THE experiments which are being conducted under the auspices of the Commission on Tuberculosis are still in progress. Some delay was caused by the difficulty of obtaining suitable cattle when the foot-and-mouth disease orders were so extensively in force. That difficulty has now been removed. We understand that some interesting and important results have already been obtained.

A MEETING of the members of the Calcutta Medical Society and of the members of the profession in Calcutta was recently held in the theatre of the Medical College of that city to unveil the portrait of Brigade-Surgeon Kenneth McLeod, which is to be placed in the Medical College Hospital as a memorial of his distinguished services as a surgeon and professor of that institution.

SIR CHARLES A. CAMERON, F.R.C.S.I., D.P.H., medical officer of health, Dublin, has accepted the Presidency of the Congress of the Sanitary Institute to be held at Portsmouth in September next.

THE Cavendish Lecture for 1892 of the West London Medico-Chirurgical Society will be delivered by Sir Charles Cameron at the West London Hospital, on Thursday, June 2nd. The subject is the Etiology of Typhoid Fever.

Digitized by Google

DR. PHILLIP MACLAGAN, brother of the Archbishop of York and of Sir Douglas Maclagan of Edinburgh, died at Berwick on the 25th inst. He was formerly surgeon to the 20th Regiment.

IT is stated as probable that Professor Virchow will visit Dublin on the occasion of the celebration of the tercentenary of Trinity College in July, as the guest of Sir William Stoker.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

THE May Session of the General Medical Council opened on Tuesday under the presidency of Sir Richard Quain. There was a large attendance of members.

New Members.

Dr. Angus Fraser, the successor of Dr. Struthers in the representation of the University of Aberdeen, was introduced by Sir Wm. Turner, and Dr. George Hare Philipson, the successor of the late Dr. Heath in the representation of the University of Durham, was introduced by Dr. Macalister.

The President's Address.

In the course of his address the PRESIDENT said that the Council would recognise with satisfaction, as the result of the late election of direct representatives, that the gentlemen returned brought back the gain of five years' previous experience at the board. At the same time the Council should be informed that the cost of the election of the English members was £489, which by further additions would increase the total cost to £550. In Scotland, there being no opposition, the expense was a minimum quantity. In Ireland the expenditure was, in round numbers, £80. He referred to the presence of the new members, and said that the Council would especially miss the presence of Dr. Struthers, whose zeal and courtesy in dealing with the subject of education and examination had made a distinct mark in the progress of medical education, he having been chairman of the Education Committee. Before his term of office had expired he had left the questions bearing on medical education in such an advanced condition that little more remained for the Council to do than to watch and to supervise their progress. Dr. Heath was distinguished for his quiet and unobtrusive manners, and, though he seldom addressed the Council, for the very clear manner in which he expressed his well-formed and just opinions. He referred to the death of Sir James Risdon Bennett and of Sir George Edward Paget, who had been former members of the Council. Referring to Sir George Paget, the President said: "My feelings of high esteem for Sir George, then Dr. Paget, have led me to occupy your attention for a few minutes with this special reference to his name. To those members who may not know the fact, I may indicate that his bust is placed at the right hand of the chair—an enduring record of the esteem and affection in which he was held amongst us." He continued: "It has been felt by some members that the Education Committee should be of a more representative character than under its present constitution. The same observation applies to the Examination Committee, and notice of a motion on the subject has been given by Dr. Church. In my observations in November last I mentioned the receipt of a communication from the Privy Council, enclosing a copy of a *projet de loi* intended to regulate medical practice in France, and which, amongst many other subjects, had reference to the practice of foreign medical men in that country. This Bill had passed the Chamber of Deputies, but had not then come before the Senate. A further communication has been received from the Privy Council Office, enclosing a very full and elaborate report on the subject presented to the Senate by M. Cornil, a member of that body. In this report it is recommended that after an interval of a year from the passing of the Act no person should be entitled to practise medicine in France except those who hold the Government diploma of M.D., obtained after going through a certain course of study and passing certain prescribed examinations. The first clause of this Bill, including the above condition, has been adopted by the Senate. Certain exemptions to the law may be made by the Minister of Public Instruction, but in no case can these exemptions extend to the three final examinations. The position of *officier de santé* is to be suppressed; so, likewise, is the title of 'Doctor of Surgery'—inasmuch as the generic word 'medicine' comprises both medicine and surgery, the Doctor of Medicine is a surgeon as well as a physician. The latest information on the subject of this Bill tells us it has passed the Senate and gone back with amendments to the Chamber of Deputies. The Council might think well, in replying to the President of the Privy Council on the subject of this last communication, to submit a statement, prepared by our solicitor, of the terms on which foreign medical men are admitted to practice in this country, with a request that this statement may be forwarded to the medical authorities in foreign countries, in order that these authorities may have before them a permanent record of what these conditions are. The decision by the High Court of Justice that a person registered in respect of one qualification cannot hold himself out as possessed of others applies *a fortiori* to persons who hold no qualification, who yet assume professional titles. This decision is of the utmost importance for the protection alike of the public and of qualified practitioners. In regard to legal matter of great importance, it is merely necessary here to say that the resolution of the Council directing the Registrar not to register the qualifications of Licentiate or Member of the Royal College of Physicians of London as in themselves sufficient to admit to the Register was duly communicated to the implicated College. As a consequence, on the application of the College, a writ was issued from the Court of Chancery and served on the solicitor to the Council. An application was made at the same time for an injunction restraining the publication of the Medical Register, which contained a table of qualifications indicating a limitation—denied by the College—of its licensing authority. Had this injunction been granted, the publication of the Register must have been postponed, resulting in a very great inconvenience to the public and the profession. The Executive Committee, being advised by counsel that this page had no legal connexion with the Register, directed that it should be omitted for the present from the Register. This course being satisfactory to the College of Physicians, their application for an injunction was withdrawn. In further reference to this case, the Council may be informed that the fullest consideration has been given by counsel to the details of the case, and information has been freely supplied by the mover and seconder of the resolution, Sir Wm. Turner and Sir John Simon, between whom and the lawyers a consultation has been held. Sir Horace Davey and Mr. Muir Mackenzie have been retained to represent the Council when the case comes before the court, which is that of Lord Justice Kekewich. Owing to the great number of cases on the list, it is thought that it may not come before the court for several months." Referring to penal cases, the President continued: "No doubt the Medical Council is prepared to do what it has hitherto done in cases in which the interests of the public are damaged by professional delinquents, but it would certainly seem to be the duty of the Colleges which grant licences to exercise a full disciplinary control over Licentiates whose conduct brings discredit upon their institutions. An association called the Medical Defence Union has thought it its duty to bring this matter before the Council. If the Colleges cannot deal with these cases themselves they should bring the matter before the Council, not leaving it to a voluntary association to protect the character and interests of their institutions."

On the motion of Sir JOHN SIMON, seconded by Mr. MACNAMARA, the President was thanked for his address.

The Business Committee.

Dr. P. HERON WATSON reminded the Council that the resignation of Dr. Struthers left a vacancy in the Business Committee, and he moved the appointment of Sir William Turner, who he understood was willing to serve.

Dr. LEISHMAN seconded the motion, and it was agreed to.

The Society of Apothecaries of London.

Mr. BRUDENELL CARTER called attention to the state of matters with regard to the Arts Examinations of the Society of Apothecaries of London. It would be in the recollection of members, he said, that the Education Committee proposed to withdraw from the Arts Examination of the

Society, and that of some of the other bodies, the recognition which they had hitherto enjoyed. When the proposal was first mooted he expressed a strong opinion that the procedure asked for was wholly outside the powers of the Council, and that any attempt to do what was suggested would be absolutely illegal and null and void. Upon his suggestion the opinion of Mr. Muir Mackenzie was taken upon the case and read to the Council. Mr. Muir Mackenzie commenced his opinion by saying that he felt difficulty owing partly to not being thoroughly familiar with the course of the practice of the Council and partly to not knowing certain facts: "The state of matters which I understand to exist, and upon which I base my opinion." That state of matters did not exist really, and Mr. Muir Mackenzie's opinion was therefore of so much the less value, because it was founded in great measure upon misconception. In the meantime he (Mr. Carter) had had an opportunity of conferring with the authorities of the Society on the question. They had referred the case submitted to Mr. Muir Mackenzie, and that gentleman's opinion, together with the comments of their own legal advisers, to Mr. Rigby and Mr. Leverson, who had given an elaborate opinion upon the case. They confirmed entirely his original contention that the Council had no power to take the step proposed. He begged to move that the whole papers be referred to the Education Committee for examination and report.

Dr. BRUCE seconded the motion.

Sir WM. TURNER asked Mr. Carter whether the Society had looked to this solely as a legal question as to what their rights were in the matter, or whether they had considered what was the most suitable and advisable thing for them to do in connexion with the wish so often expressed by the Council, and which had been acted up to by all the medical corporations except the Society of Apothecaries—namely, that they did relieve themselves from the duty of conducting preliminary examinations, and allow them to be conducted by those whose business it was to conduct such examinations.

Mr. MACNAMARA reminded Sir Wm. Turner that the Irish bodies were exactly in the same category as the Apothecaries' Society in London. They were, no doubt, anxious to get rid of the examinations, but they found difficulties in the way.

Sir WM. TURNER expressed his thanks for the correction, but pointed out that the difficulties referred to were Irish and not English difficulties.

Mr. BRUDENELL CARTER said he had no absolute instructions from his Society upon this point, but as the result of conference with the authorities of the Society, he believed that they fully shared the opinion which he himself had strongly expressed at this Council—namely, that the proposal of the Education Committee was one of extreme impolicy and unwisdom; that it was the business of the medical profession to keep the key to the door of its own house in its own hands, and not to entrust the first step towards admission to the College of Preceptors or any other body which had no interest in, and could not possibly care for, the honour and dignity of the profession. He felt that very strongly, and he believed the authorities of the Society felt it as strongly.

Sir JOHN SIMON said he would like to know something about the documents before they referred them to the committee.

The PRESIDENT suggested that the opinion of counsel might be read.

Dr. HAUGHTON thought it futile to send this business to the Education Committee.

Mr. BRUDENELL CARTER said he would not interpose any objection to the documents being made public.

Sir JOHN SIMON pointed out that there were other questions than those of law to be considered. No one contended that this was a case where the Council could lay down any direct injunction upon the Society. Their method of procedure could only be by way of recommendation. The Council had plenty of ways in which they could, if they thought it desirable, resist the contention of the Apothecaries' Society that it was entitled to act as a general examining body in arts. It was one thing that the Apothecaries' Society might accept its own examination as sufficient evidence of the preliminary education of candidates for its own licence, but it was another and a different thing that the College of Surgeons or the Conjoint Board should be obliged to accept the examination in arts of the Apothecaries' Society as superseding any other sort of examination in the universities. For himself, he did not think that the Apothecaries' Society ought to be on their list as a body whose testimonial in arts should be of general authority. He begged to move that the documents be printed in the minutes for the general information of the Council.

Mr. MACNAMARA seconded this motion.

After some further discussion, Sir John Simon's motion was carried by a large majority.

Chemistry and Materia Medica.

Mr. MACNAMARA moved: "That this Council, when including in its lists of subjects for professional study chemistry and materia medica, never contemplated that such studies could be efficiently carried on independent of fully equipped laboratories and museums, or that any of the medical authorities would accept, as satisfactory evidence of such studies, certificates issued by (*a*) the holder of any medical qualification; (*b*) persons who had passed examinations on these subjects conducted by any public board; (*c*) prizemen on these subjects in any medical school, without having any evidence of the capacity of the instructor, or any investigation as to the materials at his disposal." He felt strongly on this subject, and he wished to discuss it altogether as an abstract question. Chemistry was coming more and more to the front. It was made the subject of searching examination by their examination boards. To imagine that instruction in chemistry could be given outside a chemical laboratory was a thing he could not conceive, and they all knew that chemical laboratories were increasing every day. He implored the Council out of their kindness and forbearance to accept what he said as facts; but if any members were disposed to question his veracity, he was in a position to bring forward evidence. There was a widespread belief in medical educational circles in Dublin that a certain gentleman sent forward a pupil with a certificate on these subjects given to that pupil by his coachman.

Sir WM. TURNER: By whom?

Mr. MACNAMARA said he threw himself on the mercy of the court he was addressing. He begged of it not to ask him to particularise these things. He was satisfied that such an expression of opinion by the Council as he now proposed would fructify in a very satisfactory fashion.

Mr. COLLINS seconded the motion.

Mr. TEALE said he did not think this a question for the Council, but rather for the examining bodies.

Sir WM. TURNER said the motion, if carried, would lead to consequences which the mover evidently did not contemplate. He (Sir Wm. Turner) sympathised with the desire that the education in materia medica should be properly conducted and in proper institutions. If this motion were carried, Mr. Macnamara himself would be precluded from giving a certificate in materia medica, and not only so, but any teacher who was at the same time the holder of a medical qualification would also be precluded from giving a certificate both in materia medica and chemistry. He thought, therefore, the motion should be amended in some way.

Dr. GLOVER said that before the Council could accept such a motion it must have some definite and reliable information. If Mr. Macnamara had evidence in his possession let him produce it.

Dr. HAUGHTON thought he could hardly vote for the motion without some evidence that the things alleged actually had taken place.

Dr. GLOVER moved that the motion be referred to the Examination Committee to consider and report.

Dr. ATTHILL seconded this motion, and it was agreed to.

Visitation and Inspection of Examinations.

The Secretary presented the report of the Executive Committee with respect to the visitation and inspection of examinations. It stated that, pursuant to the resolution of the General Council of Nov. 28th, 1891, directing the Executive Committee to appoint visitors and an inspector for 1892, and assign to them such duties as might seem fit, the Committee on Feb. 22nd last considered the appointment of visitors and an inspector. In answer to an application made to all members of the General Council, intimation was received from the following members of their willingness to act as visitors:—(*a*) Willing to attend at any time—Mr. Wheelhouse, Dr. Wilks, and Mr. Teale; (*b*) able to attend at certain specified dates—Dr. Church, Dr. Kidd, Dr. Leishmann, Dr. Tuke, Dr. Atthill, Dr. Bruce, Dr. Fraser.

Digitized by Google

Applications for the post of inspector were received from twelve gentlemen, and from these the Committee selected Dr. Duffey of Dublin, who was accordingly appointed to the inspectorship. A calendar having been prepared by the Registrar according to the direction of the General Council, showing the final examinations to take place during the present year, the Committee decided that the examinations should be visited and inspected in the following order:—First year, Scotch Corporations and Irish Universities; second year, Irish Corporations and English Universities; third year, English Corporations and Scotch Universities.

On the motion of the Chairman the report was adopted.

Sir WM. TURNER then moved: "That the appointment of Dr. Duffey as Inspector of Examinations be continued during the year 1893, and that the Executive Committee be authorised to make arrangements for inspection and visitation of examinations during the same period."

Dr. BRUCE thought the appointment of Dr. Duffey was an excellent one. At the same time, in view of the importance of the position and of the fact that other candidates had presented themselves, he would suggest that in future the appointment should be placed on the programme as a separate item of business.

The motion of Sir Wm. Turner was then agreed to.

Dr. TUKE had a notice of motion to the effect that the reports of the inspector and visitors of examinations be not published until the series of inspections of the final examinations is completed. He said that the report of the committee gave no indication as to what was to be done with the reports of the inspector and visitors. He thought that until the Examination Committee had dealt with the reports, it would be unwise to give them to the public. He noticed that Dr. Heron Watson had put down an amendment which he was willing to accept in preference to his own motion.

Dr. HERON WATSON then moved "that the reports of the inspector and visitors of examinations be remitted to the Examination Committee for printing, and that this print, marked 'confidential,' be circulated among the members of the Council."

Dr. TUKE seconded, and the motion was unanimously agreed to.

It was further resolved, on the motion of Mr. TEALE, seconded by Dr. HERON WATSON, "that a confidential copy of the report of the inspector and visitors of examinations, as soon as printed, be sent to the body to which the report has reference."

Communication from the Examining Board.

The SECRETARY intimated that the Examining Board in England had forwarded, for the information of the General Medical Council, a copy of the regulations for a five years' curriculum, which was applicable to all candidates for the licence of the Royal College of Physicians of London and the diploma of Member of the Royal College of Surgeons of England who registered as medical students on or after Jan. 1st, 1892, with synopses of the subjects of the first and second examinations.

On the motion of Sir WALTER FOSTER, seconded by Dr. MACALISTER, these regulations were referred to the Examination and Education Committees for consideration, and to report to this Council.

The Sanitary Science Examination.

The Executive Committee submitted to the Council the following communication from the Royal University of Ireland:—"Dublin, March 9th, 1892.—Sir,—We would feel much obliged if you would favour us with your view of the requirement of the General Medical Council as to the twelve months which must elapse between a person obtaining his medical qualification and presenting himself for the examination in Sanitary Science."

Mr. MACNAMARA pointed out that in some cases, if the whole twelve months were enforced after the medical qualification was obtained, it would mean to some candidates an actual period of eighteen months or so.

Sir WALTER FOSTER moved that the Royal University be referred to the Council's rule as requiring not less than twelve months' interval between the attainment of the general qualification and the examination for the diploma in sanitary science.

Sir J. SIMON said that the expression "not less than twelve months" was meant to have its natural signification.

Mr. BRYANT seconded the motion.

Dr. CARTER pointed out that the University might change a little the period at which the examination in sanitary science was held, and in that way remove all trace of hardship from the candidates.

Sir JOHN BANKS said it was only right to state that the University of Dublin was ready to follow any opinion which might be given by this Council on the subject.

Sir WALTER FOSTER'S motion was then agreed to, after being altered so as to run as follows:—"That the Royal University be referred to the resolution of June 1st, 1889, marked B, and that the University be informed that the period of twelve calendar months is intended, and not any shorter period."

Preliminary Education.

The SECRETARY announced that communications had been received, in compliance with the Council's request that instances of deficiency in preliminary education should be reported by the medical examining bodies, from the War Office, the India Office, the Examining Board in England, and the University of Dublin. No returns had been received from the Director-General of the Naval Medical Department or the following bodies, all of whom had been applied to:—The Universities of Oxford, Cambridge, Durham, London, Edinburgh, Glasgow, Aberdeen, St. Andrews, Victoria University, Royal University of Ireland, Royal Colleges of Physicians and Surgeons of Edinburgh and Ireland, the Faculty of Physicians and Surgeons in Glasgow, the Apothecaries' Society of London, and the Apothecaries' Hall of Ireland.

On the motion of Dr. WHEELHOUSE, the communications which had been received were ordered to be entered on the minutes, and the thanks of the Council were given to the bodies who had replied to the request of the Council.

Dr. GLOVER moved that the returns be sent to the Education Committee, so that they might receive due consideration.

After some discussion,

Professor LEISHMAN moved the previous question, which was seconded by Dr. PETTIGREW.

In accordance with the standing orders, a vote was taken without further debate, and, the previous question being carried, the Council passed to the next order of the day.

Diploma in Public Health.

A communication was read from the Conjoint Board in Scotland with regard to a conjoint diploma in Public Health, and enclosing copies of the joint scheme or articles of agreement between the three Scottish corporations on the subject, and also copies of the relative draft regulations to be submitted to the Council for approval.

The communication was entered on the minutes.

There was next read a communication from the University of Aberdeen, enclosing a copy of the regulations for the granting of the diploma in Public Health in that University. It was stated that the regulations now submitted differed from the previous regulations only in respect of being more detailed, the requirements of study and the extent and nature of the examination being practically the same as were enacted under the previous regulations.

The communication was entered on the minutes.

Universities and Honorary Degrees.

The next business was the consideration of a communication from Dr. Francis J. Allan, hon. secretary of the British Institute of Public Health, directing the attention of the Council to the fact that the University of Durham had conferred a degree in Hygiene upon a gentleman who had not previously passed any examination for the same. The Council of the British Institute of Public Health felt very strongly that a most dangerous precedent was thereby created, and most respectfully asked the General Medical Council to consider the matter with the view of preventing any such degree or qualification being given in a similar manner, and thus prevent a great injustice being done to those who had obtained a qualification in Public Health after examination. The communication further stated that the Council of the British Institute were of opinion that the conferring of a degree in Hygiene or a diploma in Public Health was by no means on an equality with the conferring of such degrees as D.C.L. or LL.D.

Dr. PHILIPSON said the University of Durham had the power of conferring degrees in Hygiene. He took it that the degree referred to in the communication was that conferred upon Dr. Henry Armstrong. When the University

Digitized by Google

took this action they were quite aware, in offering this honour to Dr. Armstrong, that it would not be registrable. This was stated to Dr. Armstrong, and the degree was conferred upon that understanding. Dr. Armstrong had been twenty years lecturer in the University of Durham, and fifteen years lecturer on Public Health. Further, he was medical officer of the city and county of Newcastle; he was President of the Society of Medical Officers of Health; he was one of the representatives of the University of Durham at the Hygienic Conference, and one of the delegates of the city and county of Newcastle. He (Dr. Philipson) wished to say, in face of the sweeping statement about the injury that would be done by this, that he thought Dr. Allan could not be aware of the position Dr. Armstrong occupied; that he had been a medical officer of health for over twenty years, and that, in accordance with the requirements of the Local Government Board of 1888, no degree was necessary for him. He had a letter from Sir Charles Cameron, in which he stated that the Royal College of Surgeons of Ireland conferred upon him (*honoris causâ*) their diploma in Public Health. He (Dr. Philipson) wished to emphasise this point, that Dr. Allan took exception to an honorary degree being conferred upon the ex-president of the Society of Medical Officers of Health, whereas there was no communication sent by this body with regard to the honorary degree conferred upon its own president. He trusted the University of Durham would be supported by the Council.

Mr. MACNAMARA said the Council of the Royal College of Surgeons of Ireland said Sir Charles Cameron, when the degree referred to was conferred upon him, held a diploma in Public Health.

Dr. HAUGHTON said the statement of Dr. Philipson had induced him to change his mind, and he congratulated the University of Durham on having done its duty.

Sir WALTER FOSTER moved:—"That Dr. Allan be informed that the Council has no power to interfere with the right of universities to confer honorary degrees, and that the Council is of opinion that the universities have in all cases exercised due discretion in the awarding of such degrees."

Dr. HAUGHTON did not think that went far enough, and he thought Sir Walter Foster shirked the question, as Parliamentary men did. Their minds got crooked in that horrible Parliament. He thought they should go straight, and say the Council approved of the action of the University. (No, no.) This was a mere shuffling, parliamentary, House of Commons negative, which did not satisfy him.

Sir JOHN SIMON thought it was essential not to confound two different questions. Among those who were conversant with the present practice of sanitary medicine in England there could not be any difference of opinion as to the merits of Dr. Armstrong. But there was the general question of the inconvenience which might attach to giving the same title as an honorary title and as a title after examination. He did not hear whether in this case it was expressly defined as an honorary degree.

Dr. PHILIPSON: It was

Dr. MACALISTER seconded the motion, which he thought the wisest form in which the opinion of the Council could be put.

After some conversation the motion was passed in the following terms:—"That the Council is informed by the representative of the University of Durham that the degree referred to in the letter of Dr. Francis Allan was expressly granted *in honoris causâ*, and that Dr. Allan be informed that the Council has no power to interfere with the right of any university to confer honorary degrees."

The Council adjourned at 6 o'clock until the following day.

WEDNESDAY.

Education Committee.

The following were appointed the Education Committee:—Mr. Wheelhouse, Dr. Glover, Dr. Macalister, Dr. Bruce, Dr. Batty Tuke, Dr. Leishman, Sir John Banks, Dr. Haughton, and Dr. Kidd.

Examination Committee.

Sir Dyce Duckworth, Mr. Brudenell Carter, and Mr. Teale; Sir Wm. Turner, Dr. Heron Watson, and Sir George McLeod; Mr. Macnamara, Mr. Collins, and Dr. Moore, were nominated as the Examination Committee.

Reciprocity with Foreign Practitioners.

A communication was read from the Lord President of the Privy Council, transmitting for the information of the General Medical Council a report of the Commission of the French Senate appointed to examine the Bill passed by the Chamber of Deputies with reference to the practice of medicine in France.

On the motion of Sir WALTER FOSTER, seconded by Sir WM. TURNER, it was resolved: "That with reference to the communication from the Privy Council Office in regard to medical practice in France, the Council authorise the President to have enclosed in any reply to the Lord President of the Council a statement prepared by the solicitor respecting the terms upon which foreign medical men are admitted to practise in this country, with a request that the statement may be forwarded to the proper ministerial authorities in each foreign country, in order that those authorities may have before them a permanent record of these conditions."

Licensing Corporations and Professional Ethics.

The consideration of the case of Charles Augustus Bynoe, who held the licences of the Royal College of Physicians, Edinburgh, of the Royal College of Surgeons, Edinburgh, and of the Faculty of Physicians and Surgeons, Glasgow, all of 1889, was the next business. The charge against him was that he was convicted at the Central Criminal Court on Jan. 11th last of forging a warrant for the payment of £7 16*s.* with intent to defraud.

Sir JOHN SIMON desired, before entering on the consideration of the case, to bring before the Council a point which he considered of great importance to them. Speaking as a witness of the spirit in which the Act under which they proceeded was constructed, he ventured to say that this agendum raised a question going to the very root of their professional morals; that the question of the moral government of their profession, the fundamental principle that the medical corporations were the guardians of the profession's honour, was connected with the proceeding it was now proposed to take. When there had been any question of encroachment on the autonomy and privileges of the medical corporations, they had declared that they were the security for the conduct of the medical profession; that if black sheep came into their body they cast them out. But surely it had to be seen that that autonomy justified itself. They had a right to expect, and, generally speaking, they took it as a fact, that the corporate bodies had a proper jealousy in the matter of the retention of unworthy members on their rolls. Their profession, at all events, had been that they kept clean rolls, and it was in that point of view that he desired to draw the attention of the Council to the fact that in this case the Medical Council was asked to execute judgment on a certain convicted felon who for three months after his conviction had remained a member of three corporations of the profession. He maintained that that was contrary, *primâ facie*, to the principle on which those corporations were authorities in the medical profession. *Primâ facie*, one would say that the form in which this matter should have come before the Council would have been that the three corporations in question found that a certain person had been convicted of felony, and had removed him from their respective rolls, that they brought the fact of that removal under the notice of the Council, and that the only question before them would have been to give effect to Clause 28 of the Act. He thought it a great grievance that this Council should have to go judicially, with unnecessary minuteness, into questions of this sort. They had a great deal to do, and, if the corporations were to justify the position they held in relation to the Council and the dignity of the profession, he ventured to say these cases ought not to come before the Council in any primary form, but as already pronounced upon by the corporations concerned. He was not prepared to say the Council ought to refrain from entertaining the case, but he was quite clear that the Council ought not to proceed in cases of this kind where the corporations had refrained from acting; that they ought not to proceed as a primary authority in questions of professional morals without placing on record some expression of their opinion that the corporations concerned ought to have taken action, and if unable, ought to have taken power to keep their individual registers free from discreditable admixture.

Digitized by Google

The PRESIDENT said the observations of Sir John Simon were most important, and might apply in some other cases. But the Act of Parliament settled the matter for the Council. Section 29 was as plain as anything could be: "If any medical practitioner should be convicted of any felony or misdemeanour &c." This man had been convicted of felony.

Sir J. SIMON: I wish to point out that this case comes before us three months after the conviction, and that the man is still upon the registers of these bodies.

Dr. BATTY TUKE wished to explain, as representing one of the bodies concerned, that as far as he knew the case had never been reported to them.

Dr. PATRICK HERON WATSON said Sir John Simon forgot that legally the kingdom of Scotland was a foreign country as regards England. No doubt there were newspaper reports of convictions of this kind occurring in England, but they did not find that these cases were of such importance to Scotchmen as to be reported locally, so that the Colleges would have any knowledge of their having occurred. When this case appeared in the programme of business, the name was unfamiliar to him, and he telegraphed to Scotland to know whether the case had been before the College, and he had received an official answer that it had not been before them, and that they knew nothing about it. The corporations, he thought, might much more turn round to the officials here and say that they in London were duly informed of the matter by the proceedings in their criminal courts; and if this person were admitted to the profession by the Scotch licensing authorities, it was their duty to communicate with these authorities. When the Council had a simple duty to be performed under Clause 29 of the Act, it was absurd to say the corporations ought to have done it.

Charges against Practitioners.

The Council, having considered the case of Charles Augustus Bynoe, upon which the foregoing discussion arose, directed the Registrar to erase his name and qualification from the Medical Register.

The next case was that of David Hyman Dyte (registered as Member 1861, L.M. 1862, R.C.S. Eng.; L.S.A. Lond., 1861; L.R.C.P. Lond. 1875), who had been summoned to appear before the Council on the following charges, as formulated by the Council's solicitor: That he was on April 9th, 1892, convicted at the North London Police-court of the following misdemeanour—namely, that he, on March 18th, 1892, at Poole's-park, Holloway, in the county of London and in the metropolitan police district, did unlawfully and wilfully make and issue a false certificate concerning the death of one Susannah Elizabeth Waller, contrary to the statute in that case made and provided, and also that he had habitually acted as cover to an unqualified practitioner named Henry Smythe, permitting and enabling him to practise as if he were duly qualified, and signing medical certificates in cases attended by the said H. Smythe and not attended by him.

Mr. DYTE attended and expressed his sincere regret for the offence for which he had been convicted, and which he admitted he had committed; but he pleaded in extenuation that he had had a severe fall at that time, and was confined to his house for two or three days.

Dr. GLOVER asked if he was aware of the rule of the Council against qualified men keeping unqualified persons in separate houses at a distance.

Mr. DYTE replied that he was not aware of any rule prohibiting the employment of unqualified assistants. He knew that it was extensively done, but his rule had been to give personal supervision in every case. He admitted that in this case he did not give that supervision. He presented letters from Dr. Langdon Down, Mr. Jonathan Hutchinson, and Dr. Hughlings Jackson testifying to his honourable conduct, and also a letter from Professor Huxley acknowledging his medical services.

The Council deliberated in private, and on the readmission of the public,

The PRESIDENT, addressing Mr. Dyte, said: It is my painful duty to announce to you that the Council find it proved to their satisfaction that you have been convicted of the misdemeanour charged against you; secondly, it is the opinion of the Council that you have committed the offence charged against you of covering; thirdly, that the offence is, in the opinion of the Council, infamous conduct in a professional respect; and fourthly, the Council have directed the Registrar to erase your name from the Register.

Mr. DYTE asked if he could in any way appeal to the Council for their clemency.

The PRESIDENT said the Council had a duty to perform. This system was carried on very extensively, to the detriment of the profession and the public. They could not hear any more from him now.

The next case was that of Mr. John Gunn of Kilmarnock (registered as Lic. Fac. Phys. Surg. Glasgow, 1879), who was charged "that, being a registered medical practitioner, he had caused and enabled unqualified persons, under cover of his name, to carry on medical practice as though they were qualified, and had in his own name and for his own benefit given death and vaccination certificates in respect of cases attended only by such unqualified persons."

Mr. GUNN appealed to the Council to treat him leniently. He cast himself entirely upon their mercy. He never dreamt it was wrong to employ an unqualified assistant so long at least as he did not set him up in a branch or get him to work as a substitute. It was not for gain that he kept an assistant, because the practice could easily be overtaken by one man. He employed the assistant merely to help him during his ill-health.

After the Council had conferred in private for some time, the President communicated the decision. The Council, he said, had been greatly influenced by the character Mr. Gunn had received from his professional friends in the neighbourhood. They were of opinion that under the circumstances his conduct had not been proved to be infamous in a professional respect. They were, however, of opinion that he should be cautioned as to his conduct in the future. The Council had taken a very merciful view of the case. They might have ordered his name to be removed from the Register, but they had given him a full opportunity of redeeming his character, and in the future conducting his practice properly.

Mr. GUNN thanked the Council, and withdrew.

Extension of the Medical Act to India.

An Order of Her Majesty in Council extending the Medical Act to India was received and entered in the minutes.

The Council then adjourned.

THURSDAY, MAY 26TH.

The General Medical Council resumed its sittings at two o'clock to-day, Sir Richard Quain, President, in the chair.

On the motion for the confirmation of the minutes of yesterday's proceedings,

Sir J. SIMON pointed out that the minutes in reference to the Council's action in the case of a medical practitioner who had been convicted of felony required in his opinion to be supplemented. He had prepared a memorandum of what he would suggest should be added to the minutes. By it he proposed to record that he had drawn attention to the fact that the qualifications in respect of which the person convicted had been placed on the Register—derived from three Scottish corporations—had not yet been cancelled by those corporations; that in consequence of the offender's name not having been struck off the roll of membership of those corporations, this Council was being called upon to take the initiative under Section 29 of the Act, instead of being left with liberty and discretion to act under Section 28; and that he represented that, in the spirit of the Act, the Council was entitled to expect that cases like this should not be brought before it for judgment till the corporations which had conferred the qualifications on the inculpated person had themselves decided whether or not to cancel such qualification, and had reported to this Council. It should also be recorded that Dr. Tuke intimated that the Scottish Corporations in question had not been apprised of the legal proceedings. The minute should also state that the Council thereupon instructed—and he believed the Council had accepted his suggestion unanimously yesterday—the Registrar that in future, whenever information reached the office that a registered medical practitioner had been convicted of felony or misdemeanour, or had been under any judicial or other authoritative censure in respect of his profession or conduct, the Registrar should forthwith communicate the information to the medical authority from whom the practitioner held his qualification.

Digitized by Google

The PRESIDENT pointed out that it would be a most unusual thing to alter the minutes as proposed, and certainly he could not allow it to be done without a vote of the Council.

Sir WM. TURNER said that the proposal introduced a serious novelty into the Council's proceedings. He did not agree that the Council had come to any such resolution as Sir John Simon had stated. If the Council had come to such a conclusion, it would have been on the minutes as a definite resolution. But there was no record of it, and he had no recollection of Sir John Simon submitting a written motion on the subject. Only those could be resolutions of the Council which had been formally presented to the chair, put from the chair, and agreed to by the Council. But he would point out that the object could be served by Sir J. Simon adding a rider to a motion on the paper for to-day requesting the Home Office to communicate to the Registrar all cases of conviction of medical men for felony, misdemeanour, or crime.

Sir J. SIMON accepted the suggestion.

The minutes were thereupon confirmed.

Petitions for Restoration to the Register.

The Executive Committee reported that they had received and considered petitions from Mr. John Keys, Whitehall House, Portobello, Dublin, and from Mr. Richard Davies Barree Gunn, Grove Mount, Fairfield-road, Droylsden, who were removed from the Register last year, praying for the restoration of their names to the Medical Register. The committee recommended: "That the Council should restore to the Medical Register the names of Mr. John Keys and Mr. Richard Davies Barree Gunn."

The report was received and entered on the minutes, and Mr. WHEELHOUSE moved that the report be adopted.

This motion having been seconded, and notice of opposition having been given,

The Council deliberated upon the case in private.

On resuming in public, the PRESIDENT announced that the Council had resolved, in accordance with the recommendation of the Executive Committee, to direct the Registrar to restore the names of Mr. Keys and Mr. Gunn to the Register.

Society of Apothecaries' Examination.

On the motion of Mr. CARTER, seconded by Dr. BRUCE, the case submitted by the Society of Apothecaries of London to counsel, and the opinion given thereon, together with the case submitted by the President to Mr. Muir Mackenzie, and his opinion, were referred to the Education Committee for consideration and report.

Documents for the Minutes.

Dr. LEISHMAN moved, "That it be in the power of the President, if he see fit, to remit documents for report to any Standing Committee of the Council to which in his opinion the subject might advantageously be referred." He said that at present any document that might be sent in was printed on the minutes, no matter what the nature of the communication might be. If they were examined by the President, and sent to the proper committee, much time and trouble would be saved.

Mr. MACNAMARA, in the absence of Sir W. FOSTER, seconded the motion, which was unanimously adopted.

The Council proceeded to consider the case of Edmund Byron de Boune Robertson, of Croydon (registered as Lic. Fac. Phys. Surg. Glasg., 1876), against whom a charge of covering was made, and in the result came to the conclusion to erase his name from the Register.

Another charge of covering was under consideration when the Council adjourned for the day.

We reserve until next week a fuller report of the proceedings in these cases.

ROYAL MEDICAL BENEVOLENT COLLEGE, EPSOM.

THE annual meeting of the governors of the Royal Medical Benevolent College was held in the rooms, at 37, Soho-square, on Thursday, the 26th inst., and the following candidates for pensionerships and foundation scholarships were reported by the scrutineers (Mr. Stamford Felce, M.R.C.P. Edin. &c.; Surgeon-Major H. De Tatham, M.D.; and Dr. R. H. Bradley) to have obtained the largest number of votes, and were declared to have been duly elected:—

		Votes.
	Pensioners.	
1.	Gray, Isabella	7833
2.	Hooper, James	7589
3.	Steel, Camilla Harriet	5214
4.	Walker, Mary	4803
5.	Keys, Caroline	4334
	Foundation Scholars.	
1.	Turner, Thomas W. Davids	7847
2.	Cockburn, John Jenkinson	7435
3.	Lidbetter, Arthur Earle	6879
4.	George, Eric Winnall M.	6600
5.	White, Charles Henry	6472
6.	O'Meara, John Morgan	5415
7.	Buchan, John Marsh	5071
8.	Davis, Robert Douglas	4654
9.	Danaher, Alfred John	4255
10.	Dewar, Charles Edward	4204

The report of the Council was read and showed a very satisfactory state of matters, financially and otherwise. It contained allusions to the fact that the Earl of Derby had consented to accept the office of president. The Council were confident that the institution would greatly benefit by his lordship's guidance and advice. The Council also heartily thanked the Right Hon. the Lord Mayor for his earnest advocacy of the claims of the College, the result of the appeal being a collection of close upon £3000. The report goes on to call attention gratefully to the services rendered to the institution generally, and in particular with regard to the proposed changes, by the Editors of THE LANCET. "Always very willing to give the Council the valuable assistance of their columns, the Editors of THE LANCET, at the Biennial Festival Dinner held in 1890, generously promised a donation of £1000, provided the remainder of the sum required for 'a permanent endowment fund' was collected. At the last festival dinner the before-mentioned condition was most kindly withdrawn, and the Messrs. Wakley gave their munificent donation, trusting that such a course would be an incentive to others to contribute without delay to the £26,000 which are required." The Council had pleasure in reporting that they have received the first instalment of £1000 under the will of the late C. G. J. Da Silva, for the purpose of founding scholarships of the value of £50 a year. A valuable legacy had been received, under the will of the late John Palmer Stocker, for the purpose of founding the "Doncaster Gift Scholarship," and Mr. France has given another scholarship for girls at St. Anne's Society. The report noticed that Dr. Holman, the treasurer, has succeeded in collecting the sum of £3457, and Mr. J. J. Purnell £1435. The report stated that in the school the numbers have risen further, the dormitories are quite full, the health of the boys is excellent, and there are many signs of effective teaching. A proposal was made to raise the fees from 49 guineas to £60.

Dr. HOLMAN moved the adoption of the report, and Mr. HEATH seconded. It was accepted unanimously.

Sir JOSEPH FAYRER moved, and Mr. AITKEN seconded, "That the Right Hon. the Earl of Derby be appointed President of the College." This was carried unanimously.

Sir EDWARD SIEVEKING moved, and Sir JOSEPH FAYRER seconded, that Dr. Holman, Mr. J. J. Purnell, and Mr. T. H. Wakley be appointed Vice-Presidents of the College. This was carried unanimously.

Mr. PURNELL briefly returned thanks for the honour that had been thus conferred upon the newly appointed Vice-Presidents by the Council.

The other business was of a purely formal kind.

DURHAM UNIVERSITY MEDICAL GRADUATES' ASSOCIATION.

THE annual meeting of the above Association was held at Durham on April 30th, when the following officers were elected for the year 1892-93:—President, Dr. Mantle; Vice-Presidents, Drs. A. H. Robinson and W. T. Wilson; Council, Professor Philipson, Drs. Arnison, Benington, Cullingworth, Drummond, Gowans, Openshaw, Slater, Tyson, Travers, Walford, and Wood; Honorary Secretaries,

Digitized by Google

Drs. Beatley and Milson; Treasurer, Dr. Beatley; Auditors, Drs. Morton, Slater, and Squance. Several new members were elected, and it was shown that financially the Association was in a most flourishing condition. The retiring president (Dr. Milson) and the president (Dr. Mantle) both referred in feeling terms to the loss the Association had sustained in the death of Dr. Heath, the president of the College of Medicine and representative of Durham University on the General Medical Council.

The recommendation of the Southern Council to have rooms in London for the purpose of holding meetings was adopted, and it was agreed to accept the offer of the Medical Society of London, with London address of the Association at 11, Chandos-street, W.

It was decided to hold the next annual meeting at Newcastle-on-Tyne during the week of the meeting of the British Medical Association.

THE PATHOLOGICAL SOCIETY.

THE following is a list of the gentlemen who have held the office of honorary secretary (medical or surgical) at the Pathological Society since its foundation. It is clear from this record that there has been no attempt hitherto at representing, in rotation or otherwise, the teaching staffs of the various medical schools in making these appointments.

MEDICAL.	SURGICAL.
1847.—Edward Bentley, M.D.	1847.—Nathaniel Ward.
1850.—T. B. Peacock, M.D.	1849.—George Critchett.
1852.—Richard Quain, M.D.	1850.—Geo. D. Pollock.
1857.—John W. Ogle, M.D.	1854.—Mitchell Henry.
1861.—J. S. Bristowe, M.D.	1859.—Henry Thompson.
1865.—Chas. Murchison, M.D.	1864.—Timothy Holmes.
1869.—W. H. Dickinson, M.D.	1868.—J. W. Hulke.
1872.—W. Cayley, M.D.	1873.—Henry Arnott.
1875.—T. Henry Green, M.D.	1875.—W. W. Wagstaffe.
1877.—R. Douglas Powell, M.D.	1878.—W. Morrant Baker.
1880.—J. F. Payne, M.D.	1881.—Henry Morris.
1883.—J. F. Goodhart, M.D.	1884.—H. T. Butlin.

1889.—Samuel West, M.D.	1890.—S. G. Shattock.
1891.—F. C. Turner, M.D.	

As regards the medical schools represented in these offices during the forty-five years' existence of the Society, we find the following:—*Medical:* St. Bartholomew's, 1; Charing-cross, 2; St. George's, 2; Guy's, 1; London, 1; Middlesex, 3; St. Thomas's, 3; not attached to any medical school, 2; total 15. *Surgical:* St. Bartholomew's, 2; St. George's, 2; London, 2; Middlesex, 3; St. Thomas's, 3; University College, 2; total 14.

Public Health and Poor Law.

LOCAL GOVERNMENT DEPARTMENT.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

Yorkshire Combined Districts.—Dr. Mitchell Wilson reports on four rural and three urban districts, the reports being separate although included in one volume. In all the districts excellent work is going on, and the advice given as to future lines of act on is sound and well thought out. Especial advance has been made in such matters as water-supply, drainage, and scavenging, and much time has in some districts been spent in inspections under the Housing of the Working Classes Act. Cowsheds, common lodging-houses, factories, canal boats, and all such matters are kept under supervision by means of a well-matured organisation; and although there are localities where further progress and activity are needed, yet the advance made during recent years is substantial. In some localities—as, for example, in Goole—an account is given of the control of infection by resort to the use of the isolation hospital. In connexion with the sanitary supervision of these districts, we would also note that an excellent address was delivered before a local agricultural club on Our Milk-Supply, the whole subject of the relation of milk collection, storage, and delivery being set out in its scientific aspects, and yet in such a way as to be of considerable use to the farmer, dairyman, and general public.

Fleetwood Urban District.—The rate of mortality for this district during 1891 was 17·7 per 1000 living. The zymotic rate was excessively high—namely, 5·3 per 1000,—and of 25 deaths from infectious fevers no less than 19 were due to diphtheria. Unfortunately hardly a word is said as to this occurrence, except that during a certain period 6 out of 9 of the deaths were in families closely related. Indeed, an outbreak of 74 cases with a fatality of 19 is dealt with in a few lines; the opening sentence is, however, sufficiently significant, since it says that the figures alone "speak for themselves." Some details are given as to general sanitary progress, and Dr. J. D. Fausset gives an account of proceedings taken in connexion with a Bill promoted by the Fylde Waterworks Company.

West Bromwich Urban District.—This district is in the position of lacking proper by-laws, without which efficient sanitary administration is, in many respects, impossible. The death-rate for 1891 reached 22·5 per 1000, and the increase was in part due to influenza and in part to measles, which latter disease caused thirty-seven deaths in nine weeks. The system of waste-waterclosets is in some measure taking the place of privies and middens, but we may hope that Dr. Manley's reference to the pollution of the Tame, in connexion with this subject, does not imply that the change will in any way increase the existing mischief. Owing to the measles prevalence school restrictions had to be exercised. Diphtheria occurred especially amongst those inhabiting houses where excremental nuisances existed, and Dr. Manley feels convinced that the growth and development of the diphtheria poison are favoured by such conditions. The general death-rate for 1891 was 22·5 and the zymotic rate 2·9 per 1000 living.

River Tyne Port District.—During 1891 as many as 11,533 vessels were inspected in this port, 811 being found in a defective sanitary condition; and, excepting only a few vessels which left the port before they could be reinspected, all are known to have complied with the requirements imposed upon them. In 173 cases vessels had arrived from ports regarded either as infected or as suspect. The new pontoon hospital came into use in June, and a new disinfecting apparatus has been fixed on deck. Dr. Henry Armstrong, besides giving a general account of the work carried on, explains that the subject of emigration and the health of emigrants are constantly looked after, and that especial care is taken as to drinking water on board and as to the suitability of water-boats for affording the needed supply.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN thirty-three of the largest English towns 6433 births and 3769 deaths were registered during the week ending May 21st. The annual rate of mortality in these towns, which had been 19·7 and 20·4 per 1000 in the preceding two weeks, declined again last week to 19·3. In London the rate was 19·4 per 1000, while it averaged 19·2 in the thirty-two provincial towns. The lowest rates in these towns were 10·8 in Croydon, 11·6 in Brighton, 14·1 in Swansea, and 14·4 in West Ham; the highest rates were 21·5 in Birmingham, 22·5 in Oldnam and in Liverpool, 23·3 in Bristol, and 24·7 in Manchester. The 3769 deaths included 469 which were referred to the principal zymotic diseases, against 542 and 538 in the preceding two weeks; of these, 197 resulted from measles, 119 from whooping-cough, 57 from diphtheria, 35 from diarrhœa, 33 from scarlet fever, 24 from "fever" (principally enteric), and 4 from small-pox. No fatal case of any of these diseases occurred last week in Derby; in the other towns they caused the lowest rates in Brighton, Plymouth, Bradford, and Hull, and the highest rates in Bolton, Manchester, London, and Sunderland. The greatest mortality from measles occurred in Birkenhead, Manchester, Wolverhampton, Birmingham, Huddersfield, London, and Halifax; from scarlet fever in Cardiff and in Gateshead; from whooping-cough in Portsmouth, Preston, Swansea, Burnley, Bolton, Croydon, and Sunderland; and from "fever" in Norwich. The 57 deaths from diphtheria included 42 in London, 4 in Manchester, and 2 in Liverpool. Four fatal cases of small-pox were registered in London, but not one in any of the thirty-two large provincial towns; 84 cases of this disease were under treatment in the Metropolitan Asylum Hospitals, and 17 in the Highgate Small-pox Hospital, on Saturday last. The number of scarlet fever patients in the

Digitized by Google

Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 1677, against 1484 and 1592 on the preceding two Saturdays; 226 new cases were admitted during the week, against 200 and 232 in the previous two weeks. The deaths referred to diseases of the respiratory organs in London, which had been 297 and 304 in the preceding two weeks, declined to 202 last week, and were 38 below the corrected average. The causes of 80, or 2·1 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Croydon, Portsmouth, Bristol, Bolton, Leeds, Sunderland, and in seven other smaller towns; the largest proportions of uncertified deaths were registered in Liverpool, Manchester, Hull, and Gateshead.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns which had increased in the preceding three weeks from 21·3 to 22·8 per 1000, declined again to 21·5 during the week ending May 21st, but exceeded by 2·3 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 13·9 in Edinburgh and 16·1 in Paisley to 20·8 in Leith and 26·8 in Glasgow. The 598 deaths in these towns included 32 which were referred to measles, 26 to whooping-cough, 9 to scarlet fever, 5 to "fever," 4 to diarrhœa, 2 to diphtheria, and not one to small-pox. In all, 78 deaths resulted from these principal zymotic diseases, against 65 and 80 in the preceding two weeks. These 78 deaths were equal to an annual rate of 2·8 per 1000, which slightly exceeded the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of measles, which had increased in the preceding four weeks from 15 to 32, were again 32 last week, all of which occurred in Glasgow. The deaths referred to whooping-cough, which had been 30 and 24 in the previous two weeks, were 26 last week, and included 16 in Glasgow, 4 in Aberdeen, and 3 in Dundee. The fatal cases of scarlet fever, which had been 5 and 2 in the preceding two weeks, rose last week to 9, of which 7 occurred in Glasgow and 2 in Edinburgh. The 5 deaths referred to different forms of "fever" showed a decline of 3 from the number in the previous week, and included 3 in Glasgow and 2 in Dundee. The 2 fatal cases of diphtheria were recorded in Glasgow. The deaths referred to diseases of the respiratory organs in these towns, which had been 126 and 140 in the preceding two weeks, declined again last week to 126, and were 19 below the number in the corresponding week of last year. The causes of 60, or 10 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had declined in the preceding three weeks from 43·9 to 31·0 per 1000, rose again to 34·6 during the week ending May 21st. During the first seven weeks of the current quarter the death-rate in the city averaged 34·6 per 1000, against 20·0 in London and 18·9 in Edinburgh. The 232 deaths in Dublin during the week under notice showed an increase of 24 upon the number in the preceding week, and included 28 which were referred to measles, 5 to diarrhœa, 3 to whooping-cough, 1 to "fever," and not one either to small-pox, scarlet fever, or diphtheria. In all, 37 deaths resulted from these principal zymotic diseases, equal to an annual rate of 5·5 per 1000, the zymotic death-rate during the same period being 3·3 in London and 0·8 in Edinburgh. The fatal cases of measles, which had been 40 and 24 in the preceding two weeks, rose again to 28 last week. The 5 deaths referred to diarrhœa exceeded the number recorded in any week of this year. The fatal cases of whooping-cough, which had declined from 11 to 3 in the preceding three weeks, were again 3 last week. The 232 deaths registered in Dublin last week included 47 of infants under one year of age, and 51 of persons upwards of sixty years; the deaths both of infants and of elderly persons considerably exceeded the numbers in the preceding week. Six inquest cases and 4 deaths from violence were registered; and 70, or nearly one-third, of the deaths occurred in public institutions. The causes of 24, or more than 10 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

A COMPARISON.

THE Journal of the United Service Institution of India for March contains a paper by Surgeon-Colonel R. Harvey, M.D., Principal Medical Officer of the Punjab Frontier Force, in which a comparison is set forth between the medical arrangements for the expeditions of Lushai (1871-72) and Miranzai (1891), with reference to the bearing of the subject upon the efficiency of the troops and followers employed on those occasions. After adverting to the loss of life that attended the Crimean and other campaigns, and the reorganisation of the medical service that followed the Crimean breakdown, Surgeon-Colonel Harvey proceeds to illustrate the difference in method between the old regimental and modern field hospital systems by a comparison in their working as exemplified in the Lushai campaign of 1871-72 and the late expeditions on the Samana. The contrast shows what immense advances have been made in recent years. According to a tabular statement, we find that in the Lushai expedition, out of a total strength of 4564, composed of troops, coolies, and followers, 453 died, or in the ratio of 238·21 per 1000 per annum; whereas, in the first Miranzai expedition, out of a total strength of 7364 troops and followers, only 6 died, a mortality rate of 7·83 per 1000 per annum; and in the second Miranzai expedition, out of a strength of 10,085 troops and followers, the total deaths were 26, and of these only 10 were from disease, or in the ratio of 6·65 per 1000 per annum. The paper discusses the causes to which this enormous difference—the great mortality of the one and the insignificant death-rate of the other expeditions—was due. These may be summarily expressed by the scientific formula "non-conformity to environment" in the one case, "conformity to environment" in the other. Had all the arrangements been alike in the two cases the results would have been similar, and the deplorable amount of suffering and loss in the Lushai campaign would have been saved. It is only right to recognise that the Government of that day based its arrangements and rates of provision on previous experience, tradition, and the best advice available, with a desire, no doubt, at the same time to do things cheaply. In the Lushai campaign great natural difficulties had to be encountered, and the means taken to cope with them were inadequate. In the Miranzai expedition great, though not so great, difficulties were also met with, but the means taken were adequate. We have not space to enter into the detailed information set forth, but it is satisfactory to note that great progress, according to this paper, seems to have been made of late years in the hygienic and medical arrangements of our Indian Army.

THE ELECTRIC LIGHT AND THE SEARCHING FOR WOUNDED.

It has long been a problem how a battlefield on the night succeeding a battle could best be searched and stripped of its wounded. Many years ago an experiment was carried out at Aldershot with the electric light, and quite recently the Austrian medical authorities have been making similar experiments with the same end in view. It has been found that powerful search lights with reflectors are very effective aids where the country is open, but of comparatively little use where there are woods. An experiment has now been tried with portable electric lanterns, fed by accumulators, carried in the men's knapsacks. The men of the Army Medical Service conducted an experiment of this kind at Gratz, which is said to have been fairly successful, and is likely to be repeated.

NEW BARRACKS FOR THE CHIN HILLS.

The want of proper barrack accommodation for the troops in the Chin Hills having been much felt, a special grant for the construction of barracks has now been sanctioned. The work will be proceeded with as soon as possible at Fort White and Haka.

ARMY MEDICAL STAFF.

Surgeon-Captain T. A. Perry Marsh has been appointed analyst to the Aldershot Division.—Surgeon-Colonel A. Allan has been appointed to the Rawul Pindee District, vice Surgeon-Major-General A. F. Bradshaw, C.B., appointed Principal Medical Officer in India.—Surgeon-Captain J. R. Yourdi has been posted to the charge of the

Digitized by Google

Station Hospital, Aden; Surgeon-Captain T. M Corker to the Station Hospital, Hyderabad; Surgeon-Captain H. J Wyatt to the Poona District.

The retirements on temporary half-pay on account of ill-health of the undermentioned Surgeon-Captains are post-dated as follows:—John Lees Hall, to Sept. 3rd, 1891, Vere Edward Hunter, to June 29th, 1891, and Whitley Bland Stokes, M.B., F.R.C.S.I., to March 2nd, 1890.—The Queen has approved of the resignation of the Service by the undermentioned Officer: Surgeon-Captain Herbert William George Macleod, Bengal Medical Establishment (dated April 25th, 1892).

YEOMANRY CAVALRY. — Northumberland (Hussars): Arthur Brumell, Gent., to be Surgeon-Lieutenant (dated May 21st, 1892).

INDIAN MEDICAL SERVICE.

We regret to announce the death of Brigade-Surgeon Wm. Dymock, retired Medical Storekeeper, with the Bombay Government. Deceased was at one time connected with the European General Hospital. He held the post of Medical Storekeeper from 1870 to 1890. In addition to his duties as Medical Storekeeper, the late officer held the post of Professor of Materia Medica in the Grant Medical College. He was well versed in Arabic and Persian languages, and was the author of the "Pharmacographia Indica."

The civil hospital assistants in the Punjab have memorialised the Surgeon-General with the Government of India, praying for an improvement of their emoluments and status, on the lines sanctioned for the military branch of hospital assistants.

Madras General Orders —Surgeon Major A. H. Leapingwell, District Surgeon, Malabar, and Superintendent of Gaol, Calicut, is appointed to act as District Surgeon and Superintendent of Gaol, Vizagapatam, during the absence of Surgeon-Major Lionel Beech on leave.—Mr. C. A. Lafrenais, Assistant Surgeon, Malabar, is appointed to act as District Surgeon, Malabar, and Superintendent of Gaol, Calicut, as a temporary arrangement, during the employment of Surgeon-Major Leapingwell on other duty.—Surgeon-Major T. H. Pope, M.D., Acting Chemical Examiner to Government, is appointed to act as Superintendent, Ophthalmic Hospital, Madras, during the absence of Brigade-Surgeon-Lieutenant-Colonel E. F. Drake-Brockman. — Surgeon-Captain F. J. Crawford, M.D., Second Surgeon, General Hospital, is appointed to act as Secretary to the Surgeon-General with the Government of Madras, during the absence of Surgeon-Major C. M. Thompson, M.B., on leave —Surgeon-Captain A. T. Lodgepatch, M.B., Acting Civil Surgeon, Coconada, is appointed to act as Civil Surgeon, Cannanore, during the employment of Surgeon-Major S. C. Sarkies on other duty.—The Commander-in-Chief is pleased to direct the following postings:—Brigade-Surgeon-Lieutenant-Colonel G. Andrew, M.B., in medical charge of the North Station Hospital, Bangalore, to the medical charge of the South Station Hospital, Secunderabad; Surgeon-Major G. D. Bourke, in medical charge of the South Station Hospital, Secunderabad, to the medical charge of the Central Station Hospital, Secunderabad. — Surgeon-Lieutenant W. C. Sprague, M.D., has been brought on the strength of the Bombay Medical Establishment from the 23rd ult., the date of his arrival at Bombay.—Surgeon-Lieutenant-Colonel W. McConaghy, M.D., Indian Medical Service, and Major H. C. E. Lucas, Indian Staff Corps, have been permitted by the Secretary of State for India to return to duty.—Surgeon-Captain A. Street, Indian Medical Service (in medical charge of the No. 5 Bombay Mountain Battery), left Poona *en route* for Neemuch on the 22nd ult., to take over the medical charge of the 26th Bombay Infantry.—The services of Surgeon-Captain M. B. Braganza, Indian Medical Service, 24th Bombay Infantry, have been replaced at the disposal of the Military Department, from Feb. 18th, on which date he was relieved of his duties as Officiating Medical Officer of the 2nd Regiment Central India Horse and of the Western Malwa Political Agency.

NAVAL MEDICAL SERVICE. — The following appointment has been made at the Admiralty:—Deputy-Inspector-General of Hospitals and Fleets Duncan Hilston, M.D., has been promoted to the rank of Inspector-General of Hospitals and Fleets in Her Majesty's Fleet (dated May 7th, 1892).

Correspondence.

"Audi alteram partem."

"THE DEBATE ON RENAL DROPSY."

To the Editors of THE LANCET.

SIRS,—Your leading article of last week on the debate at the Medical and Chirurgical Society on Renal Dropsy makes it necessary for me to correct one expression which fell from me which was far from conveying my meaning. I am represented as thanking Dr. Broadbent for supporting, not myself, but the truth. Far be it from me to presume that those who think with me therefore think right. What was in my mind to say—and I regret that my haste or awkwardness of speech prevented my saying it clearly—was that I recognised in Dr. Broadbent, not a desire to support myself personally, but to support what he thought to be true, and claimed for myself the same aim as supreme above personal contention. I had been careful even to iteration to say that there was no finality in an explanation which had been suggested; that some of the questions before the Society were difficult and complicated; that further help from physiologists was needed. I do not claim to be the exponent of truth, but only a seeker for it. With what modicum of success this search has been attended I should shrink from expressing an opinion, which would certainly be biased, and not improbably erroneous.

I am glad to take this opportunity of disclaiming an arrogance as foreign to my intention as inconsistent with my sense of propriety.—I am, Sirs, yours truly,

May 25th, 1892. W. HOWSHIP DICKINSON.

INCREASE OF SMALL-POX AND THE INTERIM REPORT OF THE VACCINATION COMMISSION.

To the Editors of THE LANCET.

SIRS,—The two letters on the above subjects in your issue of the 21st inst. are fraught with matter of the greatest importance to the future of this densely populated country, and I trust you will allow me to briefly allude to it. With reference to the first, I have little doubt that when the force of the small-pox contagion rises, the vast amount of inefficient vaccination, as evinced by the last small-pox epidemic at Sheffield, will be terribly manifested; and with regard to the second, the isolation and destruction of propagating influences in places like Leicester will be severely tested, as the present protection of that city is largely due to the amount of even the partially efficient vaccination around it, reducing the points of attack to a manageable number. This interim report, however, of the Vaccination Commission, if carried out, must lead to the complete failure of the methods now employed at Leicester to limit the small-pox contagion, as year by year the numbers of unvaccinated cases around the city will increase; for within a few months of the suggestions of the Vaccination Commission becoming law, anti-vaccination insurance societies will spring up, which for a very small monthly payment will readily provide the amount of the fine imposed, and as these penalties are not to be cumulative, the case will, of course, remain "unvaccinated." I was quite prepared for this decision of the Vaccination Commission, as the practical failure of vaccination at Sheffield and the success of isolation at Leicester must have had a great effect on many of the members composing the Commission, and, doubtless, led some to ask, Why continue fining those who persistently reject vaccination, when their system of protection, when judged by results, seems so superior to that which cost so much in rewards alone at Sheffield, and yet failed so signally, and that in the case of a city whose manufactures—iron and steel—are least of all capable of retaining or propagating the small-pox infection. Here, perhaps, I may allude to a strange anomaly witnessed in the mode of conducting inquiries in the failure of various systems when danger to life is incurred. In my paper, read at the Epidemiological Society of London this year, entitled "What is Efficient Vaccination?" I ask a

Digitized by Google

question which ere long will have to be answered—viz., Why should an inquiry into the causes of failure in the management of a railway system—by which risk to, it may be loss of, life is incurred—be conducted by an officer of the Royal Engineers, and not by one of the civil engineers of the company, when the investigation into a failure in a system of vaccination, like that witnessed in the late small-pox epidemic at Sheffield, was carried out by a departmental officer, on whom was laid the invidious task of finding faults in a system so admirable in its execution that, in the opinion of those in the department best able to judge, it received in ten years more than £1000 in rewards?

I am, Sirs, yours faithfully,
ROBERT PRINGLE, M.D., Brigade Surgeon.

Blackheath, S.E., May 23rd, 1892.

DEATH UNDER CHLOROFORM.

To the Editors of THE LANCET.

SIRS,—Upon reading the account of the case reported by Dr. Colvin Smith, one cannot help thinking whether the result would have been different if some brandy had been given before the inhalation was commenced. We direct a patient not to take food for some hours previously to the administration of an anæsthetic, but do we always sufficiently take into account the effect produced by the fasting? In the case mentioned we have a pale, anæmic child, aged eleven, who breakfasted at 7.30 A.M. (and perhaps did not take much), had to walk to the hospital, and, nearly six hours after his early meal, was operated on. The first meal of the day we know is rapidly absorbed, and, by eleven or twelve o'clock, in many who breakfast early, a feeling akin to exhaustion arises. Then, again, do we sufficiently consider the amount of shock which an operation causes, even when the pain is prevented by narcotism? A death under chloroform is so terrible to all concerned, that we ought not to think anything too trivial to attend to which might possibly be of use in averting such an accident. Dr. Colvin Smith will, I am sure, understand that I am only suggesting queries to thinking minds, and that I am not in any way desirous of acting as a censor. Notwithstanding the Hyderabad Commission, I feel perfectly certain (having extremely good reason for saying so) that the pulse ought to be carefully watched in every case.

I am, Sirs, yours truly,
R. H. MILSON, M.D.

South Hampstead, N.W., May 24th, 1892.

To the Editors of THE LANCET.

SIRS,—In your issue of May 21st there is the report of a death under chloroform at the Victoria Hospital, Chelsea. When we consider the circumstances of the case, I for one am not surprised that the boy died of syncope. It is stated that a boy of eleven was told to have breakfast at 7.30 A.M., and to eat nothing afterwards. Now, a boy of that age would probably have supper at 7 o'clock on the previous evening, and be put to bed about 8 o'clock. Getting up about 7, he had breakfast at 7.30. He was probably told to have a light one. Being an out-patient, he walked to the hospital, perhaps some distance off, waited there some weary hours, and was not operated upon until 1.15 P.M.—i.e., five hours and three-quarters after his last meal, and only one meal for eighteen hours and a quarter. Leaving out of consideration his state of nervous excitement, the poor little man must have been in almost a condition of starvation. For several years I have considered three and a half or four hours quite long enough after a meal to give an anæsthetic.

I am, Sirs, yours truly,
Plymouth, May 24th, 1892. J. ELLIOT SQUARE, F.R.C.S.

MIDWIFERY STATISTICS.

To the Editors of THE LANCET.

SIRS,—Under the heading "Startling Figures from a Doctor," a statement attributed to Dr. Rentoul of Liverpool appeared in the lay press in the latter part of last week, to the effect that "one in every fifteen first labour cases resulted in the death of the woman." Such an assertion may well be described as "startling," and if uttered by Dr. Rentoul it would be interesting to know the source of his information, as it does not agree with the experience gained by connexion with lying-in charities. Speaking more particularly of the City of London Lying-in Hospital, with which I have been connected for the past twenty years, the records furnish the following facts:—Since the establishment of an out-door department in 1872 20,631 women have been attended at their own homes by the midwives and pupils attached to the hospital. Of this number 45 have died, being at the rate of 2·13 per 1000. I regret I am unable to say how many of these were first labours. Since July, 1886, however, I have been in charge of the in-door department, and during this period 2393 women have been delivered in the hospital, of whom eight died. The number of primiparæ was 590, and of these three died, and I have no doubt that other lying-in charities can furnish similar results.

I am, Sirs, yours truly,
G. E. YARROW.
Surgeon-Accoucheur to the City of London Hospital.

May, 25th, 1892.

"THE LONDON AND COUNTIES MEDICAL PROTECTION SOCIETY, LIMITED."

To the Editors of THE LANCET.

SIRS,—Having recently been the subject of annoyance and perhaps injury, I can readily bear testimony to the great value of combined support of my professional brethren. I will not trouble you with the details of my case, which I brought to the notice of the medical profession on public grounds; but I do feel I owe a deep debt of gratitude to many members of the profession, more particularly to Dr. Mead, Dr. Balding, and Dr. Grove, who spared neither time nor trouble to help me at a time when help and sympathy were invaluable, and I feel that had there not been friends like them I should never have obtained that triumphant vindication I did from the medical and local press. The able speeches of the chairman (Dr. Balding, J.P.) at the Cambridge meetings, and those of Dr. Latham, Dr. Beckett, Dr. Grove, and others, I much regret did not appear in print in the local press, as they would have been both valuable from a scientific point of view, as illustrating the difficulties in which medical men are often placed with respect to the stringent and little-known laws now in force in sanitary matters, and also as an enlightenment to boards of guardians and the public generally on questions of sanitary science.

I am glad to find the efficiency of this mode of combination for the professional good is likely to be rendered more efficient by the London and Counties Medical Protection Society (Limited). I am certain all members of the profession will feel that the interests of the humblest as well as the most highly placed will be safe in the hands of such men as Mr. Jonathan Hutchinson, F.R.S., Dr. G. A. Heron, F.R.C.P., and Dr. Mead. I have had the greatest pleasure in joining this Society, and in getting many of my friends to do the same. I have carefully examined the plan of organisation and fully approve of it. The system of local councils secures the least known from being passed over. The right of appeal in the first instance, if the aggrieved member wishes it, to the central council, or from the decision of the local council to the central council if he be dissatisfied, must commend itself to every lover of fair play, especially as there are on the council some of the best men of the day. I remain, Sirs, yours truly,

Brandon, May 23rd, 1892. C. M. FEGEN.

MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

The Hospital for Consumption and Diseases of the Throat.

THE in-patient department of this hospital is at Bowdon, Cheshire, some eight miles from Manchester. A new out-patient department in the centre of the city was recently opened, and at the time an appeal was made for further subscriptions, to enable the committee to open more beds at their Bowdon Hospital. It appears, however, from a letter written by the chairman and the treasurer, that only about £30 have been subscribed as a result of this appeal, and those gentlemen fear that, so far from opening new beds, some of those now open may have to be closed, as the institution has been getting into debt. It is much to be regretted that the public show so little practical interest in this matter.

Digitized by Google

Consumption.

The Manchester Consumption Hospital is the only institution within a very large radius, with the exception of the workhouse hospitals, where sufferers from phthisis can be received as in-patients, and there is no doubt that the hospital would, if considerably enlarged, justify the expenditure both on the grounds of useful philanthropy and of the increase of medical knowledge.

The Chancellor of Victoria University.

Earl Spencer was this afternoon installed as Chancellor of the Victoria University. The ceremony was impressive and very successfully carried through. In his speech, Lord Spencer made some specially apt remarks as to the value of a University education to members of the medical profession; and likewise noticed the democratising tendency which the University had had on learning generally.

The Healthy Homes Society.

The Ancoats Healthy Homes Society, concerning the object and aims of which I wrote some time ago, held its last meeting of the season on May 12 h, when Dr. Ransome, F.R.S., gave a lecture on the "Cost of Disease." The secretary of the Society announced that the attendances had increased from 10,000 two years ago to 17,100 this year, and, from the increase of interest shown, augured hopefully for the future of the Society, which has already done undoubted good.

Diseased Meat.

Two butchers were fined £10 and costs each for the offence of exposing for sale meat unfit for human food. The quantities were in each case considerable. As both butchers were, it would appear, first offenders, the fine may with reasonable hope be expected to deter them from any similar acts in the future.

Scuttling.

A lamentable "scuttling affray" which occurred last month has ended in the death of a boy. The youth guilty of the crime was the other day convicted of wilful murder, with a recommendation to mercy on account of his youth, and was sentenced to be hanged. All punishments hitherto awarded have failed to deter the gangs of scuttlers. The sentence, if carried out, ought to have a wholesome effect.

Two members of the medical profession have recently been elected Town Councillors in Salford—Mr. James Gray, L.R.C.P., L.R.C.S. Edin., and Mr. Alexander M. Kinghorn, M.B., C.M.

Manchester May 25th

NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

Health of South Shields.

DR T. EUSTACE HILL, medical officer of health for the borough of South Shields, in his report in reference to the death-rate for the past year—22 per 1000—says that it cannot be considered satisfactory, especially as it is calculated on an increased population, as ascertained at the last census. The increase in the death-rate he says is largely due to prevalence of influenza on two occasions during the year, early spring and autumn. During the latter part of the year the town was also visited by an exceptionally severe attack of measles, which had the effect of materially increasing the zymotic death-rate. Dr. Eustace Hill, in reference to the population, says that at the last census it was 78,431, or just 7000 in excess of the calculation upon which the previous health statistics had been previously made. He shows that the rate of increase had been 38 per cent., and that this rapid rate had been greater than in almost any town in the country, with the exception of Cardiff, which he says is satisfactory, as pointing to commercial prosperity that places the town in a better position from a sanitary point of view.

Sanitary Lectures in Newcastle.

The course of sanitary lectures promoted by the Corporation of Newcastle is going on very well, and Mr. Vacher, late medical officer of health for Birkenhead, has given one on the Diseases of Animals and Meat. Mr. Vacher's well-known reputation as a sanitarian ensured a good attendance, and at its conclusion he received a cordial vote of thanks.

Berwick: Improvements at Spittal.

The suggested improvements at Spittal (the seaside suburb of Berwick) have been agreed to by the Berwick sanitary authority. The estimated outlay is £2000 and the improvements include the erection of an esplanade on the beach. The medical officer's report referred to the analysis of the spa well at Spittal, which proves the water to be a mild chalybeate likely to be beneficial to many invalids.

"The Doctor."

Mr. Luke Filde's celebrated picture, "The Doctor," has been on exhibition in Messrs. Mawson and Swan's gallery in this city. We are glad that Newcastle has been selected as one of the four provincial cities where this picture was allowed by the proprietor to be shown. This is not the place for criticism of this great work, which has already passed beyond that stage. It has been visited by thousands of our citizens, and I believe by most practitioners in the district. All admit it is "The Doctor," and of the hardworking class too, who often responds to the night bell. No one questions his qualifications, for he is "The Doctor"; but a country man the other day who had paid his sixpence for admission was rather disappointed that "The Doctor" was only a picture, as he sought in "the sixpenny doctor" a cure for a cutaneous disease.

Carlisle.

It is reported that the recent outbreak of typhus fever, which caused some alarm in Carlisle, has not so far spread. I believe there were about twelve cases, all of which (with one exception) were promptly dealt with by removal to hospital by order of the medical officer.—Dr. Campbell, in his late report of the County Lunatic Asylum at Garlands, says that on comparison the figures of the last three decades do not show that insanity is on the increase in the counties of Cumberland and Westmoreland. There are more patients in the asylum it is true, but there are fewer in the workhouses, and the reporting of lunatics is now more strict than it used to be. Dr. Campbell says that the recovery rate calculated on admission reached as high as 53 per cent.—It is announced that the annual meeting of the Royal Albert Asylum for Idiots and Imbeciles is to be held this year in September at Carlisle. The Lord Bishop of the diocese is to preside. The last time the annual meeting was held in Carlisle was in 1885.

Sunderland.

The Sunderland borough surveyor has made an important proposal to the members of the Health Committee relating to the Housing of the Working Classes Act, 1890. The surveyor's estimate shows that it is proposed to deal with nineteen different blocks, containing 223 houses, and displacing 374 tenants, at a total cost of over £32,000. The subject is to be considered at a special meeting, and it is to be hoped that if the scheme is carried into effect sufficient accommodation will be provided for these displaced tenants.

A Scientific Bequest and "the Law's Delay."

I hear that a bequest amounting to over £3091, made so long ago as in 1880 by the late Mr. John Christie of Newcastle, printer and lithographer, to found scholarships in connexion with the Durham College of Physical Science at Newcastle, is now available.

The Medical Officership of Durham County.

At a special meeting of the Durham County Council held at Durham on Monday last the health committee out of twenty-one candidates elected Dr. T. Eustace Hill, of South Shields, as medical officer of health for the county. The appointment will give satisfaction, at the same time it is felt in the profession that the salary is inadequate considering the duties and the population of the county, but this mistake can be soon corrected.

Newcastle-on-Tyne, May 25th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

The Pathological Department in the Edinburgh Royal Infirmary.

CHANGES in this department of the Royal Infirmary have for several weeks been under the consideration of the managers and the staff. This has been brought about at the present time by Dr. Russell's appointment as an assistant physician and Dr. Barrett's appointment to Belfast, and the consequent necessity of appointing two

Digitized by Google

new men in their places. It has long been held by some of the more active men in the school that the infirmary should pay a man sufficient to enable him to devote his whole time to pathology. This opinion found expression, but, as is always the case in Edinburgh, there were two parties, one party wishing things to remain as they have been, the other wishing to make what they considered an important advance in pathology for the infirmary and the school. Those who oppose change are the University professors and a few others, while the majority of the staff and the extra-mural teachers appear to be in favour of it. The proposal is understood to be the appointment of a head pathologist who would give most of his time to the work, and of two assistant pathologists who would give part of their time. If money is obtainable for such a scheme it ought to be an important step in advancing pathology in Edinburgh, and the opposition of the University is quite incomprehensible, more especially as it has been suggested in some quarters that the professor of pathology might give up his clinical appointment and become head of the department.

Nurses' Sale of Work in the Edinburgh Royal Infirmary.

A sale of work, got up by the nurses in the Royal Infirmary, was opened on Tuesday afternoon by the Marchioness of Tweeddale. The sale is to raise money to help in the furnishing of the nurses' new home, which is now nearly ready for occupation. The sale was held in the afternoon and evening on both Tuesday and Wednesday.

The Queen's Birthday.

As in former years, the Queen's birthday was kept on the day of the opening of the General Assembly of the Church of Scotland by the Queen's representative, the Marquis of Tweeddale. None of the classes in the Medical Faculty met.

Health of Edinburgh.

The mortality last week was 65, and the death-rate 13 per 1000. Diseases of the chest caused 30 deaths and zymotic diseases 5. The intimations for the week were: typhoid fever, 12; diphtheria, 2; scarlatina, 28; and measles, 31.

Medico-Chirurgical Society, Glasgow.

At the annual general meeting of the Society the following gentlemen were elected office-bearers for the session 1892-93:—President: Dr. Joseph Coats. In the Section of Medicine—Vice-President: Dr. Middleton. Councillors: Dr. Alex. Miller and Dr. Auld. Secretary: Dr. C. O. Hawthorne. In the Section of Surgery—Vice-President: Dr. W. J. Fleming. Councillors: Dr. Macartney and Dr. Dalziel. Secretary: Dr. John Barlow. In the Section of Pathology—Vice-President: Dr. J. L. Steven. Councillors: Dr. Charles Workman and Dr. John Brown. Secretary: Dr. R. M. Buchanan. In the Section of Obstetrics—Vice-President: Dr. Samuel Sloan. Councillors: Dr. M. Cameron and Dr. Lapraik. Secretary: Dr. Lawrence Oliphant. Treasurer: Mr. Henry E. Clark. General Secretary: Dr. Walker Downie.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

Royal College of Surgeons.

THE annual election of president, vice-president, secretary, and Council of the College will be held on Monday, June 6th. Mr. Edward Hamilton and Mr. Thornley Stoker will be elected without opposition president and vice-president respectively; but the secretaryship, which has been held for so many years by Mr. William Colles, who has resigned, will be contested by Mr. Austin Meldon and Sir Charles Cameron. As regards the Council, there are twenty-seven candidates for nineteen places, and the following is a list of those competing who are not at present on the Council, according to their Fellowship seniority:—Messrs. George Foy, Lambert Ormsby, Richard Purefoy, John Cranny, H. Auchin Leck. Edward Thompson, Humphrey Broomfield, and Robert O'Callaghan.

Parliamentary Representation of the Medical Profession.

A meeting convened by private circular was held on Monday last for the purpose of considering the subject of parliamentary representation for Poor-law medical officers. A guarantee fund of £100 was subscribed by those present, and a committee was appointed to draft a circular urging the members of the medical profession in Ireland asking for their support. Mr. W. Dudley White was elected chairman, Messrs. Delahoyde and Falkiner honorary treasurers, and Messrs. Denham and T. Donnelly honorary secretaries.

National Hospital for Consumption.

Subscriptions are coming in rapidly, and the proposed site is beginning to engage public attention. Outside Dublin there is a general consensus of opinion that Dublin or its vicinity is altogether unsuited for an institution of the kind, owing chiefly to its damp climate. I have advocated the selection of Glengarriff on the coast of Kerry on more than one occasion, and I am gratified to find that several have endorsed my view, the climate being about the best in the three kingdoms for early cases of consumption. It is understood that Lord Howth has offered a site on the Hill of Howth; but a more unsuitable place could hardly be selected, for it has been pointed out that during the late autumn, winter, and early spring the east, south-east, west, and north-west winds enjoy a free and unrestricted sway, rendering any out-of-door exercise for invalids impossible.

Visiting Physicians to Irish Asylums.

The Medico-Psychological Association of Great Britain and Ireland have recently passed the following resolution, a copy of which they intend forwarding to his Excellency the Lord Lieutenant: "With reference to the Order in Council issued by his Excellency the Lord Lieutenant abolishing the office of visiting physician to district asylums in Ireland as future vacancies occur, the Association desires to approach his Excellency with an expression of their opinion in favour of this proposed change in the official work of asylum administration in Ireland. The Association believes that this change will be found to act with decided advantage to lunacy work generally in Ireland, as has been the case in other countries where the corresponding office has been abolished."

Puerperal Fever at the Belfast Workhouse.

At the meeting of the Belfast Board of Guardians, held on May 10th, attention was drawn to an outbreak of puerperal fever, and on May 17th a letter was read from the Local Government Board, enclosing a report on the subject from Dr. C. J. Clibborn, their medical inspector, with the request that the guardians would give his recommendations due consideration. Dr. Clibborn says that he visited the Union on May 11th and 12th, and saw the medical officers who had principal charge of these cases—Dr. Brice Smyth and Dr. Munn, the resident surgeon. He found that since March 24th, to May 1st, 1892, there had been eleven deaths among parturient women, occurring within ten days after birth of child. Of these, eight were evidently puerperal fever or from the puerperal state, two from phthisis, and one from pleurisy. After the death of the first case all unconfined and pregnant women were at once removed to another ward. The other cases were also removed into a separate ward, both nurses and resident surgeon being changed. Unfortunately, although every possible precaution in the way of disinfection was used, this second removal had not the desired effect, as it was found necessary to have these cases freshly attacked removed to the fever hospital, the only available place, and a fresh place was formed by the medical officer for confinement cases — namely, the children's ward, a separate building, all children having been removed to the original confinement department, nurses and attendants being again changed. It was now found necessary to bring matters more directly under the notice of the guardians, as there were no fresh nurses to fall back on if puerperal fever should again occur, nor any fresh building to which patients could be transferred. Up to this date no fresh case has occurred. Dr. Clibborn thinks every possible precaution has been taken to prevent the spread of the disease, as a most thorough system of disinfection of the building and the use of disinfectants by the attendants, as required by recent knowledge, is carried out in this department. Dr. Clibborn visited all the places referred to in his report, and he states that the portion of the Union buildings set apart for midwifery, and where disease first broke out, is a large ward, divided transversely into three departments and longitudinally by a wooden partition, on one side of which were chronic infirm cases, and on the other side the midwifery cases. This, he thinks, points directly to the probable cause of the outbreak, as no confinement cases should be mixed up with any other medical case. Further, on another floor, but under the same roof, there was a case of idiopathic erysipelas. Dr. Clibborn points out that, no matter

Digitized by Google

how well conducted any institution is, there must always be the risk of communications and consequent contamination between wards under one roof, either through nurses or patients, including the temporary removal of patients from one ward to another. He advises the providing of a separate building for confinement cases, containing, say, thirty beds, which would allow a complete system of disinfection and changing of beds after each confinement before a fresh case was put into it. Further, he suggests the providing of a small ward to which puerperal cases, if they should occur, could be transferred. The system in existence at the time of outbreak cannot be resumed with safety to the lives of the poor, as any temporary crowding of these wards would certainly tend to another outbreak.

Proposed Convalescent Home for the Belfast Workhouse

On May 17th a report was handed in to the Belfast Board of Guardians recommending them to consider the advisability of establishing a convalescent department with grounds in connexion with the union infirmary. In doing this they would be conferring a great boon upon the sick under their care, and will be making an advance upon the existing state of affairs.

Queen's College, Belfast: Formation of a Students' Union.

On Wednesday, May 14th, a public meeting, for the purpose of inaugurating a movement for the formation of a students' union in connexion with Queen's College, Belfast, was held in the Examination Hall. The president (Dr. Hamilton), with whom the idea originated, explained the object was to establish a union similar to that in existence at Oxford, Cambridge, Edinburgh, &c.—a building to be erected in the College grounds, containing dining- and refreshment-room, reading-room, writing-room, and accommodation for the meetings of the various College societies and their committees. About six weeks ago, a small preliminary meeting was held in reference to the scheme, and it was resolved to go on with it, and more than £2000 has already been promised. The President mentioned that the friends and admirers of a former distinguished graduate of the College, and senator of the Queen's University—Mr. Hans McMordie, M.A.,—resolved after his death to perpetuate his name by a suitable memorial. They decided to connect the memorial with the College, in which Mr. McMordie had taken a deep and lifelong interest. At first their idea was to found a scholarship, but when this union scheme was projected they unanimously resolved to offer the sum contributed to help in erecting the building of the Students' Union, on the simple condition that one of the rooms in it should bear the name of Hans McMordie. Several other gentlemen at the meeting—Mr. Shaw, Q.C. (county court judge), Archdeacon Leaver, Mr. Macknight (editor of the *Northern Whig*), Rev. Dr. Lynd, Professor Purser, Mr. J. A. Henderson, A.M. (of the *Belfast Newsletter*), Professor Redfern, Mr. Adam Duffin, B.L., Dr. Mitchell (President of the Medical Students' Association), Professor Hodges, and Professor Dill—having spoken in favour of the scheme, an executive committee was formed, and at their first meeting decided unanimously to accept the offer made by Mr. Hans McMordie's friends, as stated by the President. In this way an additional sum of £500 will be secured for the erection of the Students' Union building, for which, I hear, already altogether nearly £3000 has been promised.

The Belfast Royal Hospital.

At the quarterly meeting, held on May 23rd, it was reported that 826 intern patients were treated during the past three months, and that during the same period there had been 5651 extern cases. All accounts against the hospital have been paid, and on April 30th a balance of £159 2*s.* 7*d.* remained in its favour. The demands upon the hospital increase from day to day, and upwards of 200 more intern patients have been treated this year than for the corresponding period of last year. There seems not to be sufficient elasticity in the resources of the institution to meet the great demands. The amount received from general subscribers and from church collections is less than for the corresponding period of last year, and there have been no bequests or donations; but, on the other hand, the receipts (£1188 19*s.* 5*d.*) from the working classes have increased. It has been arranged that Hospital Saturday is to be on June 11th.

The Summer Session at Belfast.

The summer session at the hospital and college is now in full vigour, and there is a good attendance of students. Dr. Barrett's pathological class is large, and in Biology (a practical course) Dr. Cunningham has a larger attendance than at any previous period. Mr. Jamison has been awarded the Coxeter Exhibition, and Mr. Arthur Pim the Malcolm Prize, both for proficiency at the Royal Hospital; and Mr. Hislop has gained the Gold Medal at the Belfast Hospital for Sick Children.

The fifty-third annual dinner of the Irish Medical Association will take place in the Royal College of Surgeons on the 6th proximo.

Sir George Joseph Wycherley, M.D., J.P., died at his residence, South-mall, Cork, on the 23rd inst.

May 24th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Professor Pinard's Treatment of Ante-partum Hæmorrhage from Placenta Prævia.

THE management of flooding due to malposition of the placenta—a condition erroneously designated by Rigby as "unavoidable hæmorrhage"—is a matter which has put to the proof the ingenuity of generations of accoucheurs. At this faculty reliance has hitherto been placed upon plugging of the vagina, and I much doubt if Barnes' views as to the efficacy of detaching the placenta from the "dangerous zone" have ever been frankly accepted here. The introduction into practice of Barnes' bags marked a distinct progress in this branch of obstetrics; but the results obtainable, therefore, were not so good that practical men were debarred from seeking still more efficient and expeditious means of averting the dangers run by the subjects of this condition—not to mention their progeny. Your readers will be glad to have laid before them Professor Pinard's new treatment of this dangerous complication of pregnancy. The slight hæmorrhage generally marking the commencement of the trouble is treated in the ordinary way by absolute rest in the horizontal position—the head low and the pelvis raised. Vaginal injections are made with a 1 in 2000 solution of red iodide of mercury, a 1 per cent. carbolic solution, a boric acid solution, or simply water, all at a temperature of 118·4° F. This vaginal *lavage* should be continued until the returning fluid is colourless. Opiates may be advantageously administered, and should the presentation be a cross one, turning by external manipulation may be practised. Should the hæmorrhage continue, radical measures must be had recourse to in order to induce labour. All due antiseptic precautions being taken, one or two fingers, or even the entire hand, are introduced as far as the internal os, where the membranes are freely ruptured either with the nail or with a special membrane-perforator. A Champetier de Ribes intra-uterine bag is now introduced, chloroform being administered in the case of nervous patients. For its introduction, two fingers of the left hand are passed up to the os, which is then drawn slightly forward. Forceps with an antero-posterior curve is now introduced, carrying with it the bag, empty and folded, and which, well anointed with boracic vaseline, is gently pushed through the os towards the side where the placenta has been diagnosed to be present. The forceps is now disjointed and removed, leaving the bag in the uterine cavity, it being maintained in position by the left hand of the operator. The bag is then slowly filled through a tube connected with it with about 400 grammes of water. The tap is turned off, and for greater precautions a clamp is placed on the tube outside the vulva. The distended bag, compressing as it does the detached placenta, arrests infallibly all further chance of hæmorrhage at the same time that it excites uterine contractions—the precursor of labour—after a brief delay, this delay being longer or shorter according to the degree of distension of the bag. A recurrence of the hæmorrhage being possible after the expulsion of the after-birth, the patient must be watched, such a complication being combated with intra-uterine injections at 118·4° F., no ergot being given. In serious cases champagne should be administered, together with subcutaneous injections of ether, and the lower limbs should be thickly enveloped in cotton-wool. And now for the statistics of the application of this apparently highly practical method. Six out of seven cases recovered without an accident, the seventh dying of septicæmia, due to the presence of a degenerated uterine tumour. Of the seven fœtuses, four

Digitized by Google

were born living and healthy, one was in a macerated condition, and two were stillborn. From the moment of the introduction of the bag until complete dilatation, and the consequent expulsion of the bag into the vagina, in four instances an interval of from two hours and a half to three hours and a quarter elapsed, the intervals in the remaining three cases having been six hours and ten minutes, nine hours and a half, and nineteen hours and a half respectively.

Pasteur's Anti-rabic Inoculations as a Remedy for Epilepsy.

Most of your readers will peruse with astonishment the above heading, and will, doubtless, remark, "What next?" What connexion can there be between a neurosis like epilepsy and a disease distinctly traceable to the entrance into the blood of the microbe of rabies? Vulpian long ago stated that epileptic attacks were due to an exaggerated excitability of the medulla oblongata, and we know that the variable incubation period of hydrophobia is due to the variability of the time taken by the migration of the special microbe from the seat of inoculation to the medulla. Once arrived there, the explosion occurs, and all the characteristic train of symptoms peculiar to the disease appear. In 1891 two young epileptics who had been bitten by rabic dogs were treated at Pasteur's Institute. The treatment was successful; but what was more remarkable, the epileptic attacks to which they had been subject had disappeared. Struck by this phenomenon, M. Pasteur mentioned the circumstance to M. Charcot. On the 6th inst. M. Charcot sent to the Pasteur Institute an inveterate epileptic aged twelve years, who had been unaffected by all forms of treatment. Somewhat attenuated inoculations were employed, with the effect of determining, in six days after the commencement of the treatment, the total disappearance of the attacks, which had been hitherto extremely frequent.

Professor Leyden on Dr. Wiederhold's Cases.

ON the 13th inst. Professor Leyden showed his students a female patient in whom hysteria had caused sudden dumbness, and who had been treated with the cautery iron. Leyden availed himself of the opportunity, and referred to the case of Dr. Wiederhold, who, as reported in my last, actually whipped a lady patient, to induce her not to scream. He said: "In order to produce an educative effect on the patient, the physician sometimes chooses rude means. The only question is how far one may go in this. It is a matter of course that in all civilised States medical men must refrain from all brutal but not from all painful means; nay, they may even, in order to produce an impression, use certain means which excite fear. Just as the surgeon may cause pain—nay, imperil the patient's life, I cannot see why the deliberate causing of pain and fear as a means to an end should not be permitted in medicine, provided, of course, that the remedy is founded on a scientific basis and on observed experience. We are perfectly justified in using means that cause pain, and in threatening to use them, if we wish to produce an educative impression. The laws of humanity, however, must not be transgressed, and, just as the use of the cane is limited in schools, we must regard the mode of treatment resorted to in Kassel as unjustifiable."

New Books.

"How to protect Children from Tubercular Diseases of the Glands and the Joints, from Diphtheria, and from Curvature of the Limbs," by Dr. Karl Roser; "What can be done against Blood Poisoning, Cancer, and Abdominal Hernia?" by Dr. Karl Roser; "Why must we Sleep?" by Dr. Emanuel Rosenbaum; "A Compendium of Veterinary Science," published by Breitenstein of Leipsic; "A Brazilian Murder Den of Yellow Fever," by H. Brammer.

Miscellaneous News.

Professor Friedrich Müller of Breslau has been appointed Professor and head of the Medical Consulting Clinic in Marburg.

Professor Stintzing has been appointed Professor of Internal Medicine at Jena.

A new eye clinic was opened at Rostock on the 16th inst.

Berlin, May 22nd.

AUSTRALIA.

Medical Titles: Important Legal Decision.

AT the Melbourne District Court, on March 15th, a medical man practising in Melbourne was charged with using the title of "M.D.," he being registered under the Medical Act (1890) only as a Member of the Royal College of Surgeons. The prosecuting counsel, Mr. J. T. Smith, submitted that, although the defendant held the diploma of membership of the Royal College of Surgeons of England, and was so registered under the Victorian Medical Act of 1890, he had no right or title to use the letters "M.D." or the prefix "Dr." It was proved that the defendant advertised extensively in the public newspapers as "Dr." Langston and as William Langston, "M.D." A copy of THE LANCET of Dec. 12th, 1891, containing the report of the trial, in the English Court of Queen's Bench, of "The Queen *v.* the Justices of Aston," was produced, and it was contended that the case before the court was on all fours with the English case. The defendant's counsel, Dr. Mullen, who is a distinguished graduate both in medicine and law of the Melbourne University, contended that although the case cited from THE LANCET was very strong, it had no bearing on the present case, because the wording of the English and of the Colonial Act was not identical. At all events, on the Colonial Act there could be no committal. Mr. Smith's contention was that it bore the construction, "It shall not be lawful unless registered as such." Mr. Smith, in replying, remarked that the action of the defendant in styling himself "Dr." might be simply an inadvertence, but there could be no doubt of his intention to mislead when he affixed the letters "M.D." to his name and described himself as a physician. The presiding magistrate (Mr. Nicolson) said that in the first case the defendant was charged with using the title M.D. It was decidedly a case where deceit had been practised, and he was very sorry that a person holding the credentials of the defendant should lay himself open to such a charge. The bench could not inflict a less penalty than £20, with £5 5*s.* costs; in default, one month's imprisonment, levy by distress. In the other case he looked upon the charge also as having been proved, but it was one of a different character. The word "Dr." was very commonly used by many people and by medical men. It seemed to be used by every medical practitioner, and no deceit was intended, so he thought a nominal fine would be sufficient. A penalty of £2 would be imposed, with £3 3*s.* costs; in default, fourteen days' imprisonment, levy by distress. Dr. Mullen asked for a stay of proceedings for seven days pending an appeal. The application was granted. Another case decided recently by the Supreme Court of Victoria was an appeal by an unqualified man against a police-court conviction for having advertised himself as an "oculist." The court upheld the magistrate's conviction, and established a precedent which will have beneficial results in saving the unwary from the hands of quacks.

Self-styled "Cancer Curers."

A horrible case has been occupying the attention of one of the Sydney coroners recently. A woman having died in the Sydney Hospital, the medical superintendent, Dr. Hull, refused to give a certificate of death, and reported the case to the coroner. It appears that the deceased applied at the hospital over a year ago, with a small epithelioma of the lower lip. She was advised to have it removed by incision, and agreed to return for that purpose. In the meantime a friend of hers recommended her to try a "Dr." Hood, who advertised as a cancer curer, and published testimonials of cure from patients. The poor woman, dreading the ordeal of an operation, consulted the man Hood, who undertook the treatment and promised a speedy cure. It was given in evidence that the treatment consisted in the use of strong escharotics, poultices, and the removal of the cancer by means of the finger-nails. The pain was excruciating when the operator, after burning the part with some strong acid, applied his fingers, and, as he told the unfortunate patient, dragged the cancer out by the roots. The coroner, by severe cross-examination, got out of this "Dr." Hood that he was not qualified, but that his cancer cure was a secret remedy which he had learned from the Maoris, and which he was passing on to his son, who was also a cancer curer. The son displayed even greater ignorance than his father. His idea of epithelioma was that it was a parasitic disease, and he averred that he

Digitized by Google

had seen the parasites walking about in the matter. He also explained, for the benefit of the jury, that "cancer meant a crab, and a crab was a parasite, and that the 'cancer cure' killed the parasites." This highly original pathological explanation naturally gave rise to some merriment. Finally, it came out that this pair of quacks had treated the unfortunate woman for nearly a year, and then, when the case was beyond all hope, she made application for admission to the Sydney Hospital, where she died. It was found out during the hearing that the published testimonials extolling the "cancer cure" were written by the Hoods themselves and the patients made to sign them. In the end the jury found the two Hoods guilty of manslaughter, and they were both committed for trial, bail being allowed. After some trouble the old man's bail was forthcoming, but the son has had to remain in gaol. The jury attached a rider to their verdict calling the attention of the Government and Parliament to the matter, and asking that the Medical Bill should be pushed through this session. The evidence given was so sensational and the interest aroused is so great that there is every chance of the Medical Bill passing through the Assembly and becoming law before very long.

Obituary.

C. BLENCOWE NOBLE DUNN, M.R.C.S.

MR. DUNN died at his residence, The Tors, Crich, Derbyshire, on April 17th. He was born on Aug. 23rd, 1836, at Cumberworth, in the West Riding of Yorkshire, where his father was curate in charge, and by him he was principally educated. He was descended from a family of the same name who for many centuries resided at Howden, in the East Riding. He commenced his professional career with the late Mr. Charles Trotter of Holmfirth, and after that gentleman's death completed his pupilage with the late Mr. R. R. Allen of Belper. He studied at St. Bartholomew's Hospital, and obtained there the Wix prize for an essay on "The Connexion between the Studies of Ancient and Modern Literature and the Studies of the Medical Sciences." He also received a certificate for proficiency in physiology. He took his diploma in 1860, and shortly afterwards commenced practice at Crich, in succession to the late Mr. Nicholas Hathway, where, by his kind and genial presence, he soon gathered round himself a large and influential circle of friends. Mr. Dunn was medical officer and public vaccinator of the Crich district of the Belper Union, and held many honorary appointments. As a matter of fact, he was always ready to promote any scheme that would in his opinion contribute to increase the happiness and wellbeing of his fellow-creatures and the prosperity of the village he so dearly loved. Mr. Dunn was an excellent specimen of a true-hearted English gentleman, kind, considerate, and courteous to everyone. His funeral, which took place at the parish church on the Thursday after his death, although of the simplest possible character, almost took the form of a public function, so many were there anxious to pay a last tribute of respect to the memory of him who for thirty years had laboured in their midst. Amongst the many beautiful floral contributions was one from Miss Florence Nightingale with a touching inscription attached. The deceased gentleman was her medical attendant during her residence at her Derbyshire home. Mr. Dunn married the fourth daughter of the late Edward Trotter, Esq., surgeon, of Holmfirth, but leaves no family.

JAMES PENN HARRIS, F.R.C.S. ENG.

DEATH has removed from the ranks of the medical profession in Liverpool one of its oldest and most esteemed members. Mr. James Penn Harris, surgeon, of Rodney-street, died on May 20th, after many months of intense suffering. The deceased gentleman was born at West Cowes, Isle of Wight, on May 2nd, 1817, and had therefore this month completed a lifetime of seventy-five years, a full half-century of which he had spent in the practice of his profession in Liverpool. His studies were pursued at University College, London, and in 1841 he took the qualifications of M.R.C.S. and L.S.A. In 1853 he became a Fellow of the Royal College of Surgeons of England by examination. For some years he was house surgeon at the Northern Hospital, Liverpool, and subsequently had a very extensive general private practice, ultimately attaining the reputation of being one of the most skilful operating surgeons of his day. At the time of his death he still held the position of honorary consulting surgeon to the Liverpool Dispensaries, and honorary surgeon to the St. Anne's Dispensary and Eye and Ear Institution and the Asylum for Orphan Boys. He was a member of the Medical Institute and of the Royal Archæological Society, and also a Fellow of the Liverpool Northern Medical Society. As vice-president of the last-named society he delivered the inaugural addresses at the opening of the winter sessions of 1875 and 1876.

MEDICAL TRIAL.

JEAFFRESON *v.* HEWITT.

(Before Mr. Justice Day and a Special Jury.)

IN this case the plaintiff, a doctor, practising at Wandsworth, sued the defendant for his fees for attendance and medicines supplied to the defendant's wife.

Mr. Murphy, Q.C., and Mr. Montague Lush were for the plaintiff; Mr. Winch, Q.C., and Mr. Rentoul for the defendant.

Mr. Winch, Q.C., before the jury were sworn, made a statement on the defendant's behalf. He said the defence to the action had been based on the alleged negligence of the plaintiff in his professional duties; but the defendant now wished to express his conviction that there was no ground or reason whatever for such suggestion. The learned counsel further stated that the defendant's natural anxiety and inexperience as to his wife's health had misled him into suspecting the plaintiff's incapacity; as a fact, when the evidence was examined, there was absolutely nothing to lead to this conclusion, but to the contrary, and he was instructed to express great regret for the imputations made, and to withdraw them most completely and unreservedly, consenting to a verdict for the plaintiff.

Mr. Murphy, Q.C., said that the plaintiff had brought evidence of the highest kind to establish the propriety of his conduct of the case, but would gladly accept the defendant's withdrawal.

His Lordship said he considered the apology very complete and very proper. He entered judgment for the plaintiff.—(*The Times*)

Medical News.

ROYAL COLLEGE OF SURGEONS IN IRELAND.—The following gentlemen have obtained the Fellowship of the College:—

Henry B. Goulding, Edward C. Stack, Crawford Warren, Wm. Henry Woodright.

ROYAL COLLEGE OF PHYSICIANS IN IRELAND.—At the May examinations the following obtained the Licences in Medicine and Midwifery of the College:—

Medicine.—A. R. Parsons, W. Scatchard, F. Spiller.
Midwifery.—R. Miller, W. Scatchard, A. L. Wykham,

The undernamed Members have been admitted Fellows:—

S. T. Gordon. | E. Lennon.

SOCIETY OF APOTHECARIES OF LONDON.—The following candidates have passed the recent examination in the subjects indicated:—

Surgery.—R. S. Bernard and J. K. Kempthorne, King's College; A. H. Conder and H. E. B. Porter, London Hospital; A. B. Jones, University College; H. R. Phillips, Cambridge and Owens College; W. J. C. B. Pitt, Queen's College, Birmingham.
Medicine, Forensic Medicine, and Midwifery.—R. H. Calvert, Yorkshire College; C. G. Hoysted, Charing-cross Hospital; A. B. Jones, University College; R. N. U. Pickering and H. E. Simpson, St. Bartholomew's Hospital; J. W. Smith, London Hospital.
Medicine and Forensic Medicine.—S. H. R. van R. de Groot, King's College.
Medicine and Midwifery.—W. H. Savery, Middlesex Hospital; A. A. Macfarlane, St. Bartholomew's Hospital.
Forensic Medicine and Midwifery.—J. N. d'Esterre, St. Mary's Hospital.
Forensic Medicine.—R. A. Earle, Middlesex Hospital; V. J. R. Robin, King's College; G. P. Smith, Guy's Hospital; H. S. Ware, St. Thomas's Hospital.
Midwifery.—R. S. Freeland, Guy's Hospital; R. Freer, St. Mary's Hospital.

To the following candidates has been granted the diploma of the Society, entitling them to practise Medicine, Surgery, and Midwifery:—

Messrs. De Groot, Earle, Freeland, Freer, A. B. Jones, Pitt, Robin, Savery, Simpson, G. P. Smith, J. W. Smith, and Ware.

A NEW CONVALESCENT HOME.—The Mayor of Birmingham formally inaugurated on Saturday the Stokes convalescent home at Llanrhos, near Llandudno. It is in connexion with the Birmingham hospitals.

ROYAL OPHTHALMIC HOSPITAL. — A meeting for the purpose of raising funds for the enlargement of this hospital was held at the Mansion House on the 19th inst., the Lord Mayor presiding. To carry out the intentions of the Board of Management £35,000 is required. Sir John Lubbock, M.P., president of the hospital, moved a resolution, which was carried, commending the work accomplished by the institution and its utility as a school for ophthalmic surgery, and earnestly advocated the claims of the charity for generous public support.

LEAD POISONING AT BRADFORD.—A conference of medical officers was held at Bradford on the 19th inst. to consider the recent development of lead poisoning. Mr. J. P. Aston presided, and representatives from thirteen out-townships supplied with water from Bradford were present. A series of resolutions were passed setting forth the serious danger to the public health of lead contamination in the water service, at the same time suggesting the adoption of necessary precautionary and remedial measures, and that the Bradford Corporation should take steps to free the water-supply of such pollution.

ST. MARY'S HOSPITAL, PADDINGTON.—Mr. J. D Allcroft, in the unavoidable absence of the Duke of Cambridge, presided at the festival dinner at the Hôtel Métropole, last week, in aid of the Clarence Memorial Fund, for the addition of a wing to the hospital, the foundation-stone of which will be laid in October next by the Prince and Princess of Wales. The chairman, in giving "Prosperity to St. Mary's Hospital," remarked on the urgent need of the proposed extension. All the property necessary for the enlargement had been purchased. The estimated outlay of the new wing is £100,000. After an eloquent appeal for financial support, subscriptions to the amount of £10,000 were announced.

POSTMEN'S REST HOUSES AND SANATORIUM.—On Monday Sir James Fergusson (the Postmaster-General) attended at the Portman Rooms, Baker-street, and formally opened a bazaar in aid of the funds of the Postmen's Rest Houses and Seaside House. Many of the Post Office employés have several hours' leisure in the day, and it is to these homes they repair to spend that time. There are five homes, and the sanatorium is at St. Leonards-on-Sea. Sir James Fergusson commended the movement, in support of which that bazaar was held. Every new post office was now provided with a room in which the men could rest and cook their meals. About three-fourths of the post offices in London were so provided. Some of these rooms were not altogether comfortable, and the institutions which they were then assembled to assist provided the real home.

SOUTHPORT NEW INFIRMARY.—On the 19th inst. a meeting of the joint committee of the Southport New Infirmary was held in the examination hall of the Schools of Science and Art, the special object being to inspect the plans which had been sent in for the new infirmary, which it is proposed to build on Scarisbrick New-road, at a cost not exceeding £13,200. The Mayor (Alderman Pilkington, M.R.C.S.) presided. Thirteen sets of plans had been sent in, eight or nine being by local architects, and these were referred to a sub-committee, who were instructed to make a selection of three to lay before the General Committee, and to call in professional assistance, if necessary, to help them to arrive at the best conclusion. A discussion having arisen with regard to the possibility of the practice of vivisection in the new building, the Mayor stated that the new infirmary would be vested with a body of trustees, and it was impossible for any committee to enter into any undertaking which should be binding on a body not yet appointed. He believed there was not a single institution of the kind in the country where vivisection was practised, and it was extremely improbable that such practices would be introduced in Southport. But, to meet the objection, the committee had undertaken to invest the money in question in a separate fund, and to have inserted in the trust deed a special clause, empowering the donors, or their heirs or executors, to claim a return of their subscriptions should vivisection ever be put into practice there. The amount of the building fund at the present time amounted to £12,870, including £1575 which the donors wished should be set aside for the endowment fund.

VACCINATION AT COVENTRY.—The Local Government Board has informed the Coventry Board of Guardians that the appointment of a Royal Commission on Vaccination was no reason for suspending the compulsory clauses, and they refused to sanction a payment proposed to be made to the vaccination officer in lieu of fees.

FRAUDS ON MEDICAL MEN.—At the Old Bailey Sessions, on Tuesday, Charles Clark, aged sixty-one, was sentenced to three years' penal servitude for obtaining money by false pretences from medical practitioners and others throughout the country. The prisoner was prosecuted at the instance of the Charity Organisation Society.

A MEDICAL COMMISSION ON "VITALINE."—It is stated that a Special Commission, composed of the most eminent medical men in St. Petersburg, has been appointed to analyse and thoroughly test Gatchkoffsky's "Vitaline." It is also stated that the doctor who treated the late General Gresser of St. Petersburg with "vitaline," and was arrested owing to the death of the General, has been released, but is prohibited from making any further use of "vitaline," pending the result of the analysis ordered by the authorities.

PRESENTATIONS.—Surgeon-Captain J. Scott Riddell, M.A., M.B., C.M. Aberd., has been presented with a handsome dressing case by the Aberdeen public ambulance class, as a mark of respect and appreciation of his lectures and services to the class.—Dr. A. F. Wood, the medical superintendent of the Edinburgh City Hospital, has had presented to him a handsome travelling bag by the matron and nurses of the institution, the occasion being the completion of seven years' service since the hospital was taken over by the Edinburgh Corporation.

UNIVERSITY OF LONDON.—The following resolution was passed on the 20th inst. by the annual committee specially instructed by Convocation of the University of London to represent the views and guard the interests of Convocation generally in all matters connected with the Royal Commission appointed on April 25th for the establishment under charter of an efficient Teaching University for London:—"That this committee is of opinion that the omission of a direct representative of Convocation of the University of London from the new Royal Commission on a Teaching University for London is calculated to prejudice the solution of the question. This committee therefore desires respectfully to represent to the Prime Minister, to the Lord President of the Council, and to the First Lord of the Treasury that Convocation should be directly represented on the Royal Commission by its chairman."

MEDICAL NOTES IN PARLIAMENT.

The Metropolitan Asylums Board.

LORD SANDHURST has given notice of his intention to bring to the notice of the Government the document issued by the Metropolitan Asylums Board, dated May 14th, 1892, as to the engagement of doctors and nurses for small-pox hospitals, and to ask whether the document is issued with the knowledge and sanction of the Local Government Board.

Vivisection.

In the House of Lords on Tuesday petitions for the suppression of the practice of vivisection were presented from inhabitants of Folkestone, Penge, Ashbourne, Grasmere, Ambleside, and the Anti-Vivisection Society in London. On the same day, in the House of Commons, there was laid on the table the annual report of the inspector of experiments on live animals. The report was ordered to be printed.

Police and Sanitary Regulations.

The work devolving upon the Select Committee of the House of Commons on Police and Sanitary Regulations Bills has become so heavy this session, and the time for its disposal so limited, that it has been resolved to add two members to the Committee, and to divide the Committee thus augmented into two committees, each of which shall have the full powers of, and be subject to the orders and instructions in force in the case of, the undivided Committee.

The Sanitary Conditon of Grandborough.

On the 24th inst., in answer to Mr. Leon, Mr. Stuart-Wortley said that the attention of the Local Government Board had not been called to the insanitary condition of the village of Grandborough, but since notice was given of the question they have communicated with the sanitary authority. They are informed, in reply, that the population of the village is 301, and that during the first four months of the present year there were five deaths, one from bronchitis, another from drowning, one from peritonitis, a fourth from pneumonia, and one from enteric fever. The report of the medical officer of health as to the water-supply, given verbatim, is: "I must tell you that the only water-supply considered unfit for drinking purposes was closed last week. Another well is being closed in the village. With that exception I believe the quality and quantity of water are good." The Local Government Board are also informed that notices under the Public Health Act, 1875, and the Housing of the Working Classes Act, 1890, have been

served by the sanitary authority upon the owners of insanitary and overcrowded houses.

The Vaccination Committee.

On Monday last, in reply to questions by Messrs. Channing, Summers, and Picton, the Home Secretary said the recommendations made in the interim report of the Vaccination Commission involved a considerable and important relaxation in the law on this subject, and Her Majesty's Government thought it right to consider the evidence more fully and carefully than they had yet been able to do, before deciding upon the legislation they will recommend to the House, especially as small-pox has considerably increased in several parts of the country. The recommendations of the Committee were so wide-reaching that they amounted almost to a repeal of the vaccination law, and before definitely deciding what course to pursue the Government were anxious to see upon what evidence the recommendations were founded.

The Oyster Trade.

A Bill has been prepared and introduced to Parliament by Sir Edward Birkbeck, the object of which is to permit the sale during the close time of foreign oysters which have been "bedded in British waters." The courts have decided that such oysters may not be sold during the close time.

Accidents to Children.

In the House of Commons on Thursday, in reply to a question, Sir Michael Hicks-Beach said that those in charge of children's excursions by rail ought to arrange that some person old enough to keep the children out of mischief should be in each compartment. He was informed that the Great Eastern Company had issued a circular to superintendents of schools, suggesting the distribution of the adults of each party. Certain recent accidents had arisen from children opening the carriage doors by the handles inside, and he understood that the Great Eastern Company would, as far as possible, avoid the use of carriages fitted with such handles in children's excursions. In those circumstances he did not see what further steps could be taken to secure the safety of the children.

Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.

ADAMS, E. W., M.R.C.S., L.R.C.P., has been appointed Assistant House Accoucheur to King's College Hospital.

AIRD, C. M., M.B., C.M. Aberd., has been appointed Government Medical Officer at Esk, Queensland, vice Langdon.

ALLAN, THOS. S., L.R.C.P., L.M., L.R.C.S. Edin., L.F.P.S. Glasg., has been appointed Medical Officer for the Third Sanitary District of the Tonbridge Union.

BRODRICK, H. E., M.D. Durh., M.R.C.S., has been reappointed Medical Officer for the Borrowly Sanitary District of the Northallerton Union.

Notes, Short Comments, & Answers to Correspondents.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

All communications relating to the editorial business of the journal must be addressed "To the Editors."

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *to be addressed "To the Publisher."*

We cannot undertake to return MSS. not used.

"ALLEGED SCARCITY OF MEDICAL MEN IN NEW ZEALAND."

THE *Colonies and India* of May 21st says:—

"A correspondent of THE LANCET makes the statement that there is a good opening for medical practitioners on the east coast of the north island of New Zealand. It is said that in spite of a guarantee of £100 by the Government and of £200 additional by the settlers on the east coast, a qualified man cannot be found; and this is somewhat surprising, if true, considering how full the colonies are of qualified men, hundreds of whom would probably ship for the Solomons or Tierra del Fuego at an hour's notice for a guaranteed £200 a year. Possibly the district referred to in THE LANCET is somewhere on the Maori borderlands in the Uriwera direction, and this would, of course, account for the disinclination of the hard-up medicos to settle in the place. It is not pleasant to live in a territory where the natives are capable of stealing the milk out of your tea if you do not watch them."

Mr. T. C. Horsfall.—Arrangements for the manufacture and sale of the Clausen stove in England have not yet, we understand, been completed.

Dr. J. A. Shaw-Mackenzie's paper is receiving consideration.

"A GENUINE GRIEVANCE."

To the Editors of THE LANCET.

SIRS,—Knowing that your columns are always open to the exposure of any real injustice affecting the medical profession, I venture to address you very briefly on a piece of careless indifference displayed by a great London Board.

My quarter's account, delivered last Christmas to the Poplar Board of Works, amounted to the sum of £1 12*s.* 6*d.* for notifications of infectious diseases. On application on two or three occasions I was told that the cheque in my favour had not yet arrived from the Metropolitan Asylums Board, and on my last application, some three days ago, I received a similar reply. So it practically appears that I may have to wait for this trifling sum a perfectly vague and indefinite period. My March account, it is of course understood, cannot be rendered until it is asked for, so my position seems to be that I am simply in the hands of the Metropolitan Asylums Board to pay me exactly when they choose. This, Sirs, is a genuine grievance. To my own knowledge many other medical men feel it, and I have therefore no hesitation in asking you to print this letter. Enclosing my card,—I am, Sirs, yours faithfully,

May 21st, 1892. FUTURUS.

A QUERY.

To the Editors of THE LANCET.

SIRS,—I shall be glad if any of your correspondents can recommend me a school in the country suitable for a boy aged about fifteen, who is partially paralysed, and whose speech is affected. In other respects his mental faculties are good.—I am, Sirs, yours truly,

J. SADLER CURGENVEN, L.R.C.P. LOND. &c.

Craven-hill-gardens, W., May 24th, 1892.

Digitized by Google

TREATMENT OF INTESTINAL OBSTRUCTION BY THE ADMINISTRATION OF METALLIC MERCURY.

IT is not a little remarkable how discarded and discredited remedies at times reintroduced with success. Dr. Richter, of Gross-Wartenberg, relates in the *Deutsche Medicinische Wochenschrift*, May 19th, a case of acute intestinal obstruction in which, as a last resource, metallic mercury was administered with successful result. The patient, a woman forty-nine years of age, was suddenly seized with intestinal pains, for which she was treated with purgatives, including croton oil. When Dr. Richter was summoned subsequently, he found the patient very ill, the abdomen was immensely distended, painful, and tympanitic, and there was constant fæcal vomiting. Leeches, morphia, and ice gave some relief; but the distension and fæcal vomiting continued, and the patient was sinking. As the friends objected to operative interference, Dr. Richter administered a dose of 5·2 oz. of metallic mercury. This was followed by such complete apathy that death was momentarily expected. But after a few hours there ensued, with loud intestinal rumbling, five copious stools, accompanied by large quantities of stinking gases. The patient recovered rapidly, without any metallic mercury being noticeable in the evacuations.

S. T. O.—The matter is one for arrangement when an assistant is engaged. There is no invariable rule. It seems reasonable to give an assistant a holiday.

Dr. W. C. Beatley will see that we have answered his question as put by another correspondent.

Mr. Chas. W. Lancaster should consult his medical attendant.

"MEDICAL PRACTICE IN SOUTH CALIFORNIA."

To the Editors of THE LANCET.

SIRS,—In reply to "Quercus Ilex" in your issue of April 23rd, I would call his attention to Los Angelos and San Diego, counties on the "Orange Belt," in which there are several good towns to practise medicine, but, like all such climates, the places are overrun with physicians from all parts of the United States and Europe, seeking a balmy atmosphere in place of frost and chilly east winds. If "Quercus," to use a Californian expression, is a "one-lung man," then the sections above-mentioned are the best, but if he is sound in wind and limb, plenty of "go," and well up in his profession, there is room for him on the Pacific slope. The only outfit required is sufficient means to keep him while building up a practice and a thorough knowledge of his profession. In concluding, I would remind your correspondent that, in addition to the immigration of physicians from the United States and Europe, there are four colleges (two regular, one homœopathic, and one eclectic) in this city that turn out twice a year enough M.D.'s to fill every gap in the Golden State.—Yours truly,

San Francisco, April, 1892. H. ISAAC JONES, M.D., L.R.C.P., &c.

To the Editors of THE LANCET.

SIRS,—In reply to "Quercus Ilex" on the above subject, I fear he will be disappointed should he come to Southern California, as it is overrun with medical men, and the ranchers moreover are not overburdened with money. Most of the money is made out of eastern people who winter there.

Should "Quercus Ilex," however, determine to come out, let him make Los Angelos, Fresno, or Bakersfield his headquarters, and then look out for a suitable opening. As regards outfit, one requires a good set of instruments, as it is bad policy ever to refuse to undertake a case. A little extra practice in diseases of the naso-pharynx, the ear, and gynæcology would come in useful, as Americans love a specialist, and catarrh is a very prevalent disease. Living is cheap all over, but clothing is dear. Except in a large city, a top hat and frock coat is unnecessary. Simple sack suits of light weight and dark material are best. Tan leather boots save the trouble of blacking, which operation one has to do oneself.

Let "Quercus Ilex" write to the Secretary of the State Medical Board of California, San Francisco, for a copy of their official register, and he will find it afford him very useful information as regards fees, number of physicians in different localities, &c. I shall also be happy to answer any inquiries, and for that purpose enclose my card and address.

I am, Sirs, yours truly,

April, 1892. NEVADAN.

FOUR CHILDREN AT A BIRTH.

DR. SPECHT of Dudweiler reports in the *Deutsche Medicinische Wochenschrift*, No. 20, 1892, the birth of four children, three of whom were living and healthy, but the fourth was dead some time before birth. There were two placentas, each with two cords. The mother was a multipara.

IODOFORM TAKEN INTERNALLY.

To the Editors of THE LANCET.

SIRS,—Having occasion to order a patient a drachm of iodoform for surgical dressing purposes, I was surprised on calling next day to find that he had taken the whole of it on the previous night without any ill effects, but, on the contrary, he thought it had given him an appetite. On inquiry I found the full amount had been dispensed.

I am, Sirs, yours truly,

Ballarat, Victoria, April 18th, 1892. A. TREVAN.

CURE BY WITCHCRAFT.

WE are indebted to an interesting memoir entitled "Fifty-two Years' Medical Work in Jerusalem" for an apt illustration of the tenacity with which therapeutic superstition lingers. The superstition in question is that called the "indulca cure," "indulca" being a barbarous derivation from the Latin verb "indulcare," to sweeten. It is in high favour among the Spanish Jews for various conditions, such as madness, sudden blindness, sudden frights, epilepsy, sterility, and infantile mortality, and is divided into two classes—the great and the small "indulca." To take the latter, the small indulca, first. The patient is left alone in his room, all others of his household and all his neighbours having been excluded from the tenement and contiguous buildings for some days. The only other inmate of his room is the witch, who is in possession of the secret of his malady and its cure. The room having been emptied of everything, including the holy books, has been already cleaned, whitewashed, and put in decent order. On the night when the patient has to receive the indulca he is forbidden to pray, to recite the daily portion of Scripture, to breathe the word "heaven," and to mention aught concerning Holy Writ, and the witch prepares a small portion of wheat, barley, salt, water, milk, honey, eggs, and sweetmeats or sugar. At midnight she mixes these together, and sprinkles some of the compound on the patient's bed, on the threshold of the room, and in its four corners, whispering the while an appeal to the powers above to have pity on the patient, to pardon his sins, to give him health or life, and (if the patient be a barren woman) to vouchsafe children to her, or, if she is apt to lose them, to shield them from death. "Let this honey and sugar," she continues, "serve to sweeten your palates and mouths, the wheat and barley to feed your cattle and sheep, the water and salt to establish peace, friendship, love, and brotherhood, an everlasting covenant of salt between us and you." (Here she breaks the eggs, and pours their contents in the places above mentioned, kneels and prostrates herself, kisses the ground several times, and offers the following prayer: "Here I offer to you life for life, in order that you may restore the life, or reason, or health of this patient.") For two or more nights in succession this ceremony is repeated, and, if without good to the patient, is continued for seven or nine nights altogether. If through poverty the patient cannot meet the required expense, or if the neighbours decline to leave their quarters, then the witch contents herself with going to a cistern or bath, there to pour in a little salt and water, and to pray as before, saying: "Behold! water and salt to serve as a covenant of peace between us." So much for the small indulca, from which the great indulca differs only in being prolonged for forty-five nights, the patient being required to dress in rich white garments, while the room, in addition to the cleansing above mentioned, must be well lighted with many candles. Further, the ingredients of the magic compound already described must be supplemented by sundry savoury dishes and spices as adjuncts to the witch's appeal and incantation afore-mentioned. It is against superstitions like these that the medical mission in Jerusalem has still to struggle in the noble work it has for fifty-two years carried on.

A Reader.—The remarks were founded on notes on a fragment of a Coptic medical book. Information which would doubtless be useful to our correspondent appeared in the Comptes Rendus of the Académie des Belles Lettres, not in the Memoires. The paper only occupied three or four small pages. Our correspondent should also refer to the volume of the French Academy's Transactions on the subject at the Society of Biblical Archæology, 11, Hart-street, Bloomsbury, on any Monday, Wednesday, and Friday.

Member.—Undoubtedly the general and proper custom is for the senior to have the choice.

FRIENDLY SOCIETIES.

To the Editors of THE LANCET.

SIRS,—I should be glad if any of your readers would reply to the following questions.

X. is appointed surgeon to a friendly societies' dispensary, and signs an agreement not to practise his profession for a number of years within a radius of five miles of the surgery under a fine of £100. How far is such an agreement binding? Would it be modified if he abstained from taking clubs? And would the association have to prove the amount of damage he had done them before they could take steps to prevent him practising?

I have seen the above answered in your columns before, but I think not very clearly; and it appears to me that if such an agreement is binding, many provincial house surgeons and others are seriously affected, as well as

Yours faithfully,

May 24th, 1892. INIGO.

OBSTETRIC ENGAGEMENTS.

G. H. R. has, we believe, a legal claim to the fee, if he can show that he was ready on his part to fulfil the engagement. He must use his discretion as to pressing this legal claim. We scarcely advise it, unless he can show loss of time or great personal inconvenience.

Dr. Rentoul.—We cannot find room for the communication.

ADVERTISEMENT OF NAMES OF MEDICAL STAFF.

A LARGE card is sent to us—which, we are informed, it is proposed to distribute to each factory in the neighbourhood of Newcastle-on-Tyne—advertising a hospital for sick children, with the names of the staff in large letters, and their days of attendance. We are asked our opinion of this. We confess that we strongly disapprove of it. We feel sure that none of the members individually would send round a card, and that none of them would like to see individual medical men of the town doing so.

Dr. Q. C. Smith (Austin, Texas).—We cannot recommend any particular system of shorthand as specially valuable to medical practitioners. The most generally used is, of course, Pitman's System of Phonography. With regard to medical reporting by phonography, we can bear testimony to its adaptability to medical terms, and its trustworthiness in skilled hands even in the most technical passages.

Mr. Casimir de Juravski.—We do not recommend practitioners. Our correspondent would no doubt obtain the information he requires from the pages of the Medical Directory.

Surgeon.—We may refer our correspondent to two papers on Exalgine, published in our present issue.

"FLOATING SPLEEN."

To the Editors of THE LANCET.

SIRS,—Dr. Higgins requests, at page 1169, information upon the above subject. A reference to Section 987 of the "Medical Digest" will enable him to study several interesting cases bearing upon his own case. I am, Sirs, yours faithfully,

Boundary-rd., N.W., May 25th, 1892. RICHD. NEALE, M.D.Lond.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

COMMUNICATIONS, LETTERS, &c., have been received from—Mr. R. G. Allen, Belper; Miss Adams, London; Commander Blount; Dr. Byrom Bramwell, Edinburgh; Miss Bacchus, Birchington; Messrs. Bishop and Sons, London; Mr. R. Broadbent, Leicester; Mr. G. Sherman Bigg, London; Mr. Albert Benthall, Southsea; Dr. Crump Beatley, Durham; Dr. T. Churton, Leeds; Mr. J. F. Colyer; Messrs. Coxeter and Son, London; M. Crinon, Paris; Mr. Cooke, London; Dr. C. H. Cattle, Nottingham; Miss Clarke, Broadstairs; Mr. J. S. Curgenven, London; Messrs. Churchill, London; Dr. W. Duncan, London; Mr. H. Danvers, Rotherham; Mr. E. Doudney, Plymouth; Messrs. Fannin and Co., Dublin; Dr. Juan Santos Fernandez, Havana; Dr. Fortescue Fox; Mr. J. M. Finzi; Mr. C. M. Lectures
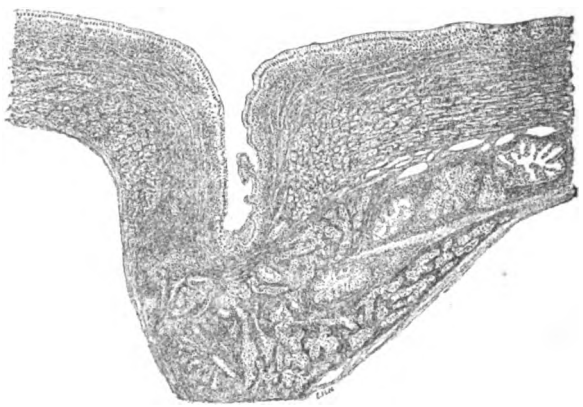
ON THE
OPERATIVE TREATMENT OF ENLARGEMENT OF THE PROSTATE.

By C. W. MANSELL MOULLIN, F.R.C.S. &c.,
SURGEON TO THE LONDON HOSPITAL.



LECTURE I.[1]

MR. PRESIDENT AND GENTLEMEN,—The question of operation as a means of permanent cure in enlargement of the prostate must be regarded as upon its trial. Portions of the gland have frequently been removed in the performance of lithotomy; you yourself, Mr. President, have done so upon two occasions, and fifteen years ago you wrote that though you were not prepared to advocate cystotomy in all cases of chronic cystitis dependent upon enlargement of the prostate, you would venture to suggest the expediency of its application in exceptional instances. And but little advance has been made in other methods of giving relief; yet until recently, when the late Mr. McGill published his first series of cases of suprapubic prostatectomy, no one has come forward to uphold it as a measure to be taken into serious consideration. Happily in most cases the question need never be raised; no one supposes for an instant that simple enlargement requires operation; but there are certain complications which only too often make their appearance, and which if they once begin pursue their progress relentlessly until life becomes unendurable and the patient prays for release; and it is for these that the operation is, if ever, to be undertaken.

And, first, they are the direct result of the overgrowth, and are not caused, although they may be helped, by anything else. I admit the weight of authority is against this view. Mr. R. Harrison, for example, holds that the habit of partial retention often precedes the physical signs of prostatic enlargement. Sir H. Thompson writes that, in spite of his having travelled considerable distances abroad and elsewhere expressly for the purpose, he has never been able to find a patient who, having previously been compelled to pass all his urine by catheter, say, for a twelvemonth, is enabled to pass only half by natural effort after division of the prostate. While Professor Guyon maintains that in these cases the whole urinary tract is involved, not the prostate only, and that the disease is merely a local expression of general atheroma. On the other hand, I maintain that the prostate, so long as it is normal, has nothing to do with micturition; that its overgrowth is a purely local affection; that the complications that follow are the direct result of the obstruction it causes; and that removal of the obstruction will prevent the development of the complications.

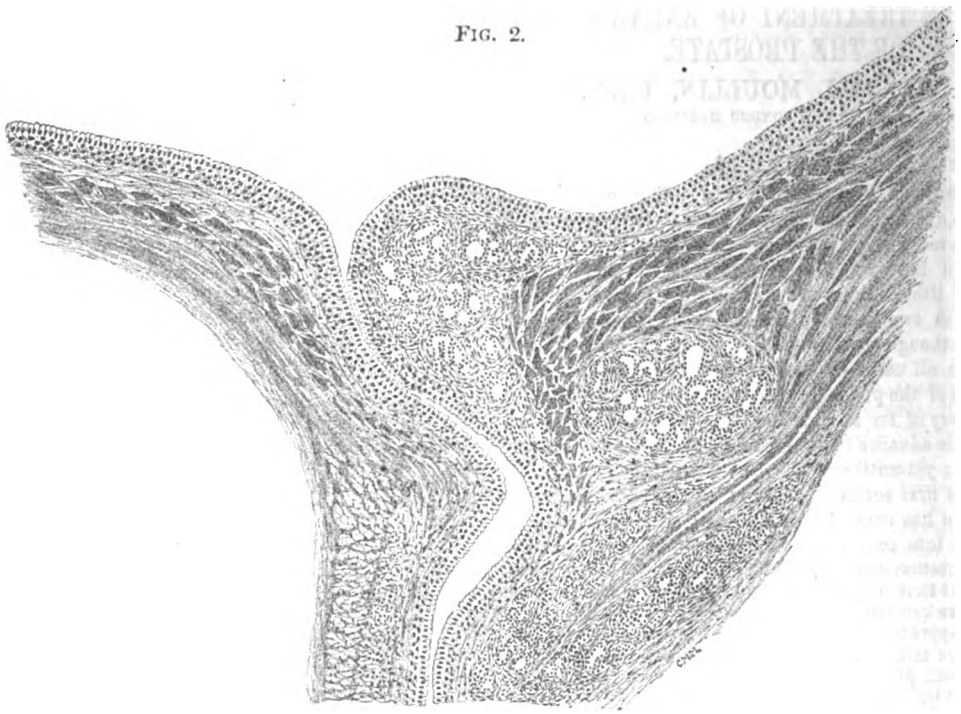
The prostate a purely sexual organ, not connected with micturition.—The first portion of the urethra, as distinguished from the prostatic that surrounds it, belongs strictly speaking to the bladder: the two are not merely continuous; they are part of the same structure, the allantois, and are absolutely distinct from the rest of the genito-urinary passages. In the Monotremata they remain distinct. In them the penile part of the urethra never becomes organically united to the rest, or serves as it does in the males of the higher orders of mammalia for the transmission of urine. As with the correspondiog organ in the female, it retains throughout life its purely sexual character. Even in man this sometimes occurs in cases of arrested development, or so-called hermaphroditism; and in those instances of imperforate rectum in which the intestine still communicates with the urethra the opening definitely marks the line of division between the two portions—the one above formed from the allantois, and the other below developed in the front wall of the cloaca; the one which becomes so often the seat of overgrowth of the prostate and never of stricture, and the other, which is so frequently strictured, and is never invaded by the gland. As Guthrie long since pointed out, the true sphincter of the bladder is not at the so called neck; there is no collection of circular fibres there like a sphincter; the circular coat of the bladder ceases almost abruptly, and the longitudinal bands changing their direction sweep round obliquely, and are lost in the fibrous tissue that invests the prostate. The arrangement of the first part of the urethra above the opening of the prostatic utricle is the same in the male as it is in the female, with three exceptions—one is the presence of the caput gallinaginis, which I take to be the rudimentary representative of the original intromittent organ before the penis was developed; the second is the addition to its distal extremity of the penile part formed out of an entirely separate structure; and the third the addition to its circumference of a sexual organ, the prostate, and because of the support it gains from this the reduction in thickness and strength of its own proper wall. The sexual character of the glandular part is not questioned; it is developed from the lining of the urethra in close relation with the orifices of the Wolffian ducts; it does not attain full growth until sexual maturity; in geldings it wastes away, and in many of the lower animals it varies in size and in perfection of development according to the breeding season. On a small scale, the product of its secretion mixed with that from the testes may be compared with what Lataste has called the "bouchon vaginale" of certain rodents. The same is true of the stroma. Its origin is from the genital cord quite separate from the allantois. In structure it is identical

FIG. 1.

Sagittal section through the neck of the bladder from an infant six months old (a little to one side of the median line), showing the structural identity and continuity of the prostatic stroma with the tissue surrounding the vesiculæ seminales and the vas deferens.

and continuous with the tissue of similar origin that invests the vesiculæ seminales; and, as Griffiths has shown, it wastes away in geldings and varies in size with the breeding season, just as the glandular part does. Women and children suffer no inconvenience from the want of it; and there is no evidence that after castration micturition is either assisted or unduly prolonged. It is a purely sexual structure.

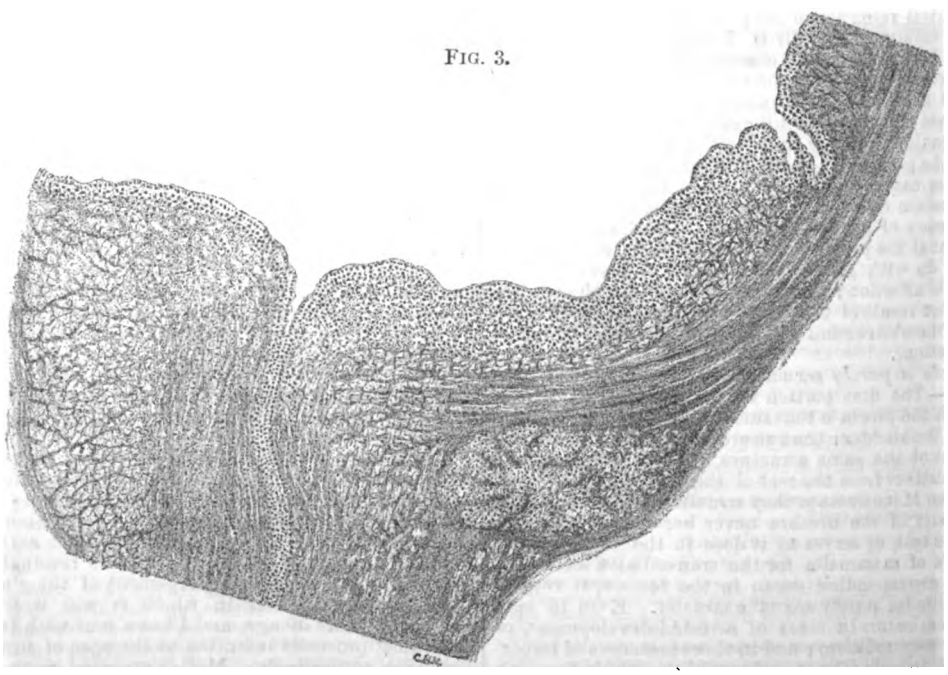
The nature of the enlargement.—This cannot be learnt from museum specimens; it must be studied from the beginning. Age is no cause for it. It does not occur in the majority of old men, it bears no relation to the age they reach, and it often occurs at a much earlier age than is usually supposed. The presence of residual urine must not be confounded with enlargement of the gland. I have figured one specimen in which it was well marked at forty-nine years of age, and I have met with two examples of typical prostatic retention at the ages of forty-eight and forty-one respectively. McGill operated upon patients at the ages of fifty-five, fifty-three, and thirty-five; and in the last case identified the part removed as prostatic tissue. One of Teale's patients was fifty-four; of Meinhardt Schmidt's, fifty-two; of Packard's, forty-three; of Bellfield's, forty-nine; of Dunn's, forty-five; of Iversen's, thirty-six; and of Mudd's (St. Louis), only twenty-seven. In all of these the overgrowth was already some years old. It is not connected with the utricle, which represents the vagina rather than the uterus. It is true there is a superficial resemblance between uterine fibroids and prostatic growths, but the



[1] Delivered at the Royal College of Surgeons of England on Monday, May 30th, 1892.

Digitized by Google

fact that they can both sometimes be shelled out as from a capsule, and that they consist of apparently similar elements, is no proof of the identity of the organs from which they spring. Nor can it be due to atheroma. Putting aside other reasons, Guyon and Launois appear to



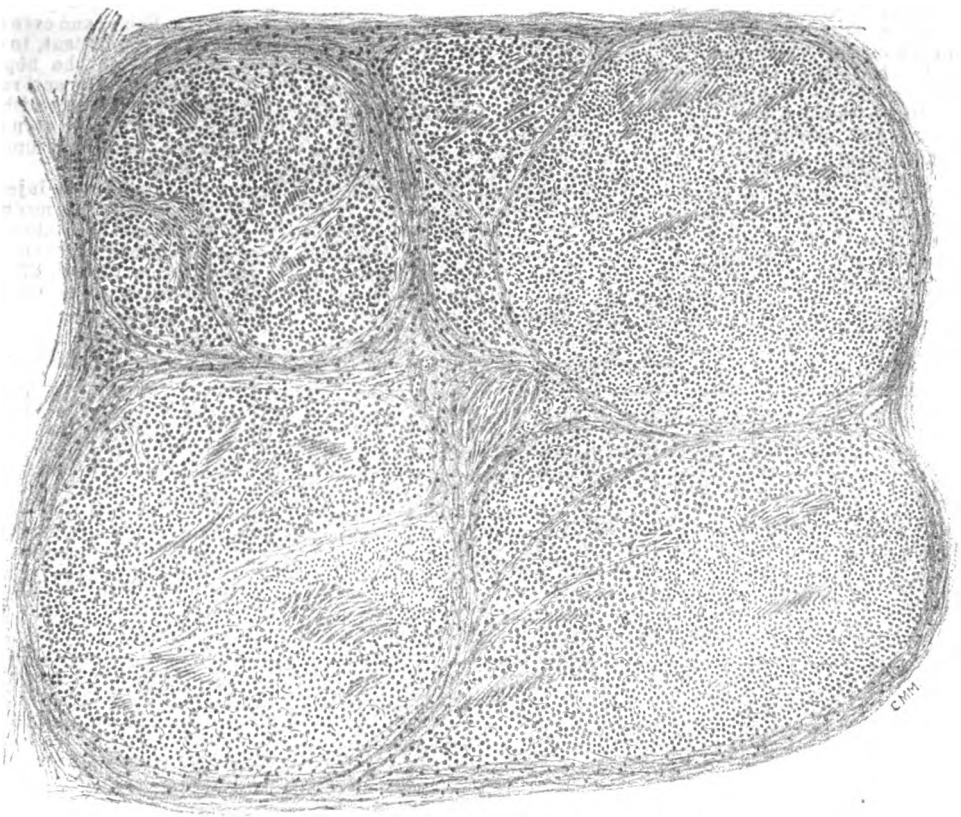
growth, distantly resembling that of the prostate, tubular, with occasional acini, but arranged absolutely without order. In the younger part there is little stroma, merely a few long fibre cells arranged concentrically around the tubules; where it is older it is much more dense, and the

FIG. 2.

Median sagittal section through the neck of the bladder of a man forty-nine years of age, showing the growth of the adenoma up the posterior wall of the urethra into the neck of the bladder. Seen from the inside the vesical orifice was markedly crescentic in shape, as if the median lobe were projecting forwards into it.

FIG. 3.

Sagittal section through the neck of the bladder, from a patient aged sixty-nine. The growth has extended up both the anterior and posterior walls of the urethra, and has reached quite to the back of the trigone. The muscular fibres around the neck are somewhat hypertrophied, and there is an indication of a commencing post-trigonal pouch.



have entirely overlooked the primary change. They describe the substitution of fibrous tissue for gland as the dominant feature, whereas it is entirely secondary. In all the cases that I have examined the first change has always been the invasion of the tissues around by a glandular

glandular element disappears. The existence of a median lobe is immaterial; the growth spreads up the urethra, at the sides or in the middle, until it projects as a collar or a nipple into the neck of the bladder; then it may extend back over the trigone, or grow out into apparently isolated

Digitized by Google

tumours. If the glandular part is in excess, it grows rapidly and forms a huge adenomatous prostate; if the fibroid change is early and extensive, the enlargement is slight but intensely hard. Whichever it is it is always local, and can be dealt with locally.

FIG. 4.

Microscopic section through the new growth, taken from the posterior boundary of the trigone of Fig. 3. It shows the peculiar character of the adenomatous tissue, composed apparently of irregularly arranged tubules, each with a basement membrane, a single layer of low columnar cells, and a few long fibre cells on the outer side, and here and there bundles of muscular fibre surrounded and isolated by the new growth.

The failure of the bladder is secondary to the enlargement of the gland.—It cannot be explained away as the result of old age or of atheroma, though undoubtedly these predispose to its occurrence. If it were the result of these, it would be much more common than it is, whereas it is only met with in a small proportion. Guyon, who holds that it is due to atheroma, relies upon the change in structure of the wall of the bladder; in many cases in which it appears to be hypertrophied it is really merely thickened and indurated, but this is the result of cystitis and not of arterial degeneration, or it would not be confined to the bladder. But the best proof is that when the obstruction is removed the bladder recovers; how often I shall discuss later. The loss of power is the direct outcome of the upward growth of the prostate. If the lateral lobes are enlarged without being elongated, the urethra is flattened into a slit like the trachea sometimes in cases of goitre, the resistance is increased, and the walls become thicker and more rigid. If, however, the growth spreads upwards into the neck, projecting as a collar or a nodule, or if the lateral lobes are so elongated that they raise up between them a fold of mucous membrane, the conditions are entirely different. The muscular mechanism for expulsion is thrown out of gear, the wave of contraction which normally spreads over the bladder on to the urethra in the act of micturition is broken, the orifice is closed before the cavity is emptied, a certain amount of urine remains behind, and that which fills the prostatic urethra slowly dribbles away. Then by degrees the muscular fibres whose function it is to close in the posterior fundus, being no longer equal to their work, begin to waste, the wall at the back grows thinner and thinner; meanwhile the rest of the bladder may become hypertrophied, and at length a definite pouch is formed. This is the beginning; age, atheroma, cystitis, and the persistent use of catheters may help, but the prime cause of the loss of power is the overgrowth; without this in the vast majority of instances all the various troubles that follow would never occur.

CURE OF A CASE OF HYDROPHOBIA.

BY PROFESSOR MURRI,

DIRECTOR OF THE PASTEUR INSTITUTE AND PROFESSOR OF CLINICAL MEDICINE IN THE UNIVERSITY OF BOLOGNA.

Translated from the Italian and Contributed by

THOS. WHITESIDE HIME, B.A., M.D.

[THE final triumph of the Pasteur anti-rabic method has been delayed, but is now complete and assured. Nearly seven years have elapsed since little Joseph Meister, the first person to be subjected to the Pasteurian anti-rabic method, began his course of treatment—a memorable date, July 4th, 1885. Hitherto the Pasteurian method had been applied to human beings only as a preventive.[1] But on

[1 In the early part of this year some important experiments were carried out at the Laboratory of General Pathology, Bologna, which seem to show that blood-serum from a rabbit, rendered immune by Pasteurian treatment, will cure rabbits in an advanced state of rabies. The serum was injected sometimes daily, sometimes every second day, and both subcutaneously and intravenously. The treatment in some cases extended over some fourteen days. The high temperature, paraplegia, loss of sensation, wasting, &c., all disappeared, and the animals rapidly recovered health and weight. V. Sul Modo di Quarire negli Animali la Rabbia sviluppata, nota di G. Tizzoni ed E. Centanni. Roma, 1892.—T. W. H.]

Digitized by Google

March 27th last for the first time the method was applied successfully, in a modified form, to the treatment of a patient *already suffering* from indubitable symptoms of hydrophobia. Under ordinary circumstances his doom was sealed. No method of treatment known up to the present has ever saved a man seized with marked symptoms of this invincible malady. Fortunately this patient was under the care of an experienced medical man, skilled in the practice of his art, and the patient still lives as a witness of the triumph of science over a disease which has hitherto baffled every effort to combat it, slaying its victims so unerringly and certainly that, after the first symptoms have appeared, there is but little time even to attempt a rescue. The credit of having first won such a victory is alone due to Professor Murri. But it must not be forgotten, and he is the first to acknowledge it, that his triumph lies in the novel and bold modification of the method originated by Pasteur. The following is the record of the case kindly furnished to me by my friend, Professor Murri.—T. W. H.]

On March 3rd, 1892, a healthy and robust young man, aged twenty-two, of Castelfranco, was bitten in the calf of the left leg by a rabid dog. The leg was only covered by trousers made of light material which was torn by the animal. The wound, which was round and deep, was not cauterised. On March 7th the patient was placed under Pasteurian treatment at the Pasteur Institute, Bologna. The course of treatment consisted of forty-nine subcutaneous injections, each 1·5 cc., and lasted twenty days. During the first four days the emulsion contained, respectively, medulla of the fourteenth, thirteenth, twelfth, eleventh, tenth, ninth, eighth, down to the seventh day. On the sixth day medullæ aged six and five days were injected, and from the fifth to the twentieth day the ordinary series of medullæ were employed—i.e., those of six, five, four, and three days, repeated down to the end of the treatment. This method has been commonly employed without any drawback, even in the case of infants but a few months old. The patient went through the course perfectly satisfactorily. But in the night of the 26th–27th of March there was a change. The patient became very unwell. He grew very agitated; he felt a sensation of heat through his whole body, and intense pain in the spinal column throughout the lumbar and lower part of the dorsal regions. He could not sleep, nor even find any position in which his sufferings were alleviated. On March 27th, when attempting to get up, he noticed that both his legs, but chiefly the right, were enfeebled. The patellar reflexes were still normal. On March 28th the loss of power was still greater, and vomiting and fever set in, while the pains in the back continued unabated. By the 29th the paralysis of the lower extremities was complete, and was then associated with total retention of urine and fæcal matter. There can be no doubt that the patient had developed the paralytic form of hydrophobia. The subcutaneous injections were continued in still stronger doses, but without avail. As this method had previously proved of no service in the case of patients in a similar critical position, it was determined to employ a more rapid method to convey the anti-rabic agents to every part of the body, the ordinary hypodermic one being manifestly too slow to allow of the danger being overtaken in time. It was therefore determined to have recourse to intravenous instead of the hypodermic injections. This decision was justified by two observations. The first was one made by Dr. Novi, who had remarked that the absorption of the emulsion injected into the subcutaneous cellular tissue took place very slowly, as proved by the unusual swelling and induration which continued at the site of injection. The second observation, which guided the decision as to the change of treatment, was the fact noticed by Dr. Poppi, that intravenous injections of the emulsified medulla are quite harmless in the case of rabbits, provided it is used fresh and has been allowed to stand, so as to effect the subsidence of any solid particles. It was therefore considered justifiable, and even imperative, considering the dire condition of the patient, to employ the method of intravenous injection, in the hope that the direct, rapid, and energetic action of the anti-rabic agents, brought almost instantaneously into contact with every part of the nervous system, might arrest and even destroy the enemy in time to save the patient from what must otherwise prove certain and immediate death.

On March 29th, therefore, intravenous injections were commenced, with an emulsion containing medullæ of six, five, four, and three days, which had been allowed time to settle. The whole course of treatment after the appearance of the symptoms of hydrophobia (March 27th) until all treatment was discontinued, owing to eradication of the disease, is shown in the following table:—

SYNOPTICAL TABLE OF TREATMENT AFTER THE APPEARANCE OF THE SYMPTOMS OF HYDROPHOBIA.

Date of injection	March 27.		March 28.		March 29.		March 30.		March 31.		April 1.		April 2.		April 3.		April 4	April 5	April 6	April 7
Hour	A.M. 10	P.M. 6	A.M. 10	P.M. 6	A.M. 10	P.M. 5	A.M. 12 noon	P.M. 6	A.M. 10	P.M. 6	A.M. 10	P.M. 7	A.M. 11	P.M. 6	A.M. 11	P.M. 6	A.M. 11	A.M. 11	A.M. 11	A.M. 11
Age of the medulla injected (days)	6	5	5	4	5	4	3	4	4	3	5	4	3	5	5	4	3	5	4	4
Quantity injected (cc)	3	4	4	4	2	4	4	4	4	4	4	4	4	4	4	4	4	4	4	4
Number of injections	2	2	2	2	1	2	1	1	1	1	2	1	1	2	2	1	1	1	1	1
Mode of injection	Subcutaneous.				Intravenous.						Subcutaneous.		Intravenous.							

The patient was admitted into the hospital on March 30th, and the following careful details of his condition were recorded:—

Right leg, complete flabby paralysis; left leg, flabby paralysis, but slight contractility still existed in the domain of the crural nerve. Abdominal muscles and detrusor vesicæ paralysed; contraction of the muscles of the neck; respiration normal.

Cutaneous reflex movements.
- Plantars reacting to strong stimulation.
- Cremasteric abolished.
- Abdominal ,,
- Epigastric ,,
- Axillary ,,
- Scapular ,,

The tendon reflexes were all abolished, except those of the musculus triceps brachialis, which were scarcely perceptible. Pupillary reflexes normal; general muscular nutrition normal, as well as the force of the upper extremities; the electro-muscular contractility qualitatively unaltered, but under direct galvanic and faradaic stimulation a slight diminution was observed, especially in the domain of the right popliteal nerve. Tactile and thermic sensibility, local and general, diminished in the lower extremities, as was also "baric" (weight) sensibility; sensibility to pain slightly lessened in the same regions, but on the external side of the left thigh there were some hypoalgesic zones, as well as some hyperalgesic points. A hyperæsthesic zone extended like a girdle round the body, between the transverse mammary and umbilical lines. All other nervous functions normal, including the special senses. There was no alteration of the visual field, and ophthalmoscopic examination revealed nothing abnormal. This condition continued unchanged until April 2nd, when the patient became able to bend his head, and abduction and adduction of the left thigh were recovered to a slight extent. During the following days the power of movement increased rapidly; and the tendon reflexes reappeared, with exaggeration of the knee-jerk and foot-clonus. By April 10th the patient could get up, but he had difficulty in standing erect, and exhibited the gait of a person suffering from spastic paraplegia. From that

Digitized by Google

day until the date of this paper (April 17th) there has been a marked improvement in all the functions of the cord, motor, sensory, and reflex.

This faithful and detailed record must convince the reader that Pasteur's method is not only marvellous as a mode of preventive treatment, but that it may also, when suitably modified, serve as a cure for the disease when manifested in its gravest form. It might be possible to raise the following objections:—

1. Was this patient bitten by a dog really rabid? Experimental proof of this was, unfortunately, impossible, because the dog was killed by some peasants in consequence of his behaviour, which convinced them it was rabid. It showed all the classic symptoms of rabies, and, having wandered (as rabid dogs invariably do) from home, it furiously attacked men and dogs. Of the former, one other person was bitten and treated at the Anti-rabic Institute; while all the bitten dogs were destroyed by the peasantry to prevent them becoming rabid. Of 609 cases treated at the Pasteur Institute, Bologna, five have died (0·82 per cent), of whom three were still under treatment when attacked by the disease. In only two (0·33 per cent.) cases, therefore, can it be alleged that the treatment was ineffective. Of these five cases, four occurred in persons bitten by dogs, which circumstance rendered it impossible to prove experimentally to have been rabid or not.[2] In the case of over 400 dogs the experimental test has been applied with positive results at the Institute, and, judging from this large experience, there is no room to doubt that the animal was rabid which bit this patient.

2. It may be asked if the patient really suffered from hydrophobia. Whoever has carefully read the preceding account cannot fail to recognise that he was suffering from acute myelitis of the lower dorsal region and the lumbar enlargement. The idea that he could have been suffering from hysteria is too absurd for serious consideration. There was no trace of hysteria or neuropathy in the patient's family or in himself; no stigmata were produced. At the outset the fever, intense rachialgia, the hyperæsthesic zone at the base of the chest, the paralysis of the bladder, and the entire abolition of the reflexes of the rectum, all prove incontestably that the medulla was profoundly affected and its functions interfered with, while a portion of the upper part, not so seriously implicated, was in a condition of excessive irritability with reference to centripetal impressions. Later on we find in the successive reappearance of the functions first abolished, and the occurrence of exaggerated tendon reflexes (to such a degree that the patient offered a typical example of spastic paraplegia), a clinical argument indicating the arrest of disorganisation of the medulla, occurring happily at the moment when destruction of the cord was impending. Further, it is a familiar fact that the bite of a rabid dog may be followed by the most serious symptoms of spinal affection, symptoms frequently present where hydrophobia occurs. To assume that the myelitis in this case was due to some unknown cause would indeed be most illogical when there existed so well-known a cause to account for it—viz., the infection from the bite of a rabid dog.

3. It might be suggested that the patient had hydrophobia, but that it was the effect of the treatment and not of the bite. But such a supposition is found to be devoid of any grounds when we consider not only the extreme rarity of cases of hydrophobia among persons treated by Pasteur's method,[3] but also the additional fact, now fully demonstrated, that the virus used for Pasteurian inoculations acts like that derived from animals suffering from street rabies. An ingenious theorist might possibly imagine that Pasteurian inoculations induce a certain immunity to their action in the bulb and cervical medulla, but which does not extend to the dorsal and lumbar portions of the cord. If this were so, then necessarily the cases of hydrophobia which occur among those who have been treated by Pasteur's method should be such as exhibit symptoms specially pointing to the concentration of the virus in the unprotected portion of the cord—i.e., the dorsal and lumbar parts. But they show no such character, and neither theory nor fact support the view that the disease is due to the treatment.[4]

The patient, then, was undoubtedly suffering from most grave symptoms due to the absorption of the virus inoculated when he was bitten by the rabid dog, and no such case has ever been known to recover. Some new influence alone saved him from death, and no other but the application of a modification of Pasteur's method can be recognised. Such a case as this gives grounds for hope that in future a cure may be at our command in even more grave cases. This opinion is not merely founded on this single case, but on consideration of the recorded cases of paralytic rabies, *including this one;* so that it must be regarded as one of a large series, all of which, with this one exception, proved fatal. Already Drs. Poppi and Novi, who proved themselves such able and zealous collaborateurs, are engaged in experiments to test all the aspects of this novel application of Pasteur's great discovery. It is to be hoped that others will be soon in a position to verify the results of this case by facts observed under similar circumstances.

[If it was worth while considering the ridiculous notion that in this case the symptoms might have resulted from the treatment, there is strong reason for observing that the treatment must have cured them. That the intravenous injections of strong material (medullæ of recent date) had no effect is of course absurd, and must appear especially so to anyone who could imagine that the subcutaneous injections actually caused the disease. The emulsion injected subcutaneously makes its way but slowly into the circulation, and that it did so particularly in this case is proved by the local phenomena; the injected material could be felt for some time, and seen as a swelling at the seat of the injection. While undergoing the preventive treatment at Paris, I several times noticed the same thing in my own case, the emulsion evidently remaining, at times, for many hours at the point of inoculation. While slowly making its way from the inoculated place into the circulation which is to carry it to the nervous tissue where it has to combat the dangerous virus from the bite, the emulsion is no doubt undergoing modifications. Undoubtedly all solid particles injected subcutaneously are perfectly filtered out in the tissues before any of the material, injected subcutaneously, reaches the nervous system. But when the emulsion is injected direct into the veins it is, in a moment almost, carried throughout the body, taking with it every particle of medulla, large or small, which it contains, and in this state it encountered the virus which was already multiplying and extending throughout the nervous system of the patient. If the subcutaneous anti-rabic injections could produce hydrophobia in a healthy man, then the intravenous injections into a man already suffering from the symptoms of hydrophobia should, like fuel added to the flames, have rapidly consummated the disaster. But, instead of doing so, we find that the symptoms soon began to disappear when once the protective material was, quickly and unaltered, brought to the seat of danger in the spinal cord of the patient. If the earlier subcutaneous injections, which were largely of weak material (old medullæ) are accused of causing the disease, then it is impossible to assume that the numerous strong injections direct into the veins could have been devoid of effect on the further development of the symptoms. But the fact is that the

[2 The same fact has been observed at the Pasteur Institute, Paris. Of 1316 persons treated there for bites by animals "suspected of being rabid" during 1886-9 there were seven deaths, being at the rate of 0·53 per cent. The general death-rate (including those bitten by animals proved by experiment to be rabid) was 0·67 per cent. This fact is probably due to the greater readiness of persons bitten by a dog presenting well-marked symptoms of rabies, or declared by a competent person to be rabid, to undergo treatment than is shown by those bitten by an unknown dog, which may not appear rabid. It is an unfortunate and general mistake to assume that rabid dogs are always furious.—(Les Vaccinations Anti-rabiques à l'Institut Pasteur, par M. L. Perdrix.)—T. W. H.]

[3 Out of 10,992 treated in Paris during 1886-91, only 62, or 0·56 per cent., died. If the treatment could cause the disease, one would certainly have expected more deaths among this great crowd of persons treated. Further, the death-rate has steadily and largely diminished year by year. How could this be accounted for if the patients all continued to be inoculated with similar material, and that a substance capable of giving hydrophobia?—T. W. H.]

[4 When an animal dies of rabies, after infection with the intense "laboratory virus," the virus taken from it is found to be still laboratory virus, and not to have changed by one passage through the animal in question. There can be no doubt that if a man were infected with hydrophobia by the virus inoculated as a preventive ("laboratory virus"), then an animal inoculated from him should exhibit symptoms of being infected by "laboratory virus." This, however, has never occurred, though such test inoculations have been frequently made. The animals inoculated with the virus from the man have not become infected in from five to six days and died in from ten to eleven days, as they must have done had the man died of "laboratory rabies"; on the contrary, they have always exhibited the symptoms, now perfectly familiar, shown by animals suffering from "street rabies." This, therefore, must have been the kind of virus from which the man died—the ordinary virus of the rabid animal which attacks and bites and not the intensified "laboratory virus."—T. W. H.]

Digitized by Google

symptoms rapidly disappeared when the strong intravenous injections were adopted. It is absurd to accuse the Pasteurian method of causing hydrophobia by weak subcutaneous injections, while compelled to admit it can cure the disease by strong intravenous injections. There is no escape from the dilemma. If the anti-rabic injections caused hydrophobia in Professor Murri's patient at the outset, they also cured him at the end.—T. W. H.]

Bradford.

A REPORT ON THE

COMPLETE ABANDONMENT OF THE OPERATION FOR REMOVING CALCULI ENTIRE FROM THE BLADDER,

AND THE METHODS EMPLOYED INSTEAD, AT THE CIVIL HOSPITAL, HYDERABAD, SINDH.

BY SURG.-MAJOR J. FORBES KEITH, M.D. & C.M. ABER.,
CIVIL SURGEON AND SUPERINTENDENT, MEDICAL SCHOOL.

SEEING an account of a discussion at the Medical Society of London in THE LANCET of March 21st, 1891, concerning the various methods adopted at the present time for removing calculi from the bladder, I thought it my duty to lay before the profession a report on the complete abandonment of the operation for removing calculi entire from the bladder, and the methods employed instead, in the Civil Hospital under my charge. As a preliminary observation I may remark that my experiences in this branch of surgery are, as far as I am aware, unique. In the course of the three years I have held this appointment I have operated 739 times for stone. In the month of May, 1891, I performed fifty operations for stone—thirty-seven lithotrites and thirteen by other methods,—to be subsequently described, all successful, notwithstanding that the thermometer stood at 104° in the operating theatre, and that the cases operated upon were indiscriminately undertaken as to age, sex, duration of disease, condition of health, or size of stone.

The first method: lithotrity.—As performed in this hospital there need be no longer any hesitation in calling it by that name, aspiration as an integral part of the operation being almost if not entirely abandoned. Lithotrity is always performed here when the screw of the largest lithotrite the urethra can readily admit coincides with the diameter of the stone—in other words, when the diameter of the stone is small enough to allow the two screws (male and female) of the largest lithotrite the urethra can readily admit to combine with a hold sufficiently powerful to crush the stone. One exception to this rule, as far as my experience goes, is when the stone is too hard to be thus dealt with, in which case the hammer-and-chisel method—to be hereafter described—is adopted. In my first attempts to crush such stones I have had two accidents in about 100 cases. Once I broke the female screw of a fine new lithotrite just out from home, and once dislodged the male blade from the female at the angle of the jaw and bent it backwards towards the screw. After the administration of chloroform the first step is to thoroughly wash out the rectum with Condy's fluid. Lithotrity cannot be elegantly performed if the finger in the rectum, intimately coöperating with the lithotrite or catheter in the bladder, is constantly coming in contact with fæces. The bladder itself must also be thoroughly washed out if the urine is in any way tainted, as it frequently is in the aged, after which it will be found more tolerant of the auxiliary fluid. When a sufficient quantity of the latter has been introduced, the point of the lithotrite on its first introduction is met by the index finger of the left hand immediately on a plane behind the sphincter ani, and is then guided by the finger through the prostate and into the bladder. The information gained is to me of paramount importance, as my finger in the rectum never loses sight (so to speak) of the relation between the stone and lithotrite in the bladder. Further, the quantity of auxiliary fluid, which is readily detected by its bulging behind the prostate; the position of the stone, with its relation to the lithotrite; the amount, character, and position of the débris, with its relation to the evacuating catheter, and any débris lurking amongst irregularities of the mucous membrane of the bladder, or behind an enlarged prostate—all these conditions are readily distinguishable by the finger in the rectum coöperating with the lithotrite or catheter, as the case may be, in the bladder.

I mentioned that lithotrity was performed when the diameter of the stone coincided with the screw of the largest lithotrite the urethra was capable of readily admitting; but although the stone is broken up in the first instance by the largest instrument admissible, a size smaller is preferred to finish the operation. Experience taught me this lesson. Some stones break up into finely divided mud or sand, which, mixing with the fluid in the bladder, wells up between the lithotrite and the walls of the urethra. It has various colours, according to the quality of the stone, appearing sometimes almost milky white, and passing through various shades, such as from meerschaum and fawn to brick red. The welling up of these colours always warns me not to go on working with the largest lithotrite the urethra can admit, but to change it for one of much smaller size, otherwise great difficulty will be found in removing it owing to the instrument having lost its glossy smoothness and become coated by a bluish-black film, and the urethral mucous membrane itself will be found to have lost its oily smoothness and become coated by finely divided mud. *En passant*, I may mention that chemical action, moreover, is not absent, for I have noticed effervescence during the operation when crushing meerschaum-coloured stones, and their débris has a peculiar way of adhering to the walls of the bladder, requiring force to separate it, and gas bubbles remain intimately mixed with débris until it becomes dried. Along with these there is another danger mentioned by Surgeon-Major Keegan—viz., spasmodic irritation caused by the frequent passage of instruments along the mucous membrane of the urethra, and there is also the continual friction of the male blade of the lithotrite; but the result of all these circumstances can be avoided and all anxiety removed by operating with a smaller-sized lithotrite than the urethra is capable of readily admitting. This is my invariable practice, and I have rarely any cause now for anxiety, except when operating upon very young children with very narrow urethræ, which admit with difficulty, and sometimes not at all, the smallest lithotrites that can be made.

I mentioned that as the aspirator is very rarely used for the purpose of evacuating the débris of calculi from the bladder, the term "lithotrity," as the operation is performed here, is peculiarly applicable. No surgeon familiar with the numerous manipulations connected with the various stages of this operation can have failed to observe that the expulsive power of the bladder is normally greater than might at first be anticipated. As illustrations it may not be considered superfluous to bring forward the following facts, which are intended to have a twofold significance, not only to demonstrate the expulsive power of the bladder, but also to show what reasons led me to abandon the aspirator as a chief factor in the operation.

1. Some time ago a boy about eight years of age was admitted into hospital suffering from retention of urine. He was brought into the operating theatre, and his case with the diagnosis was handed to me. He was placed on the table, and it was observed that urine had accumulated to some extent in the bladder. A catheter was introduced, but it proceeded only a little way when it was found that there was a small calculus impacted midway between the scrotum and glans penis. Under chloroform I tried to move it, but it would not stir out of its place. When I was making preparations to slit open the urethra the patient made a violent strain, urine was voided, and the calculus shot clean out of the urethra over the table and fell into the basin below. No one would have thought of introducing an instrument into this child's urethra with a diameter equal to that of the little oblong pebble so summarily expelled from it. Calculi carried high up the urethra and impacted in like manner are, as every surgeon is aware, of frequent occurrence. 2. While pouring the auxiliary fluid into the bladder preparatory to the operation, and holding the nozzle of the syringe in the meatus urinarius externus, I have observed, when the patient was not profoundly under the influence of chloroform, the piston, which had been pressed quite home and all fluid expelled from the syringe, gently but surely forced back again, and I have also observed it rising sometimes to the middle of the syringe, and sometimes actually reaching its

Digitized by Google

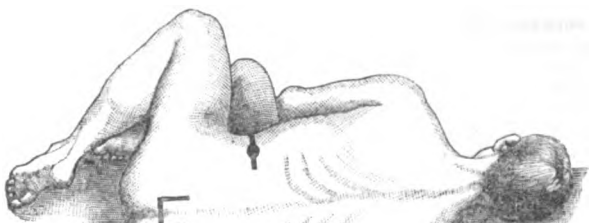
mouth. 3. Again, I have noticed that after the introduction of the lithotrite, when the auxiliary fluid could not make its way up between the walls of the urethra and the lithotrite, it forced its way up between the stems (male and female) of the lithotrite, and appeared like little beads on its shaft above the glans penis, and during the operation these beads will be seen coloured by the débris. 4. Lastly, on the first introduction of the evacuating catheter, whilst, on the one hand, I have often had it blocked so effectually that the aspirator was powerless in removing the obstacle, that the introduction of the stilette and the application of force were also as ineffectual, and at last the catheter had to be withdrawn and another used in its place, as valuable time would be occupied in extracting the débris from it; on the other hand, I have seen a column of débris expelled from its mouth and shot in a parabola six feet beyond the operating table. This *vis a tergo* appeared so great that the addition of *vis a fronte*—viz., aspiration—seemed to me superfluous.

Then, again, I had certain objections to the aspirator. 1. I have observed that after the first movement of aspiration a certain amount of mud is always mixed up with the fluid in the aspirator, and it increases indefinitely as aspiration proceeds, and for a longer or shorter period muddy water is thrown backwards and forwards between the aspirator and the bladder. I have noticed the fluid get so impregnated with mud that I could not see the heavier particles falling through it, and could only know I was gaining ground by the general accumulation of débris at the bottom of the bulb. 2. Again, in old subjects, who are invariably sufferers more or less from genito-urinary irritation, whose prostate glands and adjacent structures are congested, softened, and sometimes organically changed, whom one can scarcely touch without exciting hæmorrhage, in them it is found that, with the first aspiratory movement, not only mud, but (however delicate the manipulations may be), blood is also mixed with the fluid in the aspirator. 3. If care be not taken to keep the evacuating catheter always full of fluid at the moment it is connected with the aspirator, air will along with the mud and blood get churned backwards and forwards between aspirator and bladder. 4. During aspiration I have seen patients wince, even when under chloroform, when débris was forced against the walls of the bladder; for, if it rattles against the catheter, as it may be distinctly heard to do, it must also beat with an equal amount of force against the vesical walls. This may injure the mucous membrane of the bladder and evil results follow.

The two orders of facts connected with the bladder and aspirator were being continually contrasted together in my mind, and I confess to entertaining a certain amount of prejudice against the faults inherent in the construction of the aspirator. But although these defects kept me constantly thinking upon the possibility of remedying them, it never for once entered my mind to abandon the aspirator until I had actually done so for some time. Unwilling to pass blood through the aspirator if I could avoid it, and searching to counteract the defects of the instrument, I unconsciously found myself using the aspirator as a syringe. It was applied to the evacuating catheter, its contents gently emptied into the bladder, and the stopcock shut; after which the aspirator was removed in order to be refilled and used again in the same way. Then the water, with large fragments of débris tinged more or less with blood, would escape, always with force, sometimes with considerable violence, from the mouth of the evacuating catheter. By a few repetitions of this process I found that I not only got rid of the anxiety of having the aspirator contaminated with blood, but also of the to-and-fro movement, between the bladder and the aspirator, of débris, blood, and air; and that the evacuation of the débris from the bladder was as effectually performed as if I had been working with the aspirator itself. Having unconsciously groped my way so far in counteracting the defects of the aspirator, the next step was easy and quite natural—viz., to use a syringe instead of the aspirator, which had for some time now been performing this degraded office, with its own proper function held in abeyance. I continued to use the syringe for some time, and then an apparatus was contrived which was very simple, but at the same time very effective, and which successfully competed with the aspirator, and superseded the syringe, in the process of evacuation of the débris of calculi from the bladder, and adapted itself with peculiar facility to the coöperative process mentioned above between the finger in the rectum and the catheter in the bladder. At the other end (from the eye) of the evacuating catheter, and on the opposite side, an opening is made, close up to its mouth, similar to the eye, or like the hole of a flute, which can be closed by the finger or thumb as may be found convenient. This evacuating catheter is then attached to one end of a long piece of india-rubber tubing, which by its other end is connected with a little pipe, or tube, which issues from the bottom of an old kerosene oil tin-case, partially filled with boracic acid lotion of the proper strength. This simple apparatus forms a complete substitute for the aspirator in urethral lithotrity. When the stone is crushed and ready for evacuation, the catheter is oiled and introduced into the bladder, an assistant in the meantime pinching the indiarubber tubing between his finger and thumb to keep the water from flowing out of the catheter while it is being introduced. When the catheter is in the bladder the operator closes the flute-like opening with his thumb or forefinger, and the assistant simultaneously sets the indiarubber tubing free. Fluid flows into the bladder for a short period, and then stops of itself, as can be easily seen by a glass indicator which is attached to the apparatus. Directly the fluid stops, the operator with a simultaneous movement opens the flute-like eye in the catheter and pinches the india-rubber tubing. Fluid and débris issue with violence sometimes, always with sufficient force, from the flute-like opening. A repetition of this process for a few times, and the débris of most stones is rapidly evacuated. In children, where the débris must be reduced to finely divided powder or mud before it can get through the eyes or cannulæ of such small catheters, evacuation of the débris can be effected by merely letting the water fall out of the syringe into the mouth of the evacuating catheter without in any way connecting them, and the reflex action of the bladder thus excited will at once cause the evacuation of the débris. With the irrigation stopcock made by Joseph Leiter of Vienna (which can be opened and shut by a backward and forward movement of the thumb), attached to the india-rubber tubing instead of the evacuating catheter itself, a permanently going syringe can be held in the hand, and its nozzle can be connected with, or withdrawn from, the evacuating catheter at pleasure. Since receiving my new instruments from home (in February last) I have performed 100 operations without a death, and 157 with three deaths.

(To be concluded.)

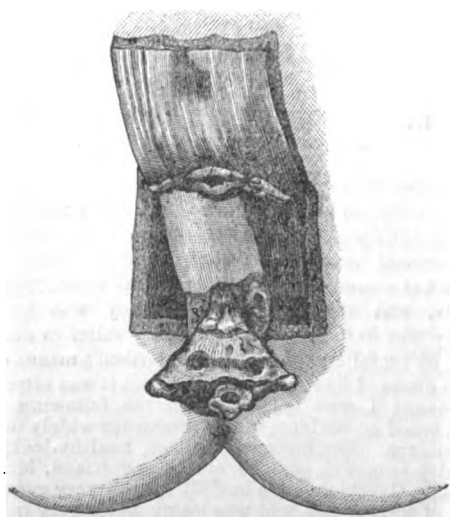
NOTES OF A CASE OF EXCISION OF THE RECTUM.



BY W. H. BROWN, F.R.C.S. IREL. &c.,
SURGEON TO THE LEEDS INFIRMARY.

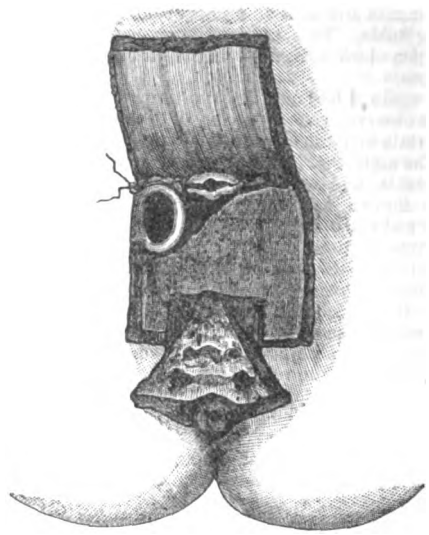
EXCISION of the rectum for malignant disease has (with a few exceptions) hitherto been confined to growth affecting only the anus and that portion of the bowel within reach of a perineal wound. In that class of case where the disease has commenced high up perineal proctectomy is not possible, and the palliative colotomy was until very recently the only means of affording relief to the distress caused by rectal cancer. Kraske described a means of reaching the diseased bowel from behind, and it was after reading his account I was led to make the following attempt which, based on his idea, differs somewhat widely in method of procedure. The patient, a robust, healthy-looking man aged fifty-two, was sent to me by my friend, Mr. Wilson of Kirkby-Overblow. He had all the ordinary symptoms of cancer of the rectum, and was losing blood very freely each time the bowel acted. Upon examination the growth could be reached, but it was situated too high up to allow of an ordinary proctectomy. The bowel was, however, freely movable within the pelvis, and the finger could, though with difficulty, be passed beyond the disease. A left lumbar colotomy was first performed, and the patient returned home for a month prior to the major proceeding of excising the rectum being carried out. Five weeks later, the artificial anus being well established and acting freely, the lower segment of the intestine—i.e., between the colon opening and the anus—was thoroughly washed out with large quantities of carbolic lotion (1 in 80) twice daily,

Digitized by Google



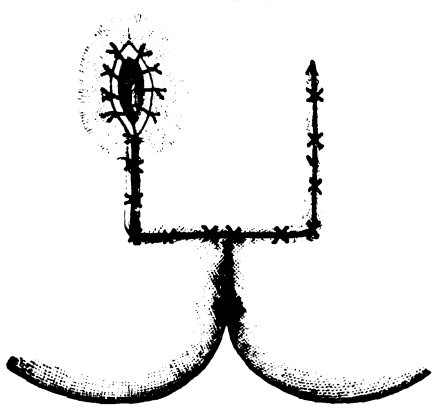
until the washings were quite free from fæcal taint; this was repeated on the two days preceding operation, and again just before the anæsthetic was administered. After ether had been given, a No. 12 silver catheter was passed into the bladder and held in position throughout the whole of the subsequent operation. The patient was then turned well over on to the right side and the thighs flexed upon the abdomen. A square flap, four inches in length and four in width (see Fig. 1), was raised from the posterior surface of the sacrum, the free edge being two inches above the anus and the attached border being opposite the third piece of the sacrum. This flap, which included in its

FIG. 1.



thickness all the tissues down to the bone, was turned *upwards*. The sacrum was then sawn transversely across at the level of the fourth vertebra, the lateral attachments below as far as the tip of the coccyx severed, and this bone "flap" turned *downwards* (see Fig 2). Hæmorrhage was very free, but was easily controlled by "clip" forceps and sponge pressure, a few larger vessels being tied. The finger was next passed through the anus well up into the rectum, and the gut gradually freed by means of scissors from its attachments. There was again smart bleeding, but it was easily restrained. On attempting to draw the bowel out of the wound, it was found that the disease extended higher than the level of the

FIG. 2.



cut edge of the sacrum. A further portion of that bone (three-quarters of an inch) was therefore removed altogether. This gave the required space. The rectum was then divided just above the internal sphincter and drawn out of the wound, and slit up the posterior surface, the cut extending well above the upper limits of the growth. This posterior incision allowed of the rectum being opened out, and gave a clear view of the extent of the disease, enabling the removal to be undertaken with precision and deliberation. The bowel was now seized above the level of the growth with large pedicle forceps and cut away with scissors, the line of removal being half an inch above the upper limit of the disease. A few vessels in the bowel required ligature. The free end of the rectum was stitched into the upper angle of the wound (see Fig. 3), and plugged with a large sponge to prevent possible fouling of the cavity. All remaining bleeding points were then tied and the wound well filled with iodoform and gauze, after free irrigation with hot antiseptic lotion (perchloride 1 in 2000). The sacrum was then replaced and the skin flap turned down, and, free drainage being provided for, secured with a few points of suture (see Fig. 4). No enlarged glands were detected. The wound was dressed with dry wool, and firm pressure exerted by means of a bowel flannel roller. There was little shock; apparently the peritoneal

FIG. 3.

cavity was not opened. A few days after the operation the opening in the colon ceased to act, this being due to the "drag" made upon the bowel, causing the "spur" to disappear. The result was that fæcal matter passed downwards into the rectum, and, in spite of most careful and repeated dressings, the wound became foul, and the patient showed signs of septic poisoning. The wound in the bowel was therefore reopened, and the colon drawn out and divided. This effectually prevented any further fæcal escape into the rectum. In a future case I would deal

FIG. 4.

with the colon in this way, instead of again trusting to an ordinary colotomy. Beyond the accident the after-history is not important. The wounds healed slowly, taking some days to recover from the disturbance caused by the exposure to fæcal matter. The patient required the catheter so long as he was kept on his side, but passed urine without assistance so soon as he was allowed out of bed. His general health was well maintained, and he suffered but little pain.

Remarks.—As the operation constitutes a new departure in dealing with rectal cancer, I have described at length

Digitized by Google

the method I adopted which, though based on the operation described by Kraske, still differs materially in many points. After reading Kraske's description of his operation and, further, the case related by Dr. John C. Davie,[1] it struck me that the incisions there mentioned might hamper one in manipulation, especially if the growth should be higher up in the bowel than at first diagnosed. I therefore made some experiments on the cadaver and decided on the incision I have described, as giving greater space without involving the sacrifice of any important structure. Again basing my action on the same experiment, I divided the sacrum transversely; this enabled me to get a clear view of the cavity. I was much struck by the extremely close relationship between the rectum, bladder, and urethra, and felt that one of the main difficulties to be avoided was wounding either of the latter. This led me to have a silver catheter kept in the bladder throughout the operation. Though this is not mentioned in either of the accounts I have quoted, I am sure it is necessary to enable the operator to avoid calamity whilst stripping off the rectum from the front. I found it by no means easy to define—when aided only by the finger in the rectum—the proper height at which to divide the bowel. I therefore slit up the rectum; this gave me a full and complete view of the area of disease, without in any way adding to the hæmorrhage or fouling the wound. This—which to me was a great help—does not appear to have been thought necessary in the previously recorded cases. The remainder of the steps of the operation were conducted on the ordinary principles employed in dealing with large open cavities. The operation is still on its trial. It seems, so far as can be judged from the few instances recorded, to afford opportunity of dealing with the particular form of cancer at least as successfully as many other recognised operations. It is also superior to the ordinary proctectomy in that it allows of a wider removal. I am, however, sure that it can only safely be employed in those cases of rectal cancer which are seen and diagnosed at an early stage, and should never be undertaken unless the limits of the disease can be clearly defined, and when the bowel is felt to be freely movable. It does not seem to be likely that it will ever be practicable to restore the continuity of the rectum with the sphincter after extensive removal, as the attempt would involve great tension, too great to permit of rapid union. The opening made into the pelvis is large, but its very size, I think, enhances the safety of the operation, for it permits of all parts involved being fully in view, and enables the needful dissection to be undertaken with precision, and, further, all bleeding points are well under control. Again, thorough drainage can be secured with certainty. In a smaller wound these difficulties and dangers would be less easy to overcome. It is certain that, should the operation be further tried, many variations and improvements will be suggested. For the present I offer this single experience, and I have endeavoured to point out the difficulties as they occurred to me.

The accompanying sketches illustrate the lines of incision and the appearance of the wound in the various steps of the operation, together with the present condition of the parts.

Leeds.

CONCEALED ANTE-PARTUM HÆMORRHAGE AND PLACENTAL APOPLEXY.[2]

BY JOHN B. HELLIER, M.D. LOND.,
LECTURER ON DISEASES OF WOMEN AND CHILDREN IN THE YORKSHIRE COLLEGE.

THIS paper is based upon observations made on the same patient in two successive pregnancies.

Mrs. A——, aged thirty-nine, mother of nine children, was daily expecting confinement; she is habitually sallow and anæmic, not strong, and liable to migraine. On August 16th, 1889, she was sitting quietly in her house sewing, when she suddenly at 4 P.M. became alarmingly faint. She had received no injury, and no shock physical or mental. There was no vaginal hæmorrhage, nor had there been any during the pregnancy. I first saw her at 6.30 P.M. She was extremely faint, with very weak pulse, and was decidedly blanched. She was not unconscious, and was said to be much better than she had been when the symptoms commenced. The os uteri was just sufficiently dilated to admit the tip of the finger; the membranes were intact, and the head was presenting. Very slight labour pains were present, but there was no coloured discharge. The patient was obviously very ill, and the probability of the presence of intra-uterine hæmorrhage at once suggested itself, but still it was not impossible that some other cause might have occasioned syncope in such a patient, especially as total concealment of accidental hæmorrhage is most uncommon. At 7 P.M. the pains were coming feebly, and I decided to give some ergot and to rupture the membranes. The liquor amnii was almost perfectly clear, and there was still no hæmorrhage. The head now came well into the os. As there seemed no indication for active interference, and as the patient was no worse, I awaited the course of events. At 11 P.M. a dead male child was born by natural efforts after an easy second stage. Now the diagnosis was placed beyond doubt. There is a phenomenon sometimes described in obstetric reports as an "avalanche." Such an obstetric avalanche was now seen. The child was followed by a gush of blood-stained liquor amnii and by a huge quantity of dark blood-clot, which at once filled an ordinary wash-hand basin, and also by the placenta. Fortunately there was no further hæmorrhage after this, and the patient was not obviously worse for what had just happened.

Convalescence was tedious, the patient suffering much from headache and insomnia, but ultimately recovery was complete. The patient again became pregnant about September, 1891, and progressed satisfactorily up to Jan. 3rd, 1892. Then she had an attack of metrostaxis, which lasted for two days and then subsided, but was followed by a very slight show for several days. On Feb. 8th, 9th, and 10th she had a return of the metrostaxis, which again was followed by a very slight daily show. On Feb. 26th hæmorrhage occurred rather severely, this time accompanied by slight pain. She also became very faint. I saw her about 9 A.M., and found on examination that the cervix was slightly patulous, and that it was difficult to reach any presenting part through the long cervix, but that the head was there. I inserted a Barnes' hydrostatic dilator and administered ergot, and at noon she was delivered of a dead female six-months' fœtus (not macerated). The placenta came in six or seven minutes, and there was no post-partum hæmorrhage. A small amount of clot accompanied the placenta. The mother made a good recovery.

Description of the placenta.—The placenta weighed seven ounces and a half. The fœtal surface was not abnormal but the maternal surface presented in its centre a soft fluctuating nodule as large as a good-sized walnut; on incision this was found to be occupied by a clot which could be enucleated easily. The clot was covered above by a layer of placental tissue, a quarter of an inch thick. Close to this there had been another hæmorrhage of about the same extent, but the clot had almost all escaped, and the smooth cavity which was left was torn open. There were several other smaller infarcts in different parts of the placenta, and at one spot the tissues were very soft and pale, as though an old infarct had broken down.

Remarks.—The patient presented, in the first place, an instance of concealed accidental hæmorrhage. Dr. Galabin says that at Guy's Hospital in 23,591 deliveries there were thirty-one cases of accidental hæmorrhage, and of these only one was concealed. Probably these figures under-estimate the frequency of the condition, but it certainly is exceedingly rare. Accidental hæmorrhage occasions some of the most dangerous conditions an accoucheur has to face. In 106 cases collected by Goodell 51 per cent. of mothers and 94 per cent. of children were lost. The present case was not an extreme one, the blood forming a localised clot and not bursting into the amniotic sac. In the last pregnancy we see an example of the occurrence of metrostaxis during pregnancy, a phenomenon which is not so very uncommon, and concerning which I have already made a communication to the Leeds and West Riding Medico-Chirurgical Society. In this instance we are able to demonstrate a cause for its occurrence. Hæmorrhage took place at more than one date into the placental structure, and probably also upon the uterine surface of the placenta. The first hæmorrhages did not interrupt the pregnancy; the

[2] A paper read at the Leeds and West Riding Medico-Chirurgical Society, Feb. 5th, 1892.

Digitized by Google

latest one would have done so, I believe, even without artificial dilatation of the cervix. The placenta as shown to the above Society is a very interesting and typical specimen of placental apoplexy. There was no history of syphilis or tubercle in this case. On microscopic examination a section through the placenta at the edge of the infarct showed some disease of the vessels, but no decided fatty change.

Leeds.

GASTRO-JEJUNOSTOMY FOR PYLORIC CANCER; RECOVERY.

BY F. A. PURCELL, M.D., M.CH.,
SURGEON TO THE CANCER HOSPITAL.

F. M——, aged forty-four, married and the mother of two children, was admitted into the Cancer Hospital on March 3rd, 1892. The patient, a spare woman, weighing (nude) 5 st. 13½ lb., is suffering from cancer of the pylorus and stomach wall. She complains of pain in the stomach and the right hypochondrium; vomiting (no blood) comes on about two hours after taking food; bowels irregular, habitually constipated, motions dark, with débris of blood; heart has a reduplication of first sound; lungs sound; urine alkaline, contains no albumen. A distinct tumour is to be felt over the pylorus, nodulated and movable, extending from the right to across the middle line of the umbilicus. The stomach is enlarged; a succussion splash is distinctly produced. The nature of the disease was explained to the patient. The gradual wasting, constant vomiting, and little or no fæces passed, confirmed the serious outlook of gradual starvation and exhaustion, caused by disease occluding the outlet of the stomach. After a consultation at which the condition was confirmed by my colleagues, it was decided to explore the pylorus and, if feasible, to perform pylorectomy, and gastro-jejunostomy by means of Senn's decalcified bone plates. The patient gave her ready consent to the resection of the pylorus. Preliminary to operation, on March 11th, the stomach was commenced being daily washed out by means of a long soft rubber syphon tube, passed into the stomach by raising the tube (with a funnel at top) and pouring the fluid in; then lowering the end below the bed, syphon action, the fluid was all drawn off, together with any débris of food and mucus; a quart of warm water was first used, then a quart of a 2 per cent. solution of salicylate of soda, finishing with a quart of warm water to thoroughly get rid of the salicylate of soda. The passing of the tube and the washing out process gave no distress, unpleasantness, or discomfort to the patient. Nutrient enemata were administered per rectum night and morning; peptonised milk and essence of beef only were given by the mouth. This was continued for nine days. On March 18th, the day prior to operation, the stomach was not washed out, owing to a feeling of weakness and faintness; that night the bowels were cleared out by a soap-and-water injection. At 10 P.M. she partook of five ounces of peptonised milk.—March 19th: Day of operating. Nothing given by the mouth. At 7 A.M. a beef-tea enema was administered, and at 2 P.M., just prior to being placed on the table, an ounce of beef-tea and an ounce of brandy were administered per rectum. Full preparations were made for resection of the pylorus, and for the gastro-jejunostomy two of Senn's decalcified bone plates were threaded with four long threads, the two end ones of Chinese silk, the two lateral of chromicised catgut; fine intestinal needles threaded with fine chromicised catgut for suturing the peritoneal surfaces together. A hot-water bed was placed on the operating table for the patient to lie on to keep her warm. She was anæsthetised with chloroform by Dr. Bourns. I arranged with him, so soon as I had completed the incision in the abdominal wall and had thoroughly explored the diseased pylorus, that he should ease the patient out of the chloroform, supplying enough to simply control her. This Dr. Bourns satisfactorily carried out. Time occupied, fifty minutes; amount of chloroform used, six drachms; no sickness. I was assisted by my colleague, Mr. F. B. Jessett. A four-inch incision was made in the middle line from the umbilicus towards the ensiform cartilage. The stomach presented itself in a much enlarged condition, and the free border on the right was implicated with disease for about four inches, extending into the pylorus and encircling the duodenum down to and fixing it to the spine below. Disease on the stomach wall was the movable tumour felt on examination. It was self-evident that the disease was too extensive to attempt resection of the pylorus. This, then, was abandoned. Gastro-jejunostomy was proceeded with. The jejunum was sought for and found deep down above the border of the left kidney and brought outside the abdominal wound. Its course towards the duodenum was travelled along until a part which came in easy apposition with the front wall of the stomach was selected to attach to the stomach. A piece about four inches was included between two round rubber elastic ligatures. These ligatures were lightly tied with one knot and clamped with torsion forceps to prevent slipping. The anterior wall of the stomach was drawn out and warm sponges packed around; a vertical fold was pinched up with the fingers, avoiding bloodvessels; a three-quarter inch incision was made with scissors through the entire coats; the mucous membrane that protruded was pared off, and a few bleeding points were secured and tied. One of the bone plates was then inserted through the opening. The lateral threads of chromicised catgut armed with needles were passed through the entire coats from within outwards, about one-eighth of an inch from the edge of the wound. The end threads of silk were brought out at the ends of the opening, and not passed through the walls of the gut; the several threads were held so as not to cross or get mixed.

The portion of jejunum already isolated was now taken; its internal aspect was pinched up into a transverse fold and cut across longitudinally three-quarters of an inch to correspond with the opening in the stomach; the mucous coat protruding was pared off, any bleeding vessel being tied; the second bone plate was passed in, and the several threads treated as above described. The threads were now drawn taut, and my assistant adapted the plates in apposition, the fingers of both hands encircling fixed them; the bottom gut ligatures were now tied firmly, but not too much squeezed; the tying was done by drawing the threads longitudinally down between the surfaces; the corresponding end threads of silk were tied; and, lastly, the upper lateral ones of gut; ends of all were cut short. My assistant still keeping hold of the plates, I passed some six quilt[1] sutures around the upper border and ends, securing the peritoneal coats of the stomach and bowel together; the under border was not touched. The round rubber ligatures were released from the bowel. The toilet completed, sponging of the abdominal cavity was necessitated to get rid of some ascitic fluid; the channel seemed perfectly stanch. The abdominal wound was brought together with silk-worm gut ligatures, dressings, and flannel binder applied completed the operation, which lasted fifty minutes. Much time was wasted in exploring the pyloric disease. The patient was nice and warm, and came easily out of the chloroform, having consumed six drachms. I thank Dr. Bourns for the way he managed the anæsthetic, and also thank my colleague Mr. Jessett for his kind assistance and for the admirable way he held the bone plates when inserted, which is a most material point in the operation.

That night, on account of severe pain, a hypodermic injection of one-sixth of a grain of morphia was inserted in the arm, after which she slept for an hour and a half. She was given a teaspoonful of tepid water every half hour; no sickness; a few drops of brandy were added later on during the night; urine drawn (seven ounces).—20th: Two teaspoonfuls of peptonised milk with the same quantity of water and four minims of brandy were given every hour; little pain. Slept three hours; urine drawn (nineteen ounces). Brandy increased to one ounce.—21st: Progressed since last report; sleep extended from six to seven hours. Milk-and-water has been partaken of freely, and to-day she has had mutton broth. Plenty of urine passed, no sickness, and little pain.—22nd: A soap-and-water enema relieved the bowels; diet increased by addition of eggs; brandy discontinued.—23rd: Fish dinner, which she enjoyed. Bowels moved by simple enema; all sutures in abdominal incision were taken out. The wound looks well; the dressing had not been touched since first put on.—27th: Removed from special ward to the general ward. She soon made a move up to the couch, and began to partake of the usual meals, without any distress

[1] The quilt or square suture for intestinal work was introduced by Mr. Halstead of Baltimore, and is a great improvement on the Lembert suture.

Digitized by Google

or discomfort. Temperature on the 20th, at 10 A.M., went up to 100°F.; on the 22nd, at 10 A.M., it was normal; it slightly varied until the 26th, after which it was not taken. Pulse was steady all through, at 86 to 80. The patient is improved in appearance, and has gained flesh. Discharged from hospital on April 14th.

I thank my house surgeon, Mr. Sylvester Willard, for the way he prepared the patient for operation, and the care he bestowed during the after treatment.

Manchester-square, W.

ACQUIRED DEAF-MUTISM.

BY R. SHALDERS MILLER, M.B. LOND., F.R.C.S. ENG.

THE popular notion that the deaf and dumb are always born in that condition is by no means correct. Deafness may be acquired in the early months of life, and if it persist it results in dumbness. I can offer no information as to the relative frequency of congenital and acquired cases of deaf-mutism, but I wish to show that in some instances, certainly, the acquired form may be remedied. Children often become deaf in the early years of life, and there seems to be no reason why the same should not occur in their early months; and in the latter event they will never learn to speak naturally unless the cause of deafness be removed. I have met with one example of the recovery of fair hearing without treatment, in adult life or in adolescence, in a man who had been regarded as a deaf-mute; but he never learned to converse, though he could utter a few short words, and could answer questions if they were so formulated as to allow of monosyllabic responses. This man had not learned "lip-speaking"; he heard ordinary sounds around him, but he always wrote his remarks if they needed to be put into several words. Another patient, a woman, presented a very similar history and condition, but was unable to articulate any intelligible sound; she replied to questions by signs only. She was, however, of somewhat feeble intellect. The case to which I would more particularly call attention is that of a child, F. P——, who was first brought to me in April, 1889, and was then four years old. She was absolutely deaf to all sounds around her, and it was impossible to get any trustworthy indication as to hearing by conduction through the cranial bones. On examination the child was found to have slight otorrhœa, the membranes of the drums were somewhat retracted, there was chronic catarrh of the naso-pharynx, and the tonsils were greatly enlarged. I removed both tonsils, treated the meatuses and naso-pharynx by ordinary means, and inflated the tympana by Politzer's method. In a few days after treatment began the child gave clear indications of hearing, being startled by loud noises, and was evidently pleased with the sound of church bells &c. She would also answer a knock at the door, and imitated the "clucking" of poultry. For many weeks, however, she made no attempt to speak, and it was difficult for her parents and sister to overcome their constant habit of communicating with her by signs, for which she was extremely watchful. One of the earliest words she learnt was her own name. In about six months she was sent to school with her sister, where she learnt much more quickly, especially from her schoolfellows. She has had several relapses of deafness due to cold during the last three years, but has been promptly relieved by inflation. Her mother has laterly supplied me with a list of over sixty words which she pronounces plainly, one of the longest being "grandmother," and another (one of the most difficult perhaps) "Irish." The list also contains some sentences, such as—"Wait a minute," "I'll tell father," &c. She pronounces all the letters of the alphabet clearly except G, K, N, Q, R, S, and Z, which are less distinctly articulated separately, though words containing those letters are fairly well spoken. She is not quick at figures, but names them perfectly up to seven, and less plainly up to twelve. Before her meals she says "grace," consisting of eleven words exclusive of "amen," which she calls "apen." She also repeats a prayer of nineteen different words, which are well articulated, though in a childlike fashion.

Another case of acquired (as I believe) deaf-mutism was that of a child two years old, who was brought to me for treatment about seven years ago. This child had never given evidence of possessing a trace of hearing. Her drums were retracted, but she had no perceptible catarrh of the external meatuses. I tried inflation, and at the first attempt succeeded in filling the left tympanum with air, but not the right. After two or three visits the child noticed sounds—e.g., she looked round sharply when I entered the room, though her back was towards the door. The first sound this patient gave evidence of hearing was the loud clacking noise of a metronome which I set in motion behind her back. The child was under observation for only about three months, as her parents, being very poor, had to leave the neighbourhood to obtain work; but before going away she had learned to recognise her own name, and responded readily when it was uttered. Up to the time of my losing sight of the case I had never been able to inflate the right drum, but probably should have done so later on, especially if I had used the tympanic catheter. It was very noticeable that on the occurrence of any sudden sound the child invariably turned towards the left, the hearing side. The only other case of deaf-mutism that has been brought to me for treatment was certainly congenital, and curative treatment was impracticable.

Twenty years or more ago a French surgeon, whose name I forget, suggested that deaf-mutism might be due to Eustachian obstruction leading to retraction of the membrana tympani and consequent pressure upon or stretching of the chorda tympani, and that the injury to this nerve was the cause of dumbness, from which, perhaps, one may infer that he regarded the chorda tympani as a motor nerve of the tongue, or as being in some way concerned in the production of articulate speech, whereas it is a secretory nerve as to the submaxillary and sublingual glands and sensory as to the tongue. Any cause of total deafness in an infant would prevent speech, and therefore in all cases of deaf-mutism in children a removable source of deafness should be carefully sought and, if found, suitably treated. In connexion with this subject I would call particular attention to the use of the tympanic catheter, by means of which the drum may sometimes be successfully inflated when all other means have failed. I have also used it with excellent results to wash out an accumulation of mucus from the tympanic cavity, employing for that purpose a warm solution of pure carbonate of soda, four grains to the ounce.

Gloucester-place, W.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

AN ANEURYSM OF THE SUPRA-ORBITAL ARTERY CURED BY PRESSURE APPLIED BY THE PATIENT'S THUMB.

BY WM. MURRAY, M.D., F.R.C.P. LOND.

THE case of "Cirsoid Aneurysm of the Eyebrow" shown lately by Mr. G. R. Turner at the meeting of the Clinical Society recalls a case which seems worthy of record. The subject of this aneurysm was captain of a ship, and was treated in Charlestown, U.S., first of all by digital pressure and then by proximal ligature, for a small aneurysm of the supra-orbital artery, about three-quarters of an inch above the notch. Although the sac seemed to be consolidated and partly absorbed before he left Charlestown, another pulsating swelling appeared during his next long voyage. Having had experience of the digital pressure treatment, he of his own accord, while at sea, applied pressure in the following manner with success. He sat on a chair in front of a strong table and placed the right elbow on his knee, the uplifted forearm being supported by the edge of the table in front of him. The head was then brought down on the thumb, which was applied on the near side of the aneurysm just above the supra-orbital notch with sufficient firmness to stop pulsation in the swelling above. In this position the poor fellow, supported by the sympathy and succour of his men, held on for several hours, and was rewarded by finding that the tumour had become quite pulseless and solid. A few months after this I

examined him, and found a small cicatrix on the forehead marking the site of the operation, and below it a slight thickening over the site of the second aneurysm, which had, I think, developed in the ligatured artery on its near side. Probably this was the origin of the second aneurysm, because the patient strongly averred that there was no return of the original swelling. Whatever value this case may possess from a surgical point of view is greatly enhanced by the almost romantic heroism of this "patient who healed himself."

Newcastle.

CASE OF HEMI-ALBUMOSURIA.

By J. WESTMORLAND, L.R.C.P. EDIN., M.R.C.S.

ON May 10th, 1891, I was sent for to see a lady, whom I found suffering from influenza. A few days after the febrile stage had subsided she complained of frequent micturition and an uneasy pain, which seemed to me to be about the base of the bladder. I directed her to send me some of her urine for examination. On adding a few drops of nitric acid to it in a test-tube it became cloudy; then, after applying heat and boiling, it became perfectly clear. I threw this away and thought no more of it, as in the course of a day or two the symptoms she had complained about ceased. About a month afterwards she had a return of these unpleasant symptoms, when I again examined the urine, adding nitric acid to it and boiling, and obtained exactly the same results as on the previous occasion; but this time after boiling I placed it in my test-tube rack. Accidentally looking at it next day, I noticed a deposit of fully an eighth in the tube. I boiled this again, and found that the precipitate entirely disappeared, but it was again thrown down on cooling. The same results followed on treating it in a similar manner with a saturated solution of picric acid. On floating it on potassio-cupric tartrate solution a distinct rosy red tint (biuret reaction) was observable. On treating it with a 10 per cent. solution of sodium chloride no change was observed when cold; but on boiling it became cloudy, and when again cold a white flocculent precipitate settled down. Saturated solutions of sodium chloride and magnesium sulphate, when added, threw down white flocculent-looking precipitates. On treating it with Tauret's reagent (potassio-mercuric iodide) a white precipitate was obtained. With the addition of alcohol it became very cloudy. In February last, on one or two occasions, on adding acetic acid to the urine, after the lapse of some considerable time, a gelatinous-looking cloudiness was observable. After a still longer time this settled to the bottom of the tube in a gluey looking precipitate. On boiling this disappeared, and, after cooling and being laid aside all night and part of the next day, was again to a much smaller extent deposited. This was peculiar, and what the explanation is, it is difficult to say; on all other occasions when treated with acetic acid only very slight cloudiness had been observed, which on boiling disappeared, but when again cool a slight white precipitate became observable. The specific gravity of the urine has ranged from 1012 to 1015, in reaction slightly acid, and under the microscope no casts of tubes, and nothing but some amorphous urates have been observed.

After the results I obtained upon treating it with nitric and picric acid, and the biuret reaction with potassio-cupric tartrate solution, I concluded that this urine contained hemi-albumose; this condition has continued since I first perceived it, the hemi-albumose being present in greater or less proportions ever since. My patient has no symptoms of osteomalacia, suffers from no purulent discharge of any kind, has no gastric trouble, but suffers occasionally from slight leucorrhœa. During my attendance I have had occasion to make a uterine examination, and found a small growth in the anterior uterine wall, the exact nature of which has not yet been determined. Since she had influenza in May last, the time I commenced attending her, she has never been well, and gets fatigued very easily. Prior to this she enjoyed average health. Is it not very probable that this condition of urine may be more frequent than is generally supposed? When one tests for albumen with nitric acid and finds any slight cloudiness to disappear on boiling, the urine is generally cast away and no more attention paid to it. I must honestly confess my attention was only accidentally directed to this condition of the urine on casually looking at my test-tube rack the following day after I had tested in the ordinary way.

Manchester.

A CASE OF HYDRENCEPHALOCELE; REMOVAL; RECOVERY.

By C. M. FEGEN, L.R.C.P. EDIN., M.R.C.S. &c.

AT the end of 1890 I delivered Mrs. —— of a female child. Labour was very prolonged through the existence of a tumour projecting from the occiput of the fœtus after birth the size of a medium-sized orange. This was diagnosed as a hydrencephalocele, pressure causing such diminution in its size that the portion of brain contained in it could be distinctly felt, though it could not be returned into the cranial cavity. The child was well developed at birth, but it began to waste at the end of about the eighth day. Ten days later—i.e., when nearly three weeks old—the tumour became turgid and very black in colour (at this time it was the size of a large orange, having steadily increased in size from about the end of the first week; no doubt the rapid emaciation of the child was due to the enlargement of the tumour,) causing the child great and continuous suffering. The child became very much worse, and appeared to be dying. The covering to the tumour had gangrenous sloughs all over it, and the integument peeled off on being touched. As a *dernier ressort* I decided to remove it. This I did by means of four double strong catgut ligatures passed through and through at the point of junction between the cranium and the tumour; and tying very lightly and separately I then sliced off the tumour, and found it to consist of gangrenous integument, meningo-opalescent fluid (about one ounce and a half), and a piece of brain substance about the size of a walnut. The child remained in a critical condition for about ten days, the pedicle sloughing and discharging very putrid pus. At the fortnight's end the ligatures came away and the child made an uninterrupted recovery. Indeed, some improvement was noticed within a few hours of the operation.

I cannot account for the gangrenous condition except by attributing it to the increase in the size of the tumour. The child was very well attended to, as the parents are most intelligent people. The tumour was kept well wrapped in cotton-wool. The child is now over twenty months old; is fairly intelligent and bright; small in size; health is very fair. She cut two teeth at six months, but none since. Occiput shows three distinct ridges running to a central prominence, just posterior to the foramen magnum, the site of the protrusion. This seems to be filled up with some fibrous material. I am well aware that most teachers of surgery advise that these tumours should be left alone; but when there is evident gangrenous sloughing and the child's life is endangered by it, I think it must be considered not only justifiable, but even necessary, to operate.

A Mirror OF HOSPITAL PRACTICE, BRITISH AND FOREIGN.

Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Procemium.

KING'S COLLEGE HOSPITAL.

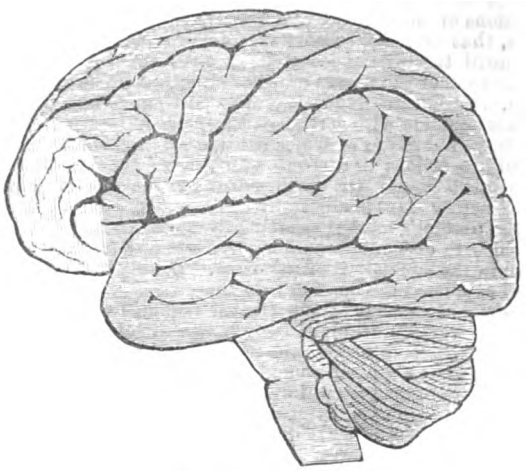
TUMOUR OF THE LEFT FRONTAL LOBE.

(Under the care of Dr. FERRIER.)

THE case, the particulars of which are given below, is one of considerable interest, and though it resembles closely in many respects others which have been from time to time placed on record, yet the completeness of its history and symptoms fully justifies its claim to a place in our columns. It illustrates the difficulty often met with in coming to a conclusion whether the origin of the growth was from meninges or cerebral tissue, though for purposes of treatment this was of comparatively little moment. The lesion of intellect, especially the loss of power of concentrating the attention, which has been observed as a constant result

Digitized by Google

of destructive operations on the prefrontal area of monkeys, was in this case a marked feature. It is a matter of regret that, owing to the fatal intervention of an intercurrent malady, the patient was unable to reap the advantage which, had he survived longer, an exact diagnosis of the case and modern surgical progress justified him in expecting. For the notes of the case we are indebted to Dr. L. T. F. Bryett, medical registrar.



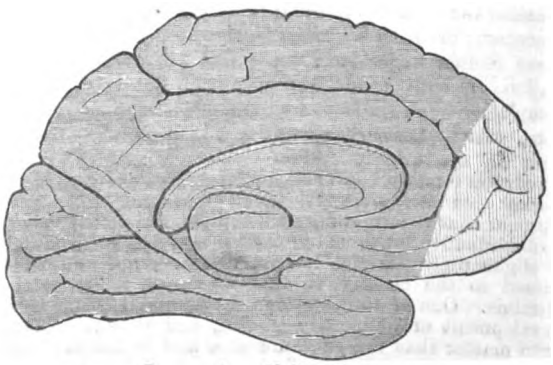
W. S——, aged forty, married, was admitted into the Todd ward, King's College Hospital, on June 30th, 1891, under the care of Dr. Ferrier. Family history unimportant. Seventeen years ago the patient was thrown from a vehicle, and is said to have been unconscious for a week. From this injury, however, he seems to have recovered completely, and enjoyed good health until October, 1890, when he caught a severe cold, from which time he is said never to have been "the same man as before." He exhibited great failure of memory, and from being energetic and active became incapable of any sustained effort, and constantly tended to fall asleep when left to himself. Occasionally he would brighten up for a short time, and again relapse into the same apathetic, drowsy condition. During his fits of drowsiness enuresis generally occurred.

On admission the patient had a healthy aspect, but with a dull, vacant expression, and when left to himself took no notice of his surroundings, and required a good deal of rousing before he could be got to answer questions. When roused, however, he answered intelligently. There was incontinence of urine. There were no indications of motor paralysis, though it occasionally appeared as if there were slight relative weakness of the right angle of the mouth. Owing to the patient's mental condition no satisfactory conclusions could be arrived at as to the condition of sensibility, general or special, more particularly as regards smell; but vision, hearing, and tactile sensibility appeared fairly good. The liver was somewhat enlarged, but in other respects the organic functions were normal. The knee-jerks were present and equal, and the plantar reflexes well marked. The pupils were small, but contractile to light. Ophthalmoscopic examination revealed the presence of typical double optic neuritis. In reply to questions, the patient denied the existence of pain in the head, but he generally winced when severe pressure was made over the left fronto-parietal region.

During the month of July the condition varied a good deal. Occasionally he brightened up and answered questions readily and rationally; at other times he was drowsy and apathetic and talked incoherently. The incontinence of urine continued. The patient would sometimes wander about in a vague, purposeless manner. He did not complain of headache, but as a rule he winced when pressure was made on the left fronto-parietal region as above indicated. During the months of August and September there was little if any alteration in the patient's condition. He was able to feed and dress himself and to walk about the ward, or go out occasionally with convalescent patients. During October he exhibited greater mental dulness. He did not know where he was, and frequently could not say what his name was, and when asked to sign his name wrote nonsense. He frequently dozed off to sleep. In walking there sometimes appeared to be relative weakness of the right leg, and his gait in general was rather tottery. The right pupil was somewhat larger than the left, and there was still marked swelling of both optic discs. There was no material alteration in the patient's condition during the month of November. He either sat in a chair, apathetic or asleep, or would wander about in a vague, purposeless manner, and with a slouching, uncertain gait. This condition continued practically unchanged until Jan. 23rd, 1892, when, during the prevalence of the influenza epidemic, he developed symptoms of this malady. On the 24th his temperature had risen to 104°, and he became delirious. He died comatose on the 26th, the temperature having risen to 106° immediately after death.

Necropsy.—There was hypostatic pneumonia at the basis of both lungs, but in other respects the thoracic and abdominal viscera were in a healthy condition. The anterior portion of the left frontal lobe was occupied by a large tumour, three inches from above downwards and two inches from before backwards. It extended from the external to the mesial surface of the lobe. It was hard, lobulated, and cut like a scirrhus. The dura mater was adherent over the front of the tumour. It was encapsuled and had displaced the convolutions. Locality: On the external aspect the tumour lay well in front of the ascending frontal convolution. The superior frontal gyrus ended against the posterior margin of the growth, as also did the superior frontal sulcus. The middle frontal convolution was broadened anteriorly, and ended against the margin of the tumour. Broca's convolution was displaced backwards. The mesial surface of the frontal lobe was entirely replaced by tumour growth. The tumour lay in front of the genu of the corpus callosum and of the gyrus fornicatus. It was difficult to distinguish the orbital surface of the frontal lobe, as the fore part was

FIG. 1.



Lateral surface (left).

entirely replaced by the tumour, and a considerable amount of compression was exerted upon the posterior part. The triradiate sulcus was distinguishable behind the tumour.

Microscopical examination (Dr. W. Aldren Turner).—The tumour is found to consist of trabeculæ of a dense fibrous tissue (containing bloodvessels of various sizes), forming alveoli separated from each other by a fine fibrous meshwork. These contain numerous cells of round and spindle form, and large size. The cells are separated from each other, there is much fibrous interstitial material, which does not stain with logwood, but which is very distinctly

FIG. 2.

Inner surface of left hemisphere.

brought out by picro-carmine, nigrosin, and orange rubin. Character: Sarcoma, with a large fibrous element. From the close adhesions which the tumour had to the dura mater over the frontal lobe, the growth probably commenced in this structure, and grew backwards, compressing the frontal lobe.

Remarks by Dr. FERRIER.—This case is an excellent illustration of the symptoms that have been met with both in man and monkeys, as the result of lesions of the prefrontal lobe. Destruction of the prefrontal regions in monkeys causes no obvious physiological symptoms; that is to say, no perceptible defects in the domain of motion or sensation, but the operation causes a mental degradation of a peculiar character, which may be characterised as due

Digitized by Google

to the loss of the faculty of attention or power of mental concentration. Monkeys deprived of their frontal lobes, instead of being as before actively interested in their surroundings and curious as to all that came within the field of observation, became apathetic or dull, or continually dozed off into sleep, responding only to the sensations or impressions of the moment, or varying their listlessness with restless and purposeless wandering to and fro. This description is almost precisely applicable to the condition presented by our patient, and similar symptoms have been observed and recorded by many observers in connexion with tumours of this region. It is not until the tumour presses backwards, and directly or indirectly disturbs the functions of the central and posteriorly situated convolutions, that motor or sensory symptoms declare themselves; and until these have occurred, or until there are signs of implication of the nerves or other structures in the anterior fossæ, an accurate diagnosis of the position of the tumour cannot be made with certainty, inasmuch as loss of memory and impaired power of concentration may also be produced by diffuse lesions or diseases which cause general disturbance of the brain. Of the structures in the anterior fossa, the olfactory tract is especially apt to suffer, but on account of our patient's mental condition it never could be ascertained with certainty whether there was any implication of smell in the one nostril or the other. During life, however, I had expressed the opinion that the case was in all probability one of tumour of the frontal region, but its precise position, whether deeply seated, or superficial, or connected with the corpus callosum, did not appear to me sufficiently clear. For this reason, though I frequently considered the advisability of operation, I did not think it well to interfere until definite localising symptoms should declare themselves; but the patient was carried off by an intercurrent malady before this event occurred. The necropsy, however, proved that the tumour might have been reached and in all probability safely enucleated by trephining over the left frontal lobe anteriorly.

ROYAL FREE HOSPITAL.

A CASE OF RECOVERY AFTER COMPLETE PARAPLEGIA DEPENDENT ON FRACTURE DISLOCATION IN THE UPPER DORSAL REGION OF THE SPINE.

(Under the care of Mr. W. H. BATTLE.)

THIS case is one of great interest and rarity. The precise pathological condition produced by the injury still remains obscure, owing to the large amount of swelling caused by the accident. Fracture was undoubtedly present, but whether the paralysis resulted from the amount of the displacement or from an excessive hæmorrhagic exudation must remain undecided; there was probably a combination of both conditions present. Recovery after a complete paraplegia from fracture dislocation is of itself rare, and it becomes especially so when the disturbance of the urinary system is so marked. The case illustrates forcibly the necessity of scrupulous care in the matter of catheterism, and it reflects great credit on the house surgeon that the urine for such a prolonged period showed no abnormality due to contamination, and though ultimately a slight urethritis was set up, this was not allowed to spread to the bladder, so that the urine never became alkaline. One of the most dangerous complications is the development of pulmonary trouble, and it was a fortunate matter that the subacute attack of bronchitis which developed at the end of the first fortnight yielded readily to treatment. Considerable importance is to be attached to the result of the manipulation under chloroform; this by depressing the displaced upper vertebræ led to a restoration of the line of the spinous processes, and its beneficial effect was proved by the marked relief which followed within a few hours, the girdle pain disappearing and the sensation commencing to improve. For the notes of this case we are indebted to Mr. A. Gale, late house surgeon.

G. B——, a labourer aged thirty-eight, was admitted on Sept. 6th, 1889, to the Royal Free Hospital. The patient was quite conscious when admitted, and complained of loss of movement in the legs and pain in the back, following an accident. He had always been strong and healthy, and had had no illness or accident before that he knew of. The patient was trying to lift a heavy beam of wood which stretched across a tunnel in which he was working. The beam was let into a hole in the clay at each side of the tunnel, and was also supported by uprights at each end. To shift the beam a little he got underneath it near one end, so that it rested across his shoulders; in trying to push one end further into the hole in the side of the tunnel the opposite end of the beam was pulled too far out of the hole in which it rested; the beam, being thus unsupported except by the patient's shoulders, forced him suddenly to the ground; he fell violently in a sitting position, with his legs stretched out before him; the weight of the beam then forced his head and shoulders forwards to such an extent that he thinks his head must have touched the ground between his legs, his back being very much bent forwards. The beam was lifted off, and he was immediately brought to the hospital.

On admission there was a fluctuating swelling over the junction of the cervical and dorsal vertebræ, about four inches by five inches in size, tender to touch, but with no discolouration of the skin. On pressure over this swelling a depression was felt, apparently below the seventh cervical spine, but it was difficult to localise. Both legs were paralysed. Both patellar and plantar reflexes were greatly exaggerated, but there was no ankle-clonus. There were excessive myotatic irritability and fibrillar contractions of nearly every muscle of the body, which, however, were temporarily stopped by drawing the finger forcibly across the muscle. Sensation was entirely lost below the level of the seventh ribs in front, there being perfect sensation in the arms. The pupils were equal, and reacted to light. Respiration was almost entirely diaphragmatic, but the lower ribs were slightly elevated. There were also priapism and retention of urine. The patient complained of feeling cold, but half an hour after admission he became warmer, the fibrillar contractions ceased, and he perspired freely. The patellar reflexes disappeared and sensation returned, with the exception of the inner side of the foot and sole. The urine was drawn off by a catheter, and came away in a pumping manner with each inspiration. The patient was placed in bed on his back, with his head low, and a pad beneath the lumbar region, and was given a milk diet. On the next day he complained of a girdle pain at the level of the manubrium sterni. He had spermatorrhœa, and his priapism and retention of urine still continued, and from this date the catheter was passed every twelve hours, being kept in a solution of perchloride of mercury (1 in 2000) when not in use. The left pupil was noticed to be slightly larger than the right.

Sept. 8th.—His bowels acted for the first time after five grains of calomel, a draught of one ounce of compound senna mixture and a simple enema.

9th.—The left side of the face and neck sweated profusely, accurately limited by the middle line. There was pain starting at both axillæ and running down the inner sides of the arms, ending at the wrist on the left side and at the elbow on the right side. The intercostal muscles were quite passive, inspiratory recession of the lower ribs being present. The abdomen was somewhat distended and moved considerably with respiration. All reflexes, with the exception of the plantar, were quite absent. Superficial sensation was quite absent up to the second rib in front and the first dorsal spine behind; the patient could, however, tell when his legs were deeply pinched or moved. Mr. Battle examined the back again, but the exact position of the depression could not be localised, owing to the difficulty in counting the spines caused by much œdema being present.

10th.—Sensation was present in the legs, and the patient could tell which of his toes was touched.

11th.—His plantar reflexes were much exaggerated, the other reflexes remaining absent. There was no sensation to pain, the patient being unable to distinguish a hot wire from ice or a pinch from a touch, up to a line just below the nipples. He was put under chloroform, and Mr. Battle manipulated the upper vertebræ backwards, so that the depression was very much less marked, and the patient lost his girdle pain the next day.

On Sept. 14th it was noticed that the slightest movement of the bedclothes caused involuntary reflex movements of the legs, and that priapism was only present when the bladder was full, disappearing after the urine had been drawn off. Sensation gradually improved, being on Sept. 14th good down to the level of the umbilicus, and on the 16th two inches lower. The

Digitized by Google

skin over the feet and toes had now assumed a glazed appearance. On the 17th the cremasteric reflexes were present. On the 18th there were intermittent pains in the chest and down the inner side of the right arm, starting from the axillæ. The left foot was now a good deal inverted, and a red patch appeared on the dorsum. On Sept. 23rd he had slight bronchitis and could cough, using his recti abdominis in the act. Sensation in the right leg had much improved. On the next day (Sept. 24th) the patient could slightly twitch the sartorius and rectus on trying to move his right thigh; and this movement steadily improved, till on Sept. 27th he could draw the limb up by flexing the knee, but could not lift the foot off the bed. Two days later (the 29th) he could move his right great toe, and could twitch the adductors of his left thigh on attempting to move the limb; and the day following he could slightly draw up his left leg and flex his right ankle-joint. He was now on a meat diet. The urine had kept acid and normal up to Oct. 4th, when a few pus cells were found in the deposit; but the urine was still acid. Four days later the patient passed a little urine voluntarily (Oct. 8th), but a pint was drawn off by the catheter afterwards. His control over his bladder gradually improved, and on Oct. 13th it was found that the catheter would be required only once in twenty-four hours. The pus in the urine was due to a urethritis set up by the catheter. Up to Oct. 18th there had been complete incontinence of flatus and fæces, but on that day he was able to control them for the first time. The patient had been kept strictly on his back till Oct. 31st, a period of fifty-five days, before he was allowed to lie on his side. The movement in both legs had steadily improved, and on Nov. 7th he could raise the left leg off the bed. The legs were rubbed with oil daily for twenty minutes from this date. On the next day (Nov. 8th) the constant current was applied to the legs, and the muscles contracted well in response. He was propped up in bed for the first time on Nov. 14th, and three days later he was moved on to a couch. The constant current was applied daily till Nov. 17th, when the muscles ceased to respond; so on Nov. 19th the faradaic current was used, and the muscles responded well. The patient sat up in a chair for the first time on Nov. 20th, and three weeks later (Dec. 11th) he could stand alone for a short time, and ten days after this (Dec. 21st) he could walk alone with the help of a go-cart support. His left leg had a curious upward jerk when the thigh was flexed during the first few days, very much like the movement called "stringhalt" in horses. The amount of urine drawn off by the catheter gradually diminished each day, till the catheter ceased altogether to be required on Nov. 16th. He had occasional pains in the chest and in the left leg, and the left leg used to be drawn up occasionally involuntarily, requiring some force to extend it again. He had a small superficial gangrenous patch the size of half-a-crown on the left heel, which appeared on Sept. 24th, and the slough separated on Dec. 11th, after which the sore commenced to heal slowly. He steadily improved till Jan. 20th, 1890, when he was discharged. He could then walk alone with the aid of two sticks. The left leg was considerably weaker than the right, and was apt to be drawn up involuntarily occasionally, and the patient could only extend it by using his hands. Both knee-jerks were exaggerated, and his sensation was good. The sore on the left heel was not quite healed, and with this exception he had had no bed-sores. Measurements of the limbs and superficial temperatures were taken from time to time, but they showed no constant comparison or variations. When heard of in October, 1890, he could walk four miles with the aid of a stick, and a letter from the clergyman of the parish in which he now lives gives information of more recent date, March 24th of this year. He could then walk as above noted, but was unable to do any work.

METROPOLITAN OPEN SPACES.—After protracted negotiations, it is stated that the several freehold and other owners have agreed to accept £75,000 for Hackney Marsh, which comprises 337 acres, and will be an important addition to the metropolitan open spaces for the use of the public for recreation purposes. The purchase money is to be raised by the following contributions—namely, the London County Council, £50,000; the Hackney District Board, £15,000; the Lord of the Manor, £5000; and local and other contributions, £5000.

Medical Societies.

CLINICAL SOCIETY OF LONDON.

Cubitus Valgus and Cubitus Varus arising from Fracture at the Elbow-joint.—Sarcoma of Buttock treated by Ligature of Internal Iliac Artery.—Gastrostomy for Œsophageal Stricture at the age of four.—Leucocythæmia treated with Arsenic.—Living Specimens.—Annual Meeting.

THE last ordinary meeting of this Society for the present session was held on May 27th, the President, Sir Dyce Duckworth, in the chair.

Mr. NUNN read a paper on a case of Cubitus Valgus and Cubitus Varus arising from Fracture at the Elbow-joint. It was in continuation of one previously brought before the Society on injury to the elbow-joint, and of a proposal to treat fractures at the elbow-joint in the extended position in place of the flexed position usually recommended, seeing that some deformity, either cubitus valgus or cubitus varus, so frequently attended treatment in the flexed position. Photographs illustrating these deformities accompanied the illustration. Mr. Nunn had already, in a postscript to his former paper, published in the Transactions, stated that Dr. Illingworth of Accrington[1] and Dr. Carl Lauenstein of Hamburg[2] advocated treatment in the extended position. Dr. Illingworth's paper was mentioned first, as it was read in 1887 at the Dublin meeting of the British Medical Association, but a report of it did not appear until the date named. On the other hand, Mr. Christopher Heath, lately President of the Society, recommended, in a lecture published in THE LANCET of January, 1889, the flexed position, and described a case where "disastrous" results—namely, sloughing of the median and ulnar nerves—followed from treatment of a fracture at the elbow in the extended position; the accident had occurred at polo playing. Mr. Nunn contended that the extreme mischief in the case was not due to the method of treatment, but to the severity of the injury, the headlong pace at polo playing being such as to make the game excessively dangerous. The case, however, indicated how serious an injury fracture at the elbow in an adult might prove to be. Mr. Nunn thought it desirable to say that Dr. Lauenstein claimed to have obtained a more free ultimate use of the joint, and that the patients had escaped from the deformity of cubitus valgus or varus by treatment in the extended position. The latter enabled the surgeon by his eye to detect any deviation from the normal axis of the limb, and to correct such deviation by the leverage afforded by the bones of the forearm. Dr. Lauenstein, referring to the deformity of cubitus valgus or varus being a source of ulterior prejudice to the patient, and that, therefore, the surgeon should not be content with conserving the mobility of the joint, instanced a case where the individual had been rejected by the army surgeon as unfit for military service in consequence of such deformity. Mr. Nunn pointed to one of his photographs as that of the arm of a gentleman now a field officer in Her Majesty's service, who, when a candidate for admission into the Royal Military Academy at Woolwich, was very near being rejected on account of cubitus varus of the left arm, consequent on a fracture of the elbow when a lad. A second photograph of the same arm showed how completely the deformity was masked in flexion; this masking of the deformity constituted a very important point for consideration in treatment, as in flexion the surgeon might be deceived as to the actual relations of the fragments. In the museum of the Royal College of Surgeons, specimen No. 934, was an example of union of the trochlear end of the humerus at right angles to the shaft. It was a counterpart of a case cited by Dr. Lauenstein, where the misplacement was the result of treatment by the rectangular splint. Mr. Nunn referred to a dissecting room specimen of fracture at the trochlea, which he had exhibited at the Pathological Society, and at the same time he had demonstrated that the deformity, which was very evident on extension, was hidden by flexion.[3] Further, in the extended position there was less danger of the anterior capsule

Digitized by Google

of the joint being caught in the callus, as it was held on the stretch, and the risk of ankylosis diminished, especially as the position permitted of effectual application of the ice-bags for the control of inflammatory action. Mr. Nunn considered that fractures at the elbow-joint fell into two categories—those before the age of puberty and those after consolidation of the ossifying centres, since a far less degree of violence sufficed to disconnect the epiphyses than to fracture the bone, and that therefore a fracture at the elbow in the adult was, from the greater violence implied, the much more serious accident.

Mr. FREDERICK TREVES next contributed a communication on a case of Sarcoma of the Buttock treated by Ligature of the Internal Iliac Artery. It occurred in a lad of eighteen, and was of at least three months' duration. The internal iliac artery was ligatured by the intra-peritoneal method. Remarkable shrinking of the growth occurred, and the lameness and intense pain disappeared. The patient remained able to walk about for ten months after the operation, and died at the end of fourteen months. The case was reported to show the effect of the ligature of a main artery upon a sarcoma not amenable to treatment by excision.—The PRESIDENT inquired whether the operation had been previously performed, and whether it was to be recommended as a rule in such cases. It had evidently acted favourably as a palliative measure.—Dr. MANSON said that this method of treatment, though not new, had of late years not been practised. He did not imagine that it could be permanently successful; at any rate, he did not know of an authenticated case, and he could not believe that a malignant tumour would capitulate to a mere threat of starvation. In ligaturing the internal iliac artery he preferred the operation above Poupart's ligament, in which the peritoneum was opened; the objection to the sub-peritoneal operation being its difficulty, on account of deficiency of light.—Mr. NUNN said that he recollected seeing the lingual artery tied in several cases of cancer of the tongue, though in no instance was the disease permanently arrested. He could not expect that it would be, for at present the assumption that cancer was a constitutional disease had not been successfully controverted.—Mr. TREVES replied that he did not believe that ligature of both lingual arteries had any effect on cancer of the tongue, neither did ligature of the carotid on cancer of the tonsil. He thought, however, the result would be more promising in sarcoma. To tie the iliac artery by an incision in the median line was an extremely simple matter, and far easier than by a lateral incision.

Mr. CLUTTON related the particulars of a case of Gastrostomy for Stricture of the Œsophagus at the age of four, in which the normal passage was eventually restored. The patient, a girl, was admitted into the Victoria Hospital for Children, in July, 1889. Seven weeks previously she had swallowed some caustic soda. At the time of her admission she was unable to swallow anything at all, and a bougie was arrested at six inches from the teeth. During August she was fed entirely by nutrient enemata and no bougies were passed, so as to give absolute rest to the œsophagus. In September, although she had materially improved in general condition, no instrument could be passed through the stricture. On September 13th the œsophagus was opened in the neck, with the hope of being able to reach the stricture. The obstruction was found, however, to be within the thorax. After these wounds were closed with suturing, the first stage of gastrostomy was carried out by means of harelip pins. Five days afterwards the stomach was opened and the child fed through the gastric fistula. On Jan. 27th, 1890, a very small whalebone bougie was at last passed through the œsophageal stricture, and, after many months of varying success, a No. 14 œsophageal bougie was eventually passed with ease. During 1891 this large bougie was passed about once a month and the plug removed from the gastric opening. Attempts to close this opening were subsequently made by passing the actual cautery along the sinus, and it was now absolutely closed. She was in perfect health, and came to the hospital once in six weeks to have the bougie (No. 14) passed. No contraction could be felt. The points of interest were: (1) The age of the patient; (2) that after gastrostomy the œsophageal stricture was eventually dilated and the passage restored to its natural function. Mr. Clutton alluded to a similar case—Mr. Morgan's—recorded in the Clinical Society's Transactions for 1886, and the rapid method of performing gastrostomy by harelip pins, first successfully carried out by Mr. Barrow in 1884.—Mr. MORGAN referred to some details of the case he had recorded, and he inquired if Mr. Clutton's patient was now able to take solid food. He had brought his patient for the purpose of inspection, and it was seen that he was very well nourished. There had been no difficulty whatever about the closure of the wound; indeed, the difficulty had rather been to keep it open.—Dr. MANSON did not see the advantage of fastening the peritoneum to the skin; it certainly added to the length of the operation. He believed in making a very small opening for gastrostomy, large enough only to admit a No. 3 or 4 catheter.—Mr. CLUTTON, in reply, said that his patient was now fed on ordinary diet, and was very well nourished. The double operation took only an hour, and the opening was of about the size of a No. 9 catheter.

Mr. DOUGLAS DREW, introduced by Dr. Ringer, brought forward a case of Leucocythæmia treated with Arsenic, which was of interest in that repeated observations were made of the state of the blood while under treatment. The history was that for about three months before his admission to University College Hospital he had been growing weaker, and felt out of health. He had no other symptoms of importance. It was found that the spleen was greatly enlarged, it extended to within one inch of the right anterior spine of the ilium, and that the blood contained a large excess of white corpuscles, the exact number, as estimated with Dr. Gowers' hæmocytometer, being one white to fourteen red. Arsenic was given in increasing doses until the limit of toleration was reached. By about the end of the first month the patient was taking a drachm of the liquor arsenicalis daily. The spleen had become distinctly smaller, and the number of white corpuscles in the blood had fallen to one white to fifty-five red. By the end of the second month of treatment he was taking ninety minims daily, and the spleen had further diminished, so that it extended just to the right of the middle line, and one inch below the level of the umbilicus; the white corpuscles had also decreased to 1 to 159 red. The arsenic was steadily pushed until 100 minims of the liquor were being taken daily. About the end of the third month the spleen reached to half an inch above the umbilicus, and the white corpuscles had fallen to normal (1 to 400 red). The patient was better in health, and was able to do some light work. He remarked that, judging from this case, arsenic appeared to be quite as efficacious in leucocythæmia as in lymphadenoma and in pernicious anæmia, and the benefit derived seemed to be dependent on the drug being administered in sufficiently large doses. The point which was most striking in this case was the direct relation between the variations in the size of the spleen and the number of white corpuscles present in the blood; while under treatment the white corpuscles gradually decreased in number until they reached the normal proportion, and at the same time the spleen steadily diminished in size. The table showed the percentage of red corpuscles present in the blood, and also the relation of the white to the red corpuscles. It would be seen from this that there was a deficiency in the red corpuscles and also in the hæmoglobin, indicating that there was a moderate degree of anæmia:—

Date.	Percentage of red corpuscles.	Relation of white to red corpuscles.	Percentage of hæmoglobin.	Dose of liquor arsenicalis.
Aug. 13th	70	1 to 14	—	Aug. 12th, 18 minims daily
,, 20th	80	1 to 22	—	48 ,,

Digitized by Google

The PRESIDENT trusted that in a year's time the further history of the case would be put on record, and any observation as to cutaneous pigmentation or arsenical paralysis made. It was evidently important to push the remedy very considerably.—Dr. BRADFORD said that they had carried out this method of treatment for several years at University College. In leucocythæmia it was observed that the arsenic had little effect on the red corpuscles, whereas in pernicious anæmia and in lymphadenoma under similar treatment they largely increased in number. The drug evidently checked the destruction of red corpuscles, for the amount of iron in the urine observed in cases of pernicious anæmia diminished considerably under arsenic.—Mr. DREW, in reply, said that neither pigmentation nor paralysis had developed. The only symptoms of intoxication by the drug were pain in the abdomen and diarrhœa, controlled to some extent by opium.

The following living specimens were shown:—

Dr. PERCY KIDD: A case of Angeioma of Larynx.

Dr. C. W. CHAPMAN: A case of Myxœdema.

Mr. JOHN MORGAN: (1) A case of Lymphangiectasis; (2) a case of Multiple Exostosis.

The annual general meeting was then held. The report of the Council was taken as read and adopted. The treasurer's report revealed a favourable financial condition of the Society. The usual votes of thanks having been put and adopted, the meeting proceeded to the election of officers, with the following result:—President: Sir Dyce Duckworth. Vice-Presidents: Charlton Bastian, Sir George Buchanan, Alfred B. Duffin, J. G. Glover, H. G. Howse, and John Langton. Treasurer: William Miller Ord. Council: John Abercrombie, Thomas Barlow, W. H. Day, E. Diver, Donald William Charles Hood, T. Ridge Jones, Percy Kidd, A. T. Myers, Andrew S. Myrtle, William Pasteur, P. H. Pye-Smith, Frederick Roberts, W. H. A. Jacobson, William Anderson, William Henry Bennett, Anthony A. Bowlby, George Buckston Browne, G. H. Makins, Malcolm Morris, and Robert William Parker. Honorary Secretaries: W. B. Hadden and A. Pearce Gould.

ANATOMICAL SOCIETY OF GREAT BRITAIN AND IRELAND.

THE third quarterly meeting of the Society was held on May 23rd at King's College, London, Professor Sir W. Turner, F.R.S., President, in the chair.

Messrs. T. H. Openshaw, M.S., E. Cotterell, F.R.C.S., and A. A. Kanthack, M.B., were elected members of the Society.

It was resolved that the next meeting of the Society be held in Edinburgh on Tuesday, Aug. 2nd, one day prior to the meeting of the British Association for the Advancement of Science, in that city.

The following specimens were shown:—Mr. J. E. Lane: A Right Subclavian Artery passing with the Vein anterior to the Scalenus Anticus. Mr. J. Bland Sutton: Sections of the Velvet from Stag's Antlers showing Sebaceous Glands; and a specimen of an Articulation between the Astragalus and Cuboid Bones. Dr. A. W. Hughes: A specimen of Abnormal Obturator and Deep Epigastric Arteries arising from the Profunda Femoris. Mr. A. S. Graubaum: Specimens illustrative of the Embryonic Relations of the Femur and Fibula.

Professor W. ANDERSON read a paper entitled "A Plea for Uniformity in the Delimitation of the Regions of the Abdomen," which evoked considerable discussion. The matter was referred to a committee consisting of Professor Anderson, Professor Macalister, Professor Cunningham, Dr. Symington, Professor Shane, and the Honorary Secretary, to report to the Society as to the best method for general adoption.

Dr. SYMINGTON read a paper on the Relations of the Peritoneum to the Descending Colon in the Human Subject. An exhaustive consideration of published views on this subject was made, and Dr. Symington then gave the results of his own investigations on sections of fœtuses and adults, which tended to show that the frequency of occurrence of a descending meso-colon has been greatly exaggerated. In his opinion the method adopted for the investigation of the peritoneal relations of the gut have been unsatisfactory, and in some cases have tended "to develop" a mesentery where it did not exist naturally. These views were concurred in during a discussion, in which the President, Professor Anderson, and Professor Shane took part, the importance of the degree of distension of the gut at the time of examination being especially dwelt upon.

Dr. ROLLESTON communicated a paper on Some Points in the Anatomy of the Suprarenal Capsules, illustrating his views by preparations and sections for the microscope.

Mr. A. EICHHOLZ communicated a paper on a Racial Variation in the Length of the Palate Process of the Maxilla. The results of measurement show that the length in the so-called "higher races" is less than that in the "lower races," the variation being gradational. Variations in width, on the other hand, are rather to be regarded as minor fluctuations of a common mean value. It is found, however, that the relative measurements of height and width in the higher races are somewhat the more constant. It is also noted that the higher the race the less steep is the typical palate curve.

Mr. R. M. MICHELL communicated a note on the Topography of the Rectum, in which he put forward as the result of the examination of 116 bodies the views that the completeness of a meso-rectum to the first part of the gut varied with the amount of distension, as also does the extent to which the bowel crosses to the right side of the pelvis.

A full report of the proceedings and the original papers will be found in the forthcoming number of the *Journal of Anatomy and Physiology*.

WEST KENT MEDICO-CHIRURGICAL SOCIETY.

FRIDAY, MAY 6TH.

H. W. ROBERTS, Esq., President, in the chair.

Influenza.

DR. MOON read a short paper on Nervous Sequelæ and Complications of Influenza. He said that the high temperature was of a nervous origin. He drew special attention to the very marked character of the great despondency. The appetite was very capricious. He had seen cases where there was a most inordinate craving for food. He also drew attention to the rapid emaciation which often ensued, and the length of time taken by the patient to get fat again. He mentioned sciatica, colic, and pleurodynia as symptoms he had often seen.

Dr. ERNEST CLARKE read a paper on Ocular Manifestations in Epidemic Influenza. He said, with the exception of the ordinary catarrhal ophthalmia accompanying the attack in many cases, the ocular troubles were mostly those due to a lowering of the vitality of the system, and hence might be classed as neurotic. The three commonest eye complications have been: (1) Conjunctivitis, generally appearing during the attack; (2) corneal ulcers, generally appearing at the end of the attack; (3) asthenopia, manifesting itself mostly during the convalescent stage. The conjunctivitis was accompanied by a good deal of photophobia, but not, as a rule, with much discharge. Phlyctenular and simple keratitis, keratonitis, and herpes of the cornea have all occurred, but simple ulcer has been the commonest affection of the cornea. He had seen, only a few weeks previously, a very bad case of iritis and cyclitis following influenza. Affections of the more important regions of the eye, such as optic neuritis, optic atrophy, retinitis, glaucoma, &c., had all occurred, and had been chronicled, but were rare. Paralysis of the intrinsic and extrinsic muscles of the eye occurred, and reminded one of the similar trouble seen in diphtheria; it pointed to the presence of some poison in the blood. Asthenopia was the commonest complication. It sometimes showed itself during the attack, when the slightest attempt to use the eye, say for reading, brought on headache and ocular pain, and necessitated the abandonment of the effort. But it chiefly manifested itself during convalescence, or even later. He had seen a large number of patients complaining of eye strain for the first time after an attack of influenza. They were mostly cases of premature presbyopia; others had no refraction defect, and their asthenopia was of the neuropathic class, allied to the neurasthenic asthenopia, and often manifesting itself in those recovering from a long illness. The lowered nerve force which is such a characteristic symptom of influenza causes the ciliary muscle to be less able to stand fatigue, and to avoid

Digitized by Google

the asthenopia many persons have been compelled to take to convex glasses earlier than usual. Muscular asthenopia due to convergence strain figures prominently as a sequel of influenza, and retinal asthenopia, diagnosed by the concentric contraction of the field of vision, has often been seen. The prognosis is good. Almost all the cases have in time made good recoveries, the exception of course being those in whom the more important structures have been attacked. There is no connexion between the severity of the attack of influenza and the ocular trouble. The treatment is chiefly rest and tonics, the local trouble being treated by the usual remedies. For the asthenopia weak convex glasses have to be ordered.

Dr. HORROCKS then read his paper on Influenza during Pregnancy and the Puerperal State. 1. Influenza during pregnancy: The phenomena of pregnancy generally are in no way altered or modified by influenza, although some of the symptoms, such as retching, vomiting, and coughing, may cause rupture of the membranes and so cause miscarriage. 2. Influenza during the puerperium: Influenza may attack a patient after child-birth, and its symptoms are apt to be confounded with those of puerperal fever. The differential diagnosis is that the influenza does not affect any of the natural processes taking place during the puerperium. The milk is not lessened; the lochia are unaltered; the uterus involutes; *vice versâ* pregnancy and the puerperium only slightly modify influenza. Advanced pregnancy intensifies the dyspnœa if present, and perhaps the blood changes of the puerperium may intensify the fever.

Mr. HARTT, medical officer of health for Greenwich, read a paper on Statistics of Mortality during the last Three Epidemics with reference to the Parish of Greenwich. The duration of each epidemic—viz., 1889, 1890, 1891, and 1892—was about six weeks, and in that respect resembled the epidemic of 1847. During the first epidemic, 1889–90, four deaths only were registered from influenza, but the number of deaths from diseases of the chest—viz., bronchitis, pneumonia, and pleurisy—were much larger than the average, and it was only fair to assume that the cause must be traced to the influence of a something which has the power of producing or, at any rate, making these diseases much more fatal than at ordinary times. During the first epidemic the deaths from influenza were 4, but the death-rate, which averages 26, rose to 42·2 per 1000. During the second epidemic the deaths from influenza were 41, and the death-rate from all causes was 30·5. The last epidemic was the most severe, and proved to be the most fatal. The death-rate rose to 46·6, and thirty-one persons lost their lives from influenza as a first cause. Influenza is a dangerous and infectious disease, and the only preventive treatment is isolation.—The President, Dr. H. Tavler, Dr. Forsyth, Mr. Thos. Moore, Mr. MacGavin, Mr. Hartt, Dr. Horrocks, Dr. Moon, and Dr. Ernest Clarke took part in the discussions which followed the papers.

Reviews and Notices of Books.

Flushing or Morbid Blushing; their Pathology and Treatment. By HARRY CAMPBELL, M.D., B.S., M.R.C.P., Senior Assistant Physician and Pathologist to the North-West London Hospital. Pp. 257. London: H. K. Lewis.

DR. CAMPBELL'S book deals with a symptom which, as he puts it, is a widespread nerve storm. He is not the only author who has deemed the matter worthy of minute attention, as Burgess produced a monograph in 1824, treating it from the side of physiology. Possibly he thought the pathology and treatment would fall more appropriately under the heads of the various nervous and visceral dyscrasiæ with which morbid flushing is associated. In the first part Dr. Campbell introduces the physiological aspect of his thesis. Flushing is considered at greater length in the second part, and is somewhat minutely analysed, according as (1) it is associated with dilatation of the cutaneous vessels, (2) their contraction, (3) excitation of sweat glands. Thus hot and cold flushes, shivering, perspiration, clammy sweat, are all taken as evidences of a central nerve storm. These dermic phenomena are then carefully traced, and cases cited in which they showed themselves in a varied sequence. The whole matter is worked out with the most laborious care. "Pathological blushing" occupies Part III., and is dealt with in detail and with as careful a hand as Part II. Very many of the cases are those of "shy persons," who doubtless—for their name is legion—will be glad to learn that their troublesome complaint has at length been thoroughly investigated, and a special system of treatment introduced. It is somewhat surprising to find a "champion athlete" who "always blushes when he thinks he will 'make a fool of himself.'" Having accepted the glowing cheek of this man of prowess, one is more prepared to find a "mason and builder" who is "timid and despondent," and who "blushes when he is looked at, but not otherwise." There is much of interest in the chapters dealing with blushing, and the one concerned with the question of its causation well repays perusal. The various forms of blush are well depicted. The reader becomes more than ever impressed as he passes through Dr. Campbell's pages that blushing, flushing, and the nerve storms which he associates with these vaso-motor disturbances are, after all, symptoms of either a poorly nourished or hereditarily feeble nervous system, or some morbid change attacking a healthy individual; and granting this, the treatment of such cases must resolve itself into the therapeusis of the general malady rather than of the symptom or group of symptoms. However, for those who wish to enter more minutely into the matter of treatment Dr. Campbell has written his fourth part, consisting of seven chapters. A copious index completes this carefully prepared contribution to the laborious literature of the medicine of to-day.

Travels amongst the Great Andes of the Equator. By EDWARD WHYMPER. With Maps and Illustrations. Two vols. London: John Murray. 1892.

THIS work belongs to a very select class of books of travel—to such works as "Belts' Travels in Nicaragua," "Bates' Travels in the Amazons," and "Humboldt's Travels." There are many writers who go deeper into science than the author, but few who are better representatives of the shrewd observer, gentleman, and scholar, who has withal a touch of humour. Mr. Whymper is perhaps the most practised mountain climber in Europe, and stimulated by the knowledge that equally high or higher summits than those he had successfully attacked in his own quarter of the globe remained unscaled in America, he determined to ascertain whether they could be ascended, and whether life can be sustained at elevations considerably above 14,000 feet. It probably occurs to everyone that Glaisher and others have reached heights shown by the barometer to be much more than 25,000 feet, and have descended in safety, but a balloon ascent is a very different affair from the ascent of a mountain. In the one case the body is entirely passive, in the other the muscular exertion involved is severe and prolonged, the only point in its favour being that the system has time to accommodate itself to the changed conditions.

Circumstances preventing the author from selecting the Himalayas or the highest of the Andes in Chili, Peru, and Bolivia, he turned his attention to the Republic of Ecuador. He took with him two well-tried Swiss guides, a set of aneroid barometers, and the usual outfit of a mountaineer. The book begins with a curious and highly interesting criticism of the statements made by Humboldt and by Boussingault in regard to their ascent of Chimborazo. Either these gentlemen made grave errors, or, and this is possible, the physical features of the mountain have changed; but Mr. Whymper shows that, as things are

Digitized by Google

at present, it is impossible they could have reached the height they thought they did, nor could they have ascended and descended as rapidly as they report, for he finds that the average rate of ascent and descent of lofty hills is about 1000 feet per hour, whereas Humboldt and Boussingault managed to descend 5475 feet in an hour and three-quarters, notwithstanding there were many difficulties and halts. Another interesting point was noticed — namely, that aneroid barometers are not very reliable for the determination of great heights, for they not only differ *inter se*, but they have a great disposition to register too high an altitude, sometimes the pressure of the atmosphere being shown by them to be one inch lower than that shown by the mercurial barometer. Mr. Whymper appears to have been a disbeliever to some extent in the necessity for the occurrence of mountain sickness; but at about an elevation of 16,000 feet he and his companions and his mules all succumbed, the principal symptoms being feverishness, intense headache, tottering gait, great exhaustion, and gasping,—which last was so constant and imperious that they were unable to drink, much less to eat or to smoke; the tobacco, indeed, almost refused to burn.

Most interesting descriptions of the ascent of various volcanoes, including some active, as Sangai, from the summit of which the jets rose 6000 feet at the rate of 22 miles per minute, and Cotopaxi, and some inactive, as Cayambe, Antisana, and Caimborazo, are given. In some of these ascents the difficulties of travelling were extraordinary. Mr. Whymper at one place, having been previously rebuked for objecting to a certain route because his animals had sunk half way up their flanks, asked his monitor what he considered a bad road, and the reply was, "A road is bad when the beasts tumble into mud holes, and vanish right out of sight." The perils of these ascents are by no means limited to avalanches and crevasses, but the storms of hail and the electrical disturbances are sometimes truly appalling. Near the summit of Sincholagua the flashes of lightning were almost without intermission; several often occurring in a single instant, "each followed by a single bang, which is all one hears when close to the point of discharge," so that the thunder kept up an almost continuous roar. The ice axes hissed ominously; yet he with his companions managed to reach the summit, and, knocking it off, carried it with them in a bag. We have said enough to show that the narrative is most interesting and entertaining, and we doubt not that when quieter times come in Chili and Peru the vast mountain range which is the continuation of the Andes of the Ecuador will be further explored by our adventurous countryman. The second volume, which is of purely scientific value, contains numerous beautifully executed engravings illustrating the various fauna, chiefly insects, captured by Mr. Whymper. They include many new species of coleoptera and lepidoptera, and the whole area seems to be worth any naturalist's while to visit, as it is by no means exhausted. Appropriate descriptions of the various species found have been given by friends who are devoted to the study of the special departments to which the animals belong.

Solutions. By W. OSTWALD, Professor of Chemistry in the University of Leipzig. Translated by M. M. PATTISON MUIR, Fellow of Gonville and Caius College, Cambridge. London: Longmans. 1891.

MR. PATTISON MUIR has rendered a valuable service to science by giving to English readers the fourth and perhaps the most important part of Ostwald's "Lehrbuch der Allgemeinen Chemie." The subject of Solution, which to the uninitiated would appear a simple, is in reality one of the most complex of scientific phenomena. This is a common experience in science. The apparently simple is often the most inscrutable; and as we are still unable to account for gravitation or electrical attraction, so we cannot explain what takes place when a piece of alum is thrown into a tumbler of cold water, although we have a very definite idea of the action of nitric acid on glycerine, apparently a far more intricate operation. It would be quite beyond our province to discuss in detail the subject matter of this treatise, in which the highest mathematical treatment is brought to bear upon a very practical study. A short synopsis of the contents will give some idea of the facts and theories contained in the book.

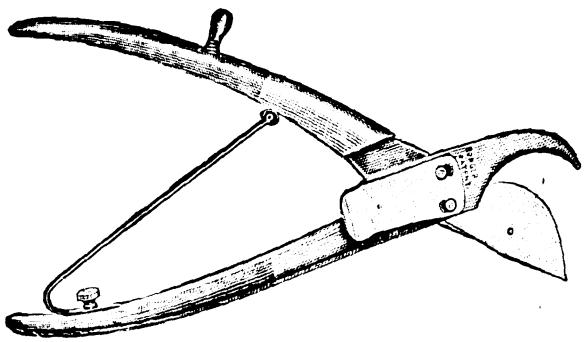
The first four chapters are devoted to solutions of gases in gases, gases in liquids, liquids in liquids, and solids in liquids. The recent results of Tilden and Shenstone, Ebard, van 't Hoff, Le Chatelier, and others, are clearly explained, although sometimes a slight curtailment has been necessary. The two following chapters (V. and VI.) contain careful historical and critical studies of osmose and diffusion. To English students the classical researches of Graham are well known, and we think they scarcely receive sufficient recognition in these pages. But with the later investigations, chiefly carried out in Germany, most of us are far less familiar. Final conclusions are not yet reached, but great progress has been made. Chapters VII. and VIII. are entitled respectively "Vapour Pressures of Solutions" and "Freezing Points of Solutions." In both, but particularly in Chapter VIII., the work of Raoult naturally takes an important place. Few modern discoveries have done more to promote the development of chemistry than the law enunciated and proved by Raoult, that the lowering of freezing point produced by the solution of a solid in a liquid bears a definite ratio to the molecular weight of the solid. Space allows us only to mention the titles of the two remaining chapters (IX. and X.): "Salt Solutions" and "Simultaneous Action of Several Solvents." But the importance of the book to those who have passed beyond the elementary stage in their study of chemistry will be apparent. An excellent bibliography, in which not only references but also in most cases dates are given, and an equally excellent index, add materially to the value of the translation.

OUR LIBRARY TABLE.

Air and Water. By VIVIAN B. LEWES, F.I.C., F.C.S. Illustrated. London: Methuen and Co. 1892.—A useful little manual belonging to the University Extension Series. The story of the two bodies at one time regarded as elements is told in an interesting and clear way, such as will appeal to the requirements of an ordinary and intelligent reader. In fact the book contains information of a kind which it is desirable should be more widely known. We refer to important subjects like ventilation, atmospheric impurities, the impurities of water, filtration, &c., all of which are ably dealt with. Professor Lewes is much in favour of "carbalite" as a filtering medium, which, he says, possesses the best properties of both spongy iron and animal charcoal, and while it has all the purifying and decolorising powers of both it is far superior, since it contains no phosphate or nitrogenised animal matter. We have had no practical acquaintance with this substance; and although it is an artificial compound we do not learn, beyond that it contains iron, of what it is composed or how it is obtained. We may add, however, that animal charcoal may be and is prepared quite free from nitrogenous matter.

The Demography of South Australia. By THOMAS BORTHWICK, M.D., Medical Officer of Health for Kensington and Norwood, St. Peter's and Burnside, South

Digitized by Google

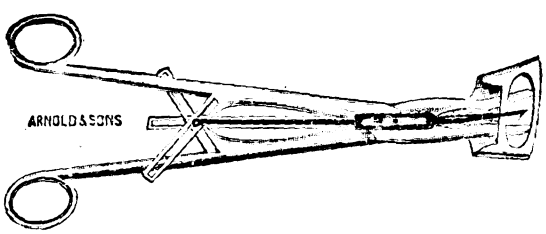


Australia. London: Baillière, Tindall, and Cox. 1891.—This is a useful and brief summary of the statistical and sanitary history of our South Australian colony, and deals with an area of 380,000 square miles; for the most part exposed to the influence of the sea. This vast tract of land was inhabited by the first settler in 1836. A few tents, a few wooden huts, were then the only signs of civilisation. On Dec. 31st, 1889, the population was estimated at 319,166. There are now 4000 miles of main road and 1750 of railway. The capital, Adelaide, has 45,000 inhabitants; and, with this rapid increase of population, the need of sanitary measures soon became urgent. It was not till 1873, however, that the first Public Health Act was passed, and it has since been amended, in 1876 and 1884. The necessity of these measures is fully demonstrated by Dr. Borthwick, and this notably in respect to the water-supply in mining districts. The author then proceeds to compare the proportion in sex, age, vitality of the population of South Australia with that of England and Wales. He shows that, whereas in the colony the urban population is equal to only 31·3 per cent. and the rural population to 68·7 per cent., it is precisely the reverse in England, where the urban population is equal to 66·6 per cent., and the rural population to only 33·4 per cent. This doubtless materially affects the death-rate, which is decidedly in favour of the colony. Thus, in 1889 the birth-rate to the 1000 of the population was equal to 32·7, the marriage-rate to 6·5, and the death-rate to only 11·1. During the same year in England and Wales there were 30·5 births to the 1000 of the population, 7·3 marriages, and 17·9 deaths. The death-rate of the colony has, it should be noticed, considerably decreased, for from 1861 to 1875 it exceeded 15·5 per 1000, and it continued to hover a little above or a fraction below 15 per 1000 till 1884. By that time the sanitary works and legislation began to tell, and then the death-rate steadily fell to the present almost ideal figure. In Adelaide, since the completion of the sewage works, the death-rate has fallen from the average of 25·5 in 1877–81 to 15·9 in 1885–89. Charts and elaborate statistics set forth in fuller detail these and other interesting facts. It is satisfactory to find that the necessity of sanitary legislation has once more been demonstrated, even at the very antipodes.

Second Report of the Superintendent of the Johns Hopkins Hospital for the Year ending Jan. 31st, 1891. Pp. 74. Baltimore: The Johns Hopkins Press. 1891.—This report, which is signed by Henry M. Hurd, superintendent, contains the statistics of the hospital during the year 1890. During the year 927 men and 725 women were admitted, a total of 1825. Of these, 165 remain under treatment, of whom 86 are men and 79 women. Twenty-six of the patients are coloured persons. In the surgical department there have been 408 operations; in the gynæcological 363; in the out-patient department 14,582 patients were treated. Courses of lectures, though not sufficient for an entire medical curriculum, have been delivered by distinguished members of the profession, and it is hoped that a complete education may soon be obtainable. The Nurses' Training School have assumed the responsibility of the nursing of sick children at the Thomas Wilson Sanitorium, supplying a head nurse and three pupil nurses. A report upon the Heating and Ventilation of the Hospital is appended by Dr. Abbott, showing that the arrangements for maintaining the temperature and purity of the air are exceptionally good, each individual receiving one cubic foot of fresh air per second. It is curious to read that in a land of equality a special ward is required for coloured persons in one of the largest hospitals in existence. There is a good plan of the hospital. There appears to have been a relatively large number of cases of malarial fever, rheumatism, typhoid fever, and of renal disease on the medical side; whilst on the surgical side the surgeons had under their care many cases of carcinoma, fistula in ano, gonorrhœal adenitis, hernia, tuberculosis, and fractures.

New Inventions.

NEW STARCH BANDAGE SHEARS.



WE have received from Messrs. Evans and Wormull a sample of their new aseptic starch bandage or rib shears, the blades of which, by means of an excentric joint, have a distinct drawing as well as a cutting motion, which allows them to cut through bandages &c. instead of forcing the material forwards, as the existing patterns so often do. They

are easily and quickly taken apart for cleaning by simply raising the flat spring which secures the blades. They are made in various sizes, and the cost is not much in excess of the ordinary patterns in use. These shears are of a pattern which presents great advantages for the purposes for which they are designed; they differ, however, but little from shears built on a similar principle and in use already for the removal of plaster-of-Paris splints and bandages.

NEW TONSILLOTOME.

THE instrument which I have devised for the removal of enlarged tonsils commends itself by its simplicity in structure and by the ease with which it can be taken to pieces for the purpose of cleaning. The fenestra in the back plate is of sufficient size to admit of the entrance of any enlarged tonsil; and then, by the simple act of closing the scissors, the tonsil is removed, and at the same moment the

detached portion is transfixed by the spear, and thus prevented from dropping into the pharynx and being swallowed, or falling into the entrance of the larynx. Many other instruments allow the detached portion of tonsil to take care of itself. Messrs. Arnold and Sons have constructed for me a very satisfactory instrument, which answers the purpose admirably, and a separate back plate of smaller size is furnished with the instrument, which can be used in suitable cases.

A. HERBERT BUTCHER, L.R.C.P.I.,
Surgeon, Birkenhead Borough Hospital.
Birkenhead Park, Birkenhead.

THE LANCET.

LONDON: SATURDAY, JUNE 4, 1892.

THE most important matters brought before the General Medical Council were connected with the consideration of charges of unprofessional conduct against medical practitioners. From the first the true position and function of the General Medical Council with regard to many of these cases formed a subject of frequent debate. The question it was desired to solve was whether the Council or the licensing body should take the initiative where there could be no doubt about the propriety of exercising penal powers. Sir JOHN SIMON raised the debate over the first case, in which a conviction for forgery formed the ground upon which it was proposed that action should be taken. He contended, with much forcible argument, that the corporations originally granting licensing powers should have taken the step of removing the name from their respective rolls and should have reported their action to the General Medical Council, and he urged this the more strongly because, in the case under discussion, the conviction was more than three months old, and the individual was still upon the registers of the licensing corporations. This question was so important that it is satisfactory to find that it was not allowed to drop, although it was argued that the corporations could scarcely undertake to keep themselves informed of criminal cases occurring in remote parts of the United Kingdom. Sir JOHN SIMON returned to the charge at a later period, and eventually it was decided to request the authorities at the Home Office to take such steps as would afford the Council early information of the conviction of a registered medical practitioner of any felony or misdemeanour; and it was also decided that the registrar should forthwith communicate such information to the medical authority or authorities from which the practitioner in question held his registered qualification or qualifications. The General Medical Council is to be congratulated upon having found such a very practical solution of a difficult problem, and Sir JOHN SIMON'S steady persistence in enforcing his views is worthy of every commendation. In the consideration of the individual cases the action of the Council was undoubtedly tempered with mercy. In two cases the inquiry ended with certain words of admonition, but in four others it was decided to erase the names from the Register. One of these calls for special note since the charges, as formulated by the Council's solicitor, were upon somewhat new lines—viz., the charge of systematically seeking to attract practice by means of extensive public advertisements, containing name, address, and qualifications, and invitations to persons in need of medical aid to consult him professionally, the advertisements being themselves alleged to be of a character discreditable to a professional medical man. These charges referred to the writings of Mr. T. R. ALLINSON in the *Weekly Times and Echo*, from which several quotations were read. For the report of the inquiry we must refer our readers to another column, where the attitude which Mr. ALLINSON adopts towards the medical profession, and his views upon the uses of drugs and upon vaccination, are fully described.

Another topic touched upon during the present session was the report of the Examination Committee upon the certificates of instruction in materia medica, systematic and practical chemistry, pharmacy, and physics. We have often in these columns had occasion to refer to the unsatisfactory nature of the evidence of instruction in these subjects required or received by the Conjoint Board for England, so that it is no surprise to learn that the charges mentioned last week (p. 1199) should be directed against this body. We had no intention of wounding any susceptibilities in noting the introduction of the story of the coachman, and the hesitation to go into particulars. Even with Mr. MACNAMARA'S letter before us, which we gladly publish, and with the report of the Examination Committee, it might still be thought that the coachman story was not supported by any proof. On the other hand, it now appears that attention was attracted because numbers of Irish students, who had not attended lectures in any recognised school in Dublin or any of the Queen's Colleges, were found to be going up for examinations. It may be hoped that under the five years' scheme this objection may be removed; but the regulations with regard to certificates are scarcely yet as restricted as Mr. BRYANT appears to believe, though they will doubtless check the reception of certificates from persons of "unascertained competency to instruct." The report of the Finance Committee indicated that during the past year the receipts had been largely in excess of the expenditure, a result which compared very favourably with that of previous years. This is a noteworthy and important fact, as it may be anticipated that the resources of the General Medical Council will, in the near future, be largely drawn upon by the expenditure incidental to the visitation and inspection of examinations. Another matter of general interest is the consent of the President to continue to act as chairman of the Pharmacopœia Committee for the ensuing year. The name of Sir RICHARD QUAIN is so intimately associated with the British Pharmacopœia that it would have been a subject for regret had his election to the presidential chair interfered with his previous genial supervision of the work of the Pharmacopœia Committee. The session is at an end and its labours have been somewhat of a routine nature and mainly confined to the exercise of painful disciplinary functions. We have not given here any detailed account of the cases investigated, as with one exception they are characterised by sadly familiar features, over which we willingly draw the veil.

MR. R. H. SCOTT, whose authority on questions of meteorology is of the first order, dedicates a paper in *Longman's Magazine* to the climate of Great Britain and Ireland, and brings out many facts of peculiar interest to the medical consultant. Having indicated the extreme untrustworthiness of popular estimates of the climate of watering-places and health resorts — estimates oftener inspired by local partiality and dread of competition than by really scientific data—he touches on temperature, and shows that differences in this respect between one

Digitized by Google

place and another are mainly due to differences of exposure. Protection from winds, either by interjacent woods or by the contour of the ground, is what mostly renders a situation agreeable to invalids, so that "in any district the existence of a drive or a walk sheltered from north and east winds and exposed to any gleams of sunshine which may come, is sufficient to attract residents at once." Following up the subject, he pronounces the warmest spot, on the average of all the year round, to be the Scilly Isles, which are a whole degree warmer than either the west of Cornwall or the Channel Islands; while the coldest region he finds to be the extreme north-east of Aberdeenshire. In all this, however, he is speaking of temperatures at the sea level, not of temperatures recorded at stations high up on the hills or in the interior. "In winter the lines of equal temperature run generally north and south, the warmth lying to the south-westward," there being but small difference along the east coast from Aberdeen to the Thames, though the really coldest region of England is the Wash. As to the question of the variability of temperature, a question to be solved by continuous records (which "are costly things, and can only be maintained at large observatories"), Mr. SCOTT attributes the highest variability to London, where "the chance is that each day may be hotter or colder than its predecessor by more than 2½°." The most equable climate is found at the two south-western stations, Falmouth and Valencia Island; but *apropos* of these findings, he enters the important caution that "this variability is not an element of climate which really affects invalids very much, for it is the variability of the mean temperature of the entire day, and not merely of the hours at which people are usually out of doors and exposed to the open air." Summing up this part of his inquiry, he shows that while Cornwall and the South-west of Ireland, as already stated, enjoy the most equable climate, bathed as they are by the Atlantic, Aberdeen comes next in equability—a result hardly to be expected from its latitude, but explained by its proximity to the sea. Sunshine is another important factor, and under this head the Channel Islands bear pre-eminently the palm, being "the only region which records, on the average of the ten years, sunshine for one-half the time the sun is above the horizon in any month, and this it does in May, with 52 per cent., and in August, with 55." Here, again, anomalies occur, for in November the sunniest parts of the kingdom are the coasts of the Irish Sea, Douglas and Dublin, and the extreme south-west of England, Falmouth, while as yet, for some unexplained reason, "Jersey falls off completely," November being the one month in which it does not top the list. Fogs are another important factor in our insular climate, but our data for them are still as little clear as the subject. From such figures as are available, however, Mr. SCOTT pronounces the very foggiest tract to be the east coast, "Yarmouth and North Shields recording respectively thirty-four and twenty-eight days in the space of four winters or twelve complete months." London and Oxford come next, each with twenty-four days. The Thames Valley is the culprit in this case, the German Ocean in that of Yarmouth and North Shields. Another deeply interesting section of Mr. SCOTT'S paper is devoted to rain, the unequal distribution of which is mainly due to the presence or absence of hills, or to their position, in a district. "When a moist wind," he says, "comes in from the sea and strikes on a hillside, it is mechanically forced to rise, to get over the crest. As it rises its temperature is lowered at the rate of about 1° F. for every 300 ft. of elevation; so that in crossing hills 3000 ft. high, the loss of temperature is 10°. This cooling process causes some of the moisture in it to be condensed, and to come down as rain." A number of practical observations occur in this connexion, such as the choice of a residence, for which "a spot with hills lying to windward on the rainy side" is recommended. Again, the rainiest months in the west are those of the late autumn and winter; in the east, the maximum fall is somewhat earlier, as the winter months, with their greater prevalence of long-continued cold and dry winds, are less moist. Finally, the afternoons are decidedly wetter than the forenoons, noon being the finest part of the day, so that, according to Mr. SCOTT, it is wisest, "as regards our own comfort, to take our outing, if we can, before lunch." The whole paper is full of suggestions invaluable to the practitioner, and can be safely recommended to the notice of our readers.

THE variety of foreign bodies that may find entrance to the ear seems endless, and those versed in the literature or practice of aural surgery are acquainted with many instances of the entrance of peas and beans into the auditory canals of children. That they should germinate when contained in a warm and moist cavity is not remarkable. Recently the death of a boy occurred from the entrance of a horse-bean into his ear; the bean is said to have been found after death, and to have commenced to sprout. We have heard of a grain of wheat long retained under the upper eyelid germinating, and doubtless other examples have occurred, and are to be explained on the ordinary principles of nature. It is quite astonishing, the amount of ignorance that prevails among the public generally as to a correct estimate of the dangers attending the entrance of foreign bodies into the ears. Insects are supposed to be peculiarly fatal. The common "earwig," according to our experience, but seldom gains access to the auditory canal. Among the weak and credulous the entrance of an insect into the ear may originate well-marked delusions. Among these is a fixed idea that the intruder has propagated its species during its temporary imprisonment, and that henceforth colonies of its progeny are doomed to dwell in and issue forth from the affected organ. The ear, of all organs of the body, has, curiously enough, longest retained the privilege of being treated by some of the remedies of remote antiquity. We published on April 30th an interesting case of impacted lead in the tympanic cavity. Cases like the one reported by Mr. SHEILD must be, fortunately, extremely rare. The difficulty of their treatment is obviously very great, and the idea of employing metallic mercury to dissolve the irregular projections of the mass was undoubtedly ingenious. Whether this treatment will be, as the author suggested, useful for impacted bullets, remains to be seen. It is certainly worthy of trial.

MANY of the earlier writers on medicine and surgery

Digitized by Google

treat of affections of the organ of hearing and of the foreign bodies that may gain access to it. From the frequent references to "worms in the ear," it may be supposed that this revolting complication of neglected otorrhœa was not infrequent in those days. Many of the remedies employed were most curious, and a detailed description of them would fill a small volume. Urine, women's milk, excrement, and decoctions of various substances, more or less disgusting, were commonly prescribed. The subject of foreign bodies impacted in the ear also received much attention. It is interesting to note that CELSUS advised their removal with a stream of water, and also counselled that the patient was to be laid on a table on his affected side, and then that the table was to be struck with a hammer, and the concussion would loosen or expel the substance. This practice is at least harmless, and has, in some respects, not been improved upon in modern days. PAULUS ÆGINETA, about the seventh century, wrote fully on the subject of foreign bodies in the ear, and recommended operations for their removal. Among much that was bad in the writings of these authors there were occasional glimpses of good. As often happens in matters other than surgery, the evils that men inculcate long survive them. All the ancient surgeons seemed to be impressed with the impropriety of ever leaving these cases alone, and most of them invented instruments, more or less formidable, designed for the process of extraction of the offending substance. In remote country districts the popular remedies for earache and foreign bodies are still numerous, harmful, and often disgusting. People generally look upon the entrance of a foreign body into the ear with much alarm and apprehension. There is no work on aural surgery but points out in eloquent and graphic terms the dangers that attend the use of instruments in these cases, and the small amount of comparative harm that accrues to the patient if the offending substance is left alone. Vainly do their authors quote the time-honoured aphorism of VOLTOLINI, "that even the point of a dagger left quietly in the ear will not do as much harm as attempts to remove it." A child—it is usually a child—forces a self-extracted tooth into its ear, a glass bead, a piece of slate pencil, a plumstone, or a little pebble. The lodgment of the foreign body certainly causes pain and discomfort, deafness, perhaps some slight discharge, but very rarely sets up meningitis or cerebral abscess. Every aural surgeon of experience can adduce cases in which adults have consulted him for deafness of long duration, and where the proper use of the syringe has expelled a foreign body which had lain forgotten and unsuspected in contact with the tympanic membrane. It is well to bear in mind that, beyond causing deafness and some local irritation, smooth round foreign bodies do no harm. Sharp, rough, angular, or pointed substances may be productive of greater evils. We believe, indeed, that it would be a safe rule for any practitioner not well accustomed to aural manipulations to trust entirely to the syringe in the removal of foreign bodies. In the vast majority of cases the proper and persevering use of the syringe will expel the offending substance.

THE unqualified assistant dies hard. He is an old-fashioned institution dating from a time anterior to the present highly organised constitution of the profession and a period when the State was not so exacting in its demands as respects the high training of those who served medically. The fact that four or five practitioners at the May meeting of the Council have been charged with using such unqualified assistants wrongly, and that nearly as many days of the Council's time have been occupied in dealing with these charges, ought to awaken registered practitioners to the risk they run unless they keep strictly within the bounds prescribed by the Council for the employment of unqualified assistants. One thing we may say at the outset, and it is this: that the Council does not appear to wish to dictate to the profession in its use of unqualified assistants; and, further, that in endeavouring to lay down rules it seems to have gone very thoroughly into the subject, and to have shown no disrespect to the old unqualified assistant, as he was known to most of us over fifty years of age in our earlier days. The duty of guarding the public against the attendance of unqualified persons under cover of qualified practitioners was very decidedly thrown on the Council ten years ago by Sir WILLIAM HARCOURT, the then Home Secretary. His attention was drawn in 1882 to a very bad case in which a practitioner was charged with having three different dispensaries at the East-end, at one of which "Colonel" GRIFFEN, apparently a half-caste, was in the habit of attending patients on behalf of the practitioner and signing certificates. Sir WILLIAM HARCOURT was asked if he could take steps to prevent such illegalities, when he replied: "Of course there is no legal authority which could deal with the matters referred to by the hon. member. The proper course would be for him to call the attention of the Medical Council, which has power to act by the 21 and 22 Vic., to these cases, and ask them to put the Act in force against them."

It must be allowed that, prior to that time, the Council had not either realised its duties or appreciated the gravity of the evil to which Sir WILLIAM HARCOURT'S attention was directed. Ever since, however, the Council has been more alive to both points. Those who doubt this, or would like to study the question of the scale on which, and the views with which, unqualified assistants are employed, would do well to obtain the Minutes of the Medical Council for 1882–83 and following years. They will be surprised at the detail with which the subject was gone into by the committee appointed, which included the late Dr. CHAMBERS (chairman) and Mr. (now Sir JOHN) SIMON, under whose influence the decisions of the Council and the rules for its guidance in trying such cases were framed. The strange thing is that ten years later we find five or six practitioners brought up charged with violation of or inattention to the often advertised rules of the Council. Not only have the rules been advertised, but the cases in which they have been broken have been from time to time reported in the medical journals. And yet session after session men appear before the Council and are struck off, and say, in answer to questions, that they were not aware that they were doing anything wrong or acquainted with the Council's views. The only explanation we can offer is of a twofold nature. First, some men seem to turn a blind eye to that which they

Digitized by Google

do not wish to see; secondly, it must be admitted that there is a certain amount of vagueness in the rules of the Medical Council with regard to the employment of unqualified practitioners—just enough to throw on the individual practitioner the onus of considering whether in his individual case he is breaking these rules. We reprint in another column a resolution passed by the Council on April 21st, 1883, and a subsequent report of the Executive Committee on the use of unqualified assistants presented at the meeting in May, 1888. Surely it is possible for the Council to be still more definite, and to specify with more precision the conditions under which its censure would be incurred by practitioners employing unqualified assistants. In the meantime, the only safe course for practitioners to take is to study the bearing of the somewhat vague, but yet significant, resolutions of the Council and the report of the Executive Committee. This Committee was appointed in order to "consider under what circumstances a registered medical practitioner would render himself liable to the censure of the Council in reference to the employment of unqualified assistants." Meantime we may give this advice to any young men who, by their own fault or that of fortune, threaten to drift into the list of chronic unqualified assistants: to give diligence to escape from a position which, except in the temporary form of pupilage, is now discredited.

Annotations.

"Ne quid nimis"

THE VACCINATION COMMISSION.

BOTH in the House of Commons and in the House of Lords questions have been asked as to the intentions of the Government in respect of the recommendation contained in the interim report of the Royal Commission on Vaccination that vaccination prisoners should no longer be subjected to the same treatment as ordinary prisoners. Mr. Matthews, in reply to Mr. Channing, said that the recommendations made in the report involved an important and considerable relaxation of the law on this subject, and Her Majesty's Government think it right to consider the evidence on which those recommendations are founded more fully and carefully than they have yet been able to do before deciding what legislation they will recommend to the House, especially as small-pox has considerably increased in several parts of the country; the Government, it was said, would lose no time in announcing the course they proposed to take. Mr. Matthews' reply did not in any way give satisfaction to Lord Herschell, who last Tuesday severely criticised it in the House of Lords. Lord Salisbury, however, held that it was perfectly fair for the Home Secretary to conclude that although the Commission might have fully intended to maintain the vaccination law, and although in their judgment their recommendation might do so, yet the practical effect of it would be that the vaccination law would cease to be operative. The desire to see the evidence did not imply the slightest distrust of the Commission, but only indicated a wish to know the grounds on which these recommendations were founded. The proposals of the Commission appeared to enable persons to buy the privilege of making themselves centres of contagion. The principle of allowing a person, after paying the penalty for a first offence, to go on offending in the same direction was so novel in our legislation that he could well understand the Home Secretary's hesitation before promising to act upon it. There is no doubt the action of the Commission has placed it in an undesirable position. We have already commented upon this at length. It is probable that before the conclusion of the inquiry the increase of small-pox in England will have afforded more than one striking example of the effects of the neglect of vaccination, and the Commission may feel itself obliged to consider what substitute shall be provided for the machinery upon which reliance has hitherto been placed.

SIR W. A. MACKINNON, K.C.B.

ON Thursday, Mr. H. G. Croly, President of the Royal College of Surgeons in Ireland, accompanied by Sir Charles Cameron, Past President, R.C.S.I., and member of the Army Sanitary Committee, waited upon Sir W. A. MacKinnon, K.C.B., Director-General of the Army Medical Service, to present him with the diploma of the Honorary Fellowship of the Royal College of Surgeons in Ireland. The President stated that the compliment was an unanimous expression of the high sense which the College entertained of Sir William MacKinnon, not only as the head of the great department in which the College was so much interested, but also of his personal merits and reputation. Sir William MacKinnon expressed his thanks for the honour conferred upon him, and his appreciation of the services which so many of the Fellows and Licentiates of the Royal College of Surgeons in Ireland had rendered to the army.

THE METROPOLITAN ASYLUMS BOARD.

THE extent of the operations in London for the isolation in hospital of cases of infectious disease may be understood from the report which Sir Edwin Galsworthy presented to the Metropolitan Asylums Board last Saturday. During last year the ambulances of the Board removed 7725 fever patients from their homes to the hospitals of the Managers; 2392 convalescents to the Northern and other hospitals; 2343 patients, who had recovered, from the Northern and Gore Farm hospitals, and 140 from the hospitals to their homes. The mortality amongst 5262 scarlet fever patients had been 6·11 per cent.; among 1312 diphtheria patients, 30·61 per cent.; and among 755 enteric fever patients, 14·19 per cent. The report also gave account of the purchase of land for the enlargement of the Western Hospital, and of the conclusion of arrangements for the extension of the administrative buildings. At the Northern Hospital the number of small-pox cases received into the hospital had only been sixty-four, the forerunners of the more serious outbreak of this year. But Sir Edwin Galsworthy pointed out that if, unhappily, small-pox should again assume epidemic proportions in the metropolis, the Managers would, by means of their efficient ambulance service and the accommodation which they possessed in the hospital ships at Long Reach and in the convalescent hospital at Darenth, be far better prepared to cope with the outbreak than at the time of any previous epidemic. No doubt this is a gain to London, and it may be hoped that the existing arrangements will stand the test of time, and that there may be no reason for London to lose the advantages of a system that removes cases of small-pox so far from its boundaries. Sir Edwin Galsworthy, in his report, touched upon a subject which is not unnaturally present in the minds of those who have constantly before them the expense to which the community is put by the spread of infectious disease. In view of the fact, he said, that the powers of the Managers, in dealing with small-pox and other infectious disorders, were strictly limited to the removal and isolation of infected persons, it would hardly be matter for surprise if their efforts should sooner or later fail to prevent that which, with larger powers, they might

Digitized by Google

not unreasonably hope to indefinitely postpone. They called special attention to the Managers being constituted a sanitary authority, with power to direct measures of disinfection, instead of this duty being shared, as the law now stood, between no fewer than forty-one distinct authorities. The question here raised is a very large one; it is, indeed, two questions—the one whether the business of disinfection of houses and of infected articles can best be done by a central metropolitan or district authority, and whether, if by a central authority, that authority should be the Metropolitan Asylums Board? Whether the Metropolitan Asylums Board should have its powers enlarged and become more intimately associated with the administration of prevention of disease in London is, we imagine, likely to receive only one answer. It is obviously impossible for two central metropolitan authorities to be engaged in the same duty, and it has indeed to be seriously considered whether the work relating to infectious disease now undertaken by the Managers should not devolve upon the London County Council. This, we believe, is the proper solution of the difficulties of divided administration upon which Sir Edwin Galsworthy dwells, and it may be expected that the need for the arrangement of the duties of the two bodies will be suggested to many by the report which has just been presented.

A REPORTED NEW ELEMENT.

IT is reported in the *Chemiker Zeitung* that a new element has been recognised in a mineral found in Egypt by Johnson Pasha in 1890. This mineral, first called "Johnsonite," but afterwards masrite, consists mainly of aluminium, manganese, cobalt and iron, in combination with sulphuric acid. It dissolves in water, and yields on treatment with sulphuretted hydrogen in an acetic acid solution a preliminary white precipitate, from which a pure hydroxide was prepared. The element masrium contained in this was found to have an atomic weight of 228. The sulphate is a white salt, crystallising badly from water, but readily from a 50 per cent. alcoholic solution. The reactions of a soluble salt of masrium somewhat resemble those of zinc. The free metal has not been obtained, neither has any vapour density been determined nor spectroscopic examination made. It would appear, therefore, that masrium has not yet been fully investigated, and the statement that a new element has been discovered must be received with some amount of reserve until more detailed particulars are forthcoming. The periodic law of Newlands and Mendeléeff indicates, however, an element of atomic weight 225 in the family containing glucinum, strontium, and barium.

DEATHS UNDER ANÆSTHETICS.

A DEATH under chloroform is reported from the Kent and Canterbury Hospital. The patient, a brewer's labourer aged thirty-two, was admitted into the hospital to undergo an operation for the relief of a strangulated hernia. He was stated to have been in a very bad state of health on admission. Chloroform was administered, but before the patient had passed completely under its influence he suddenly became collapsed and, according to the evidence of the house surgeon, died from syncope. There seems a peculiar liability to a fatal issue to cases of this nature, but it is impossible to say in the present state of our knowledge whether the danger arises from the general enfeebled state of the patients, or whether the large and important nerve plexuses which are disturbed in visceral traumatism are the determining cause. It would seem wiser to replace the use of chloroform in these cases either by a mixture, such as the A.C.E., or ether. We have to record another death under an anæsthetic, and we are indebted to the house physician, under whose care the patient was, for the following notes. The patient, a pale, weakly woman aged fifty-three, was admitted into University College Hospital suffering from a tumour in the right loin of doubtful nature. The lungs were healthy and the heart free from organic disease but feeble. On May 20th and 24th she was placed under ether. On the first occasion some difficulty was experienced, and respiration failed. However, on pulling forward the tongue with forceps the breathing was resumed, and no further trouble was experienced. On the 24th she took the ether quite well; two days later she was brought into the operating theatre and ether again given from a modified Clover's larger inhaler by a house physician of considerable experience in the use of anæsthetics. She passed under the influence of the ether rapidly and quietly, the breathing being deep and regular, although the pulse was from the beginning somewhat weak. The surgeon proceeded to cut down upon the kidney. After twelve minutes or so, and while the kidney was being manipulated, the patient began to vomit, expelling some greenish liquid. Synchronously the patient cease to breathe, and the pulse was completely lost at the wrist. She was at this time upon her left side. She was promptly turned on her back, the face piece removed, the lower extremities raised, the tongue drawn well out of the mouth, and artificial respiration by Silvester's method was adopted and persisted in. There was no blueness and no difficulty in getting air to enter the lungs. No recovery, however, took place; the heart never stirred from the first onset of syncope. Stimulation of the præcordium and other methods for resuscitation failed. A necropsy was made on the day following the fatality. The heart was found to be flaccid, and to contain no blood; the myocardium was pale and soft, and the cavities were dilated. The lungs were normal, and free from any of the signs of death from asphyxia. In this unusual form of death under ether there seems little doubt that the cause of the fatality was primary heart failure, as there was at no time any evidence of even pulmonary engorgement. The mechanism of this syncope is less clear unless we accept the hypothesis, which certainly has much to support it, that the death was really due to reflex inhibition of the heart, the inhibiting nerves being the visceral branches of the sympathetic stimulated by the manipulation which the kidney was undergoing, acting upon a heart only imperfectly guarded, as the patient appears to have been very superficially under the influence of the drug. The act of vomiting, while it heralded the partial resumption of consciousness, may itself have been a visceral reflex, associated, as we usually find visceral vomiting to be, with cardiac enfeeblement.

SENDING DISEASED MEAT TO MARKET.

A FEW days ago, at the Guildhall, London, a cattle dealer of Norwich was fined £50 and three guineas cost for sending four pieces of diseased beef to the London market, intending it to be sold for human food. It was stated that the defendant, being afraid that the cow, after calving, was suffering from milk fever, and would die, had it killed, dressed, and sent to market. An inspector stated that the flesh of an animal which had suffered from milk fever would be most dangerous and poisonous food. The punishment in this instance was well merited, we feel assured, if the evidence perfectly demonstrated that the animal was suffering from real milk fever when it was slaughtered. But if it was affected with what is often wrongly designated milk fever, even by professional people, then the decision to inflict such a heavy fine, or any fine at all, was unjustified; for it should be remembered that two very different disorders are only too frequently included in this designatio Puerperal or milk fever, which in the cow is nothing more or less than septic metritis, undoubtedly renders tha

Digitized by Google

animal's flesh unfit for food; but another somewhat frequent disorder following parturition, and which only too often receives the same names, is marked by loss of consciousness at an early stage and symptoms of cerebral apoplexy. In this, however, there is no fever or indication of septicæmia, but merely brain congestion or hæmorrhage, and the temperature is either normal or subnormal, while in milk fever the temperature ranges high, and there are the other signs of blood poisoning. The latter is usually named "puerperal fever" and the former "parturient apoplexy" by veterinary surgeons, and the distinction should be rigidly observed, as in the first the use of the flesh as food should be prohibited, but in the case of the second it may be allowed, provided the carcase is accompanied by a certificate from a competent authority stating that the animal was only suffering from parturient apoplexy, and had not received any noxious drugs. This course would prevent fraud on the one hand and injustice on the other.

FEVER HOSPITAL PROVISION.

AN evening contemporary states that the Metropolitan Asylums Board proposes to acquire the City of London Union Infirmary at Homerton for the purpose of utilising it as a fever hospital, and it urges the inhabitants of the district to lose no time in offering an organised opposition to the scheme. We trust the inhabitants will do nothing of the kind. Fever hospitals are a necessary part of the machinery for the limitation of the spread of infectious disease, and it has been found that the use of fever hospitals does not endanger a neighbourhood in the same manner as small-pox hospitals. No doubt the introduction of a fever hospital into any part of London is at first regarded with considerable distrust, and may be attended for a time by some depreciation of property until a little experience has shown that the fears are groundless. The extension of the Homerton hospital would have no such effect, and it would be regrettable if the intentions of the Managers should be frustrated.

THE CURE OF ADVANCED RABIES.

IN connexion with Professor Murri's paper on page 1231, the following detailed account of the important experiments therein referred to may prove of interest. Our readers are already aware of the treatment of tetanus by inoculation, as practised by Professor Tizzoni of the University of Bologna—a treatment the success of which has emboldened the same indefatigable experimentalist to attempt, on similar lines, an improvement on the Pasteurian method of dealing with rabies canina. That method, says Professor Tizzoni in his memoir, presented to the last meeting of the Accademia dei Lincei, seeks to hinder the development of hydrophobia, but has hitherto failed of effect after the primary symptoms of the malady have set in. It is to the latter condition—that of developed hydrophobia—that he accordingly addresses himself, and the following is a summary of his *modus operandi*. He had already proved, in conjunction with Schwarz, that the serum from the circulation of an animal rendered proof against the hydrophobic virus reveals a disinfectant action, destroying the said virus when introduced by inoculation into rabbits, and this for an interval of time of about forty-eight hours. He next verified the validity of the doctrine laid down by Valli at the beginning of the century that the substance of the nervous system of rabid animals when subjected to artificial digestions loses its toxicity, and, moreover, when injected, that it acts like the medullæ of Pasteur, endowing the inoculated animals (always rabbits, as being more alive to the infection) with resisting power against rabies. So he set himself to inquire whether in the serum of animals rendered virus proof there might not be contained an active principle capable of withstanding the hydrophobic infection. As the result of his experiments he found that the said serum destroys the virus of rabies not only *in vitro*, but even in animals in which the virus had been inoculated in the most certain of all ways by means of the sciatic nerve. Not only does the serum of virus-proof animals prevent the development of rabies, but it cures hydrophobia even when it is already established—e.g., with such unmistakable symptoms as paralysis of the lower half of the body, nervous prostration, fever, diminution of weight, and the general aspect characteristic of the rabid animal. For his own method, the Bolognese pathologist claims a distinct advantage over that of Pasteur, as being efficacious even when the virus of rabies is already diffused throughout the nervous system, its efficacy having failed only in cases in which concurrently with the infection there were profound anatomical lesions. In man, consequently, recourse to the counteracting treatment should be had in the first period of the infection, as soon as this is revealed by its characteristic and numerous phenomena. No great quantity of the liquid is then required, and it may be injected hypodermically or into the bloodvessels, care having been taken that it loses none of its virtue by exposure to light and heat. Professor Tizzoni (assisted by his colleague in the Bologna Laboratory, Dr. Centanni, of whose coöperation he makes due acknowledgment) claims, by special methods and special solvents, to have succeeded in extracting from the medulla of a hydrophobic animal the vaccinating substance, deprived of its toxicity, which forms the active agent of the Pasteurian treatment. This substance, used as a prophylactic, invariably preserves infected rabbits; but when the treatment has been begun seven days after infection it is quite inoperative. If, then, instead of resorting to the substance above mentioned, the serum of vaccinated animals be employed, advantage is taken of the "immunifying substance" (as Professor Tizzoni calls it) already elaborated in the organism of the virus-proof animal, a substance which acts directly on the poison of rabies. In other words, the vaccinating substance remains inert when the malady is developed; the "immunifying substance" (*sostanza immunizzante*) enables us to combat the poison in cases where hitherto intervention of any kind has been unavailing. Professor Tizzoni and Dr. Centanni are so satisfied of this that they await with confidence the application of their method to man, and meanwhile promise to make their clinical experience *publici juris* as soon as a sufficient number of test cases have come under their cognisance.

THE METROPOLITAN ASYLUMS BOARD AND ITS PROFESSIONAL STAFF.

"ASSUMING that the arrangement was satisfactory both to the managers and the persons who were willing to give their services on the terms referred to, the Local Government Board were not aware of any reason why it should not be carried out." This aphorism, with which Lord Henniker dismissed the subject recently raised by Lord Sandhurst in the House of Lords, a report of which will be found in our Parliamentary column, concerning a certain circular issued by the Metropolitan Asylums Board, has about it an air of common sense that is unquestionably captivating, but perhaps a little deceptive withal. The circular in question contained an invitation to medical men and nurses to take office as clinical assistants and additional nurses at a remuneration limited to residence and rations. Now it is perfectly true that the experience which can be gained at the institutions under the control of the Board is valuable experience, and worth acquiring at some personal cost, both by medical men and nurses, and,

Digitized by Google

were it proposed to organise the small-pox hospitals in the manner of a special medical school, there could be no dispute about the propriety, from the point of view of the profession, of allowing such students as chose to avail themselves of those educational facilities so to do. But there is a great temptation to the managers of any such undertaking to exploit the young professional person very unfairly to their own advantage. It is a truth which cannot be forgotten without public detriment, that the "labourer is worthy of his hire." The acquiescence of the party who gets the worst of the bargain is evidence of his inability to resist, but by no means evidence of his readiness to accept the position in which he finds himself. A young man, for example, who finds it difficult to make a start is often glad, in a sense, to accept a very disadvantageous arrangement which gives him employment and keeps his faculties from rusting. By astutely taking advantage of these necessities of a young man's or young woman's position, governing bodies may, and do, secure great pecuniary advantages in connexion with the filling up of junior places in their staffs, and to a large extent this evil must be endured, because there is no means of curing it. But with a public body, directly or indirectly responsible to Parliament, it is not impossible to make a protest, and we desire emphatically to support the complaint put forward by Lord Sandhurst. The question raised is one that nearly concerns the comfort and even the well-being of a large number of young and comparatively defenceless people, and cannot be answered by an epigram. It is taking an unfair advantage and securing an unworthy gain for the public which accepts their services to evade due payment for them by turning to the best possible account the "higgling of the market."

DEATHS FROM SWALLOWING ARTIFICIAL TEETH.

THE case reported in the daily newspapers last week of a police constable who met his death from the impaction of a set of artificial teeth in the neighbourhood of the larynx should draw general attention to a danger to which many are daily exposed. It will be remembered that in this particular case the constable, summoned by the whistle of a comrade conveying a prisoner, whom there was an attempt to rescue, to the police station, came running up and took hold of the arm of the prisoner, but almost immediately fell to the ground. He was at once conveyed to King's College Hospital, but died on the way there. The post-mortem examination revealed a set of false teeth impacted just above the larynx, and this had caused death from suffocation. The report adds that the teeth were of inferior make and no doubt became loosened through the deceased running. Year after year there are recorded cases of death from swallowing artificial teeth and probably many occur which are not reported or even suspected. As a rule these artificial teeth are what is known as "partial cases," where a few teeth are mounted on a small plate, with clasps attaching them to two or three of the remaining natural teeth. These plates may be so ill-fitted as to be loose from the first, and thus easily displaced; but more often the supports—the natural teeth—decaying little by little, the hold of the plate becomes very precarious, yet so gradual is the loss of anchorage that the patient in some instances hardly notices it, and by means of the tongue and the opposing teeth of the other jaw, keeps them in position, while the muscular movements are unconsciously performed. The danger in this latter class of cases is the greater because of the insidious growth of its cause. It has been urged that these small dentures ought never to be inserted, but this contention is hardly practicable; the dentist, however, should always impress upon his patient the necessity of seeking advice should they become loose, especially where they are worn during sleep. The extraordinary foolhardiness which is sometimes displayed in such a case is shown by the following history. A man wearing a gold plate carrying three or four front teeth attached by means of clasps to the bicuspids returned home one night after a carouse, and, in attempting its removal, allowed it to slip down his throat. After waiting patiently for three days he found, to his joy, that it had passed per rectum and he proceeded straightway to place it in its proper position. He saw his dentist a few days later, and told him that he had taken aperients, and passed a great part of his time looking for the lost teeth. The plate was green and slimy, but nothing could induce him to have it removed from his mouth or to have a frame made which would be impossible for him to swallow. However, it is not always the small artificial sets which have been the cause of death by suffocation, for the pharynx is sometimes large enough to accommodate a whole upper suction case, and in the museum of the Middlesex Hospital there is a preparation showing a loin mutton chop, including the bone, impacted in the pharynx, which is surely as large as anything made in the way of artificial teeth.

LIME IN THE SALIVA.

AN examination of the saliva for lime gives results of a variable character. A series of observations have been recently made by Dr. Lepkowsky on the subject in the hope of elucidating the cause of this variation. The method employed was that recommended by Krüger. In perfectly normal cases the saliva contained from 2 to 3 per cent. of lime, there being more a few hours after a meal than either just before or just after it. A rise of body temperature, too, appeared to cause an increase in the amount of lime. Where any of the teeth were affected by caries the lime increased to from 3 to 5 per cent. It did not appear to matter whether only one tooth or several were affected. The lime evidently was not dissolved from the teeth, for in the three-quarters of an hour during which the secretion was collected for analysis the utmost that could have been dissolved from the teeth was 0·000,004 gramme—a quantity too small to be detected chemically. Again, it was found that a still larger proportion of lime occurred in the saliva of persons who had lost all their teeth, in whom it contained from 6 to 9 per cent. Dr. Lepkowsky has not found himself in a position to advance any definite theory as to the cause of the variation in the amount of lime, but suggests that nervous influences probably play a not unimportant part in its secretion.

A NEW CONVALESCENT HOME FOR EUROPEANS IN BOMBAY.

THE new European Convalescent Home, recently opened at Khandalla, in connexion with the Bombay European General Hospital, appears to be a picturesque structure, with a handsome façade, occupying a very open and desirable site, and surrounded by a panorama of mountain and valley. The home has been erected on the plans prepared by Mr. John Adams, executive architectural engineer to the Bombay Government. The male and female quarters are isolated from one another by a large break in the centre of the building, but overhead, on the second floor, the front verandah spans the interval like a bridge, allowing a free promenade from end to end of the building, and also permitting nurses to pass from the male to the female wards and *vice versâ* without running up and down stairs. The male and female quarters have large dining-rooms, dormitories, bath-rooms, and nurses establishments. An institution of the kind has long been required, not only for patients, but in the interest of

Digitized by Google

the European hospital nurses whose duties in an Indian climate are of a very exhausting kind. The present building owes its origin to the suggestions of a lady visitor to the European General Hospital in February, 1889. We wish the new convalescent home every success, and hope that the movement will commend itself, as it certainly should, to European residents in the Bombay Presidency and to travellers from England, America, and the Continent, who cannot fail to recognise the claims of an institution which will materially alleviate the sufferings of Europeans and others who have to earn their livelihood in a distant and trying climate. One of the chief advantages of this convalescent home is that it is only a short journey from Bombay, and easily accessible by rail.

EXPERIMENTS ON ANIMALS.

THE return made to the House of Commons upon the working of the Act 39 and 40 Victoria, c. 77, for the year 1891, by Dr. Poore and his Irish colleague, shows that the work done under the licences issued from the Home Office has continued during that period to be of the very highest importance both to the human and the brute communities. Recent discoveries in the nature of disease have naturally directed the industry of investigators into this channel, since only in the living body can those phenomena be observed from which it is possible to deduce the laws of the propagation of those minute organisms which are now known to be the agents and promoting causes of many diseases, and only in the living body, and under experimental conditions, can the precise effects of treatment be ascertained and demonstrated. The list of diseases which Dr. Poore enumerates as having occupied the attention of experimenters during the past twelve months is a highly suggestive one, and one which amply justifies the workers in this field, comprising as it does scourges so terrible both to man and beast as tubercle, cholera, cancer, erysipelas, diphtheria, influenza, rabies, glanders, anthrax, goitre, and cretinism.

PROGRESS OF PHARMACY.

THE report of Professor Attfield on the Progress of Pharmacy, presented to the General Medical Council, necessarily has reference mainly to progress in its relation to the future revision of the British Pharmacopœia. Year by year the British Pharmacopœia is made the subject of researches, and suggestions in medical, chemical, and pharmaceutical periodicals, and to Professor Attfield is entrusted the arduous task of keeping record of the researches and of criticising the suggestions. The question of nomenclature occupies the first place in the report, and then stress is laid on the desirability of using the words "solution" and "soluble" with greater regard to scientific accuracy. The looseness with which these words have been employed is sufficiently indicated by the familiar "soluble in acids," which in nearly every case means that the substance is first converted into some new chemical form which is soluble. It was pointed out by Ince in a paper in the *Pharmaceutical Journal* that Great Britain stands alone in treating Latinised English names as feminine, and it is suggested that perhaps it might be desirable to change "saccharata," "exsiccata," "granulata," "ponderosa," and "acida," to "saccharatus," "exsiccatus," "granulatus," "ponderosus," and "acidus." The subject of proposing additional official synonyms is approached with caution; but there can be no doubt that the list of official synonyms should be extended, as in this way uniformity in the potency and general qualities of raw drugs and of their preparations is promoted. The Unofficial Formulary issued by the British Pharmaceutical Conference is mentioned, with the laudatory note that many substances previously in this list have already been rendered official by incorporation in the Additions to the British Pharmacopœia. The report upon materia medica and compounds is mainly of pharmaceutical interest; incidentally, however, it is pointed out that some of the difficulties suggested would scarcely apply if pharmacopœial directions were closely followed. In view of the frequent variations in strength of acidum hydrocyanicum dilutum, and of the probability that it will be replaced by prescribing a freshly made solution of cyanide of potassium, it is considered that the purity and dose of the latter should be officially established. It will be seen from the above that this department of the work of the General Medical Council is being thoroughly and efficiently performed.

MR. IRVING ON CONSUMPTION HOSPITALS.

THAT our distinguished tragedian possesses what Dr. Johnson called "the art of doing little things with grace" has been shown on many occasions, but on none more felicitously than in the short speech with which, as president at the annual dinner of the North London Hospital for Consumption, he introduced the toast of the evening. He dwelt with humour and point on the charge brought against theatres, that they are *par excellence* the parents of phthisis, from the exposure incurred by their frequenters to the night air after long hours spent in a vitiated atmosphere. Thanks to better ventilation and, *inter alia*, to electric lighting our theatres are rapidly minimising the risks referred to, though the same cannot be said of our law courts, our places of religious and political assembly, and even the House of Commons itself. Besides, as he adroitly indicated, it is not so much the playgoer who is exposed to the dangers with which theatres are said to be fraught as the play actor, who has to exert himself—in mind and in body, in voice and in limb—at unseasonable hours, and in circumstances often far from favourable. As none can testify more authoritatively than Mr. Irving himself, the very proficiency of the actor in his part makes the public more exacting—even to his having to reappear again and again (though this is more specially true of the lyrical drama) in answer to the "encores" of imperiously vociferous audiences. A better pleader than Mr. Irving for the cause of medical charity it would be difficult to find. Off the stage, as well as on it, he illustrates what Addison, in a memorable paper, contended for—the uses to which the drama and its artistic interpreters may subserve, not merely for social culture and refinement, but for the diffusion of that sympathetic and coöperative spirit which tends to make "the whole world kin."

INCREASE OF CHOLERA.

DISQUIETING intelligence reaches us from the East regarding the increase of cholera. The disease for some time past has been smouldering in Persia, but now accounts are forthcoming of its active appearance in that country and in Cashmere. The chief places affected appear to be Meshed, where the mortality is said to have reached 60 per cent., and Srinagar, where the deaths have ranged between fifty and sixty per hundred of the cases. These reports may be, and we hope are, unfounded and exaggerated. Nevertheless, grave cause for apprehension exists, the more especially as cholera is reported to have shown itself at Turbeti Sheikh Djami, a town on the Perso-Afghan frontier. This looks as if there were going to be an extension into Afghanistan, and thence into India. Thus, Western civilisation is at present exposed to invasion by cholera at two points—viz., overland from Persia through Russia, *vid* the Central Asian railway communications, and by sea from India, through the Suez Canal. With regard to the former, the Russian Government is taking precautionary measures, chiefly of an

Digitized by Google

administrative character, at Tiflis. It is satisfactory to learn that "sanitary precautions" are being taken at Djami. If these are carefully carried out in Afghanistan, the disease may not acquire an epidemic foothold in our Indian empire. Without in any way anticipating the conclusions or agreements of the parties to the Venice Sanitary Conference, it is to be hoped that the combined system of inspection and disinfection that will be promulgated in the Red Sea will arrest any Indian cholera infection at its entrance into Europe. For us Europeans, therefore, there is yet ample time given to put our houses in order, and to afford no opportunity to the dread enemy to settle in our midst. Should cholera burst the barriers raised against it in Russia and at the Canal, its success in establishing itself in any country will be in inverse proportion to the hygienic condition of that country. All filth conditions, of whatever sort, and every kind of pollution of air, water, or soil, are the nidus in which cholera flourishes. All our efforts, therefore, should be centred in perfecting our sanitary defence against the disease, which appears at the present moment to be afflicting our brethren in the East. The death of Sir Henry Harrison and his daughter at Chittagong from cholera has been the subject of much regret, as he was one of the ablest members of the Bengal administration, and was instrumental in carrying out many of the municipal reforms in Calcutta of late years. It is stated that many Europeans died of cholera at Chittagong in March last, but the disease was supposed to have disappeared.

THE LATE GENERAL H. H. MAXWELL, C.B.

ON Saturday, the 28th ult., in Rome, died one of the most accomplished and unwearied of public benefactors, General Henry Hamilton Maxwell. Placed by recent War Office regulations on the retired list, he was prematurely cut off from further distinction on the career of a soldier—distinction honourably earned in the Punjaub, in the Crimean campaign, and in the Indian mutiny; but, in keeping with the kindly nature he inherited, he could not be idle wherever thoughtful charity was to be exercised or humanity to be reclaimed. In conjunction with Count Beaufort he set himself to provide the poor victims of bodily mutilation, whether in war or in industrial life, with the mechanical assistance they required for resuming their place, even partially, in the ranks of the breadwinners. Italy, where the loss of an arm or leg is almost courted as an excuse for mendicancy, was the scene of his charity, and for more than twelve years he laboured to find out those who had been crippled in either limb, and by well-adapted artificial substitutes, gratuitously given, to save them from an all too easy lapse into beggary. Year by year he published reports of the "Arms and Legs Charity" in Rome and enlisted in the cause many compatriots who would otherwise have led the self-indulgent life of the artistic or lettered *dilettante*. From time to time THE LANCET called attention to this work and now that it has, we fear, been prematurely closed we cannot refrain from recording our sense of its value, and from laying this humble *immortelle* on its author's grave.

FLOWERS FOR THE SICK.

THE curative resources of medicine are not all included even within the compass of a bulky pharmacopœia. Nature has provided us with many such which are not the less potent in their proper place because they do not require to undergo any process of ordinary chemical preparation. Rest, exercise, diet, and the various methods of sanitation belong to this class. So likewise do numberless means of impression by which the mind is reached through the senses. The stimulant attraction of beauty is a suggestive example of this kind. It has from time immemorial been thus employed in a variety of ways, but never probably on so large a scale or with so great acceptance as where flowers have been its exponents. We are all aware of the fact that among ourselves the distribution of these to the sick has long been carried out by a special organisation, and the willing support which this body has always received is an excellent guarantee of the quality of its work. We cannot perhaps exactly trace its effects, but we know enough to be able to appreciate its refreshing influence upon mind and body when harassed by disease. Clearly, then, so useful a means should possess every facility in its mode of use. Instead of this, it is often found that flowers, though fresh and beautiful when cut, are, on their arrival at the bedside, crushed, withered, or decayed—no longer an aid to health, but a positive source of disease.

"Lilies that fester smell far worse than weeds."

Faults in packing, the failure to exclude air in particular, delays in transit or in distribution, and excessive handling by distributors, would account for their altered condition. A little care and forethought should effectually prevent this perversion of what must otherwise prove to the sick a real and unmixed benefit.

THE PERIOD OF ISOLATION IN SMALL-POX.

HAVING regard to the reappearance of small-pox in many parts of the country, and in reply to questions addressed to us on the subject, it may be useful at the present juncture to note that no uniform and definite period of time can be laid down as the minimum period of isolation of small-pox, as in measles or scarlet fever. There are so many varieties of small-pox, ranging from the varioloid and varicelloid to the confluent and hæmorrhagic, that no precise time-limit of infectiveness can be laid down. Bearing in mind the active virulence of the scabs resulting from the pustulation of small-pox, the period of complete and thorough separation of these is the only guide that we have. This will necessarily vary greatly—e.g., in a varioloid case, with only a few abortive pustules; in a mild, discrete case; in a coherent or semi-confluent case; and, lastly, in the confluent variety, where the face and head and many parts of the body show huge adherent coalesced scabs. The patient can only be pronounced free from risk of conveying infection when every trace of scabbing, and even of powdery scaling, has thoroughly disappeared. A careful system of bathing and of lubrication will, of course, greatly hasten the process.

THE POOR MAN'S MARKET.

AN interesting question was brought forward last week at the Marylebone Vestry election regarding the removal of the costermongers and stallkeepers who for years have plied their trade in High-street and Great Titchfield-street of that parish. The Markets Defence Committee urged the ratepayers to vote for such candidates as would be in favour of the retention of this threatened industry, and put forward the following arguments: That to the poor people of the district a cheap and handy market is an absolute necessity, and that during the fifty years this market has been permitted, no one has suffered annoyance, no interests have been injured, and no traffic interfered with. Moreover, it is stated to be a fact that the resident tradesmen have benefited by this open market, as no doubt customers are attracted to the locality when dealing at the stalls. Our sympathies, it must be confessed, are in favour of such cheap and open markets in cases where it can be shown that no interruption of traffic is occasioned, and where no nuisance to the surrounding district can be proved. To remove the barrows of the costermongers or the stalls of the itinerant vendors would prove a great hardship to the poor of the district, who would be driven further afield or else have to pay dearer by having to purchase their provisions

Digitized by Google

at shops for which a high rent is paid. Nor when such a market has existed for fifty years without a complaint having been raised, as regards its conduct, can we find any just reason for the action of the vestry. If they would confer a favour on the residents it would be rather in a crusade against the street hawkers, rag, bone, and bottle merchants, who perambulate the streets, hang about areas, and too often encourage servants in petty thefts; these and the perambulating hawkers of flowers "all a'bloomin'" and "strawberries, fresh strawberries," and vendors of Sunday newspapers are veritable nuisances that ought to be suppressed. But the stationary costermongers—whose barrows in some back street provide on Saturday night fresh fruit, vegetables, and cheap fish at reasonable rates to the neighbouring poor—are, we believe, hard-working and honest men and women; and to drive them from the positions they have held for many years would be a piece of class injustice which, in cooler moments, we are sure the inhabitants of Marylebone will not endorse. Surely the sanitary authority can exercise proper supervision over this "Poor Man's Market."

NOTIFICATION OF INFECTIOUS DISEASE.

WE noted in our last issue an interesting Parliamentary return showing the districts in which notification of infectious disease is compulsory, and from which it appears that this system now applies to four-fifths of the population of England and Wales; but the districts where authorities have failed to require notification remain a source of danger to the rest of the country, and Mr. Ritchie's promised measure is much needed as the only remedy. While small-pox is making its appearance in numerous places, we are reminded that Mr. Ritchie has expressed the hope that he will be able to extend the provisions of the Notification Act to all places within the area of jurisdiction of the Local Government Board.

"OBITER DICTA."

THE reports of proceedings in courts of law which appear in the English press are universally acknowleged to be remarkable for their accuracy, even when they are much condensed in substance. We do not often hear of witnesses finding fault with the statements put in their mouths, and yet sometimes one is almost inclined to believe that the reporter is a wit who delights in making some people say more than they mean. Two rather curious examples which will by no means stand scrutiny, stated to have been uttered by medical witnesses, are thus reported this week. One occurred at an inquest upon a girl who died from perforating ulcer of the stomach after a few hours' illness. The medical witness is reported to have said that "the disease was one peculiar to maidservants; in fact, it was called 'the maidservants' disease,' being found in no other station of life." Doubtless this practitioner has, in the course of his experience, met with patients of "all sorts and conditions," but that he should never have seen a case of gastric ulcer except in one class of the community is as surprising as is the information conveyed to the coroner's jury, with all the importance of a recognised scientific truth. The other case is of a different nature, but singularly calculated to bring ridicule on the profession. In the case of a man accused of a petty theft we read that medical evidence showed that he was suffering from locomotor ataxy, which "made him pick up things without knowing it." The diagnosis was doubtless perfectly correct, and the hands of an ataxic may be partially devoid of sensation and of muscular sense, and their movements clumsy and awkward. But, as has been pointed out, the fingers would hardly "drop the parcel into a pocket." In fact, that is just the very thing that an ataxic would not do without a good deal of ill-directed fumbling. In all seriousness, we would impress upon our brethren great circumspection in drawing general conclusions or making specific statements as to the capacity of an individual to perform purposive acts. There are no doubt cases where from the nature of things there may be a conflict of medical testimony. But such examples as those we have quoted afford only too readily an opportunity for unmerited scoffing at scientific knowledge.

THE PROGRESS OF THE SMALL-POX EPIDEMIC.

RECENT accounts have come to hand of the extension of small-pox from the centres at which it has been already raging. Thus, from Pembroke Dock we already hear of the disease breaking out in certain villages in the Haverfordwest Union, and at Blaina in Monmouthshire. Again, small-pox is reported to be prevalent amongst the colliery villages around Wakefield, as well as in Brighouse and Halifax. No doubt the malady has extended itself to these places from Dewsbury and Batley. At the latter place it is locally stated that nearly 500 people in all have been attacked by the disease. This is an exceptionally severe incidence for a town of some 28,000 inhabitants. But it must be remembered that Batley is contiguous to Dewsbury, a noted anti-vaccination centre, where many hundreds of cases have occurred since last autumn. We also notice that a few odd cases have already been reported from Keighley, another centre of anti vaccination. As regards measures of precaution, both in Wales and Yorkshire hospital isolation appears to be the chief thing relied on. Already hospitals are being extemporised out of existing buildings, and combined boards are being formed amongst sanitary authorities for the purpose of erecting hospitals; but we hear nothing of carefully planned methodical systems of house-to-house inquiry with a view to securing vaccination and revaccination. To our mind, measures such as these are more truly preventive than the provision of hospitals for those already attacked. There is no doubt at all as to the pre-eruptive infectiousness of small-pox; and very often the mischief is done when the patient is removed. Of course, in ignorant or semi-barbarous communities, the very removal of the patient prevents the coarser forms of infection, as visiting and the like, and is, moreover, always of distinct individual benefit to the patient. But there should be no difference of opinion as to the superiority of prophylaxis by means of vaccination over mere arrest of diffusion by measures of isolation. Then, again, the means sometimes defeats the end in these cases, and small-pox hospitals injudiciously placed may foster the disease which they are intended to lessen, as the experience of Fulham and Sheffield has abundantly shown. Indeed, so powerful a factor was this in the case of the metropolis, that by competent observers much of the comparative freedom of London from small-pox since 1885 has been ascribed to the abolition of the large land hospitals, and to the substituted use of hospital ships at a remote distance on the Thames. We trust, therefore, that the responsible authorities in localities where small-pox is now prevailing will not lay undue and exclusive stress upon the provision of hospitals in checking the spread of small-pox; but that they will rely more upon measures of vaccination, aided by notification of infected persons and houses.

FOREIGN UNIVERSITY INTELLIGENCE.

Berlin.—Dr. Leopold Caspar has been recognised as *privat-docent* in Diseases of the Urinary System.

Jena.—Dr. Stintzing has been promoted to the chair of Medicine in succession to Professor Rossbach, resigned.

Naples.—Dr. P. Sgrosso has been recognised as *privat-*

Digitized by Google

docent in Ophthalmology, and Dr. E Reale as *privat-docent* in Clinical Chemistry.

New York (Policlinic).—Dr. Herter has been appointed Lecturer on the Anatomy and Pathology of the Nervous System.

Pisa.—Dr. A. Marianelli has been recognised as *privat-docent* in Darmatology and Syphilis, Dr. E. Faranielli as *privat-docent* in Ophthalmology, and Dr. E. Burci as *privat-docent* in Surgical Pathology.

St. Petersburg.—Military Medical Academy: Dr. Lebedinski has been recognised as *privat-docent* in Children's Diseases. Helene Pavovna Clinical Institute: Dr. Afanasieff has been appointed to the chair of Medicine.

Tomsk.—Dr. Popovski of Kieff has been appointed Extraordinary Professor of Operative Medicine.

Turin.—Dr. G. Carbonelli has been recognised as *privat-docent* in Midwifery and Gynæcology.

Vienna.—Dr. Stefan Bernheimer has been recognised as *privat-docent* in Ophthalmology.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Dr. E. Nagel, formerly Professor of Surgery and of Ophthalmology in the University of Clausenberg.—Dr. Mühsam, Sanitary Councillor of Berlin.—Dr. Abel of Stettin, Surgeon-General of the Prussian Army.—Dr. Theodor Meynert, the well-known Vienna Professor of Mental and Nervous Diseases, at the age of fifty-nine. His writings on the functions of the brain have made his name familiar to medical circles throughout the world. He had been in retirement for some little time, owing to his mind having been affected after the death of a favourite child.

AMONGST the numerous messages of sympathy and congratulation received by Dr. Sinclair Coghill at the close of the recent action in which he was concerned may be mentioned the message sent to him by the official head of our profession, the President of the Royal College of Physicians. Sir Andrew Clark's words aptly reflect the general opinion amongst the medical profession. Another highly gratifying expression of congratulations has been presented to Dr. Coghill by his fellow-townsmen and friends at Ventnor, where he has for many years been a leading practitioner.

PRINCESS CHRISTIAN has consented to lay the foundation stone of the new British Home for Incurables at Streatham on the afternoon of Saturday, July 16th, when invitations to a garden party will be issued by the President and Committee.

DR. B. W. RICHARDSON, as President of the Sanitary Inspectors Association, has accepted the invitation of the President of the Society of Hygiene of Paris to visit the French capital during Whitsuntide.

Pharmacology and Therapeutics.

PEPTONIC TABLOIDS.

THE peptonic tabloids of Messrs. Burroughs, Wellcome, and Co. are ingeniously constructed so as to combine in one tabloid properties for which two distinct preparations are usually given. The object in view has been to administer zymine (pure pancreatin, Fairchild) and lacto-phosphate of lime together with pepsin, and yet to provide against the probability of the destruction of the pancreatic ferment by the action of the gastric juice. This object has apparently been attained in these tabloids by the combination of a central kernel, which is intended to pass through the stomach unchanged, with an outer coating of pepsin covered with white sugar. The inner kernel is coated with keratine, which is insoluble in the acid gastric juice, but soluble in the alkaline secretion of the intestinal canal, thus allowing the lacto-phosphate of lime and the zymine to be mixed with the food as they pass through the duodenum. The obvious advantage of combining pepsin and zymine in this way is that they accompany the food in its passage through the alimentary canal, and respectively reinforce the ordinary digestive secretions at the precise time when additional help is most required.

PALMA CHRISTI (OLEUM RICINI AROMATICUM) (STANDKE).

This aromatic form of castor oil, prepared by Thomas Christy and Co., is entirely free from objectionable taste, and is extremely palatable. The small amount of aromatic ingredients present forms an agreeable addition, which enables this preparation to be taken by many to whom the ordinary taste of castor oil is repulsive. The efficacy of the oil appears to be in no way impaired by the special mode of preparation.

CAMPHOID.

We have received from Mr. W. Martindale, New Cavendish-street, and experimented with, a new preparation for which the name of "Camphoid" has been suggested. It is prepared by mixing equal parts by weight of camphor and absolute alcohol, and dissolving pyroxylin in this solution in the proportion of 1 in 40. This mixture rapidly dries, and yields an elastic film, which is unaffected by water. It forms an excellent substitute for collodion. Camphoid readily dissolves salicylic acid, carbolic acid, iodoform, and many other medicaments intended for external application. As a convenient protective it is likely to supersede sticking-plaster, as the thin film formed is not unsightly, does not present awkward corners liable to catch, and is not washed off even when moderately warm water is used. Healing of small abrasions rapidly follows the application of camphoid or of the mixture of camphoid and salicylic acid.

SOPORIFIC EFFECT OF SULPHURETTED HYDROGEN.

At a meeting of the Greifswald Medical Society Professor Dr. H. Schulz gave an account of some experiments on animals to determine the soporific effect of sulphuretted hydrogen. He put the subjects of the experiment under a large bell-jar, the air of which was charged with various definite proportions of sulphuretted hydrogen. In some cases restlessness and asphyxia were produced, in others sleep. Rabbits appeared to be better able to resist the effects of the gas than other animals, as they did not fall asleep until after they had been half an hour in an atmosphere containing from 0·27 to 0·44 per cent. of sulphuretted hydrogen. Dogs required from 0·07 to 0·17 per cent., and cats from 0·09 to 0·1 per cent., sleep coming on in about an hour. When a very small quantity of sulphuretted hydrogen was present the animals became drowsy. The new hypnotic drugs—sulphonal, trional, and tetronal—doubtless give off sulphuretted hydrogen in the body, for if they are put into a flask along with some fresh liver tissue at a temperature of 99° F. this gas is evolved, the reaction appearing to be even more energetic when the liver has just begun to putrefy.

PERMANGANATE OF POTASH IN PHOSPHORUS POISONING.

Permanganate of potash having been found by Dr. Antal, by experiments on animals, to act as an antidote in acute phosphorus poisoning, Dr. Hajinos has employed it with apparent success in some cases which recently came under his care in the Rochus Hospital, Buda-Pesth. One case was that of a patient who drank a solution of phosphorus made from two boxes of matches and was immediately brought into hospital. The stomach was washed out and within half an hour of swallowing the poison Dr. Hajinos introduced 500 grammes of a $\frac{1}{10}$ per cent. solution of permanganate of potash into his stomach. There was no vomiting or pain, and the next day, as the man felt quite well, he left the hospital, and nothing more was heard of him. The stomach was washed out within half an hour of the phosphorus being taken.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

THURSDAY, MAY 26TH.

THE Council resumed on Thursday, Sir Richard Quain, Bart., presiding. They proceeded to consider cases of alleged misconduct in a professional sense on the part of several medical practitioners.

Case of Mr. E. B. de B. Robertson.

The Council proceeded to consider the case of Edmund Byron de Boune Robertson (registered as Licentiate of the Faculty of Physicians and Surgeons, Glasgow, 1876), summoned to appear on the following charges:—"That in the carrying on of a medical practice at Croydon in his name by means of the employment there of assistants, one of whom was an unqualified person, he systematically permitted and enabled the same unqualified person, under cover of his name and qualifications, to attend and prescribe for patients on his own responsibility in all respects as if he were duly qualified, to the detriment of persons who applied for medical aid at the places where such medical practice was carried on." The depositions in support of the charges were read by Mr. Farrer, the solicitor, who also read the verdict of the coroner's jury in the case of Price. The jury remarked: "They desire emphatically to condemn the system by which the poor are induced to go to dispensaries under the impression that they will be attended in their illness by properly qualified medical men, and instead are attended by unqualified persons, and die as the result of lack of skilled aid and advice." Mr. Robertson's defence was also read. He stated that he had two assistants, one qualified and the other unqualified. All cases were seen by himself or his qualified assistant, and it was only in an emergency that the unqualified assistant saw any case. In the case of Price, his unqualified assistant at first refused to see the boy, and only did so ultimately at the urgent entreaty of the child's guardians. At the same time, he told them that they must get other advice. In the second case the unqualified assistant was called in and urgently asked to attend, in the absence of the parish doctor. In that case the jurymen complimented the assistant for his humanity on the occasion.

Mr. ROBERTSON afterwards addressed the Council in his defence. He stated that he had suffered very severely from influenza, and that was his reason for remaining at Brighton, and since he recovered sufficiently in February last he returned to his practice, being in attendance every day when he was wanted, remaining all night if necessary.

The PRESIDENT inquired whether his qualified assistant was physician or surgeon.

Mr. ROBERTSON replied that he was a licentiate of the Apothecaries' Hall, Dublin, and claimed to call himself a physician. He had managed his father-in-law's practice, and came to him with good testimonials as to ability. His (Mr. Robertson's) practice had been both private and dispensary. At present his residence was at Purley, two miles from Croydon, and he had resided there for four years. He only went to Brighton when he fell ill last December. He went there at night and came up every morning, saw all the patients who were to be seen at High-street, Croydon. He did not practice at Brighton, where he lived in a private house. He went to Brighton by the advice of a medical friend. His name was not on the door at Brighton, nor at his house at Purley. It appeared only on the doors at Croydon and Selhurst.

In reply to Dr. GLOVER, he saw the boy Roberts the first time himself. His qualified assistant saw him next, and then Allen saw him because the qualified assistant was engaged.

Mr. WHEELHOUSE: So that when you were not able to see a patient, and your qualified assistant was engaged, Mr. Allen did see patients?

Mr. ROBERTSON: Not urgent cases.

Dr. BRUCE: Surely this was an urgent case, because the man died next day.

Mr. ROBERTSON said his orders were that Allen was not to see urgent cases. He himself gave the practice all the personal superintendence he could.

Dr. GLOVER asked what would be the number of patients seen by himself, his qualified assistant, and his unqualified assistant.

Mr. ROBERTSON replied that there was a list drawn up every day which they went through, and then he and his qualified assistant saw all the cases that were urgent. Perhaps three or four cases might be seen by the unqualified assistant. Allen attended midwifery cases, but patients understood that he was not a qualified man. At all events, he gave Allen directions to inform them that he was not a qualified man.

The room was cleared, and on the public being readmitted,

The PRESIDENT announced the decision of the Council as follows:—"Mr. Robertson, it is my painful duty to inform you that, after the fullest consideration, and everything said in your favour that could be said, the Council has come to the determination that you have committed the offence charged against you. The second resolution of the Council is: 'That the offence is in the opinion of the Council infamous conduct in a professional respect.' The third resolution is: 'That the Registrar shall be directed to erase your name from the Register.'"

Mr. ROBERTSON said he considered he had not been altogether justly dealt with. He had endeavoured all through his professional career to do his duty honestly, uprightly, and faithfully, and in this matter he could not possibly accuse himself of acting unprofessionally or infamously.

Case of Dr. D. C. Martin.

The next case for consideration was that of Donald Cargill Martin (registered as M.D. R. Univ. Irel. 1884), who had been summoned to appear before the Council on Thursday, May 26th, at 4.30 P.M., on the following charges, as formulated by the Council's solicitor:—1. That he, being a registered medical practitioner, had been and was in the employment of certain unqualified persons who, under the name of the "Stourport Amalgamated Friendly Societies and Medical Aid Association," supplied at Stourport medical aid, advice, and prescriptions at a profit, and, by placing his services and registered qualification at the disposal of such persons, had enabled and did enable a medical practice for profit to be carried on by unqualified persons to the detriment of the public. 2. That an unqualified person named Kemp, also in the employ of the said Association, had, under cover of his name and qualification, and purporting to be his assistant, been enabled and permitted by him to practise and attend and prescribe for patients on his own responsibility, as though he were duly qualified, and that medical certificates had been given by him in respect of cases which the said Kemp had wholly or partially attended on his own responsibility.

Mr. A. T. LAWRENCE, barrister, appeared on behalf of Dr. Martin, who in his statutory declaration, which was read by Mr. Muir Mackenzie, stated that he was appointed medical officer of this Society in 1888. In consequence of the increasing number of members he was unable to attend to all the cases, and he asked the Committee to provide assistance. In 1891 they appointed Kemp as his dispenser and assistant, and he continued in that capacity until April last, when he was summarily dismissed. He (Dr. Martin) had nothing to do with his appointment. During the time Kemp acted as dispenser and assistant, he showed that he was possessed of considerable knowledge and experience of medical practice. He never acted as cover to Kemp, and the latter had never been allowed by him to attend cases on his own responsibility. He had never given a medical certificate unless he had attended the patient himself. If the Medical Council thought the acceptance of an appointment as medical officer of such an Association was unprofessional, he was quite prepared to resign the appointment, and never accept another.

Mr. KEMP, in his statutory declaration, denied that he had acted under Dr. Martin's cover.

Mr. CADOGAN-MASTERMAN, medical officer of health of Stourport, at whose instance this case was brought forward, addressed the Council. He stated that when the second case of diphtheria occurred he reported to the local board, of which Dr. Martin was a member, that had that child been seen by a qualified medical practitioner he would have detected it as a case of diphtheria, and it was not so detected. In spite of that warning a precisely similar case occurred two months afterwards. It was perfectly clear that Dr. Martin's unqualified assistant attended this child for four days while it was suffering from diphtheria without detecting the disease. Dr. Martin saw the child, who died nex

Digitized by Google

morning. On hearing of the case, he (Mr. Cadogan-Masterman) thought it was his duty to take further steps. He consulted one of the magistrates of Stourport, and afterwards laid the particulars before the Public Prosecutor, who instructed evidence to be taken. The Public Prosecutor considered the case of importance. In the face of an increase of the death-rate he considered it his duty to bring the matter before the Council. If Dr. Martin had been a cleverer practitioner than he (Mr. Masterman), or if the community had received better health, he would not have said a word about it; but his income, which was £800 a year at one time, was now less than £200. He was reduced to poverty. If he saw that Dr. Martin cured more cheaply but better than he could do, he should have accepted that position and said it was the act of Providence.

At the conclusion of Mr. Cadogan-Masterman's speech the Council adjourned until the next day.

FRIDAY, MAY 27TH.

The Council met again on Friday, Sir Richard Quain, President, in the chair.

Registrations.

On the recommendation of the English Branch Council, it was agreed to register the names of Mr. John Henwood Blaney, M.R.C.S. Eng. 1886, and Mr. William Isaac Fern, L.M. K.Q.C.P.I. 1887, L.R.C.S. Edin. 1892; and on the recommendation of the Irish Branch Council it was agreed to register the name of Mr. Daniel Fegan, M.D. Q.U.I. 1870.

Notification of Default.

Mr. MACNAMARA moved: "That, in the opinion of the General Medical Council, it is highly important, for the purpose of carrying out the objects of the Medical Acts, that in any case where a registered medical practitioner is convicted of any felony or misdemeanour authentic information should as promptly as possible be given to the General Medical Council, and that the authorities at the Home Office be respectfully requested by this Council to take such steps as will afford the Council this early information." He had been assured on high legal authority that there would be no difficulty in giving effect to this motion either in England or Ireland, and he left it to his Scotch friends to say what would be the case in Scotland. He thought it was the duty of the Home Office to give the Council this information.

Sir WALTER FOSTER seconded the motion.

The PRESIDENT expressed the view that the motion was a very reasonable one, and required little discussion.

After some remarks from Dr. BRUCE, the motion was carried unanimously.

Sir JOHN SIMON moved: "That in future, whenever information reaches the Medical Council office that a registered medical practitioner has been convicted of felony or misdemeanour, or has been under the censure of any judicial or other competent authority in serious relation to his professional character, the registrar shall forthwith communicate such information to the medical authority or authorities from which the practitioner in question holds his registered qualification or qualifications."

Dr. CHURCH seconded the motion, and it was carried unanimously.

On the suggestion of Sir WM. TURNER, the two motions were made standing orders.

Finance.

Mr. BRYANT presented the report of the Finance Committee. The report stated that the income of the General and Branch Councils for the year ending Dec. 31st, 1891, had been £8713 1*s.* 3*d.*, an amount which was £640 2*s.* 8*d.* more than the income for the year 1890. The fees received by the English Branch Council in 1891 were £268 5*s.* more than those received in 1890, and those received by the Scottish Branch Council in 1891 were more by £195 5*s.* than those received in 1890. The receipts of the Irish Branch Council from registration fees during the same period exhibited, on the other hand, a decrease of £40 15*s.* The expenditure during the year 1891 had been £7695 8*s.* 9*d.*, an amount less than that of 1890 by the sum of £173 3*s.* 5*d.* A comparison of the income with the expenditure showed that the income during the past year had exceeded the expenditure by the sum of £1017 12*s.* 6*d.* A decrease of £422 14*s.* occurred in respect of the fees paid to members of the General Council, a decrease of £252 15*s.* 6*d.* in law expenses, and a decrease of £246 4*s.* 3*d.* on account of the British Pharmacopœia, the previous outlay on this work now being partly refunded by sales. There was an increase of £31 11*s.* in respect of the General Council's printing, of £9 8*s.* in respect of the Executive Committee's printing, and of £17 for other printing, making a total increase under the head of printing of £57 19*s.*; an increase of £34 2*s.* 2*d.* under the head of house expenses; and an increase of £37 8*s.* 9*d.* in miscellaneous expenses. While, therefore, the decrease of expenditure over that of the previous year in certain items amounted to £957 10*s.* 11*d.*, the increase in certain other items only amounted to £147 4*s.* 2*d.*, leaving a total decrease in expenditure during the year over that of the year 1890 of £810 6*s.* 9*d.* From the table which indicated the average income and expenditure of the General and Branch Councils during the last seven years, it would be seen that the average yearly income during that period had exceeded the average yearly expenditure by £277 0*s.* 9*d.* As to the investments, those of the English branch amounted to £35,000 the Scotch branch to £4300, and the Irish branch to £852 6*s.* 8*d.* The receipts of the Dental Registration Fund amounted to £931 19*s.* 2*d.*, showing an increase of £425 16*s.* 6*d.* on those of 1890, which were £506 2*s.* 8*d.*, an increase mainly due to registrations under Section 37 of the Dentists Act (1878) prior to the date on which the by-laws relating to that section were revoked. On the other hand, the expenditure had been £582 11*s.* 9*d.*, being less than the income by the sum of £349 7*s.* 5*d.* The indebtedness of the fund to the General Council amounted only to the sum of £94 8*s.* 9*d.*

Sir WM. TURNER expressed his satisfaction that the indebtedness of the Dental Fund was now almost removed. They had almost reached a stage when the income of the fund would balance the expenditure.

On the motion of Mr. BRYANT, seconded by Sir DYCE DUCKWORTH, the report was adopted.

The Education Committee.

Dr. LEISHMAN submitted the report of this Committee, in which it was stated that the committee had resolved to delay consideration of the regulations of the Examining Board in England, until at the end of the current year the regulations of all the bodies were submitted to them.

The report was adopted.

The Examination Committee: Mr. Macnamara and the Conjoint Board.

The report of this Committee set forth, with regard to the returns presented by the Public Departments and the Licensing and Examining Bodies, as to the results of professional and other examinations, that the Committee was not yet in a position to make any report. Respecting Mr. Macnamara's motion on the subject of scientific study, the Committee reported "that it had been brought to their knowledge that the Conjoint Board for England had received certificates of instruction in materia medica, systematic and practical chemistry, pharmacy, and physics from persons in Ireland of unascertained competency to instruct, who were not recognised as teachers by any Irish Examining Body, and who were imperfectly furnished with the means of instruction; and the Committee recommended that the Council should call the attention of the Conjoint Board to these irregularities, with a view to precautions being taken against their recurrence."

Mr. BRUDENELL CARTER, in moving the adoption of the report, said that Mr. Macnamara had laid before the Committee evidence of the most conclusive character that certificates had been received by the Conjoint Board from persons who could not have any proper claims to grant such certificates. It appeared to be the practice of other examining boards to receive certificates only from persons of ascertained competence. The recommendation of the committee was that the Council should call the attention of the Conjoint Board to the matter in order to prevent the recurrence of what they could not but think was an irregularity. He felt sure that the attention of the Conjoint Board had only to be called to the matter to bring about a change.

Mr. MACNAMARA, in seconding the motion, said he had been anxious to have this matter discussed simply as an abstract question. He had the greatest dislike to bringing the name of any of the authorities under the consideration of the Council. He was sorry to find THE LANCET had accused him of reviving the somewhat ancient story about the signing of a certificate by a coachman. He considered

Digitized by Google

that the merits of the question would have been sufficiently met by an expression of opinion on the part of the Council that provision should be made by the different examining boards, his own among the rest, for the efficiency and proficency and position of the persons who signed these certificates. Now the reason why they entered into the investigation of these cases was that they found numbers of their pupils going over to a certain examining board, who they knew had not attended lectures in any recognised school in Dublin or any of the Queen's Colleges. They went to the expense of sending over a most intelligent professor, Professor Stoker, who went to the Conjoint Examining Board in England. This gentleman found the facts which he (Mr. Macnamara) had produced and laid before the committee. He reported: "I found that a considerable number of candidates had been admitted on certificates in materia medica, chemistry, systematic and practical, pharmacy, and physics, which would not be accepted either in Ireland or Scotland, and some of which were not in accordance with the recommendations of the General Medical Council requiring instruction in professional subjects to be taken subsequent to registration. I further noted, in the majority of cases, instruction in all the subjects had been given by one person. I found the practice to be that (1) any holder of any medical qualification was held competent to issue certificates in all the above-mentioned subjects; (2) persons who had passed at an examination at a public board could issue certificates for the subjects in which they had passed; (3) prizemen at medical schools had certified in the subjects in which they had been awarded prizes. No investigation was made as to the capacity of the instructor or the adequacy of the appliances at his disposal. I have most thankfully to acknowledge the great courtesy of Mr. Hallet and the ample facilities he gave for making all needful investigation." He had documentary proof in his possession when he introduced the subject. It was considered proper to refer it to the committee who had investigated the subject. He would suggest without any unkindly feeling to the Conjoint Board that when certificates came from Ireland on these subjects they should only be received from persons that the Conjoint Board in Ireland would accept. If they came to some such resolution as that, they would be perfectly safe. As he said before, he feared very much that they were going too far in the direction of depending on examination, to the exclusion of education. If the Conjoint Board in England confined themselves to certificates signed by bodies recognised by the Conjoint Board in Ireland, then they were safe; but as to the other certificates, they were simply bogus certificates. This did not hold in Scotland at all; it was confined to the English Conjoint Board.

Mr. BRYANT said he was quite pleased that Mr. Macnamara should have mentioned the board against whom he brought those charges. He was quite willing to admit that when the Conjoint Board framed their scheme they did not think it was expedient to draw the lines too closely as to the sources from which men should get their information. They felt that so long as they brought the information that was enough, guarding of course against any bogus certificates. Upon this the Board had acted up to the present time. But things have changed completely. They had the five years' scheme, and for the future certificates would only be accepted from schools and institutions which had been visited and which had been recognised as fit to give certificates upon any of these subjects. He thought, therefore, that the accusation fell to the ground. It was a thing of the past, and he believed it was scarcely possible to have introduced this arrangement sooner. It was not right to use the term "bogus certificates." When Mr. Stoker came over and got his information he admitted that there were no bogus certificates. The certificates were all true so far as they went. There were no certificates such as that of a coachman. They did not look on anything that had occurred as an irregularity. At any rate, nothing of the kind was now possible.

Mr. MACNAMARA said he was perfectly satisfied with Mr Bryant's statement, and he accepted it most cordially.

The report was then adopted.

The Executive Committee.

The following members were elected to the Executive Committee for the ensuing year—viz., Mr. Wheelhouse, Sir Dyce Duckworth, Sir Wm. Turner, Dr. P. Heron Watson, Mr. Teale, Mr. Macnamara, Sir Walter Foster, and Dr. Moore.

The Pharmacopœia Committee.

Mr. MACNAMARA announced that in response to the unanimous request the President had consented to act as the chairman of this committee for the ensuing year. In doing so he considered that the President was conferring a great boon upon all parties connected with the work of the committee.

Charges against Practitioners: Case of Dr. D. C. Martin.

The Council then resumed consideration of Dr. Martin's case.

Mr. LAWRANCE, counsel for Dr. Martin, said he wished to address a few words to the Council. While the charges brought against his client were of immense gravity, the evidence adduced in support of them was of extraordinary weakness. He submitted that Mr. Cadogan-Masterman's statement did not relate with any distinctness to the evidence before the Council. It was charged against his client that he had been guilty of infamous conduct in a professional respect, being in the employ of the Medical Aid Association. Mr. Cadogan-Masterman said that that differed essentially from all other employments at a salary, but counsel failed to see that that was so. He said that Dr. Martin had sold himself to this association. There was not a shadow of evidence of his having sold himself or that he was employed in any servile fashion. He received a salary for his services. The Council might have views upon the subject of these Medical Aid Associations. They might all have views with reference to the advancement of socialism. Counsel certainly had adverse views with reference to what was called socialism; but this was mere coöperation on the part of these people, and whether they regarded this kind of coöperation favourably or not it would come in spite of them. He had no reason to suppose that the Council was about to make its stand against coöperation in general, or in this particular form. Much less could he conceive it possible that the Council would think of commencing by treating as infamous conduct the conduct of this gentleman, who was employed by one of these associations. If there were a formal and general declaration on the part of the Council that it was not considered proper to enter into the service of such associations, then of course a man would enter them with his eyes open; but no such declaration had been made. There was no pretence by any fact for saying that Dr. Martin had sold himself or become a servant of these people, or that they were more his masters than in the scores of other cases well known to the Council, in which doctors received a salary and gave their professional attendance, not for remuneration in respect of each attendance, but for the service which they rendered a particular class of individuals. He could see nothing in this case to differentiate in essentials from those numerous cases to which he had alluded. The next charge made against Dr. Martin was that of covering. What Dr. Martin had done with reference to Kemp was to allow him to occupy the position of assistant. It was true that Kemp was an unqualified person in the sense of not having any medical degree; but, apart from that, there was no evidence whatever that Dr. Martin was behaving improperly in using his services as assistant. The evidence was clear that he was neither engaged nor discharged by Dr. Martin. He was engaged, upon excellent testimonials, by the committee of this association. He was the son of a surgeon himself, and had been apprenticed to his father. After that he had been for two years in the General Hospital at Sheffield. From 1872 until 1891 he had acted as assistant to various practitioners. Counsel did not know whether it was right or wrong to employ an unqualified assistant, but it was clearly not a thing which had hitherto been treated as infamous conduct. It might perhaps be suggested that Dr. Martin allowed Kemp to act as though he were duly qualified. He could easily understand that there might be conduct worthy of so strong a term as infamy, if one medical practitioner allowed another—an unqualified one—to fraudulently pretend that he was qualified, and so to use his qualifications as a cover to his conduct. But here Mr. Cadogan-Masterman, examined, said that it was notorious that Kemp was not a qualified man. It must be observed that the people with whom he was dealing were all members of the association whose committee had retained him; and really, to make this into a case of fraud was to ask this Council to believe that all these people were blind or idiots. They had themselves chosen this gentleman by their committee, and Dr. Martin had nothing in the world to do

Digitized by Google

with it. So far as Dr. Martin was concerned, he was able to testify to the Council that Kemp behaved properly in every respect. Kemp, it was true, was dismissed by the Association, and he thought it was to Dr. Martin's honour that he had not paraded the causes of that dismissal. His instructions were to say nothing unkind of Kemp. Dr. Martin did not desire to do the man the smallest injury; but his leaving the employment of this association had nothing to do with Dr. Martin. Coming to the details of the charge counsel said he was at a loss to know why any imputation should be made upon Dr. Martin in respect of these three cases. A severe outbreak of diphtheria occurred in Stourport, and these three persons were among the victims. Nothing was said by Mr. Cadogan-Masterman to justify the charges. The only thing in the declarations of any importance was that the father of the child Cook declined to make a declaration in support of the charge against Dr. Martin.

Mr. CADOGAN MASTERMAN, addressing the Council again, said that the charge he made against Dr. Martin was that he had enabled a trading company—an association of mechanics and tradesmen—to make money by employing a medical practitioner as their servant. It was perfectly clear that the medical association could not exist without him.

The PRESIDENT invited Mr. Cadogan-Masterman to keep to the point whether Dr. Martin had covered an unqualified practitioner. He need not trouble about what the association did.

Mr. CADOGAN-MASTERMAN said his contention was that Dr. Martin enabled the association to employ an unqualified assistant. It was perfectly clear that the association could not itself engage an unqualified man to act for them. Therefore they must get some qualified man to enter their service, and then engage an unqualified assistant to act for them. He submitted that that constituted a clear case of covering. He begged that the deposition of Mrs. Cook, the mother of the child that died, might be read to the Council.

Several members of the Council expressed doubt whether this should be done.

The PRESIDENT said that their object was to get at the truth. If they could not do so now the only course open to them would be to adjourn the case.

Mr. LAWRANCE asked the President if the document might be read rather than that it should be supposed Dr. Martin made any objection. Indeed, his client would far rather that it was read.

Mr. FARRER, solicitor to the Council, read at this stage a letter from the Public Prosecutor to Mr. Cadogan-Masterman, saying that no criminal proceedings could be successfully instituted against Dr. Martin, and that in his judgment the charges might very properly be made the subject of inquiry by the General Medical Council.

The PRESIDENT repeated that the object of the Council was to get at the truth, and no technicality should be allowed to hinder them. Mr. Lawrance had said that there was no objection on the part of Dr. Martin to the document being read. If it were not read, and the whole evidence were not available, he thought the case should be postponed.

After some further discussion, it was agreed that the statement should be read.

Mr. FARRER thereupon read it. After explaining that she, her husband, and all the family were members of the association, Mrs. Cook detailed the circumstances prior to the death of the child. She said that if Kemp had only been able to discern the disease from which the child was suffering she would have called in further assistance, and the child's life would have been spared. She further said that she felt Kemp had been guilty of great neglect, and that he was responsible for the death of her child.

Questions were then addressed to Dr. Martin by members of the Council.

Dr. MARTIN, in reply to Dr. Glover, said he found the work of the association too heavy for him, and he applied for an assistant. He wanted an assistant, not only for dispensing medicine, but for seeing patients. In the first instance the association appointed a qualified assistant, who left of his own accord. He did not protest against an unqualified man being appointed. He was not aware that it was improper for him to have an unqualified assistant. He was somewhat doubtful about it now. When the appointment was made it never occurred to him that it was improper to have an unqualified man. When the child Cook was brought to the surgery diphtheria might not have developed, and if he had seen the child probably the treatment would have been the same as that prescribed by Kemp. It was not usual for patients coming to the surgery to see Kemp, but only when he (Dr. Martin) happened to be called out. In reply to Mr. Macnamara, he said he had no ground for believing that he was acting in an infamous manner in having Kemp, an unqualified man, under his supervision. The association knew he could not do all the work himself. Kemp was never represented to anyone as a qualified man. He did not come here to defend Medical Aid Associations; that was none of his business. In further reply to Dr. Glover, he said the majority of the members of the association were poor persons. In answer to Dr. Macalister, he said he was at present without an assistant, and the association were advertising for one—this time a qualified person. In reply to the President, he said that in the case of the child Cook he must admit that he regretted deeply that he had not seen it before. He did not know that its life would have been spared, for qualified men as well as unqualified made mistakes.

The Council then deliberated in private for some time on the case which had been presented to them.

The PRESIDENT announced the decision. The Council, he said, had considered the case very carefully, and had come to the conclusion that the charges made against Dr. Martin had not been proved; but the Council were of opinion that he should have been more careful to avoid associating himself with an unqualified person. That was all he (the President) had to say. No doubt Dr. Martin would be more careful in the future.

Dr. MARTIN asked whether the Council were disposed to give any expression of opinion as to his holding his present position.

The PRESIDENT said they did not deal with that; it was not their business.

The Council then adjourned.

SATURDAY, MAY 28TH

The Council resumed at one o'clock, Sir Richard Quain presiding.

Pharmacopœia Committee.

The Pharmacopœia Committee presented the following report:—"The registrar reported that during the past year a reprint of 3000 copies of the British Pharmacopœia of 1885 had been issued, making the total number of copies of this edition issued up to the present date 35,000. Professor Attfield attended and handed in a report on the Progress of Pharmacy, in relation to the future revision of the British Pharmacopœia." Accompanying the report was a communication from the Secretary of State for India, enclosing a letter from the Government of India, in which it is suggested that reference should be made to the General Council upon a proposal which has been made that "crocus" should be expunged from certain medical preparations, and asking that Viscount Cross might be favoured with the opinion of the Council upon the subject. Copies of two reports by Dr. Macnamara, examiner of medical stores, were annexed. In the first of these reports, dated Feb. 26th, 1891, Dr. Macnamara states that in their tenders for the supply of crocus, "the Government of India are paying £176 for a substance which medicinally is absolutely inert and useless, excepting as a flavouring or colouring ingredient. Beyond doubt no one would be one whit the worse if this expensive and therapeutically obsolete drug was no longer supplied to India."

The report continued: "It was agreed to inform the Secretary of State for India that the suggestions contained in his communication will be fully considered, but that it was not possible to name a time for the issue of the next edition of the British Pharmacopœia. It might, however, be said approximately that it would not be before the year 1895."

On the motion of the PRESIDENT, the report was entered on the minutes and adopted.

Case of Mr. T. R. Allinson.

The Council then took up the consideration of the case of Thomas Richard Allinson (registered as L.R.C.P. Edin., 1879, L.R.C.S. Edin. 1879), who was summoned to appear before the Council on the following charges, as formulated by the Council's solicitor: "That, being a registered medical practitioner and Licentiate of the Royal Colleges

Digitized by Google

of Physicians and Surgeons of Edinburgh, he systematically seeks to attract practice by a system of extensive public advertisements containing his name, address, and qualifications, and invitations to persons in need of medical aid to consult him professionally, the advertisements so syste matically published by him being themselves of a character discreditable to a professional medical man."

Sir JOHN SIMON asked if the case was brought before them in consequence of any communication addressed to the Executive Committee, and, if so, he thought the Council should have these documents before them. They had an anonymous accusation brought against a medical practitioner. He wished to know whether the Scottish Colleges had sent any kind of memorial in regard to the case, and, if so, whether the memorial could be laid before them.

The PRESIDENT said there were such documents in existence, but the Executive Committee thought it better that they should not be made public. A representative of a public body would appear before them in support of the charge.

Sir JOHN SIMON protested against the documents being withheld, and said it was necessary they should know the relations of the Scottish Colleges to the question.

Sir WALTER FOSTER said they had got a certain charge made against this gentleman by a certain public body, and that public body would be represented there in the person of the secretary. He should consider the case simply on the evidence that was laid before him, and he did not want to be saddled with any other documents before he heard the evidence.

Sir JOHN SIMON observed that Sir Walter Foster referred to a public body taking proceedings. He asked where there was any evidence on their programme that a public body was taking proceedings.

The PRESIDENT replied that there was the sworn affidavits of Dr. Bateman. Secretary of the Medical Defence Union.

Dr. HERON WATSON thought the matter should be considered *in camera*.

The PRESIDENT said they must really proceed to business. There was a distinct charge made by a society composed of several very well known medical men, and they were prepared to hear the charge.

Sir JOHN SIMON said his point was that the public body ought to be named in the programme.

The PRESIDENT thought they should now ask Mr. Allinson to come in.

Mr. MUIR MACKENZIE said that the body who had brought the matter before the Council was the Medical Defence Union, and, in view of the decision in a recent case, he thought it would be expedient that the President should inquire if there were any representatives on the Council who were members of the Medical Defence Union.

The PRESIDENT accordingly asked if there was any gentleman present who was a member of the Medical Defence Union.

Mr. TEALE said he had been a member of the Medical Defence Union, but had now withdrawn from it.

Dr. GLOVER also stated that he had formerly been a member of the same body, but had withdrawn.

Sir WM. TURNER suggested that, in the event of the case being taken to a higher court, it should be limited.

Mr. Allinson, accompanied by Mr. H. Schulbes Young, his counsel, was then admitted, and the registrar having read the charge.

Dr. A. G. BATEMAN, who appeared for the Medical Defence Union in support of the charge, addressed the Council. He said that Mr. T. R. Allinson resided at 4, Spanish-place, Manchester-square, and he was brought up there for what amounted to a charge of infamous conduct in a professional respect. The charge was founded on facts, of which there could not be any dispute. Mr. Allinson had been advertising himself for many years—his address, his qualifications, and his method of treatment—in the *Weekly Times and Echo*, which was published every Saturday in London. They were not making any charge against Mr. Allinson for the adoption of any particular treatment of medicine and surgery; what they did complain of was that, in advocating the principle of hygienic medicine, he never lost an opportunity of advertising himself and his qualifications, and rarely lost an opportunity of depreciating all other members of the medical profession by calling them "drug doctors," and almost charging them with murder. Dr. Bateman put in twenty-five copies of the *Weekly Times and Echo* of different dates, from May, 1891, to January, 1892, containing Mr. Allinson's advertisements. Following these advertisements was a column of general advice as to what to eat and what to avoid. Amongst the things to avoid, specially mentioned, were all drugs, medicines, pills, powders, potions, lotions, gargles, ointments, &c. Then followed a number of so-called answers to correspondents, and he (Dr. Bateman) had no hesitation in stating, after a careful examination of these answers, that a very large number of them were purely bogus. In one of his advertisements Mr. Allinson invited the readers of the *Weekly Times and Echo* to forward a postal order for 5*s.* and a stamped directed envelope, and he would send them advice which would benefit them. In another advertisement he said that his fee was reduced, and that those who wanted to know what it was would have to send a stamped directed envelope. In regard to the treatment of influenza, he advised the public to avoid all drugs or medicines, and stated that the majority of those who died during the last epidemic died because of the drugs they took. He further stated that he had scarcely lost a patient between the ages of six and sixty, and that a large percentage of those who died between six and sixty years of age were killed by drugs and by the absence of hygienic treatment. In another advertisement Mr. Allinson said his patients died of old age, and were not hurried out of life by poisonous drugs. "It is my lot," he said, "more than that of the ordinary run of doctors, to have as patients those who are suffering from severe long-standing disease. The drug doctor gives them poisonous medicine, and in any case makes them worse; those who do get well, get well in spite of the drugs." Dr. Bateman quoted a number of other extracts from Mr. Allinson's advertisements, in which the latter condemned the use of opium and other medical prescriptions. Mr. Allinson was cautioned by the Royal College of Physicians of Edinburgh in January last, but his column of advice continued to appear in the *Weekly Times and Echo*.

Mr. YOUNG then examined Mr. Allinson in his defence. In reply to the questions put to him, the accused said he had every week about 150 letters sent to him to answer through the *Weekly Times and Echo*. To the best of his knowledge all the statements made in his column of the paper were true. He had no interest whatever in a paper called the *Hygienic Advertiser*. Of the 150 patients whom he advised every week in the *Weekly Times and Echo*, perhaps about 5 per cent. came to him directly through the paper. He had never advertised any secret remedy. Everything was open and above board, and there was no invitation in any one of his published books to patients to consult him. When he signed the Edinburgh Register in 1879 there was no mention of advertising, and, so far as he knew, there was nothing in the rules of the Scottish College which prevented him from advertising. Any advertisements he made use of were not so much advertisements of himself as of a system he advocated. He had a hospital in which patients were treated according to his ideas. He took patients into the hospital at a nominal sum, and he was out of pocket by it. He had never advertised the hospital, and had never requested any patient to come there to be treated privately. He had treated 400 or 500 patients in the hospital during the last two or three years, and there had only been three deaths altogether. Between 80 and 90 per cent. of them had been cured or relieved. He was strongly opposed to vaccination. The Royal College of Physicians of Edinburgh had once or twice complained of his articles disparaging drugs and vaccination, and threatening to cancel his diploma on these two grounds. He did not know that they had ever complained of his advertising. In 1888 he gave an undertaking to the Royal College of Physicians of Edinburgh that he would discontinue issuing a little pamphlet entitled "How to Avoid Vaccination." He had kept his promise and had never issued the pamphlet since. His books dealt solely with hygienic treatment, and were not medical books in the ordinary sense of the term. About the beginning of this year he issued an order to the advertising agent to stop all his advertisements, and they had all been stopped. In regard to the column which he wrote in the *Weekly Times and Echo*, he was quite willing to receive any suggestions from the Medical Council as to any modification of his language, and to attend to these suggestions as far as he could.

Dr. BATEMAN said he had no questions to put to Mr. Allinson.

In cross-examination by Mr. Muir Mackenzie, Mr.

Digitized by Google

ALLINSON stated that the hospital was conducted by himself. The patients had to pay a small fee, which did not cover the cost of maintenance. He was in the habit of delivering public lectures on health subjects. He had no control in the management of the *Weekly Times and Echo*. He simply sent in his column every week, and the editor cut out what he chose. He received a salary from the paper.

Mr. YOUNG said his client was amply paid for the health and hygienic advice he gave in the paper, but he did not make use of the paper as a means of getting patients.

The PRESIDENT (to Mr. Allinson): Do you think the drug portion of the medical profession are little short of murderers?

Mr. ALLINSON: Oh! certainly not. I do not say that.

The PRESIDENT: When you so strongly disapprove of drugs, why do you desire to continue a member of those Colleges which recognise drugs? Why do you not withdraw altogether from such an association?

Mr. ALLINSON: Simply because of the social advantages it gives me. I am perfectly independent of the Colleges, and I only wish to remain a member of the medical profession in consequence of the influence it has on the public.

The PRESIDENT: You desire to derive any advantage you can from association with the medical profession?

Mr. ALLINSON: I only desire to remain in the profession in order that the public may know that I am a properly qualified man.

In answer to Dr. Batty Tuke, Mr. ALLINSON admitted that in August, 1890, in one of his answers to correspondents in the *Weekly Times and Echo*, he advised a woman in a case of vaccination to wash off the vaccine matter as soon as possible. In giving the advice he did not consider that he had broken his promise to the College of Physicians of Edinburgh to discontinue the publication of his leaflet on "How to avoid Vaccination." He had never reissued the publication. The Anti-vaccination Society had reproduced the leaflet, or what was substantially the same leaflet, but he had nothing whatever to do with it himself. It belonged to the Society, and his name was not attached to it.

Sir WM. TURNER: Still you continue to advise people to get it?

Mr. ALLINSON: Certainly. The same as I advise them to avoid vaccination.

Dr. GLOVER: Do you still justify the leaflet?

Mr. ALLINSON: I simply told a correspondent to apply to the Anti-vaccination Society to get whatever printed advice they might have.

Dr. GLOVER: In the *Weekly Times and Echo* there is a reference to "the ranks of professional poisoners." Will you define the difference between a poisoner and a murderer?

Mr. ALLINSON: A poisoner is only a matter of degree. Give a small dose, and it poisons; give a large dose, and it kills.

Dr. GLOVER: Do you withdraw the expression, "the ranks of professional poisoners"?

Mr. ALLINSON: If you give drugs I stick to it.

Dr. GLOVER: Do you still justify it?

Mr. ALLINSON: Well, sometimes I have been very much irritated and annoyed by medical men, and in a moment of pique perhaps I have said some rather strong things about them.

Dr. GLOVER: And you apply this libel to the whole medical profession, of which you wish to continue a member? Dr. Glover then questioned Mr. Allinson with regard to a piece of advice he had given a correspondent, in a case of rupture—namely, to "leave it alone." Mr. Allinson justified the advice in the case of an umbilical rupture of a child.

Mr. YOUNG: In respect to the question of drug doctors being murderers, have you ever suggested that medical men deliberately treated their patients in a manner in the efficacy of which they did not believe?

The PRESIDENT: That is a quite unnecessary question. It has never been suggested that any medical man deliberately ill treated anybody.

Mr. YOUNG: Mr. Allinson has simply stated that he believes drugs are poisonous.

Mr. ALLINSON said he entirely repudiated any idea that a medical man who gave drugs did so with the intention of poisoning. All he said was that the giving of poisonous drugs did harm. He simply objected to the mode of treatment, and not to the men who administered drugs. In objecting to the system he had never mentioned any medical man by name.

Mr. YOUNG then addressed the Council on behalf of his client. At the outset he reminded the Council that they were not only the judges, but also the jurors, who would deliberate in secret, and they were the intimate associates of the accusers, two of whom had been admitted to the Council within that very week.

Mr. MUIR MACKENZIE: That is not so.

Mr. YOUNG: Two members of the Medical Defence Union.

Mr. MUIR MACKENZIE: No.

Mr. YOUNG: Well, one member—Dr. Philipson.

Dr. PHILIPSON: I resigned my position in the Medical Defence Union the same day I was elected a representative on this Council.

Mr. MUIR MACKENZIE: No representative on this Council is connected in any way with the Medical Defence Union.

Mr. YOUNG went on to say that Mr. Allinson was not summoned before them on a charge of vilifying medical men or objecting to vaccination, but simply on the one ground of advertising. These advertisements were advertisements of Mr. Allinson's books, and not systematically advertisements of himself. In these books there was not a single invitation to persons outside or inside the profession to consult him for a fee or otherwise. When his client had never been before the Council or reprimanded by them for issuing advertisements, he submitted that it would be an unprecedented thing to take any severe steps against him on that occasion. The present charge in part arose from his contempt of drugs. Although he must denounce medical men as drug-givers, it could not be alleged against him that under the strongest incitement or provocation he had even allowed himself to write or speak against any individual medical man. He simply told the public that "prevention was better than cure." The learned counsel went on to complain of the action of the Medical Defence Union in bringing a charge against Mr. Allinson for advertising, and pointed out that members of that body were guilty of a similar practice themselves. He denied that the Medical Defence Union were representatives of the profession, and complained that that body showed a distinct prejudice in attacking Mr. Allinson, while they left alone other men in the profession of doubtful qualifications. There was no precedent, he said, for removing a professional man from the Medical Register unless his advertisements were personally objectionable and persisted in. Mr. Allinson had withdrawn all his advertisements from the press, and he was perfectly willing to modify what the Council might see amiss in his writings.

The Council then deliberated in private. On the readmission of the public,

The PRESIDENT informed Mr. Allinson that, in the opinion of the Council, he had committed the offence charged against him; that, in the opinion of the Council, it amounted to infamous conduct in a professional respect; and that his name would be struck off the Register.

Mr. ALLINSON asked when he could apply to have his name placed on the Register again.

The PRESIDENT said he could apply at the office after a certain interval.

Sir JOHN SIMON then asked that a notice of motion should be entered on the day's minutes, setting forth that although the conduct of which Mr. Allinson had now been found guilty was practically the same as that of which complaint had been made to the College in Edinburgh in years gone by, yet no step had been taken by the College; and that the Council expressed regret that the College had not seen fit to take any action, but had left the initiative to the Council under Clause 29 of the Medical Act.

Dr. BRUCE seconded.

The PRESIDENT ruled that the motion could not be received.

Dr. BATTY TUKE protested against such a motion at the present time. He should be most happy at the beginning of the November session to consider any resolution which Sir John Simon might bring forward with the view of elucidating the matter.

Sir WALTER FOSTER said they were all very much of the same mind as Sir John Simon. He had entered his protest in the shape of giving notice of motion, and if he put it on the agenda for the November meeting they could then discuss the matter fully and arrive at some conclusion which would

Digitized by Google

probably be favourable to his view. He thought that ought to satisfy Sir John Simon.

Dr. GLOVER said it could not be urged that this motion had been sprung on the Council, because they really had had notice of it for three days, when this question was first raised.

The PRESIDENT took the opinion of the Council upon the question, when it was decided that the motion should not be entered and printed on the minutes.

Sir JOHN SIMON gave notice of his motion for the adjourned meeting of the Council.

Sir WM. TURNER pointed out that the adjourned meeting was for the special business of confirming the minutes.

The PRESIDENT: I think we may consider the matter settled.

This concluded the business of the session.

THE ASSOCIATION OF FELLOWS OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

A MEETING of the Committee of the Association of Fellows of the Royal College of Surgeons of England was held on June 1st, at the residence of the President of the Association, Mr. G. D. Pollock, who occupied the chair. There was a large attendance of members of the Committee. After the minutes of the preceding meeting had been read and confirmed, the honorary secretary, Mr. Percy Dunn, read a letter from the secretary of the College, in reply to the request of the Committee that a deputation should be received at the College in reference to the advantages to be extended to the Fellows. This reply was published in THE LANCET of May 14th (p. 1112). The Committee decided that it was unnecessary to send any answer. A letter, dated May 8th, was read from Mr. Lawson Tait apologising to the Committee for having announced in THE LANCET his intention not to accept the invitation of the Committee to stand for the Council before previously communicating his decision to the Committee. He also tendered his resignation as a member of the Committee of the Association, and concluded by saying that he was also retiring from the political affairs of medical life. The Committee instructed the honorary secretary in his reply to express the regret of the Committee, and to add that they trusted he might perhaps see his way at some future time again to coöperate with the Committee on behalf of the Fellows of the College. The subject of obtaining a second candidate to represent the views of the Association at the coming election at the College was then discussed, and in connexion with this subject two letters—addressed to the honorary secretary by Mr. C. Steele of Clifton—were read. Mr. Steele had been asked by the honorary secretary whether he would stand as a candidate if nominated in the Committee, and one of his letters was to the effect that he did not feel prepared to do so on the present occasion. The following resolution was unanimously passed by the Committee: "That, considering the present critical condition of College politics in relation to the Fellows of the College, and of the great importance of returning to the Council candidates of high position in the profession favourable to increasing the privileges of the Fellows of the College, this Committee unanimously requests Mr. T. Holmes to allow himself to be put in nomination for the Council. Mr. Holmes, in reply, intimated his inability to come forward again, but said that he would return to the hon. secretary an official reply in a few days' time. Other names were mentioned in the Committee, and ultimately it was agreed to invite Mr. Paul Swain of Plymouth, who originated the Association in 1884, to come forward, and in the event of his declining, to write to Mr. Mayo Robson of Leeds. It was considered advisable to secure, if possible, a provincial candidate. The hon. secretary presented an estimate for printing and binding the report of the proceedings of the Committee of the Association, lately drawn up by a subcommittee appointed for the purpose. This report was submitted to the Committee at the last meeting and approved. The estimate was passed, and in the course of a fortnight the report will be issued to the Fellows of the College. Every Fellow whose address is known will have a copy sent to him. The hon. secretary reported the decease of Mr. William Adams of Regent's-park, a member of the Committee of the Association. Some other routine business was transacted, and the Committee adjourned at 6.30 P.M.

THE INFLUENZA EPIDEMIC.

THE full history of the remarkable visitation of influenza which the world has experienced during the past three years has still to be written. Meanwhile, thanks to the Society for Internal Medicine at Berlin, we are in possession of a record which, for completeness and interest, surpasses any yet produced. In a handsome quarto volume,[1] embellished by many well-executed maps, is contained the analysis of a "collective investigation," commenced in January of last year, under the auspices of a committee of the above Society and of delegates from the Medical Society and the Public Health Association. The plan pursued was that which for some years was undertaken in this country by the British Medical Association, as promoted by the late Dr. Mahomed, and it is with some regret that we feel that, owing to the cessation of that work, the opportunity for collecting facts upon influenza should have been allowed to slip past in England, whilst Germany, not loth to adopt new ideas, should have carried on work which an organisation like the British Medical Association should have been able to continue. For the purpose of collecting information the Berlin Committee issued some 20,000 cards to all practitioners in Germany, and of these more than 6000 were returned with more or less ample information. The points raised in the queries thus addressed to the profession comprised the time and place of the first observed cases in the practitioner's district, the time at which the epidemic was at its height, and at which it may be said to have terminated, the age, sex, and occupation of the patients, details of noteworthy symptoms (nervous, circulatory, respiratory, digestive, cutaneous), complications, and sequelæ; the frequency of the association with pneumonia and the type of the latter; the frequency of relapse, the course of convalescence, the influence of influenza upon other diseases, the mortality and causes of death, the treatment adopted, and, lastly, the opinion of the practitioner as to contagiousness.

The analysis of the returns, which is shared in by many eminent men, is preceded by an article on the Literature of Influenza—a bibliography extending over thirty-eight pages, and comprising references to works dating from the year 1700 to the end of October, 1891. This is furnished by Dr. A. Wurzburg. Then comes a section on Statistics by Dr. Carl Rahts, based on the returns. From this it appears that the majority first met with cases in December, 1889; but one case was observed in Gobersdorf (Silesia) on Sept. 15th, and at Homburg (Baden) on the same date; at Eilenberg (Saxony) on Oct. 1st, at Berlin on Oct. 1st and 30th. The epidemic prevailed from the middle of December to the end of January, but many of the returns either give no information upon its termination, or state that the disease was still present. Very varied are the estimates of the numbers attacked relative to the whole population, but a mean is given as being about 40 to 50 per cent. It is also impossible to get an accurate idea of the mortality, since some reporters include all indirect causes of death, and therefore give a death-rate of enormous proportions, whilst others, setting aside all complications and sequelæ, reduce the rate practically to *nil*. It is curious to note that whereas in Bavaria and Saxony the majority of practitioners affirm the contagiousness of influenza, in Berlin the majority take an opposite view. Practically, about 57 per cent. of the whole number expressing their views on this point (2643) are in favour of its contagiousness, and 42·5 per cent. of its non-contagiousness. Some guarded themselves by asserting that it was contagious "under certain conditions," or that it was miasmatic as well as contagious." Most of the patients were between the ages of twenty-one and fifty years, and

[1] Die Influenza-Epidemie, 1889-90. Im Auftrage des Vereins für Innere Medicin in Berlin. Herausgegeben von Dr. E. Leyden und Dr. S. Guttmann. Wiesbaden: J. F. Bergmann. 1892.

Digitized by Google

in the practice of 1273 there were more males affected than females, in 190 more females than males, whilst 1221 stated that there was no difference between the sexes. By far the majority found that the calling of the patient (out-door or sedentary) had no appreciable influence in determining an attack. Respecting relapses, 2849 practitioners supplied information; of these, 410 had not met with cases of relapse, 1788 had "occasionally," and 654 had "often" seen them.

Next follow two very interesting papers—the one, on the Course of the Epidemic of 1889-90, by Dr. G. Lenhartz; the other, on the Course of the Epidemic of 1891-92, by Dr. J. Wolff—and the charts appended to the volume embody in a striking manner the information here collected. As to the first epidemic, the earliest notice was by Heyfelder, who observed cases among the Europeans at Bokhara in the latter half of May, 1889, which he subsequently identified as similar in character to those occurring in St. Petersburg six months later. By July about one-half the population of Turkestan had been attacked; next the disease spread to East Siberia, and thence to the Caucasus and South Russia; but of its progress in China there is no information. In November it was raging at St. Petersburg, and its further course was in a direction more or less generally from east to west. By the end of November it was at Copenhagen, Stockholm, and Berlin; in the first week of December it appeared at Kiel, Bremen, and Leipsic; in the second week at Breslau, Mayence, and Frankfort-on-Oder; in the third week at Halle, Dresden, Strasburg, Hanover, Cologne, Frankfort-on-Maine, Hamburg, and Stuttgart; in the fourth week at Magdeburg, Nuremburg, Bonn, Dusseldorf, Heidelberg, and so on; the steps of the epidemic in Germany being also illustrated on charts. Its extension to other countries—Austro-Hungary, Turkey, France, Switzerland, Italy, England, Ireland, North America, Central America, South America, Egypt, Burmah, China and Japan, the Cape, Australia, and New Zealand—in much this order took place with marvellous rapidity, but it was not until July, 1890, that it appeared in Iceland and the Azores. The tale is taken up by Dr. Wolff in his article, who points out that influenza epidemics do not often recur as the present one has done; but in 1729-30 an epidemic which arose in Russia, and traversed the globe in the space of a year, returned two years later with similar intensity and course, and that a like experience was afforded in 1829-33. The epidemic of 1889-90, which had completed the circuit of the earth by October, 1890, when it was noted in Central Africa, was followed by another wave, which mainly took a reverse course—viz., from west to east. Meanwhile, there had been several localised outbreaks, sometimes repeated three or four times in the same place (e.g., Copenhagen), and from one or other of these a fresh extension took place. A mild course and gastric character generally marked these local epidemics of "autochthonous" origin. At the beginning of 1891 a fresh pandemic started on its world-journey. It began in New Orleans, thence travelled north to New York and Chicago, persisting in the States to the end of April, by which time it had already reached Ireland and England, when Hull and Sheffield, which had but a slight visitation in the previous year, were severely attacked, and when most other of the large towns, notably Nottingham, Liverpool, and London, were again visited. It was found that in this second outbreak there was a greater liability for children and old people to be attacked, and that there were a larger number of cases with nervous complications and gastric symptoms. From England, where it remained until the end of August, it radiated in two directions—viz. (1), S.E. to Spain and Portugal, and thence to France (October), whence some extension occurred into Germany, and (2) N.E. to Scandinavia, Denmark (end of July), Russia (September), Poland, Germany (November), and Italy (December). Then it careered back again over Denmark (December), Sweden, the Netherlands (December), to Ireland and North America (end of December). It is "not unlikely," adds Dr. Wolff, "that in the coming spring and summer, perhaps from the residua of this second pandemic, there may be local epidemics here and there, and then we may hope that for a series of years mankind will be free from this malevolent visitor." Had his record been extended into the present year (1892) he would have found ample corroboration of this surmise, and we trust that his concluding hope will be verified.

(To be continued.)

THE ROYAL MILITARY TOURNAMENT.

THE arrangements made by Colonel Tully, the secretary of the Royal Military Tournament, and his staff, to ensure the success of so popular a meeting as the Royal Military Tournament cannot be spoken of in terms of too high praise. The organisation of so vast an undertaking entails immense labour and untiring attention. Evidences of this were everywhere visible, both in the arena and behind the scenes. The vast masses who attended testify to the public interest in an exhibition by our soldiers. On the Continent the military element is always in evidence, the people are familiarised with military pageants; but in this country military displays are as rare as they are frequent in other portions of Europe. The "best troops in the world" are, as it were, hidden away, and it is therefore not surprising that the Military Tournament should excite much enthusiasm on the civil part of the public as being an occasion on which opportunity is afforded for witnessing feats of arms and skill, of expertness and precision, which can only be attained by prolonged experience and training. But it was not only in the arena that points of interest could be observed.

For example, in travelling through the long rows of horses stabled in the hall an interesting sight was observed. Some of the troopers quartered there, with a thoughtfulness and kindliness that cannot be too warmly commended, endeavoured to relieve the suffering of their horses by fanning them with huge Japanese fans. This picture of brave warriors thus tending their horses is very creditable to the soldiers, but it does not suggest that the ventilation of the Agricultural Hall is completely efficient for such an enormous mass of animate creatures as this gathering brings together. It is, indeed, but another illustration of the manner in which the important question of ventilation is neglected. Day after day the Hall has been crowded to overflowing. To meet the emergencies incidental to gatherings so large, special arrangements of a very complete kind have been organised by the Ambulance Association, and under the immediate superintendence of Surgeon-Captain E. J. Lawless, M.D., 4th V.B East Surrey Regiment, and staff officers of the Royal Military Tournament. Two huts have been erected under his special direction, one for male cases and the other for female, and have been equipped with all the armamentaria requisite for ambulance work by Messrs. Evans and Wormull. The Civil Hospital for the reception of lady patients was under the charge of Miss Edith Ward, who nursed the Royal Princes, and her sister, Miss Luisehen Ward, of the Royal Infirmary, Edinburgh. This ward was fitted with the electric light, and communication with Dr. Lawless in cases of urgency was kept up by an electric bell. Two orderlies from University College Medical Corps were under the command of the two sisters. This is an entirely new department. It has succeeded well, and the public will doubtless be grateful for the arrangements made for their comfort. The casualties treated at the female station included a transverse fracture of the tibia, a lacerated wound of the hand, and many cases of syncope, epilepsy, and hysteria. The position was no sinecure. In one single afternoon there were no less than nine ladies taken suddenly ill. Most of those treated were cases of syncope, and not altogether unconnected with bad ventilation. Undoubtedly the question of ventilating so large a building is a very difficult problem to grapple with. Some have suggested that steam punkahs might be beneficial. But we are not prepared, offhand, to say what methods of ventilation are best suited to such a place as the Agricultural Hall under ordinary or exceptional circumstances. This much, however, we may say—namely, that no system of ventilation will be effective unless mechanical force is employed. It is comparatively easy to set air in motion when it is very cold—that is, when there is a great difference between the in-door and the out-door temperature—or else when the wind is blowing violently. It is, however, when the air is quite still, when it is hot and close everywhere, that ventilation is most wanted. But it is just at such a moment that any system of ventilation which is not based on a mechanical motive-power altogether fails to act. Consequently there may be some good in the proposal to use steam punkahs at the Agricultural Hall. But though it may be pleasant to be fanned by steam power, something more scientific than this

Digitized by Google

is required. It does not suffice to beat about or stir up the air. The hot and vitiated atmosphere has to be driven out and fresh air admitted in the necessary volume, and yet so equably as not to occasion draughts.

The male ambulance station was in charge of a party of the Volunteer Medical Staff Corps—in the afternoon furnished by No. 1 University College Company, Surgeon-Captain V. Matthews; in the evening by No. 5 City of London Company, Surgeon-Captain J. Squire—and was also made use of for minor casualties.

Accidents which occurred to the soldiers in the arena were attended to in an army hospital fully equipped with all the hospital armamentaria from Aldershot. This hospital was under the charge of Surgeon-Captain F. J. Greig from Aldershot, who was assisted by Surgeon-Captain J. B. Beach from the same station. Fortunately the services of these gentlemen were not called into requisition except to attend to a trooper who received a subcoracoid dislocation of the humerus during the Balaclava *mêlée*. The dislocation was reduced in the army hospital, under chloroform, and next day the patient was sent by ambulance waggon to the Guards' Hospital in Rochester Row. Besides the above-mentioned officers, twelve men and three non-commissioned officers of the Medical Staff Corps were in attendance.

The sanitary arrangements had received considerable attention. Latrines were provided by the Sanitas Company, and several of Moule's earth closets were erected.

The sanitary appliances for the soldiers had likewise received attention from those in charge of the tournament. Water was plentiful, and ablutions could be performed with comparative comfort. Objection, however, must be taken to the sleeping accommodation provided for the soldiers. Tents had been erected in an upstairs portion of the building. It may be that this is the readiest mode of providing the men with a "local habitation," but tents under such circumstances are not sufficiently airy and ventilated to be occupied at night, and can hardly be taken to illustrate, even from a spectacular point of view, the exigencies of life in a military camp. That British soldiers should be sweltering in a small, ill-ventilated tent in the upper room of a building, the air of which has been vitiated by its having been occupied for many hours by vast numbers of men and horses, is scarcely in harmony with army hygiene or complimentary to those who made the arrangements. It seems to us that it would have been an easy and preferable arrangement to provide the required accommodation in the shape of extemporised cubicles.

THE DRAINAGE OF RANGOON.

THE municipal authorities of Rangoon have courageously grappled with the drainage problem, and this is the more creditable as local circumstances rendered the question one of exceptional difficulty. Rangoon is situated at a distance of thirty-five miles from the sea, on very low-lying ground. It was occupied by the British troops from 1824 to 1827, but did not become definitively an English possession till 1852. At that time it was but a collection of bamboo and plank houses and huts built on piles that had been sunk into a swamp which was periodically flooded by spring and other high tides. Yet, historically, the town is very ancient, having been founded, according to popular belief, by the brothers Pov and Tapaw, B.C. 585. Thus the swampy ground on which Rangoon stands has had ample time to be contaminated by its inhabitants.

Though annexed by the English forty years ago no attempt was made to deal with the sewage before 1873. The population had greatly increased. It was only 8660 in 1826, but it rose to 61,138 in 1863, and 98,745 in 1872. The cesspools with which the town was provided leaked frequently, and in 1873 they were abolished; but the pail system, instituted in their stead, was only a partial improvement. These pails were conveyed in carts to the jetties on the river bank, and there emptied into the water. Thus the air of Rangoon was polluted throughout the night by the horrible stench caused by the emptying and washing of the pails. For many years, however, no better plan could be devised. To build ordinary sewers was a matter of exceptional difficulty, as the ground was too flat and too unstable. Then there was the question of the rainfall, which is equal to 100 inches per annum; but as this rain comes down in the course of six months, the sewers would have to deal with what in England we should consider as equivalent to an annual rainfall of 200 inches. At Rangoon rain falls sometimes to the amount of 5·5 inches in one single hour. The soil becomes softer and softer and more unstable the deeper the trenches for sewers are dug. It was therefore impossible to build sewers large enough to deal with such a rainfall. Under these circumstances the Shone system seemed well suited to solve these special local difficulties if applied as a separate system, the rain being left to flow to the river in the ordinary manner. The gravitating sewers of this system are only 6 inches in diameter, and the largest sealed main 21 inches. Such small sewers, even in the driest seasons, are easily and efficaciously flushed. The fall given to the gravitating sewer is always sufficient, even in so flat a town as Rangoon; for it is never less than 1 in 200 for a 6-inch pipe. This advantage has been secured by dividing Rangoon into twenty-two sections or districts. Each of these districts has its ejector station, where there are two ejectors of 200 gallons capacity each. This means that Rangoon has twenty-two outfalls, situated where they are most needed—that is, at the lowest levels. These ejectors can be placed anywhere, even in the most crowded part of a town. Their construction need not be minutely described, as the system is now so well known, having been applied to the Houses of Parliament at Westminster and the towns of Eastbourne, Henley-on-Thames, Lowestoft, Southampton, and many other places being drained in this manner. The point to note is that when once the small and comparatively short 6-inch sewer has reached the nearest ejector, a distance which rarely exceeds 400 yards, the sewage is locked up, and has no further communication with the outer air.

When the ejector is full the pressure of the sewage on the air confined in a bell or cup, situated in the top of the ejector, forces open a valve, and then there is a rush of compressed air into the ejector. The force of this air is sufficient to lift the sewage out of the ejector up to a higher level, and into a sealed main. The compressed air is distributed to the various ejectors with the same facility and in the same manner as coal gas for lighting purposes. As the motive power consists of compressed air, it causes but little friction and practically no wear and tear. The sewage being forced out from the bottom of the ejector, the whole of the sewage—including solids, sludge, grit, &c.—brought down the sewer, is discharged out of the ejector. Therefore no screening or straining of sewage is necessary, as is the case with pumps, and the nuisance caused by the cleaning of pumps is avoided. Then the sudden rush of the whole contents of the ejector into the sealed main forms a good flush. Finally, each ejector acts as a trap, which completely disconnects the house drains of each district from the other districts and from the main outfall sewer. This main outfall is made of iron, and as it receives the sewage from the twenty-two ejectors it is always full and under pressure. The sewage has no time or space to generate sewer gas, nor could such gas escape and pollute the town, for the pipe main is air-tight. Its outfall is in the Rangoon river (which is much larger than the Thames), and is placed three feet below the lowest tide.

Each 6-inch gravitating sewer pipe has an automatic flush tank of 200 gallons. As these pipes are short and the fall ample, the sewage from the furthest house cannot take more than five or six minutes to reach the ejector, and there it is, as it were, locked up and put out of harm's way. To further ensure the perfect cleanliness of these pipe sewers, and so that all sewage, when in certain parts of the day the quantity is very slight, should not remain any length of time in the ejectors, there is an automatic discharge of 200 gallons of clean water from the flush tanks. In a 6-inch sewer, where sewage travels the whole distance in a few minutes, there is not time or space for the generation and accumulation of sewer gas. Also, as the volume of air in the pipe is very small, the flow of sewage and the regular flushing are more likely to be a sufficient motive power to replenish the air within the pipe. By smallness in diameter and shortness in length of the pipes, the volume of water and of air required to thoroughly flush and ventilate is reduced to a minimum. Financially the great cost of deep cuttings is avoided, and it is not necessary to provide for more than the district actually requiring drainage. The system can afterwards be easily

Digitized by Google

extended according to the increase of population. The air-compressing station built near the fire brigade station supplies the motive power capable of raising 3300 gallons per minute, or 4,750,000 gallons of sewage or water per day to a height of sixty-two feet. All the machinery and all the pipes had to be sent out from England, and the cost of skilled labour at Rangoon is about double what it would be in England; and yet the outlay on sewage works for the town proper only amounted to £155,377, or £2 5*s.* per head of the population. There are towns in England which have cost as much as £8 per head for their sewage works. But there has been an extension of the original scheme at Rangoon, increasing the total cost to £162,573. As, however, this embraces a population of 77,196, the cost per head is reduced to £2 2*s.* 4*d.*

Such, briefly, are the main features of the drainage works successfully accomplished at Rangoon. They seem to have given the greatest satisfaction. Major R. C. Temple, President of the Rangoon Municipality, in speaking on the subject at the International Congress of Hygiene and Demography of 1891, said:—"Most exhaustive trials have been made of the works, which have now been in operation nearly two years, and the result has placed beyond doubt that the favourable estimate originally formed of the Shone system has been completely justified by the result of its working. Rangoon is now the only city in the Indian empire which can boast of a scientific system of drainage which fulfils all the requirements of sanitarians."

It is nevertheless regrettable that at Rangoon the outfall sewer should pour all the sewage into the river. The volume of water in the river is estimated roughly at 150,000 times the volume of sewage, but in any case there is a waste of useful fertilising material. Then again, however satisfactory the Shone system may be in itself, the coupling of the houses to this system has not yet been fully accomplished; and where the connexion is established the workmanship has not always been of a satisfactory character. These are points on which the municipality should enact very severe by-laws and exercise a strict supervision. We have little doubt that this will ultimately be successfully accomplished, and hope that the example afforded by the town of Rangoon will stir all the great municipalities of India to similar useful sanitary action.

THE MEDICAL COUNCIL AND UNQUALIFIED ASSISTANTS.

THE following resolution of the Council and Report of the Executive Committee should be in the possession of practitioners who employ unqualified assistants.

RESOLUTION OF THE COUNCIL, APRIL 21st, 1883.

"That the Council record on its Minutes for the information of those whom it may concern that charges of gross misconduct in the employment of unqualified assistants, and charges of dishonest collusion with unqualified practitioners in respect of the signing of medical certificates required for the purposes of any law or lawful contract, are, if brought before the Council, regarded by the Council as charges of infamous conduct under the Medical Act."

REPORT OF THE EXECUTIVE COMMITTEE ON THE USE OF UNQUALIFIED ASSISTANTS.—MINUTES, MAY 22ND, 1888.

The Executive Committee, without attempting to make a formal definition of the misconduct in question, reports to the General Council that, in its opinion, "a registered medical practitioner would render himself liable to the censure of the Medical Council in case of the employment of an unqualified assistant in the practice of medicine, surgery, or midwifery on behalf and for the benefit of such registered practitioner, either in complete substitution for his own services or under circumstances in which due personal supervision and control are not, or cannot be, exercised by the said registered practitioner." "The Executive Committee furthermore takes this opportunity of stating, in reference to the proceeding known as 'covering,' that in its view a registered practitioner covers an unregistered person when he does, or assists in doing, or is party to, any act which enables such unqualified person to practise as if he were duly qualified."

ANNUAL MEETING OF THE BRITISH MEDICAL TEMPERANCE ASSOCIATION.

THE sixteenth annual meeting of the British Medical Temperance Association was held on Tuesday last in the rooms of the Royal Medical and Chirurgical Society, 20, Hanover-square, W. The President, Dr. B. W. Richardson, took the chair at 5 P.M. The annual report was read by the hon. secretary, Dr. Ridge, and showed the total number of members in the United Kingdom to be 415, and of associates eighty-one, the latter being medical students. Thirty-eight new members had joined during the year, but there had been some losses by death (including Dr. Alfred Carpenter, Dr. Maclagan, and Rev. Mr. Lowe) and by resignation. The balance-sheet showed a debt of £8 to the treasurer. A rule was added to admit lay associates interested in science, under certain conditions, without vote. Mr. Moir subsequently read extracts from a lecture on Alcohol delivered in 1837 by Dr. H. W. Dewhurst, who took up an advanced position with regard to the evils resulting from the use of intoxicating liquors.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN thirty-three of the largest English towns 6444 births and 3797 deaths were registered during the week ending May 28th. The annual rate of mortality in these towns, which had been 20·4 and 19·3 per 1000 in the preceding two weeks, rose last week to 19·4 In London the rate was 18·8 per 1000, while it averaged 19·9 in the thirty-two provincial towns. The lowest rates in these towns were 8·7 in Derby, 13·0 in Brighton, 13·4 in Portsmouth, and 13·8 in Croydon; the highest rates were 24·0 in Liverpool, 25·2 in Manchester, 25·6 in Wolverhampton, and 27·5 in Sunderland. The 3797 deaths included 478 which were referred to the principal zymotic diseases, against numbers declining from 542 to 469 in the preceding three weeks; of these, 203 resulted from measles, 113 from whooping-cough, 51 from diphtheria, 49 from scarlet fever, 44 from diarrhœa, 17 from "fever" (principally enteric), and 1 from small-pox. No fatal case of any of these diseases occurred last week in Derby or in Gateshead; in the other towns they caused the lowest rates in Huddersfield, Newcastle-upon-Tyne, Plymouth, and Leeds, and the highest rates in Bristol, Manchester, Sunderland, Wolverhampton, and Halifax. The greatest mortality from measles occurred in Birmingham, Sheffield, London, Liverpool, Manchester, and Halifax; from scarlet fever in Cardiff; from whooping-cough in Burnley, Blackburn, Wolverhampton, Bristol, and Sunderland; and from diarrhœa in Wolverhampton and Bolton. The mortality from "fever" showed no marked excess in any of the large towns. The 51 deaths from diphtheria included 39 in London, 3 in Birmingham, 2 in Portsmouth, 2 in West Ham, and 2 in Oldham. One fatal case of small-pox was registered in London, but not one in any of the thirty-two large provincial towns; 96 cases of this disease were under treatment in the Metropolitan Asylum Hospitals, and 12 in the Highgate Small-pox Hospital, on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 1741, against numbers increasing from 1226 to 1677 on the preceding nine Saturdays; 202 new cases were admitted during the week, against 232 and 226 in the previous two weeks. The deaths referred to diseases of the respiratory organs in London, which had been 304 and 292 in the preceding two weeks, further declined to 285 last week, and were 25 below the corrected average. The causes of 51, or 1·3 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in West Ham, Bristol, Leicester, Leeds, Newcastle-upon-Tyne, and in seven other smaller towns; the largest proportions of uncertified deaths were registered in Birmingham, Halifax, and Hull.

Digitized by Google

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 22·8 and 21·5 per 1000 in the preceding two weeks, rose again to 22·1 during the week ending May 28th, and exceeded by 2·7 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 16·3 in Aberdeen and 17·1 in Edinburgh to 24·8 in Greenock and 26·5 in Glasgow. The 616 deaths in these towns included 32 which were referred to measles, 25 to whooping-cough, 10 to diarrhœa, 5 to scarlet fever, 5 to "fever," 3 to diphtheria, and not one to small-pox. In all, 80 deaths resulted from these principal zymotic diseases, against 80 and 78 in the preceding two weeks. These 80 deaths were equal to an annual rate of 2·9 per 1000, which exceeded by 0·5 the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of measles, which had been 32 in each of the preceding two weeks, were again 32 last week, all of which occurred in Glasgow. The deaths referred to whooping-cough, which had been 24 and 26 in the previous two weeks, were 25 last week, and included 18 in Glasgow and 4 in Edinburgh. The 10 fatal cases of diarrhœa exceeded the number in any recent week, and included 6 in Glasgow. The deaths from scarlet fever, which had been 2 and 9 in the preceding two weeks, declined again to 5 last week, of which 4 occurred in Glasgow. The 5 fatal cases of "fever" corresponded with the number in the previous week, and included 3 in Glasgow. The deaths referred to diseases of the respiratory organs in these towns, which had been 140 and 126 in the preceding two weeks, further declined last week to 120, and were 53 below the number recorded in the corresponding week of last year. The causes of 65, or nearly 11 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 31·0 and 34·6 per 1000 in the preceding two weeks, declined again to 29·1 during the week ending May 28th, a lower rate than in any week since December last. During the first eight weeks of the current quarter the death-rate in the city averaged 33·9 per 1000, against 19·9 in London and 18·7 in Edinburgh. The 195 deaths in Dublin during the week under notice showed a decline of 37 from the number in the preceding week, and included 23 which were referred to measles, 6 to whooping-cough, 4 to "fever," and not one either to small-pox, scarlet fever, diphtheria, or diarrhœa. In all, 33 deaths resulted from these principal zymotic diseases, equal to an annual rate of 4·9 per 1000, the zymotic death-rate during the same period being 3·1 in London and 1·6 in Edinburgh. The fatal cases of measles, which had been 24 and 28 in the preceding two weeks, declined again to 23 last week. The deaths referred to whooping-cough, which had been 3 in each of the previous two weeks, rose to 6 last week. The 4 fatal cases of "fever" considerably exceeded the number recorded in any recent week. The 195 deaths registered in Dublin last week included 28 of infants under one year of age, and 43 of persons aged upwards of sixty years; the deaths both of infants and of elderly persons showed a marked decline from those recorded in the preceding week. Five inquest cases and 4 deaths from violence were registered; and 66, or one-third, of the deaths occurred in public institutions. The causes of 21, or nearly 11 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

LIEUTENANT MCMUNN, R.A.

IN a recent article we incidentally called attention to the latest example of British pluck and enterprise as exhibited in Burmah by a young officer of the Royal Artillery, Lieutenant McMunn. It may interest our readers to know that this officer is the son of Dr. J. A McMunn, formerly Surgeon in the Royal Horse Artillery, and now Senior Physician and Surgeon of the Royal Hospital, Chelsea. Dr. McMunn, before he retired from the Army on half-pay, had served in the Crimean campaign and Indian Mutiny. His son, Lieutenant McMunn, has, it is stated, been recommended by the Commander-in-Chief in India, Lord Roberts, for the Victoria Cross, which he certainly deserves. and we may congratulate Dr. McMunn, of the Royal Hospital, Chelsea, on his son having already made his mark in the Service.

THE LATE MORTALITY AMONG THE NATIVE FOLLOWERS IN BURMAH.

We directed attention in THE LANCET of May 7th to the deplorably high death-rate among the native followers of the British army in Burmah, as set forth in an address of Deputy Surgeon-General C. Sibthorpe, of the Indian Medical Service. This loss of life, alleged to be attributable to preventable causes and the want of proper provision in the way of food and necessaries for these unfortunate natives, has, we have since understood, excited much attention in India; and assuming that there is no mistake about the facts and figures—viz., that only 400 out of 6000 native followers admitted into the General Hospital recovered sufficiently to return to their duties in the field—we cannot wonder at it.

FIELD MEDICAL SERVICE CODE FOR INDIA.

A new edition of the Field Service Departmental Code, Medical, India, and the Syllabus of Field Medical Organisation for the Indian Army has just been issued by the Government of India for the information and guidance of all concerned. This code will be henceforward the sole authority on all the subjects to which it refers, and is to be quoted in all official correspondence. It is to supersede the Field Medical Service Manual of 1888 The principles underlying the regulations of the medical service in India may be said to be identical with those which obtain elsewhere in the British army, but the methods by which the objects are attained are somewhat different, as might be supposed. The code for field medical service in India is distinctly good. It is short, clear, and precise, and does not darken counsel with a cloud of words. The appendices include a vast amount of information in tabular form, and arranged in scales of establishments and equipments, according to the strength of the force and nature of the service.

THE GENERAL HOSPITAL, MADRAS.

Consequent upon the strong recommendation of the Surgeon-General, the local government has agreed to the proposal to increase the professional staff of the General Hospital, and has accordingly addressed the Government of India on the subject.

ABOUT SOLDIERS, BY A SOLDIER.

The June number of *Blackwood's Magazine* contains an article under this heading which is worth reading at the present time, in connexion with the controversy that has arisen about the state of the army, for the fair commonsense and unsensational spirit in which the subject is discussed.

YEOMANRY CAVALRY. — Gloucestershire (Royal Gloucestershire Hussars): The undermentioned Surgeon-Majors to be Surgeon-Lieutenant-Colonels: W. Wickham and A. Grace (both dated May 28th, 1892).

INDIAN MEDICAL SERVICE.

Surgeon-Major Edward Levinge, District Surgeon, Kistna, died at Masulipatam on the 7th inst.

The services of Surgeon-Captain T. W. Shaw, M.B., I.M.S., have been placed at the disposal of the Government of India in the Foreign Department.—Brigade Surgeon-Lieutenant-Colonel R. Bowman, I.M.S., has returned to duty on the Indian Establishment.

Hospital Reports, Bombay.—Prof Wellington Gray has started an annual volume in which a selection of the cases coming under the notice of the Medical and Surgical Staff of the Jamesetjee Jejeebhoy Hospital and Grant Medical College will be published.

Bombay.—Brigade-Surgeon-Lieutenant-Colonel A. Berry has been appointed to the medical charge of the 6th Bombay Cavalry, vice Surgeon-Captain T. D. C. Barry.—The following transfer of medical officers has been effected:—Surgeon-Major H. D. Masani to the medical charge of the 24th Bombay Infantry, vice Surgeon-Captain Braganza, and

Digitized by Google

Surgeon-Captain M. B. Braganza to the medical charge of the 30th Bombay Infantry, vice Surgeon-Major Masani.

Government of India Orders.—Surgeon-Major G. S. A. Rankin, M.D., Bengal Establishment, is appointed to officiate as Secretary to the Board of Examiners during the absence on special leave of Colonel H. S. Jarrett.—Brigade-Surgeon-Lieutenant-Colonel W. Center, M.B., Civil Surgeon, Lahore, is appointed to officiate as Administrative Medical Officer and Sanitary Commissioner, Central Provinces, vice Surgeon-Colonel J. G. Pilcher.—Mr. W. R. W. James is temporarily admitted into the Uncovenanted Medical Service, and appointed to the Central Provinces.—The undermentioned pensioned officers are temporarily employed, and their services placed at the disposal of the Bengal Government: Honorary Surgeons C. L. Fox and E. W. Browne.

Dr. R. A. K. Holmes, who was appointed to officiate a few weeks ago as Inspector-General of Gaols in the North-West Provinces and Oudh, in place of Sir John Tyler, on leave, has been compelled to go home on sick leave. Dr. E. Mair, Superintendent of Bareilly Central Gaol, will act till Sir John Tyler returns.

In the Chin Hills.—4th Bengal Cavalry: Surgeon-Captain W. W. White to medical charge of Regiment.—24th Punjab Infantry: Surgeon-Captain H. F. Whitchurch to medical charge of Regiment.—26th Punjab Infantry: Surgeon-Captain J. H. Close from 21st Punjab Infantry to medical charge of Regiment.

Surgeon-Captains F. O'Kinealy, E. Wilkinson, and W. Henvey have been appointed to the officiating medical charge of the 2nd Bengal Lancers, 2nd Sikh Infantry, and 2-5th Gurkhas respectively.

The transfer of Surgeon-Colonel R. Harvey from the administrative medical charge of the Punjab Frontier Force to that of the Presidency District has been cancelled.

Surgeon-Captain H. N. V. Harington, Indian Medical Service (Madras), Medical Officer of the Deoli Irregular Force and of the Harowtee and Tonk Pol Agency, is appointed to officiate as Agency Surgeon in Ulwar, from the date of assuming charge, and during the absence on furlough of Surgeon-Major A. S. Faulkner, or until further orders.

Surgeon-Captain R. Shore, M.D., Indian Medical Service (Bengal), Officiating Residency Surgeon in Turkish Arabia, is appointed to officiate as Medical Officer of the Deoli Irregular Force and of the Harowtee and Tonk Pol Agency, from the date of assuming charge, and during the absence of Surgeon-Captain H. N. V. Harington, or until further orders.

Surgeon-Captain E. Butt, M.S., Ranikhet, to hold charge of the civil medical duties of Ranikhet, in addition to his military duties, from date of taking over charge from Brigade-Surgeon-Lieutenant-Colonel J. R. Greenhill, who has resigned the appointment, and until further orders.

Surgeon-Major A. E. R. Stephens, Officiating Deputy Sanitary Commissioner, 1st Circle, on being relieved by Brigade-Surgeon R. Jameson, to officiate as Superintendent to Central Prison, Lucknow, during the absence on deputation of Surgeon-Major R. A. K. Holmes, or until further orders.

Brigade-Surgeon-Lieutenant-Colonel Spencer, Chief Medical Officer, Rajpootana, succeeds Deputy Surgeon-General Morice, invalided from Calcutta. Brigade-Surgeon-Lieutenant-Colonel W. Center will on promotion relieve Brigade-Surgeon-Lieutenant-Colonel Welch, at Peshawar. Dr. Center is one of the best chemists in India, and his services in this respect have, during his residence at Lahore, been utilised by the local and supreme Governments. Surgeon-Captain D. G. Crawford, Civil Surgeon of Purneah, goes to Chupra as Civil Surgeon of that station. Surgeon-Captain E. Harold Brown, Civil Surgeon of Cooch Behar, accompanies her Highness the Maharanee to England.

NAVAL MEDICAL SERVICE.—The undermentioned Staff Surgeons have been promoted to the rank of Fleet Surgeon in Her Majesty's Fleet:—Ralph Westropp Brereton (dated May 13th, 1892), and Isaac Henry Anderson (dated May 19th, 1892); Staff Surgeon Horace E. F. Cross to the Haulbowline Hospital (dated June 1st, 1892).

Correspondence.

"Audi alteram partem."

THE GENERAL MEDICAL COUNCIL.

To the Editors of THE LANCET.

SIRS,—Your leader writer, in his anxiety to poke fun at me, in your last issue, remarks that I had not adduced any evidence in support of my statements in reference to the reception of certificates from parties whose certificates would not be received by the medical authorities in the divisions of the kingdom whence they emanated, "and that I threw myself on the mercy of the Council." That I did so is true, but it was in the direction of begging of the Council not to ask me to name the authorities that so acted, but rather discuss the matter as an abstract question. That I had plenty of evidence to support the charge is evidenced by the report on the subject of the Examination Committee.

I am, Sirs, yours obediently,

Langham Hotel, May 28th, 1892. R. MACNAMARA.

HEALTH IN TOWNS.

To the Editors of THE LANCET.

SIRS,—Among the many valuable facts in Dr. Poore's recent lecture, not one of the least valuable is his statement as to the amount of land on which may be used the refuse of the average house. This amount he places at thirty perches, or rather less than one-fifth of an acre, which, he says correctly, is about the maximum amount of garden which a business man can cultivate at his leisure.

The greatest risks to dwellers in towns, *pace* sanitary engineers, arise from drains and the matters passed into them. The present system of dealing with these waste products is most harmful and extravagant, and only to be defended on the score of necessity. These products, which, put into the ground, become transformed into innocuous and life-giving products, when allowed to putrefy in drains become a source of the greatest danger to man. This danger might be avoided in great measure—altogether except for neighbouring drains—by the possession of the above amount of ground, and the using of the waste material on it. And, as Dr. Poore says, "a wise sanitary authority will do well by a remission of taxation to encourage" such by the means in their power. It is to be feared that sanitary authorities are not wise in this way; that they consider property and land as rateable objects, and not simply for the good of the individual citizen. Unfortunately, even sanitary authorities think more of trade than of health, and that a closely packed town is preferable to a large semi-rural village; for these authorities are composed of tradesmen, and crowding is good for trade.

I am, Sirs, yours obediently,

St. James's-rd., Liverpool. RICHARD LEIGH, M.R.C.S. &c.

THE ELECTION TO THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS.

To the Editors of THE LANCET.

SIRS,—Permit me briefly to recite my connexion with the contests for seats on the Council for the last three years, and I am sure you will see that you do me some slight injustice in your leading article of May 28th. I was induced to take an interest in the questions of College reform by several members of the Association of Members, and after having gone as thoroughly as I could into it, I came to a conclusion which I formulated in a speech at the annual meeting of that Association held at the Holborn Restaurant in 1888. I was then elected a Vice-President, and my views were to the effect that "the Membership of the College included all corporate rights, and the Fellowship is a mere academic distinction." Despite Mr. Justice Romer's decision, I hold this to be the fact still, for I cannot understand how, according to the constitution of our country, a mere Royal Charter can override an Act of Parliament. At the trial of Steele *v.* Savory this question was never touched, and

Digitized by Google

not a particle of the voluminous evidence bearing on it was heard. In not one word that I have ever written or uttered have I departed from this platform, but the unfortunate action of the Committee of the Association of Members has made any further efforts to fight it perfectly impossible. I fully accepted the platform of the Association of Fellows, but at the very last meeting of its committee, at which I attended, I asked for an alteration of wording in a resolution which seemed to me essential, so that I might be free to retain my platform. My colleagues most courteously granted my request, so that I cannot see how they at least could misunderstand my position. At the next meeting, when I was not present, they paid me the compliment of asking me to be one of their candidates, but unfortunately, the day before, the circumstances had occurred which determined me that the fight for the Members' rights had become perfectly hopeless. The first announcement I had of my selection was in your own columns, and I was obliged hurriedly to make these columns the vehicle of my declining to stand.

The grievances of the Fellows, which are apart from those of the Members, are of but slight political import, but they are real. The grievances of the Members are practically those of the whole country in the reign of George II. The decision of Mr. Justice Romer would make the position of any ardent democrat on the Council of the College of Surgeons a very bed of thorns. What could such a one as I am do save sit till the end of each Council meeting and then go out, like the Scotch laird, into the road and "swear at lairge"? I am deeply grateful to those Fellows who have supported me in past years, and I express my deep regret to any of those who may have voted for me under the mistaken belief that I was a sort of liberal-conservative in college politics. I retire from the contest, for I feel that the battle is hopeless; but at the annual meetings of the College I shall as often as I can be one to support the annual vote of censure which the Council so pachydermatously endures.

I am, Sirs, yours obediently,

Birmingham, May 31st, 1892. LAWSON TAIT.

THE USE OF MERCURY IN SUSPECTED SYPHILIS.

To the Editors of THE LANCET.

SIRS,—As no surgeon has commented upon Mr. Arthur Cooper's article in your issue of May 7th on Certain Modes of Treatment which interfere with the Diagnosis of Syphilis, I would like to ask one or two questions. Mr. Cooper strongly deprecates the use of (1) lunar caustic, (2) iodine paint, and (3) mercury internally, in cases of suspected syphilis in an early stage, on the ground of the obscuration of diagnosis. As regards the two former, I have nothing to say; but I submit that the use of mercury in such cases is not to be too readily ruled out of court. Mr. Cooper's objection to the use of mercury in these suspected cases is that, if the case be syphilitic, it may so modify the early signs of the disease as to render them difficult to recognise, or may even prevent them altogether, "bearing in mind the remarkable rapidity with which syphilis in some cases is influenced by the drug." I do not gather that if syphilis be not present the mercury will do any harm.

Now, a certain diagnosis is of course highly important; but is there not some danger, if I have understood the author's meaning, of sacrificing the patient's interests to the diagnosis? Suppose that a sore is acquired which is not yet characteristically indurated, but one that most probably will become so after a few weeks. The surgeon has a remedy which, on Mr. Cooper's own showing, has a powerful effect in preventing or greatly modifying the early symptoms of the disease. Ought he to refrain from its use in order that the disease may develop its symptoms unchecked, and so provide him with a certain diagnosis? There is no doubt difficulty in the after-treatment of cases in which under mercury the sore has healed without induration, and such cases would doubtless need watching and much caution in the disuse of the remedy; but would not the gain to the patient have been a real one?

I am, Sirs, yours truly,

R. HINGSTON FOX, M.D.

Finsbury-square, E.C., May 31st, 1892.

DEATH UNDER CHLOROFORM.

To the Editors of THE LANCET.

SIRS,—I venture to trespass on your valuable space to make answer to the letters appearing in your last issue touching the circumstances of the death under chloroform which occurred recently at this hospital, as I, and not Dr. Colvin-Smith, was responsible for the preparation of the patient. I quite concur with the opinions expressed in those letters that the interval between the boy's breakfast and the operation was undesirably (and, I may add, unintentionally) long; but I do not hold that it contributed materially to the unfortunate result. It is so important that the stomach should be empty before an anæsthetic is administered that it is better for the patient to fast a little longer than usual, rather than run the risk of being narcotised with the stomach filled with recently ingested, and as yet undigested, food. It is a matter of great difficulty to get parents to appreciate this, and at least a quarter of the number of out-patient children who are anæsthetised vomit up large quantities of undigested food either during or immediately after the administration of chloroform. In many cases where this has occurred the parents have assured me that the children have had no food within the prescribed four hours, the obvious conclusion being that the stomach frequently does not rid itself of its burden of semi-digested food under four hours; while in other cases the children have been plied with biscuits or cakes to keep them quiet, shortly before being brought to the hospital, and the operation has been postponed in consequence. To avoid these difficulties as far as possible, I direct the mother to give the child nothing after eight o'clock, the operation being performed between twelve and one, thus ensuing a clear interval for digestion of four or five hours, which in the majority of cases is sufficient. Different directions are of course given for very young children or those who are being suckled. In this particular case the boy had his breakfast at 7.30, finishing it some time before 8; the operation was delayed till 1.15, in consequence of there being a large number of out-patients to be seen, and because it was thought desirable to perform the other two operations fixed for that day first, the patients being babies who required circumcision. Dr. Milson's suggestion of the administration of brandy before operation is one which I have many times put into practice whenever the condition of the patient or the severity of the operation has appeared to call for it; and I feel sure that on more than one occasion it has helped the patient to come with safety through the ordeal. In the case of out-patients the operations performed are not severe or prolonged, neither are the patients in a state of great debility, such as to demand the exercise of extra precautions, and I have not yet seen reason for administering brandy beforehand to such patients. The possibility that a dose of brandy might have prevented the unhappy result in this case I must admit; of the probability I venture to doubt. Most London patients affected with adenoids are pale and anæmic and of weakly constitution, and this boy was no worse than many I have seen. While recognising the reasonableness of Dr. Milson's *ex post facto* suggestion, I do not think there was anything about the boy's aspect to cause me to think that extra precautions were necessary.

As regards Mr. Square's remarks, I feel bound to say that he has, perhaps unintentionally, entirely overstated the facts. The boy was told to have nothing after 8 o'clock. It so happened that he began his breakfast at 7.30, though that hour was not mentioned expressly by me. The meal consisted of bread and milk, an egg, and tea, probably about as much as he would ordinarily take. He went to bed at 9 o'clock the previous evening, a little earlier than usual, and had his supper just before. He walked to the hospital, a distance of a little over a mile, not an excessive walk for a boy of eleven years, arriving about 11.30, the time he was told to come, accompanied by his mother, who remained with him in the waiting-room, where there were several other people, during the "weary hours" preceding the operation. It surely is a little ridiculous to assert that the boy had had but one meal in eighteen and a half hours, seeing that he had had both his supper and breakfast within that interval.

The "state of nervous excitement" is entirely a myth the boy took the chloroform quietly and composedly, as

Digitized by Google

Dr. Smith stated, and was in no way agitated. He was anxious to get the operation over, so that he might have his dinner. When Mr. Square says that he has found three and a half or four hours a sufficient interval at which to give an anæsthetic after a meal, I presume he is alluding to patients in hospital wards, to whom nourishment in a concentrated and easily absorbed form can be administered with the full confidence that the stomach will not be embarrassed by its contents at the time of operation. I must apologise for trespassing at such length upon your space, but it seemed to me that Dr. Milson's suggestion deserved acknowledgment, and that Mr. Square's statements required an answer.

I am, Sirs, yours truly,
HERBERT G. COOK, M.B., F.R.C.S.,
House Surgeon.

June 1st, 1892.

To the Editors of THE LANCET.

SIRS,—The profession is much indebted to Dr. Milson and Mr. Square for having directed attention in your last week's issue to the danger arising from too many hour's fasting before the administration of an anæsthetic. As Mr. Square says, the boy must have been in almost a condition of starvation. Adding to this low condition the amount of chloroform administered (two drachms used in from five to ten minutes), the danger from an overdose was enormously increased. Some time ago I had chloroform administered to a very nervous boy of six years for the removal of both tonsils. My friend, Mr. Newham, who kindly gave the chloroform, in order to allay the boy's fear, allowed him to hold the face-piece himself before his face, whilst he gave the vapour in very small doses, probably no more than one-tenth part of a minim with each inspiration. No objection was made to breathe the vapour, and satisfactory anæsthesia was induced, and the operation completed within five minutes, with the consumption of thirty minims of chloroform. Full consciousness was regained within ten minutes.

I am, Sirs, yours faithfully,
F. A. PURCELL, M.D., M.CH.

Manchester-square, June 1st, 1892.

"STEELE *v.* SAVORY" FUND.

To the Editors of THE LANCET.

SIRS,—In forwarding herewith the first list of subscriptions to the above fund, the special committee formed for the purpose of collecting the same, and thus relieving the four plaintiffs and others of the legal responsibility resting upon them, desire to draw attention to the fact that the total amount of the costs on both sides, to be paid by the Association of Members, is now ascertained to be £2162, and that of this sum less than half has up to the present time been received. The committee, however, confidently appeal to those Fellows and Members who have not yet contributed to do so without delay, and would urge that if each subscribed even a small sum the full amount required would easily be realised.

An impression existed in the minds of some that the Council of the College, taking into consideration the special circumstances of the action, would refrain from pressing for costs. But although the Council derive a yearly income of £17,000 from its Members alone, and have recently expended £70,000 of the corporate funds on building operations, without even consultation either with the Fellows or Members, they find they cannot conscientiously forego the comparatively small sum of £720 incurred in ascertaining the legal position of the larger portion of the body corporate. On the application of the four plaintiffs for remission of such costs the Council resolved that their solicitors be instructed to recover the same forthwith. Accordingly, half has already been paid in cash, and personal security, to the satisfaction of the President, has been given for the remainder, and the committee trust that the necessary funds will be forthcoming shortly to enable them to settle the costs incurred by the Association. Although in the law courts the Association of Members has been defeated, the justice and reasonableness of its claims remain the same; and efforts will now be directed to the furtherance of the Bill in Parliament with which the Members are familiar, and all other legitimate means used until success is ultimately secured.

I am, Sirs, yours faithfully,
GEO. DANFORD THOMAS, Treasurer.

Park Lodge, Paddington, W., June 1st, 1892.

TREATMENT OF COMPOUND DEPRESSED FRACTURE OF THE SKULL.

To the Editors of THE LANCET.

SIRS,—In the preliminary remarks upon the case of compound depressed fracture of the skull under the care of Mr. Walsham at the Metropolitan Hospital which was published in your last issue, I observe that you regard the entire closure of the wound as an unusual procedure, and one which is not free from risk unless the surgeon "felt perfectly satisfied as to his power to make the wound and adjacent parts thoroughly aseptic and keep them so afterwards." With regard to this point I venture respectfully to make a few observations. I think that if the surgeon has satisfied himself that the wound has been rendered thoroughly aseptic at the time of the operation, he is more likely to succeed in maintaining it in an aseptic condition by avoiding the use of a drainage-tube. It is now, I believe, well recognised that in antiseptic operations it is best to discard the drainage-tube whenever possible, and, when it is found necessary to use them, to keep them for a very short time, for the reason that, if used for any length of time, they establish a sinus which offers an easy entrance to septic organisms, and is therefore difficult to keep aseptic. In the case in question I think there was less danger in running the risk of an accumulation of fluid within the wound than in exposing the wound to the chance of septic infection through the use of a drainage-tube, because the former complication could have been at once detected and rectified in a patient who was under close observation. Moreover, in this case the use of a tube for even twenty-four hours was not necessary: first, because the wound was nearly dry before the sutures were tied; and secondly, because a small triangular space was left in the scalp sufficient to drain away any oozing which might occur in the first twenty-four hours.

I am, Sirs, yours truly,

May 31st, 1892. C. F. MARSHALL, M.D.

TERRITORIAL MONOPOLIES OF QUALIFICATIONS.

To the Editors of THE LANCET.

SIRS,—In your admirable annotation you say: "We should like to see our Irish and Scotch friends begin by liberalising the rules of their own hospitals" &c. I am happy to assure you that there is no hospital in Ireland in which any particular diploma is required for office. Prior to the Medical Act, 1858, county infirmaries' surgeons should be licentiates of the Irish College of Surgeons, but that body at once consented to the removal of the restriction. Now, in two of the clinical hospitals of Dublin there is a surgeon without that diploma, and in a third a physician who is not connected with the Irish College of Physicians.—I am, Sirs, your faithfully,

E. D. MAPOTHER,
Chairman of Council, Irish Medical Schools' and
Cavendish-square. Graduates' Association.

DRAINAGE AT SURBITON.

To the Editors of THE LANCET.

SIRS,—I think you will admit there must be some reason for complaint as regards the drainage at Surbiton when eight out of thirteen medical men resident in the district have signed a petition asking for a regular inquiry into the matter. Four out of the eight medical men whose names do not appear on the requisition paper are, in one way or other, connected with the public health service, and their signatures were not asked for. It may be urged, as you say, that it is the duty of each person to get his own drains properly inspected, and put in order; but it must not be lost sight of that it is impossible to educate all people up to this standard, and, moreover, that this is a matter which concerns not only the occupant of any particular house, but to a greater or less extent all the inhabitants of the district, inasmuch as one case of infectious disease may, under circumstances, be the cause of a serious outbreak. Besides all this, the resident medical men are particularly anxious that the sanitary condition of the place should be proved beyond all doubt, once and for all, because at the present time, when it becomes known that a few cases of infectious disease have arisen, some person who is not over-anxious about the welfare of the locality at once writes to the papers to say that we have a serious outbreak of disease. If this can be stopped it will be of great benefit to us all.

I am, Sirs, your obedient servant,

Surbiton, May, 1892. F. P. ATKINSON, M.D.

*** In expressing the hope that the residents of Surbiton will, without delay and before illness occurs, have their house drains carefully tested by some competent persons, we did not propose to suggest that the sanitary authority was free from responsibility in this matter; but we presume that the cost of reconstruction, if necessary, must fall on the owner, and certainly owners will do well not to wait until compelled by the authority.—ED. L.

FARCY AND GLANDERS."

To the Editors of THE LANCET.

SIRS,—In THE LANCET of March 12th is a leading article on the Prevalence of Glanders in Great Britain, pointing out several defects in the Contagious Diseases (Animals) Act, under the working of which farcy and glanders are looked upon as separate diseases, and twenty-one days have to elapse before an animal declared to be affected can be destroyed. It may perhaps be interesting to you to know that in the Punjab the Glanders and Farcy Act (Act 20 of 1879) has been in operation for the last thirteen years, and all the defects in the English Contagious Diseases (Animals) Act have been avoided. In it glanders and farcy are looked upon as one and the same disease. On a diseased animal being certified as such, destruction is instantaneous. Animals that have been in contact with a diseased one are isolated, at the owner's expense, until certified to be fit to work. The disinfection of stables and premises, as well as the disposal of the body of the diseased animal, has to be carried out at the owner's expense. Any gear, saddlery, or grooming apparatus is destroyed. No compensation is given, and any person obstructing an inspector under the Act in his duties, or preventing his entering any premises where he has reason to suspect there is a glandered animal, is liable to a fine or imprisonment, or both. Surely, if an Act that so completely provides for the suppression of what is not only a fatal disease with equines, but which is also transmissible to mankind, can be worked in a country like India, there ought not to be any difficulty in making the alterations that are required in the English Act.

I enclose a copy of the Glanders and Farcy Act of India (Act 20 of 1879).—I remain, Sirs, yours faithfully.

JOSHUA A. NUNN, F.R.C.V.S.,
Veterinary Captain, Army Veterinary Department, and
Principal, Lahore Veterinary College.

Lahore, Punjab, May 6th, 1892.

VOLUNTEER MEDICAL OFFICERS.

To the Editors of THE LANCET.

SIRS,—I am requested to send you the following copy of the reply received from the War Office to the letter of April 21st, which was published in THE LANCET of the May 7th. I am, Sirs, yours faithfully,

J. EDWARD SQUIRE, M.D.,
Surg.-Capt., V.M.S., Hon. Sec.

101, Great Russell-street, Bedford-square, W.C.,
London, May 31st, 1892.

[COPY.]

No. V.—General No. 1561.

War Office, Pall Mall, S.W., May 16th, 1892.

SIR,—I am directed by the Secretary of State for War to acknowledge your letter of April last, submitting for his special consideration the claims of medical officers of the Volunteer force to share in the honours and rewards bestowed upon the combatant officers of that force, and soliciting on their behalf that the distinctions of Queen's Honorary Physician and Queen's Honorary Surgeon conferred upon officers of the Army Medical Staff may be accessible to medical officers of Volunteers who have established a title to them by long and efficient service. In reply, I am to state, for the information of the Council of the Volunteer Medical Association, that, as regards the eligibility of medical officers for the Order of the Bath, Mr. Stanhope regrets he can add nothing to his letter of June 5th, 1890, wherein his views upon the subject were expressed. In regard, however, to the distinctions of Queen's Honorary Physician and Queen's Honorary Surgeon, I am to observe that service in the Volunteer force, under its normal conditions, does not appear likely to lead to any qualification for these honours, inasmuch as they are only conferred upon officers of the Army Medical Staff either in

Digitized by Google

recognition of service in the field or as the reward of special professional merit displayed in services to the Army, under conditions of exposure to epidemics and diseases in unhealthy climates throughout the world, to which medical officers of Volunteers are not subject.

I have the honour to be, Sir, your obedient servant,

RALPH THOMPSON.

The Hon. Secretary, Vol. Med. Assoc.,
10, Great Russell-street, W.C.

NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

Proposed Memorials of Newcastle Citizens.

A MOVEMENT has been initiated to perpetuate the memory of the late Dr. J. C. Bruce of Newcastle. Seeing that he was so long and intimately connected with our Royal Infirmary, and indeed gave his last hours to its service, it is appropriately suggested that the "Bruce Memorial" should be connected with the institution, and it is proposed to do this by building a pavilion to be called "The Bruce Pavilion." The Mayor has been requested to call a public meeting to consider the proposal. Then we have "The Heath Memorial;" but about this I have heard little since its inception. If it is true that Dr. Heath has himself left about £19,000 for various purposes connected with the College of Medicine, it appears to me that he has left his own memorial in that splendid building; and if it is not true, it is a pity that the Heath and Bruce Memorials could not be combined; and probably sufficient funds would be forthcoming to go a long way to erect a new building in place of the present old one, which is open to many objections viewed in the light of modern hospitalism, to say nothing of its defective site.

A City without a Fever Hospital.

It is strange that the ancient city of Durham, with its comparatively modern University, is without a Fever Hospital. Dr. E. Jepson is taking active steps to induce his fellow-citizens to supply the want. There is now a disused Board School available for the purpose, and it can be made convertible to hospital requirements at a small cost. Dr. Jepson should receive ready aid in his effort to remedy this sanitary shortcoming in Durham.

Great Church Parade of Tyneside Cyclists.

On the 15th ult. a great church parade of cyclists took place at Delaval Hall, near Blyth, kindly lent by Lord Hastings for the meeting. It is estimated that about 1500 cyclists attended. The sermon was preached by the Bishop of Newcastle, who was formerly as noted a wheelman as he is now a pedestrian. The Bishop rarely employs wheels of any kind now if he can possibly walk The collection which was made at the conclusion of the service was double that of last year, and it was principally devoted to the Newcastle and Tynemouth Infirmaries, but at the same time the minor charities were not forgotten.

Carlisle.

On Thursday last the Mayor of Carlisle, in the presence of a large number of citizens and invited guests, laid the foundation stone of a new institution to be built by the Corporation of Carlisle, comprising a public library, museum, school of science and art, and art galleries. The cost is estimated at between £18,000 and £20,000, which has been raised partly by subscription and partly by the Corporation out of the city fund, and other resources which the Town Council happened to have available. The mechanics' institution, after an existence of sixty years, handed over their library on the adoption of the Public Libraries Act, and a fine old mansion in the city (Tullie House) has been purchased, and will, when altered, make the scheme complete.

Ambulance Work in the North

Surgeon-Major Hutton has examined an ambulance class at the Sailors' Mission, Middlesbrough, composed of seamen, rivermen, and dockmen, who have been instructed by Dr. Howell. Mr. Wayman Dixon has taken a great interest in the class from its commencement, and has given several lectures. Surgeon-Major Hutton spoke very highly of the efficiency of the class, which commenced with sixty-five members, fifteen of whom were prevented attending the examination by being called away to sea. At West Hartlepool Dr. Gourley's ambulance class was examined by Dr. Ellerton of Middlesbrough. The class includes policemen, naval reserve men, and civilians. Dr. Jepson of Durham has examined a class of railway men in ambulance work at Leamside station, near Durham.

Death of Mr. Alexander Fothergill of Darlington.

Mr. Alexander Fothergill of Darlington, a well known dentist, died last Thursday from cardiac embolism. Mr. Fothergill had reached nearly seventy years of age, and was a member of a well-known medical family at Darlington, his father being Mr. John Fothergill, well known in connexion with the Croft Spa waters and from his very long practice in Darlington as a surgeon.

I regret to hear that Mr. Young, surgeon of West Hartlepool, had a severe accident last week. While driving, one of the wheels of the trap came off, throwing the unfortunate gentleman on his back, and, together with the shaking, injuring his left leg. He was dragged some distance by the horse before he could extricate himself from the reins.

Newcastle-on-Tyne, May 30th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

The Edinburgh University Medical Staff Corps.

THIS corps has returned from its annual camp out. The camp was near Dunbar on Mr. Hamilton Ogilvy's property, and was under the command of Surgeon-Captain Hepburn. They seem to have had a very good time, in great part owing to the kindness shown them by Mr. Ogilvy, by whose orders the camp was supplied daily with wood for fuel, while the members were granted various privileges about his house and grounds. They received a cordial invitation to return next year.

Edinburgh Royal Infirmary and Lady Medical Students.

Notice has several times been taken here of questions bearing upon the admission of lady medical students to the Royal Infirmary. One of several reasons given for the enlargement of the Infirmary is that provision could then be made for their instruction in clinical medicine and surgery. The matter has come up again in a somewhat acute form by an application from the Scottish Association for the Medical Education of Women to the infirmary managers, requesting that arrangements be made for the clinical instruction of twelve women. It is well known that for various reasons the managers are anxious to accede to this request, but they necessarily felt bound to consult the staff while indicating their own strong desire to provide what was asked. At a meeting of the staff it appears that it was determined by fifteen votes to five that no arrangements could be made until the infirmary extension was carried out. It has transpired that the managers are not satisfied with this reply.

The Edinburgh City Hospital.

A report by the medical officer of health and the staff of this hospital has been laid before the authorities dealing with the necessity of reconstruction, in order to make the hospital more satisfactory for the treatment of some of the more infectious and dangerous of the diseases which are admitted into its wards. This report will doubtless receive careful consideration, and the great value of the hospital to the community has been so thoroughly established that the authorities would do well to take such steps as would remove any possibility of suspicion that patients suffering from one infectious malady were liable to contract another within the hospital. It may even be hoped that they may see their way to complete reconstruction, so that Edinburgh may have an Infectious Diseases Hospital, of which the public might be as justly proud as they are of the Royal Infirmary.

Health of Edinburgh.

The mortality last week was 82, making the death-rate 16 per 1000. Diseases of the chest caused 35 deaths, and zymotic diseases 4. The intimations for the week were—typhoid fever 2, diphtheria 1, scarlet fever 10, and measles 41.

Proposed Extension of Aberdeen City Hospital.

The Public Health Committee of Aberdeen Town Council have had before them Dr. Matthew Hay's report as to the necessity for extending the City Hospital. Dr. Hay, in his statement, said that while Aberdeen had bed accommodation in the hospital for one out of every 1300 of population,

Digitized by Google

Edinburgh had one for every 888, and Glasgow one for every 830 of population. The numbers admitted to the hospital in recent years were as follows:—In 1886. 473; 1887, 454; 1888, 167; 1889, 427; 1890, 579; and 1891, 632. The present accommodation in the hospital for patients was practically only ninety-six beds. After discussion, the matter was remitted to a small committee, in conjunction with Dr. Hay, to make full inquiry as to all modern appliances in use in epidemic hospitals, and to furnish a report on these matters as well as on the point as to how additional accommodation could be provided. The committee appointed have visited the principal fever hospitals in Scotland and the north of England, and have suggested increased accommodation for about fifty patients, but no official report has yet been issued.

Aberdeen University Students' Representative Council.

At the last meeting of this Council, the President (Mr. Ashley W. Mackintosh, M.A.) proposed the following motion, which was unanimously passed:—"That the Students' Representative Council of Aberdeen University, understanding that the Lord Rector's Assessor has given notice of a motion praying the University Court to sanction the admission of women to graduation in the said University, desires to place on record its satisfaction that the claim of women to receive a full academic training has been recognised by the Universities Commissioners, and its respectful hope that the University Court of the University of Aberdeen will see fit to open freely the doors of that University to students without respect to sex; and instructs the Secretary to communicate the terms of this resolution to the said University Court."

June 1st.

IRELAND.

(FROM OUR OWN CORRESPONDENT.)

Dinner to the President of the College of Surgeons.

MR. H. GRAY CROLY, J.P., President of the Royal College of Surgeons, was entertained to dinner at the Royal Marine Hotel, Kingston, last week, by the vice-president, Mr. Carte, J.P., and the Council of the College. The dinner was a most enjoyable one, and the toast of Mr. Croly's health as the first biennial president of the College was enthusiastically received by those present.

Proposed Testimonial to Mr. Wm. Colles, F.R.C.S.

Mr. Colles has recently resigned the secretaryship of the Royal College of Surgeons, which he has held for upwards of a quarter of a century; and in recognition of his services some of his friends held a meeting last week to carry out the necessary steps for presenting to the College of Surgeons a portrait of the late secretary. A committee has been appointed, of whom Mr. Meldon, D.L., 15, Merrion-square, is hon. secretary, and Dr. E. H. Bennett, 26, Lower Fitzwilliam-street, treasurer. Subscriptions are limited to one guinea. I learn that in addition to the names of Sir C. Cameron and Mr. Meldon, J.P., already mentioned as candidates for the post vacated by Mr. Colles, may be added that of Mr. J. Kellock Barton, ex-President of the College and Senior Surgeon to the Adelaide Hospital. The election will be held next Monday, June 6th.

Meath Hospital, Dublin.

It has been decided that the money subscribed for a memorial to the late Earl of Clonmell shall be devoted to the Meath Hospital. A ward in that institution is to be called the Clonmell ward, and one bed is to be kept exclusively for patients from the county Kildare. The Marquis of Drogheda and Mr. Percy La Touche are trustees of the fund, and a third will be appointed by the governors of the hospital.

Local Government Bill.

The Royal College of Physicians have petitioned Parliament in reference to the sanitary clauses of this Bill. They state that having carefully considered the provisions of the Local Government (Ireland) Bill, 1892, they are of opinion that Clause 12, which provides for the transfer to county councils of the powers of boards of guardians acting as rural sanitary authorities, is defective in the following particulars: in being permissive, not compulsory; that it is vague, and introduces elements of confusion into the existing sanitary organisation of the country, the exact relations of which to the proposed county councils are not specified. The College also believe that in Clause 52 an invidious distinction is drawn between the county surveyor and the medical officer of health by inference. The former officer cannot be dismissed by the County Council, who may remove at their pleasure the medical officer of health and other officers. The College, while not considering the existing sanitary organisation of Ireland to be perfect, or even satisfactory, urge that the clauses in the Local Government (Ireland) Bill now before Parliament which affect that organisation should be omitted from the Bill.

Prosecution by the Pharmaceutical Society.

At Ballybay Petty Sessions a firm of chemists and druggists were prosecuted for four breaches of the Pharmacy Act by compounding medical prescriptions. Before the case came into court the defendants admitted they had committed the offences for which they were charged, and agreed to a penalty of £5 in each case and 5 guineas costs. They also promised that for the future they would strictly observe the provisions of the Act. Fines amounting to £20 and £4 costs were then recorded and paid by the defendants.

May 31st.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Horse-itch in the Human Being.

THE polymorphism of the disease due to the burrowing under the epidermis of the female sarcoptes hominis is traditional, but even such an authority as M. Besnier avowed himself at first nonplussed by a case recently seen by him, in which the man's body was red from head to foot, covered with a confluent red miliary eruption complicated with hyperidrosis, the hands, beard, eyebrows, the nape of the neck, and a part of the scalp being, in addition, covered with a thick layer of seborrhœic crusts. The nipples were, on the contrary, normal, as were also the elbows and the armpits. The patient was a groom, and had suffered from the disease for nine weeks. After a period of very natural hesitation, M. Besnier pronounced the disease to be the itch. A well-known veterinary surgeon, M. Méguin, saw the case, and said at once that the crusty concretions were quite characteristic of scabies as found in the large ruminants, and the correctness of the diagnosis was proved on the spot by the discovery of the parasite.

Poisonous Gingerbread.

The Minister of the Interior—very appropriately named in this instance—has addressed a circular to the Prefects of Departments, calling their attention to the adulteration of the above popular confection with "tin salts" or stannous chloride. The addition of this salt, so useful in the hands of the dyer and calico-printer, allows of the utilisation of inferior flour in the manufacture of gingerbread, as also of the substitution of molasses for honey. Analyses of such gingerbread, conducted by the Comité Consultatif d'Hygiène, showed that the proportion of the salt used varied from 500 to 2000 grammes per 100 kilogrammes of flour. One pennyworth of gingerbread weighing about 200 grammes was found to contain from one to two grammes of stannous chloride. On the double ground of fraud and of danger to public health involved by the employment of this irritant poison, the inspectors of drug stores and grocery establishments have received instructions to maintain a sharp look-out for this adulteration of the delicacy so beloved of Parisian youth in the month of April, when the famous gingerbread fair is held on the Boulevard Richard Lenoir.

The Relationship between the Odour and the Toxicity of Alcohols.

M. Passy tells us[1] that researches recently conducted by him on the above subject enable him to formulate the following observations: (1) The *pouvoir odorant* of alcohols increases in a nearly constant ratio with their molecular weight; (2) a remarkable parallelism exists between the increase of toxicity and that of the *pouvoir odorant*, although the latter slightly oversteps the former as the

[1] Acad. de Méd., May 24th.

Digitized by Google

scale of alcohols ascends. This second law only holds good as far as amylic alcohol.

A Statue to Ricord.

The world owes a debt of gratitude to the man who, by his labours in the investigation of syphilitic diseases, confirmed (in 1838) Benjamin Bell's views (dating from 1793) as to the non-identity of gonorrhœa and syphilis. It was not to be expected that Ricord's name and fame would be allowed to remain unrecognised, and the Paris Municipal Council have authorised the placing of his statue on a spot in the Boulevard de Port-Royal, exactly fronting the Hôpital du Midi, the scene of his labours and teaching for thirty years. The statue, due to the chisel of M. Barrias, is now on view at the Salon. Its existence is due to the exertions of a committee who undertook the charge of a subscription raised by his pupils and friends. I last saw Ricord on the occasion of the funeral of Béclard, late Dean of the Faculty. He was then a decrepit old man, nearly bent double. Not very long after his own remains were escorted, with equal pomp, from his well known residence in the Rue de Tournon—a stone's throw from the Faculty—to their last resting-place. Some of his quaint sayings deserve to find a permanent place in treatises on the branch of medicine so intimately associated with his name. Who could forget that the lymphatic gland situated the nearest to a hard penile chancre was larger than the rest of the inguinal group when he christened it "Le Préfet de l'Ain" (*aine* = groin)? The atrophied remains of a syphilitic testis he wittily described as a "haricocèle," from its resemblance to a bean or pea. It is such little touches as these that reveal the good and successful teacher.

Paris, June 1st.

EGYPT.

(FROM OUR OWN CORRESPONDENT.)

English Language Prize Fund.

SINCE Napoleon's expedition to Egypt nearly a century ago the country has virtually been intellectually occupied by France; so that, while many adult officials talk French, there are very few who are conversant with English. But a year ago some fifty Englishmen here subscribed £170 to offer prizes to the boys in the Government schools, including the Medical College. The idea took so well that 1312 pupils competed, from twenty-three Government schools in the country, for 123 prizes, for a prize or two was offered to every class learning English. In some cases the examination was very severe, and it is highly satisfactory to report that 1074 candidates gained more than half marks, while 533 of them obtained over 75 per cent. The chief credit is of course due to the staff of recently imported English teachers, who are doing their utmost to make our language popular. There is no difficulty on the part of the students, but the movement has unfortunately aroused the active jealousy of the French, who do not seem to understand that there is nothing to prevent their offering similar prizes for proficiency in their own language.

Infectious Diseases.

There is at present a mild small-pox epidemic in six provinces, as well as in Cairo, Suez, and Damietta, numbering 104 cases altogether. Fortunately the native still remembers the scourge of serious small-pox, and therefore believes in vaccination; but the barbers who vaccinate are ignorant and careless about lymph, so that complete immunity is not always secured. Experiments are being made upon calves with the idea of starting a Government Vaccine Institute, where the operation may be well done and well taught to country barbers. At this time of year there are always some cases of typhus fever from overcrowding and underfeeding during the winter months. Now there are reported fifty-five cases from Damietta, Cairo, and Cherbine. No infectious hospital exists in the whole country, so the sick are at present isolated in tents in the desert. This is excellent so far as hygiene goes, but makes nursing and guarding the sick difficult. In the Tourah hospital, to which sick prisoners are sent, there were last month thirty typhus fever patients collected from four different prisons.

Influenza Epidemic.

For the third time influenza was introduced into Egypt from Europe by visitors last October; but no cases then occurred except in families which had been in direct communication with infected ships. The disease seemed at that time unable to spread, possibly from a limited amount of infective zones; but in December there were a few doubtful cases after fresh importation, and during January and February there was a serious outbreak among both residents and visitors. The poison was more intense than in the two previous winters, and the bacilli (?) showed a decided preference for the broncho-pneumonic form of the disease, thus differing markedly from the former epidemics. As a consequence, many Europeans were seriously ill from the complications of influenza, though there were practically no deaths. Among the natives there was for a month greatly increased mortality from lung diseases. Some of the schools, including the Medical College, had to be closed for a time. The disease travelled leisurely up the Nile, and treated the invalids massed at Luxor with great leniency. (Could this have been immunity secured by one or two previous attacks?) But in February the disease suddenly broke out at Assouan among the Egyptian troops in the well-known classical method. So many hundreds of the native soldiers were attacked that the spring manœuvres on the frontier had to be abandoned. Since the end of March influenza has not been heard of in Egypt. After an experience of three years, the third having been decidedly the worst, it seems evident that influenza runs a much milder course here than in Europe or America. The disease, as pointed out before, is entirely different to dengue, though it resembles it in contagiousness, short incubation, and other particulars. Influenza doubtless retained its hold upon the hotels in Cairo, in part owing to the carelessness of patients who refused to isolate themselves during invasion and convalescence.

The "Bosphore Egyptien."

This is a French daily paper published in Cairo, and famous for its attacks upon English officials. Seven years ago, in consequence of its hostile attitude to the Egyptian Government, it was officially suppressed; but the French Government insisted upon its rights of capitulation, and the paper has appeared ever since. One of its last exploits has been to accuse the present Premier of Egypt of having been actively concerned in the disappearance of a pacha, who is said to have been strangled by Ismail Pacha's orders several years ago. The issue of May 4th contained two editorial columns in large type, headed "Dissecting Room or Hospital?" This is an attack upon the English doctors attached to Kasr-el-Aini Hospital, and is probably written or inspired by a native medical man. The writer states that Kasr-el-Aini Hospital has been transformed into an enormous and painful field for experiments, and goes on to quote two cases where he alleges normal pregnancy was mistaken for tumours and then wrongly operated upon, occasioning the death of the patients. England is invited to send some surgeons to Egypt, instead of butchers! And it is stated that lives are daily sacrificed to surgical apprenticeship and morbid curiosity. The article winds up by begging for a denial if possible, and in any case for an inquiry into the "abominable practices" thus disclosed. Mr. Milton, who as the chief operating surgeon is the person obviously attacked, has determined, with the sanction of the Egyptian Government, to take the *Bosphore* at its word, and has brought a civil action against them for £10,000. Sympathy for Mr. Milton is felt on all sides, and it is thought that this presents a good opportunity for teaching the French press to restrain its criticisms within certain limits. It will be easy to prove in the law courts that pregnancy was diagnosed in the cases referred to, and that one of the patients is alive to this day after the removal of a huge uterine fibroma containing a fœtus of two months. The other patient died of intestinal paralysis fifteen days after removal of a dermoid tumour.

Cairo, May 17th.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, BLOOMSBURY.—The annual report for the past year is, on the whole, very satisfactory; the good work done was larger than in past years. The hospital provides 170 beds, and this number is shortly to be raised to 190; eighty pensions have been founded for incurables. The receipts for the year were £15,539, the largest amount since the hospital had been rebuilt, and since the preparation of the last account the board had been enabled to repay several loans. The number of in-patients was 839, and the attendances of out-patients had increased to 25,588.

Obituary.

PROFESSOR CESARE FEDERICI.

TUSCANY has lost her leading consultant in Dr. Cesare Federici, who died in the Villa Sardé at Maiano on Sunday last, the 29th ult. His end had been manifestly approaching for some time back; he himself anticipating it even whilst his intimate friends, who, loth to lose him, continued to hope against hope for his recovery. He retained his cheerfulness and serenity to the last, leaving behind him the clearest and fullest directions for the perpetuation of the clinical and balneological work in which he had already proved himself a master. He was born at Serravalle del Chierenti, in the province of Macerata, on Feb. 9th, 1838. The son of Dr. Francesco Federici, a local practitioner of high cultivation and professional skill, from his youth he was passionately fond of study, and both at school and university he laid solid foundations of humanistic and scientific accomplishments which afterwards stood him in excellent stead when he advanced to medical qualification. After graduation he entered on an academic career in 1870, when he filled the chair of medicine in the free University of Camerino. In the December of that year he was promoted to the professorship of clinical instruction in the University of Palermo, where, two years later, he rose to be professor extraordinary, and in October, 1873, to be professor in ordinary, of the practice of physic. By this time his fame as a consultant and teacher had spread throughout the peninsula and even beyond its frontiers, diffused as it was by numerous papers read before the various medico-chirurgical societies of Italy and by successive contingents of enthusiastic pupils who found posts in the chief professional schools. On Nov. 4th, 1883, he was nominated Professor of Clinical Medicine in the Istituto di Studi Superiori e di Perfezionamento at Florence, and more than justified the favourable anticipations with which he entered on the duties of the chair. He soon became the most popular consultant in the city and province, winning not only the respect but the devotion of his colleagues and his *clientèle* by his high proficiency in the hospital and the household, by the remarkable success of his treatment, and by the singular suavity of his disposition and address. Another post which he filled with yearly enhanced acceptance was that of Director-in-Chief of the Government baths of Montecatini, the signal efficacy of which in hepatic disorders and in passive congestions he placed before the world with clearness and cogency both by pen and speech. The growing favour with which these mineral waters are regarded, not in Italy only but throughout Europe, is due in great measure to his advocacy of them for drinking as well as bathing, his lucid and skilful directions as to the special cases in which they are indicated having been ably supplemented and reinforced by his colleagues, Drs. P. Fedeli and Casciani. The elevation of balneology, indeed, to the position it now holds in the therapeutic armoury owes not a little to him, especially in Italy, where justice is only beginning to be rendered to resources in mineral waters hardly inferior, if at all, to the best of France, Germany, and Austro-Hungary.

Dr. Federici filled many other posts besides those of clinical medicine in the Florentine School and of the official directorate of the Government baths of Montecatini. He sat on the board of the "Consiglio Superiore d'Istruzione Pubblica," of the "Consiglio Amministrativo del Regio Arcispedale di S. Maria Nuova," and of the "Consiglio Sanitario Provinciale" of Florence. He was also a member of the Florentine "Consiglio Comunale," a position where he did admirable service to city and province in all matters of education, of hygiene, and of the general advancement—moral, intellectual, and material—of Tuscany and its capital. As a consultant, not only in private practice, but also at the baths of Montecatini, he came frequently into contact with English-speaking practitioners, American as well as British, and never failed to earn their respect and gratitude by the more than professional interest he took in the cases brought before him, and by the kindly spirit of coöperation with which he received, or modified, or finally adopted suggestions in circumstances of delicacy and difficulty. His loss will be felt by brother-consultants of many another nationality besides that of Italy, and when the great International Congress of Medicine and Surgery meets in Rome in the September of 1893 there will be few whose presence will be more regretfully missed than that of the able and pleasant-mannered Tuscan physician who has all too prematurely passed away.

The funeral, which took place on Monday, the 30th ult., was a public one and in its progress from the church of Sant' Ambrogio to the cemetery was attended by all the chief dignitaries—official, municipal, and professional—of the city and province. One special characteristic dwelt upon by the orators who, *more Italiano*, pronounced eulogies over his grave was his love of country, attested by his active interest in the several struggles for its unity and independence, to which he enthusiastically dedicated the best years of his youth and early manhood.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—In addition to the list published in THE LANCET of May 7th, the following gentlemen have passed the necessary examinations, and, having conformed to the by-laws and regulations, were admitted Members of the College:—

Bobardt, Albert Otto, M.B. Melb., Putney.
Bracewell, Walter Hansford, M.B. Melb., West Norwood.
Fisher, Walter Mulrea, L.S.A., Accrington.
Harman, Albert Brice, L.S.A., Ruishton, Taunton.
Lunt, David Charles Morgan, L.K.Q.C.P.I., Edinburgh.
Porritt, William, L.K.Q.C.P.I., Huddersfield.

The above candidates have not presented themselves under the regulations of the Examining Board in England.

UNIVERSITY OF LONDON.—The following is the list of successful candidates at the recent examination for the degree of M.B.:—

First Division.—Arthur Norman Boycott, St. Thomas's Hospital; Herbert Caiger and Harry Finley, University College; Malcolm Langton Hepburn and Wilfrid Kent Hughes, St. Bartholomew's Hospital; Thomas Holmes, Percy Lord, and Alfred William Sheen, Guy's Hospital; Harry Lambert Lack, King's College; J. Herbert Parsons, B.Sc., Bristol Medical School and University College; Caroline Sturge, London School of Medicine for Women; William Howard Sturge, London Hospital; Arthur Longley Whitehead, Yorkshire College.

Second Division.—Albert James Adkins, St. Thomas's Hospital; Annie Mary Slate Anderson and Amy Sheppard, London School of Medicine and Royal Free Hospital; William John Cameron, Queen's College, Belfast; Charles John Girling and John William Frank Jewell, Guy's Hospital; Sasi Bhusan Mitra, B.Sc., and William Britain Morton, University College; William Robert Smith, King's College; William Kay Walls, Owens College and Manchester Royal Infirmary.

THE DUFFERIN FUND, BURMA BRANCH.—The fifth annual report of this branch states that during the year 1891 the objects of the Dufferin Maternity Hospital and the Training Home for Burmese Nurses and Midwives in Rangoon had been maintained. The patients and pupils showed a steady increase, and the institution had grown in favour with the Burmese and other inhabitants of the city; 131 in-patients had paid sums varying from R.1 to R.50 for treatment, the receipts from this source amounting to R.2236·13. The balance-sheet showed that R.3330·7. had been transferred to the Building Fund, which now amounts to about R.18,000, and the balance on the current account was R.1668·12.

QUEEN'S COLLEGE, BELFAST.—The prizes of the medical classes of this College for the session 1892 have been awarded as follows:—*Anatomy and Physiology:* Second Year—William Hanna, A. G. Caldwell, Robert Watt, J. A. Corbitt, M. J. Ryan, T. D. Luke. First Year—Joseph Matson, F. T. Heron, F. E. Shawe. *Practical Anatomy:* Third Year—J. J. Wallace, R. J. Mac Keown, J. A. Corbitt, A. Y. Caldwell and M. J. Ryan (equal). Dissections—R. H. Steen, Wm Hanna. Second Year—William Hunter, J. C. Adams, F. T. Heron, Robert Watt. Dissections—T. D. Luke. First Year—R. R. M'Lean, James Huston, B.A. Dissections—Alexander Burns, A. L. M'Cully. *Medicine:* W. J. J. Arnold, B.A., and T. S. Kirk, B.A (equal). *Surgery:* Second Year—W. D. Donnan and Samuel Gaun (equal). First Year—James Colville, B.A., T. S. Kirk, B.A., J. C. Rowan. *Materia Medica:* Alex. Burns, R. H. Steen, B.A., and J. F. Stewart (equal), W. J. M'Keown, Robert Watson. *Midwifery:* W. J. J. Arnold, B.A., Robert Watt, Adam Fulton, B.A., J. B. Johnson. *Practical Chemistry:* Laboratory—R. W. Bingham. Practical Class (senior division)—Alexander Burns. Practical Class (junior division)—W. A. M'Williams, F. T. Heron, and H. J. Ritchie (equal).

Digitized by Google

VACCINATION GRANT.—Mr. Peter Swales, public vaccinator, Sheerness, has been awarded the vaccination grant for the tenth time.

DIPHTHERIA.—This disease has broken out amongst the children at North Creake during the past fortnight. Of the eight cases which occurred one proved fatal. The school is closed in consequence.

A HOFMANN INSTITUTE.—The committee of the German Chemical Society, of which the late Professor Von Hofmann was president, has resolved to honour his memory by founding a "Hofmann Institute" in Berlin, to serve as a centre for efforts of all kinds in the province of scientific and practical chemistry.

EPIDEMIC OF MEASLES AT LEAMINGTON.—Sixty cases of measles had occurred up to the 30th ult. among the children of the Clapham-terrace Infants' School, Leamington, and the disease had also attacked the children of the infants' school, Leicester-street. Both schools have been closed in consequence.

IN MEMORIAM.—The Board of Management of the Salford Royal Hospital has resolved, in order to perpetuate the memory of the late Mr. Oliver Heywood's connexion with the institution, that a ward be named the "Oliver Heywood Ward," and also to erect in the entrance-hall a marble memorial tablet by private subscription.

CREMATION.—The annual report just issued (for 1891) of the Cremation Society shows that the number of cremations at Woking during the year was 99, against 54 in the previous year.—It was resolved at a meeting of the Liverpool Burial Board, held on the 26th ult., that the application of the Liverpool Crematorium Company to purchase half an acre of ground be entertained, subject to certain conditions. It was also resolved to apply to the general vestry of Liverpool for power to sell a portion of the unappropriated land for the purposes of a crematorium.

HOSPITAL FOR CONSUMPTION, BROMPTON.—The annual report for 1891 (the 51st) showed that 1774 in-patients had been admitted during the year, 13,392 new cases had received treatment as out-patients, and the attendances were 70,618 The total year's income, from all sources, was £37,395, and the expenses £27,829. Contracts had been accepted for the necessary enlargement of the chapel, undertaken as a suitable memorial of the Jubilee year of the hospital. Subscriptions amounting to £1380 towards this special object had been received, but a considerable deficit remained to be made up.

SMALL-POX.—Mr. J. W. Walker, medical officer of the Wakefield rural sanitary district, reported on the 25th ult. that since the last monthly meeting of the sanitary authority there had been thirteen cases of small-pox reported up to that time, from Lingwell Gate, Rothwell Haigh, Robin Hood, Lofthouse, Middlestown, and Crigglestone, but by the prompt measures adopted the further spread of the disease at each of the centres had been checked. It was also reported that there were cases of small-pox in the hamlet of Middlestown which had not come under the notice of the medical officer, owing to the infected persons not being attended by a medical practitioner.

PRESENTATIONS.—Dr. A. Dingwall, of Fraserburgh, has been presented with a purse of sovereigns by the members of the Fraserburgh Ambulance Association in appreciation of his valuable services to the class.—On Thursday, May 26th, Mr. O. Pemberton was entertained at dinner and presented with a large silver bowl at the Grand Hotel, Birmingham. Mr. Whitcombe occupied the chair, and there was a large gathering of medical men of the city and neighbourhood. One of the last acts of the late Sir William Bowman, whose medical education commenced at the Birmingham General Hospital, was to join in paying tribute to the esteem in which Mr. Pemberton is held. An address was presented with 130 signatories attached. It pointed out the forty years' service of Mr. Pemberton to the Birmingham General Hospital, and congratulated him on his election as coroner of Birmingham. It concludes with the words—"We are both proud and gratified that the responsibilities of such a position should have been entrusted to so eminent a member of our own profession. We wish you every happiness, and trust that you may long be spared to fill the honourable post to which you have been called, and to adorn our profession."

CENTENARIAN.—Mrs. Markham, a widow, residing at Royley, near Winterton, Lincolnshire, attained her 107th year on the 29th ult. Excepting failing sight, she retains the use of all her faculties.

BINGLEY COTTAGE HOSPITAL.—This institution has recently obtained an endowment of £3000 from Sunderland's charity, which was founded in 1671, by Samuel Sunderland of Bingley. The hospital was one of the memorials of the Queen's Jubilee. This endowment will augment the funds by about £80 per annum. The income for the past year was £376.

MEDICAL NOTES IN PARLIAMENT.

Birmingham Corporation Water Bill.

THIS Bill gave rise to several long discussions on Thursday in the House of Commons. They had reference mainly to common and fishing rights in the proposed area of supply. Mr. Chamberlain undertook that when the Bill reaches the House of Lords provisions shall be introduced to give a local inquiry with regard to certain of these rights when required by the County Councils concerned. A new clause was added to the Bill on the motion of Mr. Morton, providing that the Corporation of Birmingham shall not use any barbed wire in connexion with the proposed works.

The Gibraltar Sanitary Board.

Lord Carrington has given notice that on Thursday, June 16th, he will call attention to the recent changes in the constitution of the Sanitary Board of Gibraltar, and ask the Secretary for the Colonies (Lord Knutsford) whether he will lay the correspondence on the subject before the House.

Sale of Food and Drugs Act (1875) Amendment Bill.

A petition against this Bill from Glasgow was presented to the House of Commons on Monday.

Casual Wards in London.

The President of the Local Government Board (Mr. Ritchie) has prepared a Bill "for the provision of central stations in connexion with casual wards in London and for other purposes relating to such casual wards." It sets forth that the managers of the Metropolitan Asylum District shall provide a central station and other stations for the reception of information as to the state of accommodation in the casual wards, and speedy means of communication either by telephone, telegraph, or otherwise between the stations and the wards. They shall also, where necessary, provide for the conveyance of any person in need of accommodation in a casual ward to the ward where that accommodation can be most conveniently obtained. Where the Local Government Board by order declare that the board of guardians of any poor law union in London have failed to provide within their union such casual wards with such fittings and furniture as the Board consider necessary, they may require the Metropolitan Asylum managers to make such provision, the managers being vested with the same financial powers for this purpose as the board of guardians. The Bill also gives the boards of guardians power to transfer casual wards belonging to them to the Metropolitan Asylum managers.

Hospital Doctors and Nurses.

In the House of Lords on Monday last, Lord Sandhurst rose to call attention to a document issued by the Metropolitan Asylums Board, dated May 14th, 1892, as to the engagement of doctors and nurses for small-pox hospitals, and to ask whether the document was issued with the knowledge and sanction of the Local Government Board. He said that a circular had been received by the managers of a large general hospital with which he was connected from the Metropolitan Asylums Board, asking whether they were willing to receive clinical assistants and additional nurses, the remuneration to be limited to residence and rations. He did not think it was a good principle for a great institution like the Metropolitan Asylums Board to advertise for medical men and nurses on such conditions as this circular set forth, and he wished to know whether, if the circular was issued without the knowledge or sanction of the Local Government Board, they would communicate with the Asylums Board on the matter.—Lord Henniker said the Local Government Board were not aware of the issue of the circular letter referred to by the noble lord. They had made inquiry on the subject, and they found that the letter was addressed to several of the general hospitals in London. This, however, was not altogether a new question. As regarded the question of clinical assistants, the matter was brought under the attention of the Board so long ago as 1886. It was then proposed by the managers of the metropolitan asylum district that they should be empowered to arrange for registered medical practitioners to reside in the hospital, on condition of their making a payment at the rate of 12s. per week for board and lodging, and the payment of a fee to the medical superintendent. It appeared to the Board that this was not a desirable arrangement, and they suggested to the managers that if the services of clinical assistants were required it would be better that such assistants should be appointed by the managers as officers of the hospital, and that they should receive remuneration for their services, although such remuneration might, if the managers deemed it expedient, be limited to board and residence in the hospital. The managers would have in connexion with the hospital their regular medical staff for the treatment of cases, and the clinical assistants would no doubt render help; but the primary object in proposing the arrangement, and in the Local Government Board agreeing to it, was not that the staff of officers of the hospital should be supplemented by assistants of this character, but that means should be afforded to medical practitioners of obtaining experience in the treatment of small-pox cases. With regard to the question of nurses who were employed as probationers the Board had had no communication from the managers on the subject. But as to the nurses, also, it might be assumed that th

Digitized by Google

managers had in view the affording of opportunities for them to obtain experience with regard to cases of this disease. Of course, the managers had their own staff of nurses, quite independently of the assistance rendered by such probationary nurses. The matter, so far as regarded the nurses, was one which the Local Government Board left entirely in the discretion of the managers, and the Board would hesitate to intervene unless for very substantial reasons. The Board were not aware whether it was probable that the offer that had been made by the managers would be accepted by suitable persons, but, assuming that it was, and that the arrangement was satisfactory both to the managers and the persons who were willing to give their services on the terms referred to, the Local Government Board were not aware of any reason why it should not be carried out.—Lord Thring's remarks on this subject were inaudible to the reporters.

The Royal Commission on Vaccination.

In the House of Commons on Tuesday last Dr. Clark asked the Home Secretary whether, in view of the opinion expressed by the Royal Commission on Vaccination in their recent report, he could see his way to recommend local authorities to refrain from prosecuting until Parliament had had an opportunity of considering the before-mentioned report.—Mr. Matthews: It would be an unprecedented and an arbitrary course of conduct on my part to recommend local authorities to disregard an unrepealed law in the manner suggested by the hon. member, and I cannot see my way to adopting his suggestion.

Sale of Intoxicating Liquors to Children.

On the motion of Mr. Conybeare, leave was given to bring in a Bill to prohibit the holding out of inducements to children to visit public-houses, and the Bill was afterwards brought in and read a first time.

Drainage and Improvement of Land (Ireland) (No. 2) Bill.

This Bill was read a second time.

The Alkali Works Bill.

Sir Henry Roscoe has given notice that on the second reading of this Government Bill he will move, "That no extension of legislation for the control of the escape of noxious vapours will be satisfactory which does not bring processes evolving certain specified noxious gases under inspection and regulation."

The Health of Arabi Pasha.

In the House of Commons on Thursday Mr. J. W. Lowther was questioned as to the state of Arabi Pasha's health. In the course of his reply he stated that a Medical Commission had investigated the complaints made by Arabi, and they reported that no change had taken place in the health of the exile. He suffered from dimness of vision in the right eye. The question of the continued exile of Arabi was a matter for the Egyptian Government. The Foreign Office had no information as to a report by Dr. Vandhort certifying that Arabi was in a state of chronic invalidism.

The Police and Glove-fights.

In the House of Commons, on Thursday, a large number of questions were addressed to the Home Secretary with reference to the glove contest, at the National Sporting Club in London, between Jackson and Slavin. Mr. Matthews said that before the contest the manager of the club was cautioned by the police that he would be held responsible if any breach of the law occurred. He had requested the Public Prosecutor to consider whether there was any cause for proceedings being taken. It was not so much a question about gloves being used. There might be a prize-fight with gloves; the question was whether it was really an athletic sport, an exhibition of skill, bringing in manly strength for self-defence, or whether it was a vicious contest, with intent to do harm. The police did their utmost to put down prize-fighting, but they could not take the law into their own hands.

Medical Diary for the ensuing Week.

Monday, June 6.

ST. BARTHOLOMEW'S HOSPITAL.—Operations, 1.30 P.M., and on Tuesday, Wednesday, Friday, and Saturday at the same hour.

ROYAL LONDON OPHTHALMIC HOSPITAL, MOORFIELDS.—Operations daily at 10 A.M.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL.—Operations, 1.30 P.M., and each day at the same hour.

CHELSEA HOSPITAL FOR WOMEN.—Operations, 2.30 P.M.; Thursday, 2.30.

HOSPITAL FOR WOMEN, SOHO-SQUARE.—Operations, 2 P.M., and on Thursday at the same hour.

METROPOLITAN FREE HOSPITAL.—Operations, 2 P.M.

ROYAL ORTHOPÆDIC HOSPITAL.—Operations, 2 P.M.

CENTRAL LONDON OPHTHALMIC HOSPITAL.—Operations, 2 P.M., and each day in the week at the same hour.

UNIVERSITY COLLEGE HOSPITAL.—Ear and Throat Department, 9 A.M.; Thursday, 9 A.M.

LONDON POST-GRADUATE COURSE.—Royal London Ophthalmic Hospital: 1 P.M., Mr. W. Lang: Diseases of the Cornea.—Great Northern Central Hospital: 8 P.M., Dr. Galloway: Nervous System.—Parkes Museum (Margaret-st., W.): 4 P.M., Dr. A. Wynter Blyth: Disinfection.

Tuesday, June 7.

KING'S COLLEGE HOSPITAL.—Operations, 2 P.M.; Fridays and Saturdays at the same hour.

GUY'S HOSPITAL.—Operations, 1.30 P.M., and on Friday at the same hour. Ophthalmic Operations on Monday at 1.30 and Thursday at 2 P.M.

ST. THOMAS'S HOSPITAL.—Ophthalmic Operations, 4 P.M.; Friday, 2 P.M.

ST. MARK'S HOSPITAL.—Operations, 2 P.M.

CANCER HOSPITAL, BROMPTON.—Operations, 2 P.M.; Saturday, 2 P.M.

WESTMINSTER HOSPITAL.—Operations, 2 P.M.

WEST LONDON HOSPITAL.—Operations, 2.30 P.M.

ST. MARY'S HOSPITAL.—Operations, 1.30 P.M. Consultations, Monday, 2.30 P.M. Skin Department, Monday and Thursday, 9.30 A.M. Throat Department, Tuesdays and Fridays, 1.30 P.M. Electrotherapeutics, same day, 2 P.M.

ROYAL INSTITUTION.—3 P.M. Professor R. C. Jebb: Some Aspects of Greek Poetry.

LONDON POST-GRADUATE COURSE.—Hospital for Skin Diseases, Blackfriars: 4 P.M., Dr. Payne: The Diseases called Lichen.—Bethlem Hospital: 2 P.M., Dr. Theo. Hyslop: General Paralysis of the Insane.

ROYAL COLLEGE OF SURGEONS.—4 P.M. Prof. H. B. Robinson: Certain Diseases of the Breast.

Wednesday, June 8.

NATIONAL ORTHOPÆDIC HOSPITAL.—Operations, 10 A.M.

MIDDLESEX HOSPITAL.—Operations, 1.30 P.M.; Saturdays, 2 P.M. Obstetrical Operations, Thursdays, 2 P.M.

CHARING-CROSS HOSPITAL.—Operations, 3 P.M., and on Thursday and Friday at the same hour.

ST. THOMAS'S HOSPITAL.—Operations, 1.30 P.M.; Saturday, same hour.

LONDON HOSPITAL.—Operations, 2 P.M.; Thursday & Saturday, same hour.

ST. PETER'S HOSPITAL, COVENT-GARDEN.—Operations, 2 P.M.

SAMARITAN FREE HOSPITAL FOR WOMEN AND CHILDREN.—Operations, 2.30 P.M.

GREAT NORTHERN CENTRAL HOSPITAL.—Operations, 2 P.M.

UNIVERSITY COLLEGE HOSPITAL.—Operations, 1.30 P.M.; Skin Department, 1.45 P.M.; Saturday, 9.15 A.M.

ROYAL FREE HOSPITAL.—Operations, 2 P.M., and on Saturday.

CHILDREN'S HOSPITAL, GREAT ORMOND-STREET.—Operations, 9.30 A.M. Surgical Visits on Wednesday and Saturday at 9.15 A.M.

LONDON POST-GRADUATE COURSE.—Hospital for Consumption, Brompton: 4 P.M., Dr. R. Maguire: Pathology of Pulmonary Phthisis.—Royal London Ophthalmic Hospital: 8 P.M., Mr. J. B. Lawford: Colour Blindness.

ROYAL COLLEGE OF SURGEONS.—4 P.M. Prof. H. B. Robinson: Certain Diseases of the Breast.

Thursday, June 9.

ST. GEORGE'S HOSPITAL.—Operations, 1 P.M. Surgical Consultations, Wednesday, 1.30 P.M. Ophthalmic Operations, Friday, 1.30 P.M.

UNIVERSITY COLLEGE HOSPITAL.—Operations, 2 P.M.; Ear and Throat Department, 9 A.M.

ROYAL INSTITUTION.—3 P.M. Mr. R. G. Moulton: Faust.

LONDON POST-GRADUATE COURSE.—Hospital for Sick Children, Great Ormond-st.: 4 P.M., Dr. Arkle: Pathological Demonstration, Tuberculosis.—National Hospital for the Paralysed and Epileptic: 2 P.M., Mr. R. Brudenell Carter: Ocular Symptoms in Diseases of the Nervous System.—London Throat Hospital, Gt. Portland-st.: 8 P.M., Dr. Whistler: Laryngeal Phthisis.

BRITISH GYNÆCOLOGICAL SOCIETY (20, Hanover-sq.).—8.30 P.M. Specimens of Three Dermoid Cysts by Dr. Wm. Travers. A Discussion on Anæsthetics in Gynæcology will be opened by Dr. Dudley Buxton.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM.—8.30 P.M. Patients and Card Specimens at 8 P.M. Mr. Story (Dublin): Detachment of the Choroid.—Dr. Bronner (Bradford): (1) Recurrent Keratitis Punctata Superficialis, Symptoms aggravated by Cocaine; (2) Mercurial Deposit in the Cornea after the use of Sublimate Lotion.—Mr. Swanzy (Dublin): Primary Leuco sarcoma of Iris.—Mr. Priestley Smith: Lodgment of Metallic Particle in Retina for many months.—Mr. Griffiths: Instrument for the easier Removal of Meibomian Cysts of the Lower Eyelid.

Friday, June 10.

ROYAL SOUTH LONDON OPHTHALMIC HOSPITAL.—Operations, 2 P.M.

LONDON POST-GRADUATE COURSE.—Hospital for Consumption, Brompton: 4 P.M., Dr. R. Maguire: Pathology of Pulmonary Phthisis.—Bacteriological Laboratory, King's College: 11 A.M. to 1 P.M., Prof. Crookshank: Leprosy and Glanders (Sections).—Charing-cross Medical School: 8 P.M., Dr. Duncan: Cancer of the Uterus.

ROYAL COLLEGE OF SURGEONS.—4 P.M. Professor H. B. Robinson: Certain Diseases of the Breast.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM.—9 P.M. Bowman Lecture by Professor Leber on "The Origin of Inflammation and the Action of Phlogogenetic Substances."

ROYAL INSTITUTION.—9 P.M. Professor Dewar: Magnetic Properties of Liquid Oxygen.

Saturday, June 11.

UNIVERSITY COLLEGE HOSPITAL.—Operations, 2 P.M.; and Skin Department, 9.15 A.M.

LONDON POST-GRADUATE COURSE.—Bethlem Hospital: 11 A.M., Dr. Theo. Hyslop: General Paralysis of the Insane.

ROYAL INSTITUTION.—3 P.M. Professor H. Marshall Ward: Some Modern Discoveries in Agriculture and Forest Botany.

Notes, Short Comments, & Answers to Correspondents.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

All communications relating to the editorial business of the journal must be addressed "To the Editors."

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *to be addressed "To the Publisher."*

We cannot undertake to return MSS. not used.

"AN APPEAL."

DR. JOHN LOWE asks us to acknowledge the following subscriptions, received in support of the unfortunate practitioner (an M.D.) whose circumstances were described in a letter under the above heading in our issue of May 14th (p. 1116):—A Surgeon, 10*s.*; Amicus, 10*s.*; Dr. Watson (Pevensey), 10*s.*

Dr. Herbert R. Spencer.—The paper has received consideration, and is marked for insertion.

Mr. D. Ainley is referred to an annotation on the subject.

FILLING UP FORMS FOR INSURANCE COMPANIES.

To the Editors of THE LANCET.

SIRS,—On several occasions, after signing the ordinary death certificates, the deceased's relatives have brought me printed forms from insurance companies to be filled in by me before the policies could be paid. These forms contained a large number of searching (and perhaps useless) questions, and involved considerable trouble and responsibility; but, being entirely for the companies' use, I applied to the companies for a fee, and have always been told I must apply to the relatives of the deceased. This I did not like to do, for their expenses and troubles were quite enough without their having to pay for certificates other than those from the registrar. If I refuse to fill in these forms—and the insurance companies will not pay policies without them—I give offence to, and perhaps lose, connexions; and if I do the work without a suitable fee I consider I am encouraging the insurance companies in their already great and, it seems to me, increasing impositions on the profession. Some time ago, when I remonstrated with an insurance agent at being paid only 10*s.* 6*d.* for examining for a £200 policy, when the fee for a £500 was 21*s.*, although the questions &c. were the same for both, the explanation given was that the law compelled a certain amount of the premium to be invested, so it was impossible to increase the smaller fee. I have lately been informed that this law does not prevent a certain amount being deducted from the second or subsequent premiums to make up an adequate fee for the examination; and if this information is correct, it appears the insurance companies are determined to get their medical examinations done at the cheapest rate possible, and subsequently to obtain, *at no cost whatsoever*, additional professional evidence concerning the deaths of those they have insured, even if the forms have to be filled in by other practitioners than those that examined for the policies.

To-day a form has been sent me in which I am asked not only to give particulars of the causes of death &c., but also opinions concerning the deceased's state of health before his last illness. The latter I declined to do. Suggestions as to how to act in similar cases will be thankfully received by

Yours truly,

Ormskirk, May 20th, 1892. HENRY PILKINGTON, M.R.C.S. &c.

THE METROPOLITAN PROVIDENT MEDICAL ASSOCIATION.

Mr. C. H. Warren, the Secretary of the Association, in a courteous note, admits our chief charge that in the Bills complained of all and sundry persons and families are invited to membership, without any mention of conditions as to circumstance, means, &c. This is entirely unjustifiable. He says, indeed, that a wage limit of 30*s.* a week for single men, and 40*s.* for men with a family is enforced. Men with such wages have no difficulty in coming to terms with medical men privately. Many such pay their medical men with a regularity and a readiness that is not exceeded by richer people.

Dolens will perceive, by reference to the present issue, that his communication has not been overlooked.

THE USUAL BOND AND FRIENDLY SOCIETIES' AGREEMENTS.

To the Editors of THE LANCET.

SIRS,—In reply to your correspondent "Inigo," I beg to say that I do not think his agreement with the Society binding. The distance is too great for the consideration money, and *vice versâ*. Medical men who become identified with these medical aid associations should be exceedingly careful to ascertain beforehand the terms and conditions upon which they are engaged, for in the majority of instances it is only after three or four months of their engagement that these documents are forced on the medical officers to sign. In a purely business transaction—e.g., where a man sells his business, goodwill, &c.—purchaser binds vendor not to oppose him in any way within a given radius. Here "Inigo" will see that purchaser has paid vendor for something, and the latter agrees that in consideration of this, the money paid, he will not "set up" within the prescribed distance. Should he do so he forfeits the penalty stated in the bond, and, moreover, purchaser may (through a lawyer) apply to the county court judge for a restraining order, and restrain vendor within a month—i.e., at the next sitting of the court. Now this cannot be done in the case illustrated by "Inigo," for "Inigo" pays nothing, and has received nothing more than his salary for services rendered by him as servant to the members; the same observation holds good with the usual bond between principal and assistant. I have been assured on good legal authority that nearly all the agreements between principals and assistants are worthless for reasons above stated. A subject's liberty cannot be destroyed thus, unless he has received in consideration of the contract something more than mere wages, the worth of which he returns to his employer in work done. This is equity, the fundamental basis of legal jurisprudence, and is therefore a forcible argument. Probably this is what "Inigo" and several correspondents have alluded to previously. I know of several cases where medical officers to these societies have been shamefully treated through appending their signatures to one-sided covenants, the legality of which would have been severely denounced in a court. I have by me a copy of agreement which I keep for its novel character. Several of the clauses would suggest the medical officer to be a pronounced rogue. "Inigo's" agreement is doubtless one that would be successfully criticised in a court of equity; but as law is somewhat expensive when fought out to its limits, I would advise him to consult a barrister, plenty of whom would not charge him more than a guinea; and failing this, if I were he, and had been shabbily treated or "taken in," as several of my colleagues have, I would start practice, and let them sue in the county court for the penalty, which he need not pay, for with ten pounds (which covers all expenses) he may seek the protection of the honourable Court of Bankruptcy, by filing his petition, and putting them in the schedule. After this he may start when and where he pleases. This was done at Ashford, in the case of an institution which I believe is now defunct. The proceedings may be dubbed sharp practice, but when professional men have dealings with the class who constitute the management of these so-called Medical Aid Associations, such action often becomes imperatively necessary. May I suggest that should "Inigo" seek a barrister's help, he would kindly give us through THE LANCET the result and benefit of the consultation, as the question is very interesting, and one of great moment to a large number of the profession? The validity of the so-called usual bond might be settled once and for all. I would strongly urge every medical officer to these societies to join the Medical Defence Union, as the nature of their employment renders them particularly exposed to libel, threats, breaches of contract, &c. Trusting you will kindly give this long-vexed question publicity once more,

I am, Sirs, yours obediently,

May, 1892. AN ASSISTANT MEDICAL OFFICER.

THE USE OF PESSARIES.

To the Editors of THE LANCET.

SIRS,—Having noticed accounts of pessaries being retained for lengthened periods in the vagina, I beg to state that a patient came under my treatment recently suffering from a leucorrhœal discharge which resisted treatment. On making a vaginal examination a foreign body was found, which proved to be an ordinary vulcanite ring pessary, corroded and encrusted with the various secretions of the parts. The pessary was removed with some difficulty, owing to its having formed a deep groove for itself in the soft parts. The patient appeared unconscious of its presence in the vagina, but on being interrogated stated that she remembered something being placed there some fourteen years ago when attending the hospital.

I am, Sirs, yours faithfully,

Charrington-street, N.W., May 30th, 1892. R. J. KENNEDY.

MEDICAL ADVERTISING IN INDIA.

M. J. C. MACDIARMID, whose consulting-room is at Nos. 1. and 2, Mysore Medical Hall, Bungalore, invites public attention through an Indian newspaper, the *Spectator*, to the "very special" modern and advanced principles and treatment for infectious, contagious hereditary, endemic, and cerebro-spinal diseases, as well as septic poisons," &c. Our readers can imagine the rest. All is under the direct European professional management, and under the right honourable and distinguished patronage of the public. *Payment by results.* We commend this advertisement to the corporations who include Mr. Macdiarmid in their roll of diplomates.

L.R.C.P., L.R.C.S.Edin.—A certificate must be obtained from a teacher of vaccination. Certain of these teachers may, after satisfactory examination, give certificates to persons whom they have not themselves instructed.

Mr. Edw. F. Grün.—We would advise our correspondent to lay his facts before the Society in question.

Mr. Sidney Hersee (Chiswick).—We do not recommend practitioners.

Mr. Jas. Thompson.—The address, we believe, is Fulham.

CORONERS' INQUESTS AND FEES TO MEDICAL MEN.

To the Editors of THE LANCET.

SIRS,—On Sunday last I was called to a house near, and on arriving I found that in the absence of the family at church, and when quite alone in the basement, the cook had died, a large quantity of blood being on the floor of the kitchen and on that of a front room. I at once sent for the police, and, as life was quite extinct, returned home. Shortly afterwards a constable called upon me and asked if I could give a certificate. This I could not do, as I had not attended the woman during life, and I stated that without a further examination I could not give an opinion as to cause of death with certainty. The constable said the coroner liked to have the opinion of the medical man attending, and at his instance I again visited the house; and on the removal of much bloodstained bandage and the stocking I found, as I had previously surmised, that the hæmorrhage had proceeded from a large ulcer in the leg. I made a report to the police, which they submitted to the coroner; and he did not think it necessary to hold an inquest, as he considered that my evidence would prove death from natural causes. I wrote to him asking if he was prepared to pay my fee for the examination and report, and in answer I received the enclosed letter.

I think the case is of interest to the profession, first, as the woman was going on with her usual work, and made no complaint to her fellow servant, and yet was dead from hæmorrhage in a very few minutes, before any aid could be summoned; and, secondly, because I should like your opinion expressed as to whether I should be justified in any other case of sudden death in reserving my evidence until in the witness-box—as, if medical evidence is to be obtained and used without fee, it seems to me that the profession will greatly suffer.

I am, Sirs, your obedient servant,

Southsea, May 29th, 1892. ALBERT BENTHALL.

*** Mr. Benthall has certainly just cause of complaint. At the same time the coroner has no power to give any fee, except for evidence given on oath before him at an inquest, or for a post-mortem examination made on his order. Our correspondent does not state who called him in the first instance to the deceased woman. If it was one of her fellow servants, the master or mistress of the house would be responsible for his fee for the visit. Again, if he paid the second visit at the request of the police officer, the local police authorities should have remunerated him for this. *Fees paid by the coroner must not be considered as remuneration beyond that for giving evidence or for making post-mortem examinations.* Giving, however, every latitude to the coroner's discretionary power, it is clear that the death was sudden, and also that its cause was sufficiently unknown to demand an inquest. Assuming the correctness of our correspondent's statement that the coroner's reason for not holding an inquest was that his evidence would prove death from natural causes, it may first be observed that death from hæmorrhage from varicose veins is not a natural but an unnatural death, and, combined with its sudden character, brings it doubly within the terms of the third clause of the Coroners Act, 1887. Again, to assume beforehand what a verdict would be is begging the whole question of inquests. We would advise our correspondent in any future similar case to send the coroner a note giving the name and address of the deceased, with the necessary details and the addition that the circumstances are such as to demand an inquest. Medical men have as good, or even better, right to express this than has a coroner to express his opinion that a death from hæmorrhage was natural.—ED. L.

Anti-Tax.—If actually separated, we think the smaller tax only should be charged; but probably the passage unites both premises as one tenement.

Mr. R. H. Elliot should consult our advertising columns.

F.R.S. has not enclosed his card.

RECOVERY OF LUNACY FEES.

To the Editors of THE LANCET.

SIRS,—In the autumn of 1890 I was by a magistrate's order directed to examine and report on a patient not a pauper and not wandering at large. I subsequently (but without receiving any subpœna) gave evidence before two magistrates. Every effort has been made by the second doctor who examined the patient to recover this and other fees, but unsuccessfully, as no magistrate will sign an order, and threaten that if the matter is carried further he may lose his appointment as district medical officer. I am naturally anxious to put a stop to this state of affairs, and shall be obliged if any of your readers will say what steps I ought to take, as I do not care to apply to a magistrate until I know what steps, if any, can be taken in case the order for payment of fees is refused. The Lunacy Act makes no provision for such a case. In order to be safe, I should like to know what fee should be applied for, as the Act only mentions "reasonable remuneration." Does the interval since the examination at the end of 1890 in any way affect the recoverability of the fee?—I am, Sirs, yours faithfully,

May, 1892. RURAL.

Penang.—The following journals might be useful: Le Progrès Médical, Gazette Médicale de Paris, La Semaine Médicale (weekly); Revue de Médecine, Archives de Médecine (monthly). Each about 15*s.* to 20*s.* annually.

AN ABSTRACT OF

The Cavendish Lecture

ON

SOME POINTS IN THE ETIOLOGY OF TYPHOID FEVER.

By SIR CHARLES A. CAMERON,

EX-PRESIDENT, DIPLOMATE (HONORIS CAUSA) IN PUBLIC HEALTH, AND PROFESSOR OF CHEMISTRY AND HYGIENE, R.C.S.I.; PRESIDENT OF THE BRITISH INSTITUTE OF PUBLIC HEALTH AND OF THE IRISH MEDICAL ASSOCIATION; ETC.

MR. PRESIDENT AND GENTLEMEN,—I have selected a subject which has engaged so many pens that its literature would fill many volumes, and in relation to which it is no easy matter to make any novel contributions. There is, however, some degree of appropriateness in my choice of it from the circumstance that I am the principal health officer of a city which is more ravaged by typhoid fever than almost any other town in the United Kingdom. The results of my observation of typhoid fever in Dublin may perhaps be of some slight use in the general consideration of the causation and modes of propagation of this widespread and formidable disease.

The lecturer, after giving some statistics showing "that in Dublin typhoid fever causes a greater waste of life than in any English town except St. Helens, and in Ireland is only exceeded by Belfast," observed that Professor Notter of Netley had pointed out the marked increase of typhoid fever in the European army in India, which was all the more remarkable as the general and zymotic death-rates in that army had decreased. During the ten years ended in 1879 the deaths amongst the troops ascribed to typhoid fever were in the ratio of 2·03 per 1000; in the period 1880–85 they were 2·98 per 1000; in 1887, 3·76 per 1000; and in 1888, 3·75 per 1000 Compared with these rates the mortality caused by this disease in British cities—even in Dublin—was trivial. He said: "Typhus fever caused formerly frightful ravages in Dublin, and even within a comparatively recent period it was rather rife. If we compare the mortality produced by this disease with that attributed to typhoid fever during recent years, it will be seen that the former is rapidly dying out, whilst the latter is increasing. The lessened death-rate in our towns, and more especially the decrease in the mortality caused by the infective diseases taken as a group, are unquestionably due to the improved hygienic conditions under which the urban populations are now placed. Acts of Parliament which deal with this subject, aided by the efforts of sanitary associations, of individual sanitarians, of hygienic literature, and a more general knowledge and appreciation of the natural laws of health, are lessening decade by decade the difference between urban and rural death-rates. Typhoid fever is probably coextensive with man, but it is more prevalent in some countries than in others, and in many parts of the world, including the British Islands, it is endemic. There seems to be little doubt as to the disease being caused by a micro-organism. This organism has been found in the blood, spleen, liver, kidneys, and other organs, and in great numbers in the mesenteric glands. Whether an attack of typhoid fever can occur without an antecedent one is a question which has often been discussed, and has been answered affirmatively by one of the greatest authorities on the subject of fever, the late Dr. Murchison. The spontaneous origin of the *materies morbi* of the disease by the decomposition of fæcal matters is a theory which recent bacteriological research has, I think, completely exploded. There being a consensus of medical opinion in favour of the microbial origin of typhoid fever, the biology of the microbe comes to be a subject of great interest. There are pathogenic microbes which apparently soon perish when detached from the animals in which they have been developed, whilst others are more persistent, and the spores of many kinds long retain, like vegetable seeds, their vitality and power to develop under favourable conditions. When supplied with nutrient material, such as gelatine, potato, &c., the pathogenic microbes seem to live and multiply, from which we may infer that they may, when detached from animals become deposited by accident in dead organic matter capable of affording nourishment to them. It may, however, be reasonably assumed that the great majority of the pathogenic micro-organisms would soon perish if the animals with which they are associated ceased to exist. It is, moreover, quite certain that the microbes which produce some diseases would continue. For example, the bacillus malariæ and amœboid bodies, and no doubt the bacilli and other micro-organisms producing all kinds of intermittent fevers, have an independent existence. They are found in the soils of many districts, or rich alluvium, and in the polders and banks of rivers, especially in tropical and subtropical climates. They existed abundantly in these islands in former times, and have been got rid of by the drainage and cultivation of the soil. These organisms are clearly of the earth, but they produce specific diseases in man. Without admitting or denying the theory that there is a kind of hybrid fever—typho-malarial—intermediate between typhoid fever and ague, I am disposed to believe that in relation to their propagation there are several points of resemblance between typhoid fever and the intermittent fevers. The intimate connexion between them has been pointed out by Dr. Harley in the Lumleian Lectures for 1889. Johnston,[1] treating of Continued Fevers of the South (the United States), states that it is probably changing its character in that region, is assuming a less defined type, and a milder form. He believes that many cases of so-called malaria are really typhoid fever, and he concludes by acknowledging the existence of a typho-malarial fever. I am disposed to look very favourably upon Dr. Woodhead's theory, that all bacilli are primarily saprophytes—that is, have an independent existence apart from animals; and that they become under altered conditions pathogenic, and prey upon living tissues.[2] The saprophytes are, with perhaps the exception of the micro-organisms connected with malarial diseases, innocuous; but under certain conditions, at present not well understood, they may acquire virulence. Those eminent bacteriologists, MM. A. Rodet and G. Roux, have stated very positively that the typhoid bacillus of Eberth is merely an altered and virulent form of the bacillus coli communis described by Escherech. This assertion is a very remarkable one. Pasteur and others have shown that the 'attenuation' or degeneration of certain pathogenic microbes greatly reduce their virulence, and may even render them completely innocuous.

"According to Rodet and Roux[3] the bacillus coli communis, without losing its general botanical characters, acquires a toxic nature within the human organism, and becomes, in fact, Eberth's typhoid bacillus. The researches of Rodet and Roux seem further to show that the bacillus coli communis, which may exist in the human organism without doing injury to the latter, can become highly virulent and infective when introduced into water. Hence they conclude that not only typhoid dejections, but simple fæcal pollution of water, may produce typhoid fever in those who drink it. This view would seem to favour Murchison's pythogenic theory; but they really differ completely. In the latter it is assumed that the toxic principle of typhoid fever may originate in decomposing fæcal matter; but, according to Rodet and Roux's theory, a harmless saprophytic organism acquires by mere contact with water new and infective properties. It seems not improbable, then, that an organism which can exist for at least some weeks in earth and water is the *materies morbi* of typhoid fever. The organism may be harmless until it has undergone certain transformations in the system, or it may be immediately infective. Such an organism is clearly much nearer akin to the microbes of malarial disease than to those of such affections as gonorrhœa, typhus fever, or measles. The condition of soils or water has little relevancy to these and most other of the infective diseases; but it has a great deal to do with remittent, intermittent, and typhoid fevers—perhaps, also, with dysentery and diphtheria. The connexion between the sinking of ground water and the occurrence of typhoid fever has been investigated with great care by Professors Pettenkofer and Buhl of Munich. They found that the cases of typhoid fever increased whilst the ground water was sinking, and that they were most numerous when the water, having been unusually high,

[2] Bacteria and their Products. By German Sims Woodhead, M.D. London: Walter Scott, 1891.

[3] Comptes Rendus de la Société de Biologie, tome II., No. 7, 1890.

sunk rapidly to the lowest level. This theory has been supported by many eminent epidemiologists, and opposed by others. It holds good as applied to several German towns; but it is stated that in others no relation between the sinking of ground water and increase of typhoid fever has been noticed. In England Pettenkofer's theory has not received much support. An elaborate official report upon the prevalence of the disease in Cologne was issued in 1889. It attributes it, not to fluctuations of the underground water, but rather to the temperature and composition of the subterranean atmosphere, the proportion of bacterial life in it, and the opportunities afforded the micro-organisms to invade the atmosphere.

"Localised outbreaks of typhoid fever can frequently be directly traced to the use of a particular supply of polluted water or milk; but the widespread epidemics of this disease, and even its persistent occurrence in so many towns, must be due to some other cause or causes. For example, in Dublin it was epidemic in 1891–2 and in 1889; it appeared in all parts of the city and adjacent districts. The city and all its suburbs, with one exception, are supplied with water procured from a gathering ground twenty-six miles distant, in a mountainous region of the county of Wicklow. There are very few persons living on the drainage-shed which furnishes the Dublin pipe water, and of those few nearly all reside in a small village close to the reservoir in which the water is impounded. Last year it was asserted that a portion of the drainage of the village passed into the reservoir, but the statement was completely refuted. I believe there are few cities in the world supplied with such good water as Dublin fortunately possesses. I make this statement from the result of many careful examinations of the reservoir and its surroundings, and of hundreds of chemical and biological examinations of the water. There are very few wells now in Dublin, and only an almost infinitesimal proportion of the water drunk by the inhabitants is obtained from those sources. I dwell upon the fact that Dublin has a very pure water-supply, because, in view of the undoubted fact that typhoid fever is propagated by the medium of infected water, it is noteworthy that Dublin has almost the highest typhoid fever death-rate in the United Kingdom. The one suburb of Dublin (Rathmines township, population 27,410) which has an independent supply of water derives it also from a pure source, the gathering grounds being districts in the Dublin mountains composed of granite and silurian rocks. In Rathmines typhoid fever prevails much to the same extent as in the other townships which are placed under similar conditions as regards site and drainage.

"The street sewers in Dublin are of excellent construction, and many of the more important ones have been recently reconstructed. Unfortunately at present they deliver their contents into a tidal river (the Liffey) which bisects the city. The mouths of the sewers are provided with valvular gates, which close and open as the tide in the river rises and falls. Some of the sewers are sealed up for the greater part of the twenty-four hours, and consequently their contents accumulate, and have to be in part removed by the usual methods of pumping them up to a higher level, whence they are run into the river. The sewers are provided with the usual ventilators, which allow a free communication between the street air and the sewers. It will be seen, then, that Dublin is a low-lying city. The floors of the basement storeys of houses are not above the level of the highest tides, and some are actually below it. It is evident, then, that the soils, subsoils, and rocks in the low-lying districts of the city have but a poor natural drainage, and that for a large portion of the day drainage is altogether suspended, except from the more elevated parts of the city, in the lower. There is much stagnation of the water in the ground. A railway which, passing over the Liffey, connects the Dublin and Kingstown Railway with the Great Northern Railway, has recently been constructed. In sinking for foundations for the many bridges required by this line, a good opportunity for examining the nature of the subsoils and rock was afforded. I took advantage of it. I found that near the river the deep-lying gravel was more or less filled up with mud, which often possessed an offensive odour, and even evolved sulphuretted hydrogen gas. The water taken from the excavations was loaded with organic matter, and literally teemed with micro-organisms. Fraenkel found a similar condition of things in the soil of Berlin, near the Spree. On the whole, the distribution of typhoid fever in the suburbs resembles that described for the city. There is not much of the gravel in Clontarf, but upon it most of the cases in the district occur. The rate is as high as in the city, whilst the general and zymotic death-rates are lower. In our report to the War Office on the sanitary condition of the Royal Barracks, Dublin, Dr. Grimshaw, Registrar-General, and myself pointed out that typhoid fever prevailed where the gravel existed."

The lecturer then indicated the different localities on the map where the fever prevailed, and showed that many were scarcely above sea level. Continuing, he said,

"Dublin is a city with an undue amount of typhoid fever in it. It is supplied with pure water drawn from a distant source. Its local wells have fallen into disuse. Its street sewers are as good as those in the English towns. Like other places, its milk-supplies may be now and then infected with typhoid poison. The prevalence of typhoid fever in Dublin in 1889 and 1891–2 was by many persons attributed to the consumption of oysters, and for a time so great was this oyster scare that the sale of the molluse nearly died out. In Belfast the same idea prevailed, but not so generally. I have repeatedly detected sewage in oysters taken from the shores of Dublin Bay. Oysters, cockles, mussels, and other lamellibranchiate molluscs are often eaten uncooked, and their shells enclose a liquid which is also often drank raw. Although oysters, when deserted by the tide, usually keep their valves closed, they do not invariably do so, and therefore at low water sewage trickling down the shore is likely to find its way into the interior of the oyster and other shell fish. I would prefer having my oysters taken from the lonely coasts of Clare and Kerry than from the estuaries of rivers which receive the filth of large towns. It is possible that vegetables taken from an infected soil might be the vehicle of the disease. Salad, radishes, and other esculents are often brought into the house without having been separated from the soil in which they have been grown. It might happen that, if eaten without being perfectly washed, they might introduce the microbe of typhoid fever into the body. Although infected food may cause cases of typhoid fever in Dublin, it is not probable that they are more numerous there than elsewhere; we must therefore look for some other more common source of the disease than infected water, milk, and other foods. Of course, the house drains may be blamed for the prevalence of the disease. I examine, or cause to be examined, the sanitary condition of the houses in which it occurs; in a large proportion of them defects are detected, the traps are out of order, the drains are choked up with fat or other obstruction, or they may consist of rubble—in short, the usual sanitary defects found in so many houses when carefully overhauled are detected in nearly half of the houses examined. On the other hand, the disease constantly makes its appearance in houses where no defects can be detected, where the 'smoke test' shows no leak of drain or defect of trap, where the waterclosets are of the most recent construction and in good working order, and where the water is taken direct from high-pressure taps.

"It is admitted that there has been a great improvement during recent years in the construction of house drains, and the old 'built' sewers have been all but completely replaced by earthenware pipes laid in cement. As I have already stated, the zymotic death-rate has greatly declined, but still typhoid fever more than holds its own. I can only account for this by assuming that the microbes of the disease have established themselves in the soil, that they multiply therein, and that they issue occasionally from it into the atmosphere, which, consequently, becomes infected. It is only in this way that we can reasonably account for the periodic character of the disease, for its seasonal intensity, for its epidemics. It may be said as against this view that we have epidemics of small-pox, scarlet fever, measles, and so on; but these diseases are directly communicable from person to person, whereas that is not the case with typhoid fever. The waterclosets, house drains, and street sewers do not vary much from year to year, and when they do vary it is generally because they are improved. In the soil therefore we must look for the cause of the endemicity of typhoid fever in Dublin and in other places. This theory is greatly strengthened by the fact that the porous soils are to a much greater extent likely to be the habitat of the disease than the stiff clays. The conditions of existence to all kinds of organisms are more favourable in loose soils than in adhesive dense clays, in which air cannot freely circulate. The action of strong winds and the rising and sinking of underground water

Digitized by Google

more readily cause movements of air in gravels and loose soils than in clays; and the escape of microbes from the former under such circumstances must the more freely occur. The streets of Dublin have lately been to a large extent paved with stone setts, which circumstance may, perhaps, account to some extent for the increase of typhoid fever. The underground air cannot now diffuse into the atmosphere over the roadway, and therefore may be drawn in larger quantities into the houses, the basement floors of which are rarely concreted. Hoffman[4] has pointed out that there is in porous soils what he terms a superficial zone of evaporation, in which the moisture varies from saturation to zero. In the hot summer weather the zone is considerable in extent, and when rain descends on it, after a period of heat and drought, it is often capable of retaining the whole of the latter without its lower border becoming wet. In such there is always a dry layer between the surface part, which is temporarily wetted by the rain, and the deeper strata in which the water lies. Under these conditions the impurities which reach the soil become deposited in the dry zone; under this zone is situated a layer which is always wet. When the upper zone is filled with rain the amount of water in the second zone remains constant, for any excess which it may receive passes down into the third zone, or that of the underground water. If the typhoid bacillus exists in the first zone, it must alternately be immersed in water and in air. In the former case it remains in the soil, in the latter it may be transported to the atmosphere by air currents. The deeper the ground water sinks the greater will be the extent of the zone in which the movements of organisms can take place; but even whilst the ground water is sinking the outermost layer of soil may be kept moist by slight and long-continued rain. In this case, however large the dry zone, none of its organisms would escape from it into the air. I admit that the chances of detaching micro-organisms from most surfaces are slight, but it must occur now and again. Those of typhoid fever have not, I believe, been detected yet in the atmosphere, but pus organisms and the microbes of diphtheria have.

"It is to the bacteriologist that we must look for the proofs that several forms of microbes are concerned in the production of the typhoid diseases. At present they are not agreed as to the actual form of the typhoid microbes. Letzerich has described them as consisting of micrococci, either isolated in colonies or in chains, very dissimilar to those of diphtheria and infectious pneumonia, but which by cultivation reach a size twice or thrice greater than the micrococci of the last-mentioned disease. On the other hand, Klebs describes the bacillus typhosus as large-sized filaments of 50 micro-millimetres in length and 0·2 micro-millimetres in breadth, without segments or ramifications. As typhoid fever presents considerable diversity, not only in individual cases but in its epidemics, it is only reasonable to suppose a similar variety in the microbes which produce it. This may account for the somewhat conflicting accounts which bacteriologists have given in reference to the micro-organisms found associated with the disease.

"The means which we must use in order to eliminate typhoid fever or lessen its ravages are numerous, and on the whole costly, and all directly or indirectly relate to the ground. A supply of pure water is absolutely necessary. The disease is propagated by means of water, but that which we use is gathered from the ground, and consequently from the latter it derives its pathogenic organisms. London is a city in which the water carriage of excreta is general, but it is fairly free from typhoid fever. Bolton, Preston, Salford, and other towns where waterclosets are few, have excessive typhoid fever death-rates. I attribute the prevalence of typhoid fever in Dublin to the system of storing excreta in pits, generally having a mere clay bottom. This practice, continued for centuries, has ultimately caused the soils to become impregnated with filth and its organisms. The development and retention of those organisms are favoured by the circumstances that subsoil drainage of a large part of the city is very defective, and I attribute in part to this condition of the soil the undue amount of typhoid fever to which I have so often referred. I look to its thorough drainage and its freedom from pollution as the two important means of lessening the amount of typhoid poison in it. As the microbes can only escape when the outer layer of soil is dry, it is well to prevent dust rising from the roadways, by having the latter well watered in hot and dry weather. A most important preventive measure is to keep the soil from pollution by fæcal matter, or any kind of organic matter, upon which microbes could develop. We should be as careful not to pollute our ground as our air. I am convinced that typhoid fever is often caused by underground air entering our dwellings. This may be to a great extent prevented by having even the thinnest layer of asphalte or allied material covering the whole of the site upon which the house rests. No air or moisture can pass through such a layer. As microbes are most abundant in the upper layers of soil, the water from superficial wells should not be drank. The fact that typhoid fever is the one zymotic almost equally fatal in town and country may be due to the use of water from very shallow wells by the rural population. The lower the well the more likely is its water to be free from microbes. I found in a very deep well that two kinds of water were present; near the bottom it was hard and comparatively free from bacteriological life; near the top it was soft, loaded with organic matter, and teeming with micro-organisms."[5]

Lectures
ON THE
OPERATIVE TREATMENT OF ENLARGEMENT OF THE PROSTATE.

By C. W. MANSELL MOULLIN, F.R.C.S. &c.,
SURGEON TO THE LONDON HOSPITAL.

LECTURE II.[1]

THE operations that have been performed for the relief of prostatic retention may be divided into palliative and radical. The former do not require mention, except in so far as they provide a standard by which the others are to be judged. Supra-pubic tapping and perineal drainage are the simplest. Supra-pubic cystotomy with the same object was performed by Sir H. Thompson as long ago as 1869. Recently McGuire of Richmond has modified the operation by making the fistula run obliquely from the bladder to the upper end of the cutaneous incision; and Morris of New York has still further improved upon this by lining the channel with two flaps of skin transplanted into it from the sides. In some instances the patient appears to have been able to dispense with a permanent drainage-tube, and has managed fairly well by passing a catheter down the new route occasionally, and in a few even this has not been necessary. Bennett May has shown that where there is a large intra-vesical growth a supra-pubic drainage-tube cannot be borne, owing to the irritation it causes; but in other cases there is no doubt a very fair degree of comfort may be obtained in this way, and many patients are exceedingly enthusiastic about it, but their praise is rather discounted by comparison with the misery they were suffering before. Of radical operations there is a great variety, not all of them deserving the name. Iodine, ergotine, and other substances have been injected into the gland itself, but the practice is not without danger, and it has not been shown that any permanent benefit has been derived from it. Galvanism and electricity have been employed in many ways. Newman of New York speaks very highly of superficial cauterisation of a mucous membrane by means of instantaneous flashes of the galvano-cautery. Biedert first, and later Casper and Roux, claim to have effected some reduction in size by introducing the negative pole of a battery through the wall of the rectum into the substance of the gland. Casper made use of a current of twenty milliampères and prolonged the sitting for fifteen minutes, changing the position of the needle from time to time. Roux used a much stronger current, so that there was severe pain. Biedert found great improvement in one out of five. Casper claims to have cured two out of four, but the amount of residual urine was very considerable still, and in one

[1] Delivered at the Royal College of Surgeons of England on June 1st, 1892.

Digitized by Google

there was a rectal fistula. Of Roux's six patients one did not return, one was under treatment still, and in four there was a sensible diminution. Many sittings, however, were required; other treatment was employed at the same time; and no evidence is brought forward to show how far the improvement was due to the electric current. Reduction in size has often been noted after simple puncture.

Penile operations.—Gouley of New York has recently revived Mercier's method of incising the prostate or punching out pieces from it with a prostatectotome, through the urethra, using an instrument which differs chiefly from Mercier's in the greater inclination of the back of the male blade to the shaft (so that it rides more easily over the obstruction), and in the edge being flattened instead of sharp. He finally expresses himself, however, as in favour of the perineal route; and as part of the after-treatment consists in introducing a catheter every day for the sake of irrigating the bladder and maintaining the patency of the opening, it is difficult to see where the benefit lies. Four cases operated upon in this way by Swinford Edwards all relapsed within a few months; and in two in which the operation was repeated the period of relief was shorter the second time than it was the first. Bottini makes use of the galvano-cautery, applying it by means of a special instrument directly to the obstructing mass. According to the latest account he has operated upon seventy-seven cases in all. Of these two died (it is only fair to say they were among the earliest), in twelve there was no result, in eleven some improvement, and in fifty-two complete cure. In addition to these a few cases have been operated upon in England by Bruce Clarke and Harry Fenwick. Unhappily, no definite account as to the condition of the bladder before and after the operation accompanies any of these statistics; it is merely stated that the residual urine ceased to collect, or was very greatly reduced in amount—a result which is not uncommon for a time, without any operation, in patients who have previously neglected themselves. On the whole, it seems more satisfactory than Mercier's, and it is not so likely to be attended by hæmorrhage (which has been known to prove fatal on more than one occasion), but it shares with it the very grave disadvantage of being performed altogether in the dark, without any exact knowledge about the size, shape, or position of the obstruction. It is useless for advanced disease; or if the lateral lobes are enlarged or if the growth projects upwards into the bladder, the form which, above all others, causes the most distressing symptoms. If the obstruction is confined to the posterior wall of the urethra, just at the neck of the bladder, and has not caused thickening of the lateral lobes or elongation of the canal, it can be dealt with in this way, so far as immediate removal is concerned, provided, that is to say, the condition is diagnosed and the symptoms are sufficiently severe to require it—a combination which is not usual; but even if the immediate result is successful, it is very doubtful if the improvement would be permanent. For a cure to be lasting either the glandular tissue that is left must undergo fibroid transformation and cease to spread, or the amount removed must be sufficient to leave a channel too wide and too capacious to be closed by any ordinary form of overgrowth.

Prostatectomy in the course of lithotomy.—The number of cases in which portions of the prostate have been removed is very large; in most it has been accidental, a pedunculated median lobe being caught in the angle between the blades of the forceps and torn away, or a rounded mass shelling out from its bed under the pressure of the finger. In others, however, it has been done of set purpose after exploration with the finger. More rarely the lateral lobes have been torn away as in Dittel's case, in which, while extricating a calculus by the median route, at the third attempt he pulled out both, together with a stone. In a few of these cases there was permanent improvement in micturition, notably in Landerer's, in which the patient was enabled to dispense with the use of a catheter, which before had been necessary; and none seem to have been in any way the worse; but in the majority there was no difference one way or the other. Nor is this to be wondered at. In nearly all the part removed was either a pedunculated median growth or an isolated tumour that was accidentally exposed and sometimes divided by the lateral incision; but it is quite the exception to find either of these conditions developed sufficiently to act as an obstruction without at the same time great modification in the rest of the gland. It is true, as Thompson suggests in the account that he gives of his own four cases, that the muscular coat of the bladder may never have recovered, but certainly in most it never had the chance; the whole, or even the greater part, of the obstacle was not removed.

Perineal prostatotomy and prostatectomy.—The perineal operation consists in opening the urethra at the apex of the prostate, exploring the canal from the interior, and then dealing with the obstruction according to what is found. It may be divided and split open, or transfixed and excised. Isolated growths may be shelled out; sessile portions may be punched out with a prostatectotome, or the galvano-cautery may be used. It is plain at the first glance that this method must be much more thorough than the penile, but it is equally clear that it must fail in the majority of cases. The anatomy of the part is against it. A small pedunculated median lobe can be removed, or a V-shaped channel punched out; but this is the limit, and cases that require operation and present no more serious obstruction than this are few and far between. Nothing can be done for the lateral lobes; vesical growths, which often cause as much irritation as phosphatic calculi, are quite out of reach; and a median lobe of any size requires such an amount of manipulation (especially as in these cases the urethra is usually compressed into a slit) that the tissues around would be bruised and crushed beyond recovery. In one case that was under my care a fatal result followed ten weeks after the operation from this cause; the wound was never repaired, the cavity could not contract, the walls remained covered with sloughing shreds, and the patient sank from exhaustion. Not only the width but the length of the urethra is against it. If the neck of the bladder is distant more than three inches from the perineum, the finger cannot reach into it to explore it. So long as the perineum is soft and yielding an extra half inch can be gained by passing a sound through the wound by the side of the finger, hooking it against the trigone and pulling it down; but if the increased distance is due to fat in the perineum or to overgrowth of the lateral lobes this is of no avail. Watson, in his monograph on the operative treatment of the hypertrophied prostate, states that out of thirty specimens taken from a museum, he would have failed to reach the bladder in one third. McGill put the proportion, and I believe correctly, very much higher. According to him, in only three out of his first twelve cases would it have been possible to remove satisfactorily the projecting portion of the prostate by the perineal route.

Results.—Excluding those cases in which portions of the prostate were removed during lithotomy (though as none of them proved fatal, they would tend very considerably to lower the death-rate), I have been able to collect particulars of thirty-eight cases. Of these, three died—one, eighty years of age, from uræmia on the third day; a second, from either iodoform poisoning or uræmia on the tenth day; and the third, the one I have already mentioned under my own care, from exhaustion and secondary hæmorrhage in the tenth week. Of the rest, in one case the operation was not completed, and in another there is no note as to the final condition. Seventeen are described as cured, and sixteen as benefited or improved. These results, however, are capable of further analysis. Simple incision in the median line behind seems almost as useless as the urethral operation, and for the same reason. The few cases that have derived any benefit from it probably owe it to the congestion having subsided. Prolonged drainage after division, as recommended by Harrison, is much more satisfactory. It cannot act simply by mechanical dilatation; probably the more or less friable tissue of the prostate undergoes disintegration around it and then slowly heals over so as to leave a canal of greater width; but undoubtedly it greatly increases the chance of success. Of the eleven cases in which it is expressly mentioned, six are returned as cured and two as much improved. Two, however, were distinct failures; a third was very little benefited, and in one of the successful ones a small fistula persisted. Leaving this aside, however, the cause of the failure is of some importance; it is not now recurrence of the obstruction, but decline in the expulsive power of the bladder; the route was opened, and remained so, but the muscular coat was damaged beyond recovery. The fault this time was not in the operation, but in the operation having been delayed too long. Perineal prostatectomy has better results still. Of fourteen cases two (those already mentioned) died;

Digitized by Google

one was a complete failure, the growth springing from the anterior wall of the urethra and reaching into the bladder (it was subsequently removed by the supra-pubic method with complete success), and the remaining eleven were practically cured. One, it is true, suffered from a small perineal fistula afterwards; but as he was eighty years of age, and was relieved by the operation both from the hæmaturia and the frequent and painful micturition which he had endured for years, the result cannot, I think, be considered a bad one. One other could not empty his bladder thoroughly, although his condition was so far improved that incessant dribbling was replaced by voluntary urination at intervals of three or four hours. But these were the only exceptions. Occasionally, but not nearly so often as is usually believed, a small median outgrowth is found acting like a valve. Complete retention comes on suddenly in an old man who has not been conscious previously of any serious urinary trouble. A catheter can be introduced without difficulty, showing that there is no congestion, but not a drop of urine can be passed without its use. Such instances are rare, but they do occur, and they can be diagnosed. One such I have met with myself, and the result of removal of the growth through the perineum was most successful. Sometimes, too, the enlargement is so shaped that a wedge can be excised or punched out, or even burnt away from the posterior lip; and occasionally both these conditions are met with in the same subject, but this I believe to be the limit for the perineal operation. If the lateral lobes are much enlarged, either the urethra is compressed into a slit or so elongated that the finger cannot reach the bladder. Vesical growths are quite out of reach, and masses of any size, even if they are pedunculated, cannot be extracted without inflicting a most injurious amount of bruising. Of the fourteen prostatectomies I have been able to collect, certainly one of the two deaths, and one failure, must be put down to the fact that the method adopted was unsuitable.

Dittel's operation, or lateral prostatectomy.—The difficulty of dealing with the lateral lobes through the prostatic urethra, which is practically inoperable, has given rise to another method which, although it is not likely to meet with general acceptance, deserves mention, as it has been practised with some success by Küster. It was first devised by Dittel, who, however, only tried it upon a dead subject, and it consists in excising a wedge-shaped piece from the under or posterior surface of each lateral lobe with the view of making their inner surfaces recede from each other and leave the urethra open. The patient may be placed either in the prone or the lateral lithotomy position. The bladder is emptied, a catheter tied in, and the rectum filled to establish its position and avoid injury. The external incision is carried from the tip of the coccyx around the sphincter ani, on one side, laying open the ischio-rectal fossa. The rectum is separated from the right lobe of the prostate, and the latter carefully exposed. A little farther dissection beyond the middle line enables the same thing to be done upon the other side; and then as soon as the bleeding has ceased and a good view can be obtained a wedge-shaped piece is removed from each. This was proved by actual demonstration on the dead subject to be capable of relieving prostatic obstruction when due to increased thickness of the lateral lobes: it allows their urethral surfaces to fall apart and restores the shape of the canal, which is practically flattened into a narrow slit. Küster has performed this operation upon three occasions with a certain measure of success. In one only was there much bleeding; but in one the membranous part of the urethra was opened unintentionally, and in one the vesicula seminalis of the left side was cut into. In two instances (in both of which the urethra was opened during the operation) fistulæ persisted, though in one it is true that the opening was very small; and in one the residual urine still amounted to 50 cc. As the lateral lobes can in general be dealt with quite as well, if not better, from the interior of the bladder, it is not likely Dittel's operation will be frequently required, though now and then a case may occur in which supra-pubic prostatectomy is indicated, but is practically impossible owing to the small size of the bladder and the rigid character of the walls; but it is of interest as showing the great importance attached by him and Küster to the usually neglected lateral lobes, and the necessity, if the operation is to be a radical one, for dealing with them thoroughly.

INTRAVENOUS INJECTION OF "NORMAL" SALT SOLUTION FOR THE GRAVE HÆMORRHAGES OF MIDWIFERY.

By HERBERT R. SPENCER, M.D., B.S. LOND., &c.,
ASSISTANT PROFESSOR OF MIDWIFERY IN UNIVERSITY COLLEGE, LONDON, ASSISTANT OBSTETRIC PHYSICIAN TO UNIVERSITY COLLEGE HOSPITAL.

THIS paper is an account of eight cases in which "normal" salt solution has been injected into the veins for the treatment of grave hæmorrhage unrelieved by ordinary remedies. The cases occurred amongst 10,000 labours attended in the out-door maternity of University College Hospital from July 1st, 1887, until Jan. 11th, 1892. They are the only cases amongst that number in which the operation has been performed, and they include all cases of death from hæmorrhage—with or without injury to the parturient canal, "exhaustion," "syncope," or "shock"—with the exception of four patients who died either unexpectedly or before I could be summoned.[1] I was led to inject "normal" salt solution in quantity for the treatment of hæmorrhage in 1888 by a conversation with my friend and colleague, Dr. J. Rose Bradford, who informed me of the very large quantities which had been successfully injected into animals by physiologists, and by the fact that small quantities had already been injected by some of the staff of University College Hospital, although, I believe, without success. I was till a few weeks ago unaware that the treatment had been previously employed for hæmorrhage in the human subject, but find that Landerer,[2] on July 10th, 1881, injected a litre of normal salt solution into the veins of a patient aged seventy-one, suffering from shock and hæmorrhage after amputation of the thigh. The patient temporarily improved and recovered consciousness, but died an hour later. On Oct. 8th, 1881, Bischoff[3] successfully treated a case of post-partum hæmorrhage by injecting 1250 cc. of normal salt solution into the radial artery. Recently cases have been published by Hermann Thomson,[4] Mr. W. H. Brown,[5] Mr. Arbuthnot Lane,[6] and others. The literature of the subject of intravenous injection of "normal" salt solution, which, on the experimental side, is somewhat copious, may be found quoted in the references I have given. It is right here to remark that to Goltz[7] is due the credit of showing that the cause of death from hæmorrhage lay, not in the loss of corpuscles or hæmoglobin, but in the loss of fluid and the consequent incomplete filling of the heart, and that as long as the blood could be kept moving by injection of fluid life could be saved. Kronecker and Sander[8] were, I believe, the first to suggest the injection of normal salt solution for this purpose in animals. I trust that the following cases will afford evidence of the value of the treatment in hæmorrhage in the human subject:—

CASE 1. *Multipara; adherent placenta; severe post partum hæmorrhage; fetid ischio-rectal abscess at time of labour; transfusion of thirty ounces of saline fluid; recovery.*—On April 24th, 1888, I was called by my assistant, Mr. L. de Chazal, to a case of severe post-partum hæmorrhage. The following are the notes of the case. Mrs. G——, aged thirty-seven, is naturally a strong plethoric woman. She has had five children and one miscarriage. Five years ago she was attended at University College Hospital for placenta prævia. Three years ago she nearly lost her life from post-partum hæmorrhage caused by an adherent placenta. She has since had a child normally. In the present pregnancy her only complaint was that she had not been able to sit down without pain for the past month. The present labour was normal in the first and second

[1] The cause of death in these four cases was—1. Accidental and post-partum hæmorrhage; the patient, thought to have safely recovered, died suddenly of syncope. 2. Post-partum hæmorrhage (one pint); the patient, thought to have safely recovered, died suddenly of syncope. 3. Accidental and post-partum hæmorrhage (same patient as Case 4 in the paper); died before I could be summoned. 4. Perforating laceration of cervix, with hæmatoma of the broad ligament; patient died before I could be summoned.

Digitized by Google

stages, which were over in four hours. Directly after the birth of the child blood poured out with gushes in considerable quantity. As expression of the placenta could not be performed by the student, he (against regulations) gave a drachm of liquid extract of ergot and summoned the obstetric assistant, who arrived an hour and a quarter after the birth of the child. Attempts to remove the placenta had meanwhile been made by the student and a neighbouring practitioner, but without success, and the patient had during this time lost an enormous quantity of blood, which filled a chamber-utensil and soaked through the sheets and mattress. On the arrival of the obstetric assistant the patient was in a very grave condition, extremely blanched, the pulse very small and compressible, beating at the rate of 140 to the minute, but at times it could not be felt. The patient was extremely restless and faint, complained of nausea and retching, but did not vomit, was constantly throwing her arms about and wanting to change her position and to get fresh air, and yawned frequently. The pupils were moderately dilated, and she could see well; there were no noises in the ears; the mouth felt dry, and the patient craved for drink; the tongue was moist. Part of the placenta was found lying in the vagina, and the rest was removed by the hand, except a portion as big as a crown piece, which was very firmly adherent. The patient during this manipulation lost a small amount of blood, and as it was feared she was dying, no further attempt was made to remove the remaining portion. An intra-uterine injection of iodine solution having been given, I was summoned. On my arrival, four hours after the birth of the child, in addition to raising the limbs, hypodermic injections of ether and drachm doses of brandy had been administered every few minutes. The pulse was, as nearly as could be counted, 140 to the minute; but for a few seconds at a time it was quite imperceptible, and at best it could but just be felt. Within a quarter of an hour of my arrival the patient's condition got even worse. She began to get drowsy, answering only when addressed in a loud voice; the heart apex beat could not be felt, and the pulse was as bad as possible. I considered that the patient would die unless transfusion were performed. I therefore opened the right median basilic vein (the patient not feeling the operation) and injected thirty ounces of normal saline fluid at a temperature of 104° F. Two minutes after the fluid had begun to flow the pulse was felt to be stronger. As the flow continued the patient roused up, and she felt better and not so faint. The radial pulse could be *seen* beating; and at 12.50 P.M., when all the fluid had been injected, about fifteen minutes after the commencement of the operation, the pulse was regular, of normal size and fair strength, and 110 to the minute. Some colour had appeared in the patient's lips. All her symptoms definitely ceased, and she said she felt well and comfortable. At 1.15 P.M. the pulse was 110; at 1.30, 100; at 8 P.M. it rose to 120, but was not very compressible, and all the beats could be felt, and the patient was cheerful and comfortable. Ten hours after the operation half a pint of urine was drawn off and examined by my colleague, Dr. J. R. Bradford, and found to be normal and free from hæmoglobin. On April 25th, at 9 A.M., the patient had a rigor. I found an ischio-rectal abscess, from which I let out about three ounces of fetid pus, and after disinfecting with chloride of zinc solution dusted with iodoform. Next day I removed the adherent piece of placenta without an anæsthetic. The patient had slight fever during the puerperium, the highest temperature being 102·6° on the fourth day; it was practically normal on the eleventh day. She made an excellent recovery, although she remained pale for two or three months. The patient menstruated regularly from September, 1888, till February, 1890, when the courses ceased. She was in good health, and had a good colour when seen on Feb. 4th, 1892 This is, so far as I know, the first successful case of intravenous injection of normal saline fluid for hæmorrhage.

CASE 2. *Accidental hæmorrhage; transfusion; recovery; relapse; a second transfusion; recovery.*—Mrs. K——, aged thirty, multipara. On July 1st, 1888, at 1 A.M., the patient, who was nearly at the full term of pregnancy, suddenly lost a large quantity of blood from the vagina, and fainted several times in succession. She had not strained or injured herself to her knowledge. On the arrival of the obstetric assistant, at 1.30, the patient was pale, but the lips not blanched. She had just recovered from a fit of unconsciousness, in which she had been throwing herself about. The pulse was about 90 to 100, full and soft. The clothes were saturated with blood. She appeared to have lost from one to two pints. Bleeding had then stopped. The os was the size of half a crown; the head presented; the membranes were intact; no placenta could be felt. The membranes were at once ruptured and one drachm of ergot was given. Profuse hæmorrhage now occurred, and after an unsuccessful attempt at version the os was dilated by bags and the forceps applied, and a dead child delivered. The placenta was expressed, together with a moderate amount of blood and clots. The continuous hæmorrhage during the above manipulations had greatly depressed the patient, who had become extremely blanched, the lips being of an ashen hue; the pulse rose in frequency to 150 or 160, and gradually diminished in force till it was quite imperceptible, and the patient became unconscious, with insensitive conjunctiva and moderately dilated pupils; the heart sounds could only just be heard. This state of the patient had been reached by a steady downward progress, and in spite of the employment of all the usual remedies. On my arrival, at 3 A.M., I did not think the patient had five minutes to live. I at once opened the right median basilic vein, and in twenty minutes transfused thirty ounces of saline fluid. The patient was completely unconscious, and did not move when the incision was made. After ten ounces had been injected she recovered consciousness, expressed herself as feeling better, and conversed rationally. The pulse, from being extremely frequent and finally imperceptible before the operation, rapidly improved in force and volume, and stood at 110 at the end of the operation (3.20 A.M.). Dr. Deanesly watched the patient till 10.30 A.M., and took notes of the pulse every few minutes. During the last hour or two of this time the patient's condition again became grave, the pulse rising in frequency and failing in strength, so that at 10.30 A.M. it was almost imperceptible. I decided to repeat the transfusion in the other arm, and injected thirty ounces into the left median basilic vein. After this the pulse became stronger and steadier, and the patient looked and felt better. In the after progress the highest temperature was 101·2° on July 5th and 8th; on the 10th it was normal, and remained so. The patient remained anæmic for two or three months, but was able to get about. She was seen by me about two years afterwards in robust health. On Feb. 4th, 1890, she had a miscarriage at four months and a half, when she lost a good deal of blood. The hæmorrhage continued for six weeks. On Jan. 29th, 1892, she was alive and in fair health.

CASE 3. *Accidental hæmorrhage; transfusion of saline fluid; death.*—Mrs. H——, aged thirty-one, had had eight children in fourteen years without any difficulty. Her mother died from flooding in childbed. The patient suffered from prolapse of the womb, but was otherwise a strong, healthy woman. On Sept. 12th, 1888, she was up washing all day "hard at work." At 7 P.M. the pains came on "pretty strong" for an hour; there was no "show." At 8 P.M. the pains ceased and she fainted. The student in attendance found the abdomen very prominent and distended, and the membranes intact. As he could not make out the presentation, the obstetric assistant was summoned and a little brandy administered. At 9.45 the patient was seen by the obstetric assistant. She had recovered from her faintness. There had been no external bleeding; the pains had not returned. The uterus, which was prominent and much tilted forwards, was very tense, and external examination was difficult. The uterine souffle was very loud and the pulse 88. She complained of a good deal of pain all over the front of the abdomen, no special point being indicated. There was no history of any sudden pain. The os was very high up, the edge thick and soft, of the size of half a crown; the membranes intact, but not tense; the vertex presenting. The patient looked a strong, healthy woman, not blanched or appearing any longer faint. Twenty drops of laudanum and rest were ordered. She was left at 11 P.M. At 11.35 external bleeding occurred in considerable amount. At 11.50 the student arrived, and found a large amount of blood in the bed, and a copious flow occurred on vaginal examination. At 12 midnight the obstetric assistant saw her, thought the membranes were ruptured, and made strong pressure on the uterus by a binder; the external bleeding had ceased. At 12.30 she was seen by me. She was lying on her left side, quiet, and speaking rationally, with an occasional parturient moan. She answered only

Digitized by Google

when spoken to in a loud voice; said she felt faint and a little sick. She vomited once, and retched a good deal. In looking at her as she lay on the shady side of the badly lit room there was nothing to attract particular attention. She was not at all restless, and had scarcely any pains. She had lost about a pint of blood. I had a good light thrown on her face. It was quite white, the lips being of a pale ashen colour. She was quite pulseless on both sides. The heart was beating 148 to the minute, but only one sound, apparently the second, could be heard. The uterus was very tense; the os as big as a crown-piece, easily dilatable; the head in the fourth position; the membranes unruptured; no placenta to be felt. Recognising her almost hopeless condition, and that she was bleeding internally, I at once ruptured the membranes, a considerable quantity of bloody fluid escaping. I then applied the forceps and easily delivered the child, without rupturing the perineum. The body was easily extracted, and was followed by the placenta and some large adherent and loose clots, and, I should say, a pint and a half of fluid blood. The uterus contracted well and remained hard, with the exception of a momentary relaxation which permitted the escape of a couple of ounces of blood. The patient was now a little restless. The head was lowered, the legs raised and bandaged, the binder tightly applied, and brandy given her. Once or twice she raised her arm above her head and partly rolled over, and said quietly "Can't I have some air?" She now became deaf and rapidly became unconscious. The pupils were moderately small, as they had been all along. I at once opened a vein in the right arm. When the cut was made through the skin she murmured, "Who's that pinching me?" and then lay quite quiet as if dead. Before two ounces had been injected her face became set with a hideous grin, lasting a few seconds; then a few clonic contractions of the face and slight ones of the arms and legs appeared, and she was dead.

(To be concluded.)

A MODIFICATION OF THE OPERATION OF PARTIAL OR COMPLETE EXCISION OF THE TONGUE.

By W. ARBUTHNOT LANE, M.S.,
ASSISTANT SURGEON TO GUY'S HOSPITAL AND TO THE HOSPITAL FOR SICK CHILDREN, GREAT ORMOND-STREET.

THE suggestion which I am going to make in this brief communication is possibly one that is already familiar to some surgeons; but as I have never seen it used or heard of its use, I think it is of sufficient importance to bring it before the profession. Though it is but a trifling modification of the usual methods adopted, I have found it of the very greatest service not only in diminishing the pain and discomfort which are usually experienced by the patient after these severe operations on the tongue, but also in lessening the danger of pneumonic trouble by the small amount and inoffensive character of the discharge, and in hastening very considerably the process of recovery. The mucus which collects in the mouth and pharynx can also be removed without the patient experiencing any considerable pain, since the sponge is not applied to any raw and sensitive surface. In some cases also the patient retains a fair proportion of the sense of taste. In the case of removal of a half of the tongue the suggested modification consists in the very accurate suturing of the cut margin of the mucous membrane on the dorsum of the tongue to the edge of that covering the floor of the mouth in such a manner that no raw surface is left uncovered by mucous membrane. In some cases it is necessary to alter the form of the portion of the tongue left, so as to make it fit the gap left with perfect accuracy. This is, however, easily met by a little ingenuity, and assistance may often be obtained by loosening the mucous membrane from the floor of the mouth and gum. When it is necessary to remove the body of the tongue, after carefully defining the extreme limits of the growth and giving it a wide margin, a large flap of mucous membrane with a substratum of muscular tissue is sliced off from that portion of the tongue which is of a certainty free from growth, and this flap is accurately sutured with fine silk sutures to the free margin of the mucous membrane in the floor of the mouth, and to that covering the root of the tongue, in such a manner as to cover the whole of the raw surface of cut muscle which is left exposed by the removal of the tongue. This procedure would, of course, not be adopted if there was any chronic inflammation of the mucous membrane, which might form the starting-point of malignant disease; but even in these cases the mucous membrane covering the under-surface of the tongue is probably unaffected, and it is surprising how large an area of raw surface a small portion of mucous membrane can be made to cover. The very vascular flap of muscle and mucous membrane unites with remarkable rapidity to the subjacent raw surface, and in this manner within a few hours of the operation the floor of the mouth is covered by a smooth layer of mucous membrane, instead of by a large inflamed or granulating area discharging abundantly a secretion which rapidly decomposes, and which may be, and often is, readily sucked into the larynx and air passages, where it produces trouble with which we are only too familar.

As illustrations of the mode of application of this method I will give only two cases, the following brief descriptions of which are, I think, sufficient to indicate its advantages.

J. S——, aged fifty, was admitted into Job ward under my care on June 26th, 1890, suffering from a deep epitheliomatous ulcer in the right margin of the tongue in the middle third of that organ. The growth had started in a gumma which had not been treated. There were two or three small glands to be felt in the right submaxillary triangle. These were removed and the lingual artery was tied. The right half of the tongue was removed, with the exception of a portion of its posterior part. The remainder of the tongue was so altered in shape by small incisions that when the mucous membrane covering its dorsum and under surfaces was attached by sutures to that covering the stump of the right half of the tongue and that lining the inner half of the right half of the body of the jaw no raw surface was left exposed. Within forty-eight hours of the operation these margins appeared to have united. Certainly at no period did any gaping or yielding take place along the lines of suturing. The well-being of the patient after the operation, as regarded freedom from discomfort or pain, the absence of discharge, the ready manner in which mucus could be painlessly, or almost painlessly, removed by sponges from the mouth and throat, together with the very rapid convalescence, was remarkable as compared to the usual course pursued by such cases.

T. O'B——, aged forty-five, was admitted into Job ward, under my care, on Dec. 9th, 1890, suffering from an ulcerating epitheliomatous growth involving about a third of the diameter of the tongue in its middle third, and extending slightly over its margin to the mucous membrane covering the floor of the mouth. A small gland could be felt in the submaxillary region on the same side. On Dec. 19th the right lingual artery was tied, and three small glands were removed from the submaxillary region. Eight days after, tracheotomy having been performed, the right cheek was split back to the anterior margin of the masseter in order that free access might be obtained to the floor of the mouth on that side. A carefully-planned flap of mucous membrane and muscle was then cut from the left side and tip of the tongue, every care being taken to keep at what appeared to be a perfectly safe distance from the margin of the growth. The rest of the tongue was next removed, and the flap was then accurately sutured into the floor of the mouth by means of silk sutures, which attached it to the divided margin of mucous membrane both in the floor of the mouth and along the alveolar margin, where it was necessary to remove the mucous membrane covering the floor and to that covering the closure of the stump of the tongue posteriorly. The subsequent course of this case was quite as satisfactory as that of the preceding.

I have used this method on several occasions, and in every case I have felt myself very well repaid for the time and trouble spent in perfecting the operation, and if used with discretion I can see no circumstances under which it could be other than of the greatest benefit to the patient. The increased duration of the operation is of very slight moment as compared to the advantages obtained by it, and in order to ensure the accurate approximation of the divided edges I do not hesitate to split the cheek or perform tracheotomy, although either of these measures might be unnecessary if one were satisfied with the ordinary mode of excision. The benefit gained counterbalances the slight extra risk.

Since writing this I have read the account of an operation

by Dr. Widenham Mansell,[1] for excision of the tongue in leucoplakia or cancer and the utilisation of a portion of the under surface of the organ to fill accurately the gap with the best possible results.

St. Thomas's-street, S.E.

SCORBUTIC HÆMATURIA IN AN INFANT.

BY JOHN THOMSON, M.D., F.R.C.P. EDIN.,
EXTRA-PHYSICIAN TO THE ROYAL HOSPITAL FOR SICK CHILDREN, EDINBURGH.

THE following case seems worthy to be put on record, as being an example of an extremely rare type of infantile scurvy. The clinical facts are as follows.

J. E——, aged seven months, brought from Leith on Feb. 11th, 1892. The infant has been losing flesh and energy for two months, and for the last month his urine has been red. The parents are healthy and tolerably well-to-do. They are very careful of the infant, and his home surroundings seem, on inquiry, to be quite satisfactory from a hygienic point of view. At birth he seemed quite strong and healthy. From birth to the present time he has been given condensed milk. During the first week of life he had nothing else. Then for a month or two months he had barley-water added to it. After that for about ten days he was given a little raw meat juice along with the condensed milk; but he did not like it, and it was therefore stopped. When the raw meat juice was abandoned (four months ago) he was given a pancreatised "infant's food," and on that, along with condensed milk and water, he has been fed exclusively since. He has been in the habit of vomiting about half of the food given to him. His bowels have always been regular and normal in their action. Of late he has been very restless at night; he has always sweated very freely on his head. He has never before had any illness, except that he was "feverish" and had a slight cough when his teeth appeared. About two months ago the infant was noticed to be very languid and to be getting thinner and paler. This has gone on steadily increasing. At the beginning of January the father, who was eating an orange, held it out to the infant. He made a wry face at first when he put his lips to it, but immediately afterwards he clutched hold of the orange with both his hands, and would not give it up until he had sucked a considerable amount of the juice. After doing this he was very sick. The parents were amused at his eagerness to suck the orange, but they thought they had made him ill by letting him have it, and therefore they have never allowed him to have anything of the kind since. About a month ago the urine was noticed to be bright red, and it has remained so ever since. The infant has suffered no pain of any kind, except occasionally "from wind." No special tenderness or bruise of any part has ever been noticed.

The infant is very languid and listless, with a pale, yellowish, earthy complexion; the gums are pale, and not at all swollen, and there are no ecchymoses on them. The lower central incisors are the only teeth through the gum. The fontanelle is large and the ribs beaded, but there are no further signs of rickets. The abdomen is normal; no tumour is to be felt, and the liver and spleen are not enlarged. The heart and lungs are normal; temperature also normal. There is no distinct tenderness anywhere on palpation or passive movement, but the child evidently dislikes being pulled about. There is no ecchymosis, and no swelling of any bone, or joint, or other part. The urine is of a bright-red colour. On standing, a copious reddish deposit takes place, but the clear urine which is left remains bright red; reaction acid. Much albumen found on testing with nitric acid and boiling. On microscopical examination the deposit is found to consist almost entirely of red blood-corpuscles. There are also a few leucocytes and blood-plates, but no tube casts, and nothing else of importance. The case was diagnosed as scorbutic hæmaturia due to improper feeding. The infant was ordered to have nothing but the following diet: (1) As much fresh cow's milk and barley water (equal parts) as he will take, every three or four hours; (2) a dessertspoonful of raw meat juice (prepared as advised by Dr. Cheadle) thrice daily; (3) a dessertspoonful of orange juice twice daily. No medicine.—Feb. 18th: For some reason the diet recommended was not given until the evening of the 13th. On the 14th the urine was quite free from any red colour, for the first time for a month. On the 15th it was somewhat pink, but since then it has been quite free from any tinge of red. It is now found on examination to be perfectly normal in appearance; there is not a trace of albumen, and no deposit is seen with the naked eye or under the microscope. The mother reports that the child is "very much better." He sleeps better, is more satisfied with his food, and has stopped vomiting altogether. He is also "much cheerier." His complexion has improved greatly, and he kicks about his legs while being examined in a healthy way which contrasts strongly with his former lassitude.—21st: Improving in every way. "Just very well." Urine remains quite clear.—29th: Still improving in every respect except that he is somewhat restless at night and sweats a little on the head. Ordered cream, to be added to the milk, and cod-liver oil emulsion.—March 14th: Sleeps well; sweating stopped. Oat flour once daily.—24th: Very well in every respect; has cut two upper incisors.—May 5th: Has continued to gain steadily in strength since last note, and now has a rosy complexion, firm limbs, and the general appearance of a thoroughly healthy child.

Remarks.—The specially interesting and, so far as I know, unique feature of this case is the fact that, with the exception of the general lassitude, the hæmaturia was the only apparent manifestation of scorbutus present. And yet there cannot surely be any doubt whatever about the diagnosis, in spite of the entire absence of sponginess of the gums, periosteal hæmorrhages, and the other well-known signs. Hæmaturia is a recognised symptom of infantile scurvy, although one which is met with only in a small proportion of cases. Dr. Cheadle reports[1] a case of "obstinate and unexplained hæmaturia," very like this one, which, however, was found to be associated with ecchymoses, œdema of the limbs, and sponginess of the gums, and which was clearly scorbutic. The absence of spongy gums in this case does not militate against the diagnosis, for not only is this condition not met with where there are no teeth, but Dr. Barlow has published[2] an undoubted case of scurvy in which two incisors had appeared (as in this case), yet the gums were quite unaffected. The diet in my case was one well fitted to produce scurvy. The child's craving for the juice of an orange is an interesting incident, and tends to confirm the diagnosis. A similar craving in an infant with scurvy, who clutched hold of an orange which was offered to it, and "then proceeded to souse its lips and nose in the juice," has recently been recorded by Dr. Northrup of New York.[3] Finally, we have here, in a marked and satisfactory degree, the "most important diagnostic of all, definite and rapid amelioration by anti-scorbutic regimen" (Barlow).

A REPORT ON THE

COMPLETE ABANDONMENT OF THE OPERATION FOR REMOVING CALCULI ENTIRE FROM THE BLADDER,

AND THE METHODS EMPLOYED INSTEAD, AT THE CIVIL HOSPITAL, HYDERABAD, SINDH.

BY SURG.-MAJOR J. FORBES KEITH, M.D. & C.M. ABER.,
CIVIL SURGEON AND SUPERINTENDENT, MEDICAL SCHOOL.

(Concluded from p. 1235.)

The second method: perineal lithotrity.—When the diameter of the stone is too large for the screw of the largest lithotrite the urethra can readily admit, then recourse is had to the second or perineal method or perineal lithotrity. It is only a modification of the first method, which may be distinguished as "urethral" in contradistinction to "perineal." I do not think it will be considered a waste of valuable time to briefly review the various incidents which

Digitized by Google

led me to adopt the perineal method. When I took over charge of this appointment there was in the hospital a little girl about nine years of age, who had been lately operated upon for stone by the cutting method. When she was lying quietly on her back the urine collected in small quantities in the bladder, but when she assumed the perpendicular posture all the accumulated urine escaped with a rush. This case made such a profound impression on my mind that I determined to try some other operation. There were a few lithotrity instruments in the hospital; but some of them were old and of a very inferior sort, and none of them were fenestrated. However, by the kindness of the engineer in charge of the municipal workshops here, I got them as well fenestrated as could be expected from men unaccustomed to such work. The first case admitted was a young child about five years of age. She had a wide urethra for such a young child, and no dilatation was necessary. The operation was completed without a drop of blood having been lost, the water in the bulk of the aspirator not having been even tinged by it; there were no signs of irritability of the bladder after the operation, and its functions remained unimpaired. No more convincing proof of the good results attending the operation in this hospital can be given than the fact that the children refuse to keep their beds the morning after the operation. These facts have been brought forward not so much for their own importance, although that is a sufficient reason, as to render the one which is to follow much more conspicuous—viz., the fact that during the operation no auxiliary fluid could be retained in the bladder. This last-mentioned fact was my bugbear; and if I had not been driven to try lithotrity on females as the only operation which seemed fitted to preserve in their integrity the functions of the bladder, I would have been frightened to try the operation about to be described on males. It may be said, however, that we can do anything we like with children and they get over it, but the next case operated upon was an old woman at the other extreme of life. She had a very large stone, suffered from great irritability of the bladder, frequent and painful micturition, and her urine contained pus, and was very fetid. Now, although no auxiliary fluid could be kept in the bladder during the operation very little blood appeared at the meatus urinarius externus during the crushing of the stone, the bulb of the aspirator was only slightly tinged with blood during aspiration, and all symptoms of irritability of the bladder ceased with the evacuation of the débris. The functions of the bladder remained intact. The operation was in every way successful. But to show the success of the operation in all phases of life, as well as in healthy and diseased conditions of the bladder, I may be permitted to introduce also the case of a young girl about the age of fifteen, whose bladder was as irritable as in the preceding case. The fetor of the urine was overpowering during the operation, although disinfectants were freely employed. So penetrating was the odour that I felt it long after the operation was finished. The stone was also a very large one. Now, although no auxiliary fluid could be retained in the bladder, the show of blood during the act of crushing the stone was very insignificant; during aspiration the fluid in the bulb of the aspirator was only slightly tinged with blood, for the débris could be seen falling down through it. All symptoms of irritability may be said to have ceased with the final washing out of all the débris from the bladder. Its functions remained intact after the operation.

I could go on multiplying these experiences. Quite recently I operated on a child about six years of age, using a No. 5 lithotrite with a No. 6 catheter. The débris was evacuated without so much as the appearance of blood in the bulb of the aspirator; and the functions of the bladder were left completely unimpaired, and the child was playing next morning in the verandah as if nothing had happened to her. But now enough, I think, has been put on record to justify the establishment of the following proposition: That lithotrity in the female can be successfully performed in the absence of auxiliary fluid in, and even in the presence of a high degree of irritability of, the bladder without disturbing its functions in any way. The truth of this proposition being established, it next occurred to me that an operation similar to this could be performed on males whose urethræ were too small to readily admit the lithotrite, whose screw coincided with the diameter of the calculus. The narrowest part of the male urethra is the membranous portion; it is only necessary, therefore, to slit open this part of the canal, and the remainder, the prostatic portion, offered no obstacle to the passage of larger instruments. The only step necessary, therefore, to make the operation in the male almost similar to that in the female, was to make a direct opening through the perineum into the membranous portion of the urethra, large enough to admit a lithotrite whose screw was long enough to embrace the diameter of the stone to be crushed. I had contemplated the possibility of the perineal method long before the experiences recorded above were realised, although the idea of the impossibility of retaining a sufficient amount of auxiliary fluid in the bladder rose up and condemned the operation in my mind. Still the determination to risk any, rather than the cutting, method in the female, the unexpected success and brilliancy of results which attended my efforts at lithotrity in them—its beauty, simplicity, and perfection—urged me on to try a similar operation in males in whom urethral lithotrity was inadmissible on account of the size of the stone and narrowness of the urethra.

The operation suggested above is performed by me as follows: I introduce a grooved staff into the bladder in the ordinary way in operations for stone, then take a sharp-pointed narrow-bladed knife, and, holding the staff up against the angle of the pubes with the left hand firmly resting on the patient, insert its point at the angle formed by the root of the penis with the perineum, and push it upwards and slightly backwards into the groove of the staff, making slight forward and backward movements to make sure the knife has entered it, and keep it there. I then take a small director and push it alongside the knife into the groove of the staff, making with it also some decided backward and forward movements to make sure it is in the groove of the staff; then removing the knife, I push the director home into the bladder and withdraw the staff. Thus far there is no difficulty. That the director has entered the bladder is known in two ways. One can as a rule feel the stone, and urine escapes from the wound. An endeavour should now be made to find if that lithotrite will enter the wound whose screw coincides with the diameter of the stone, the size of which can be most accurately determined by previously measuring it by means of a lithotrite which the urethra can readily admit. If the wound in the skin and the membranous portion of the urethra is not large enough to readily admit this lithotrite, a probe-pointed knife must be introduced into the groove of the director and the wound slightly enlarged. Having fitted the wound for the lithotrite, its point is to be gently introduced along the groove of the director with the handle downwards. When the jaws of the instrument have been completely introduced into the wound, by simultaneous movements the director is withdrawn, and raising the lithotrite upwards to the perpendicular by a sweeping motion to the right, it is gently pushed into the bladder. If we let, by some accident, the director fall out of the wound and its walls collapse so that the bladder cannot be entered again, the best way out of the difficulty is to introduce the staff again, and we may get the director into its groove, and so into the bladder; if not we must make another incision, which is bad practice, although I never yet saw any untoward circumstance occur attributable to this contingency. The knife must not to pushed along the groove of the director in the direction of the bladder; if we do so the prostate will be in danger of being wounded and the great aim of the operation will be lost, its end and design being to preserve both the structure and the function of the prostate gland intact. There is, as a general rule, no blood lost after the introduction of the lithotrite and after it has begun to work, for the wound is in all cases exceedingly small, it is in the mesial line, and only capillary vessels are cut. The débris is removed in the ordinary way by the evacuating catheter and aspirator. In this method the aspirator is necessary, as the catheter remains more or less in the horizontal position during aspiration.

Urethral and perineal lithotrity dispose, therefore, of all stones whose diameters coincide with the screws, not only of the largest lithotrites that can be readily introduced through the urethra into the bladder; but also of all stones, except very hard ones that lithotrites cannot crush, whose diameters coincide with the screws of any lithotrite made, and yet preserve in their integrity the structure and function of the prostate gland.

By the perineal operation I have successfully removed

Digitized by Google

the largest stones whose diameters coincide with the length of the screws of the largest lithotrites that can enter the urethra; and, firm in the impression that lithotrites of much larger dimensions could be introduced into the bladder without injuring the prostatic portion of the canal after division of the membranous portion, and that this operation could be extended to yet much larger stones without in any way endangering its chief object, I ordered a perineal lithotrite from Coxeter and Son, Grafton-street, which is two sizes larger than the largest lithotrite the urethra can admit, together with a catheter corresponding in size. I have successfully commenced operations with this one, but I believe, as the calibre of the prostatic portion of the urethra differs in size in different individuals, I shall require a series of perineal lithotrites and evacuating catheters to perfect the parallel between the perineal and urethral operations. This problem will have to be solved by future experience.

The chief peculiarities of this new modification of the lithotrite are its length of screw (which, in order not to make the instrument abnormally long, derives its length by encroaching on the shaft), its massiveness of jaws and shaft, and the strength of the female screw. This last I have found to be the weakest part of urethral lithotrites. When I wrote out the description of the kind of lithotrite I wanted to Messrs. Coxeter and Son, I little thought I should receive an instrument so perfectly adapted in every way to the work it would have to perform. After it came into my possession only a few days passed before I had an opportunity of testing its merits. The patient was an old man about sixty, with a urethra so narrow that it would scarcely admit a No. 10, and when the stone was seized by it the screw was quite outside the box, and when the diameter of the stone was measured it was found to be a little over the length of the screw of even the largest urethral lithotrite. The idea of introducing such a large lithotrite by slitting up the meatus and running the risk of stretching the urethra could not in this case, or, in my opinion, in any other case of a patient so far advanced in age, be lightly entertained. In other hospitals the patient would have had to submit to some one of the usual three operations—the lateral, median, or supra-pubic. The small perineal incision was made, and scarcely any hæmorrhage occurred. The new lithotrite passed through the prostatic canal with the greatest ease, the anticipations about the capabilities of the calibre of this part of the canal to admit larger lithotrites being fully realised. The large instrument was as sensitive and as easily handled as could be wished. The first break was the loudest I have heard, as of course I had never before crushed such a large stone. After crushing the stone into small fragments the operation was finished by my favourite No. 10. It is my belief that the lighter and more sensitive the instrument used the more benefit to the patient. The wound was not too large for the No. 20 evacuating catheter, for no fluid escaped during aspiration from between its walls and the catheter, which invariably takes place if the wound is too large. The operation lasted about two hours, the delay being due to the phosphatic and adhesive quality of the débris of the stone and the consequent difficulty of separating it from the vesical walls. The stone weighed about two ounces. The patient passed urine freely by the penis after the operation, and continued to do so afterwards, the wound in the perineum being scarcely even wet during micturition. But the best proof of the success of the operation is the fact that the patient left the hospital cured on the third day after the operation, with the functions of the bladder and prostate intact, and the structure and function of the latter remaining unimpaired. It is reasonable to suppose that the sexual powers were not interfered with. I have now done seventy-six of these operations, with only two deaths.

The advantages of the operation may be briefly enumerated as follows:—1. Non-interference with the structures and functions of the bladder and prostate. This can be proved to demonstration. After the operation is finished and the débris evacuated with the large perineal evacuating catheter, introduce the nozzle of a syringe (= a No. 16 catheter) through the wound and empty its contents into the bladder; then, on withdrawal of the syringe, no fluid escapes; but if now the smallest evacuating catheter be introduced, the bladder will immediately empty itself through the catheter. 2. Smallness of the wound and no important structures cut. 3. No hæmorrhage to speak of. 4. The scientific accuracy with which the operation can be performed. 5. Urine as a general rule passes almost, if not entirely, by the urethra instead of through the wound; and it is always a voluntary act. 6. The bedclothes are kept dry. 7. Speedy recovery. 8. No danger of fistulous openings. 9. Absence of shock, unless the patient be old and weak, and with a large stone. 10. Non-interference with the sexual powers, as inferred. 11. Mortality comparatively favourable; two deaths in seventy-six operations, or 2·6 per cent.

Third method: hammer and chisel.—When the stone is too large for the largest-sized lithotrite, then recourse is had to the hammer-and-chisel method. This was the system adopted before I received my perineal lithotrite; now this method is employed only for those stones which are too large for it. The object of the operation is to remove the débris of the largest stones through an opening capable of admitting the largest lithotomy forceps with concave jaws, the amount of débris removed at each time being limited to that contained within the concavity of the closed jaws. The operation may be described as follows: An incision is made in the median line through the perineum into the bladder large enough to admit the largest-sized lithotomy forceps, with concave jaws. Having introduced the forceps and firmly seized the stone and handed the forceps over to the care of an assistant, I take a small-pointed chisel, and, introducing it parallel to and on the mesial line of the forceps, push it onwards until it is felt to be well planted against the stone, and, holding it so that it cannot pass beyond control, hit it firmly with the hammer. If it is a soft stone, a few firm little taps will be sufficient to crush it; if it is a hard one, more force will have to be used. In soft stones, when they are broken up—which will be known by the handles of the forceps coming together—the forceps should be withdrawn with the mouthful of débris contained between the closed jaws. But projecting splinters of hard stones must be carefully guarded against. If, by the finger in the rectum, they are found projecting beyond the lower side of the forceps, it must be partially opened and the projecting portion or splinter pushed within the concavity of the jaws of the forceps, or made to project on their upper side; then, firmly closing the forceps, I take a sharp, crescent-edged chisel, and introducing it as above, shave off the projecting splinter or splinters. By this method I have successfully removed from one patient seventeen ounces of débris. It is devoted only to very exceptional cases (4 per 1000), as is shown by comparing the number of stones in the museum of this hospital with the screw of my new lithotrite.

These methods which I have described above, for the removal of vesical calculi, have in my hands proved satisfactory, as being the operations attended by the least risks and with a very fair result as to mortality. I have performed in the present year 270 operations for stone. Since receiving my set of lithotrity instruments I have done 157 lithotrities with three deaths, seventy-six perineal lithotrities with two deaths, and twelve operations by the hammer-and-chisel method with four deaths. The proof of the success of the operations is seen in the fact that a much larger number of patients flock to the hospital now than formerly. In former years the average number of cases was about 180 per annum. Last year, up to the beginning of October, there have been 270 cases; and as the people come to take advantage of the new methods at an early date of their complaint, it is reasonable to suppose that the few exceptional cases (= 4 per 1000) of stones too large for the grasp of even my perineal lithotrite will become absorbed by them, and therefore the hammer-and-chisel method will also, along with the cutting methods, sooner or later become obsolete. As these methods will, with regard to the various terms used for the removal of stones by crushing, make "confusion worse confounded," I have taken the liberty of coining the following word for distinguishing the methods herein advocated — namely, "lithotritlapaxy," hence "urethral lithotritlapaxy" and "perineal lithotritlapaxy."

Hyderabad.

THE FORRES HOSPITAL, LEANCHOIL.—Sir Donald A. Smith, R.C., M.P., Montreal, a native of Forres, has sent a further endowment of £3000 to this institution. The first endowment was £5000, the second being promised on the completion of the buildings, which are now opened for patients. In addition to these endowments, Sir Donald Smith also paid £260, the cost of the site. The buildings, which are handsome and commodious, cover a considerable extent of ground, and are situated about a mile from Forres.

SEA-SICKNESS.

BY HERBERT DANVERS, L.R.C.P., L.R.C.S. EDIN., &c.

AFTER several years' experience as a ship surgeon I should be glad of an opportunity to chronicle my experiences of the above evil, which comes to most of us on leaving our native element. First, as to the cause: I consider it to be brought about by a mechanical irritation of the walls of the stomach due to contact of parts not usually in apposition with one another. The effect of this is to produce (*a*) reflexy stimulation of the vomiting centre in the medulla and directly a subacute gastritis, (*b*) diminished blood-supply to the head and neck (as seen in the extraordinary pallor of the face), and a disturbance of cerebral circulation, resulting in a general nerve starvation, evidenced by headache of neuralgic intensity. I would therefore for clinical purposes group all cases into three divisions, according as (1) head symptoms largely predominate, (2) gastric symptoms largely predominate, or (3), the most common, those in which one finds head and gastric symptoms equally combined in minor degrees, and which I propose to speak of as mixed cases. Cases of the first group I have found always among delicate nervous women, men in broken-down health, and young people of both sexes between the ages of twelve and sixteen. There is little if any vomiting, but they complain of the feeling of nausea, total anorexia, ringing in the ears, and intense headache either frontal, vertical, or as a constriction round the temples. Every object on board seems dancing about before their eyes; and in bad cases this continues for some days even after landing—they are utterly incapacitated, quite unable to leave the prone position, and occasionally even beg to be thrown overboard, as life has lost all charm.

Cases of the second group are seen chiefly among young women and men of the burly overfed or "liverish" types. They complain of constant retching, acrid eructations, and vomiting of intensely bitter green or greenish-yellow fluid; but their chief complaint is a total inability to keep down any food. They can sit on deck in their chairs and try to take some nourishment, which the stomach only retains a short while. Headache is present as a dull pain in the occipital region. To the third group belong the large majority of cases, in which neither headache nor vomiting is specially prominent, and who only experience a certain temporary amount of discomfort at the altered conditions for equilibrium; they can come down to meals but complain of having to leave hurriedly in the middle.

Next as regards treatment: In the first group of cases one is generally called in the day after sailing—the time when the headache &c. is most acute,—and invariably finds the bowels have not acted for at least twenty-four hours and the urine is very scanty and high coloured. Here I commence with a dose of calomel or an enema, and then give some form of nerve sedative, as bromide of ammonia with aromatic spirit of ammonia, antipyrin with chlorodyne, butyl chloral with compound tincture of chloroform, bromidia, or the effervescing hydrobromate of caffeine, which is my favourite remedy. Here I may mention an experience of nitro-glycerine for these cases. I was summoned on deck one afternoon to a passenger sitting in a chair with a very anxious, startled expression, and complaining of giddiness and cold hands and feet although it was an extremely hot day. His history was as follows: He was an hotel proprietor, and a phthisical patient who came out from England and stayed at his hotel had presented him with a sure cure for sea-sickness. The invalid had been given the prescription at home by the physician who ordered him abroad, but having had no occasion to use it on the voyage out, he presented the box intact to his landlord, who owned to being a very bad sailor. On this trip the landlord had recourse to the new remedy whenever he felt any headache, and altogether had taken "about a dozen of the little chocolate pills" since sailing that morning. The box was labelled "Tab. nitro-glycerine, $\frac{1}{100}$ gr each. One to be taken at intervals when necessary." He said he had no headache; the pulse was decidedly intermittent. However, the recumbent position, hot stimulants, and handing the "cure" over to me, effectually tided him over by night. I have not felt justified in making any experiments with this "cure," and should feel obliged if any therapeutist would explain the *rationale* of the drug. Diet ought to be an important part of the treatment in these cases; but, finding it nearly always impossible to get patients to take anything, I fall back on alcohol—administered in the form of champagne, sparkling moselle, or gin and potash water, with a dry biscuit. My contention is that the patient's view of life in general is already extremely morbid, and under an entirely depressant line of treatment this would be aggravated. Finally, I would insist on the necessity of getting patients either up on deck or in the ladies' boudoir at the earliest opportunity. Nothing is more fatal than to let them stew down in their cabins with only their melancholy thoughts for company. In cases of the second group I always begin treatment with a couple of glassfuls of warm water, which are promptly rejected, and then give a mixture composed of the following: carbonate of bismuth, bromide of potassium, dilute hydrocyanic acid, and spirit of chloroform; or bicarbonate of soda, carbonate of bismuth with chlorodyne; either prescription effectually allays the gastric irritability. In the cases, however, where nature suggests the remedy by a craving for lemons or lime juice, I give small doses of this mixture: dilute muriatic acid with the infusion of cusparia and spirit of chloroform shortly before an attempt is made to take any food. I have also found cocaine tabloids useful here.

Alcohol in any shape is unsuitable for these cases, causing further congestion of the already irritable mucous membrane of the stomach, which is evidently wrong. I give as little fluid as possible, and ice to relieve the thirst. Diet should be of the blandest substances—cornflour, sago, or tapioca boiled in milk, *weak* mutton broth or beef-tea, not taken too warm. Broths or beef-tea as usually made by a cook are bitter, unpalatable fluids, so I always order them made weak, and then a body given by boiling down tapioca in them. These cases should not be interfered with too soon, as the vomiting is undoubtedly nature's curative effort on a system overloaded with bile, produced by the series of farewell dinners and luncheons preparatory to sailing. A dose of white mixture (carbonate of magnesia, sulphate of magnesia, and essence of peppermint) in hot water the first thing one morning is a most useful finale. For the mixed cases I find some soda and compound tincture of cardamoms or nitro-muriatic acid and gentian during the day with a pill of calomel, colocynth, and hyoscyamus at bedtime, all that is necessary to make them come up smiling to breakfast next morning. They have found their sea legs by then. As regards diet generally, at first one always recommends plain grilled or cold meats, with toast or a dry biscuit, and some fruit, and for drink, weak tea with a slice of lemon (no milk), or whisky, or brandy-and-soda. Coffee and cocoa as a rule do not suit. I must mention, however, that I have seen such a variety of foods and fluids taken as "preventives," with apparent success, that the conclusion is forced on me that each one's palate is the best judge of what suits. "What is one man's food is another man's poison" is a wise saying which contains the experience of many generations, and, as Dr. Austin Flint very sensibly puts it, "Diet should be regulated by the appetite, the palate, and by common sense."

The foregoing remarks apply solely to large ocean steamers on which the passengers remain a week or more; but alluding now particularly to short trips on small vessels, I feel sure we do not possess any drug or combination of drugs which will act as a panacea in all cases of *mal de mer*; and think the practice of giving some powerful drug, hypnotic or otherwise, to anyone who dreads crossing the Channel a most reprehensible one. A *placebo* suits all the cases which would not be ill; there is a great deal in faith, and no drug will alleviate appreciably the sufferings of bad sailors in the course of an hour or two. It is entirely a question of how soon a system can adapt itself to the altered conditions for equilibrium. I have often seen an altered motion of the ship, pitching for rolling or *vice versâ*, upset passengers again who thought they had quite found their sea legs. Old tars off a sailing vessel have frequently been known to be sick on a steamer; and many a passenger off a big Transatlantic liner, who fancies himself a bit of a sailor, has had to part with his last meal when crossing over to France or Ireland in a little Channel steamer. The motion of a sailing ship and steamer is entirely different, and the difference in motion between a big ocean liner and a Channel steamer is as marked as the difference between a thoroughbred's stride and a Margate donkey's canter. In an excellent article by Dr. Burney Yeo,

Digitized by Google

on the "Cure of Pulmonary Tuberculosis," he holds as a first essential that the conditions of cure shall be present in the individual. So here I maintain that those who are not sea-sick have the conditions of cure in themselves, while those who suffer can only get over their trouble by steadily declining to leave *terra firma*.

CHLORIDE OF GOLD AS A REMEDY FOR COBRA POISON.

BY A. A. KANTHACK,
JOHN LUCAS WALTER STUDENT IN PATHOLOGY, CAMBRIDGE UNIVERSITY.

IN a recent number of the *Annales de l'Institut Pasteur*,[1] Calmette states that he succeeded in neutralising and counteracting the effects of cobra poison on animals by means of chloride of gold. My attention was roused by this statement, because about nine months ago I had tried the same substance in India, but unfortunately with no result. It seemed reasonable to try it, as it had proved successful in the treatment of diphtheria artificially induced in animals. At that time I had tried the chloride locally only. I gather from A. J. Wall's book[2] that he also tried the same substance, but was equally unsuccessful. That chloride of gold neutralises and precipitates the albumose of cobra poison in a test tube is a well-known fact. Therefore, when a mixture of cobra poison and chloride of gold is injected into an animal no harm will result; but, of course, this is not a cure, as one might as well inject as much water into the animal. Calmette's experiments may be arranged under the following headings:— (*a*) injection of a mixture of cobra poison and gold chloride; (*b*) injection of a lethal dose of poison and gold chloride all round the seat of inoculation; (*c*) injection of a lethal dose of poison and gold chloride into a part some distance from the seat of inoculation; (*d*) injection of a lethal dose of poison and intravenous injection of gold chloride. For the latter he used 0·2 per cent. solutions of gold chloride, in all the other cases 1 per cent. solutions. The first series of experiments we need not discuss, as practically no poison had been injected. The second series may be subdivided into two classes. In some cases Calmette injected the chloride all round the seat of inoculation *immediately* after the administration of the poison, in others he waited five minutes and more. Of the former most survived, but not all—viz, nine out of ten,—of the latter many died: four out of five. It might be claimed that injecting the chloride immediately after the inoculation is hardly a fair test. However this may be, it is a significant fact that even under such favourable conditions at least one death occurred, and that after waiting a short time the percentage of deaths rose enormously. And if it be remembered that Calmette worked with comparatively small doses, it will be seen that even if the results were always equally good, yet for practical purposes the method will be of little use, if of any.

In India I performed a series of experiments similar to these, the results of which I propose to summarise here. (*a*) Three rabbits were inoculated with 1 cubic centimetre of cobra poison solution (sufficient to kill a rabbit in from one or two hours), and without removing the nozzle of the syringe 6 cubic centimetres of a 1 per cent. solution of gold chloride were vigorously injected. Two animals survived, but the third died after four hours—i.e., after a slight delay. (*b*) Three rabbits were inoculated as above, and gold chloride of the same strength as in the previous set of experiments injected all round the seat of inoculation after an interval of three, four, and five minutes respectively. All the animals died; one after three hours, the other two after an hour and a half. (*c*) Three rabbits were taken, and the skin over the abdomen shaven. They were then bitten by three different cobras, and at once 15 cubic centimetres of gold chloride (1 per cent.) injected around the seat of inoculation. All three died in from twenty to ninety minutes. It must be remembered that an inoculation by a strike from a cobra differs greatly from a cautious hypodermic injection; and in several cases I found that it was possible to cause a certain delay of the exitus lethalis while working with smaller doses and a syringe, after injecting some trichloride of iodine over the seat of inoculation; but when an animal was actually bitten no such delay occurred. Before, then, any procedure is pronounced as a cure, it should be tested under natural conditions.

On reading Calmette's paper I was naturally astonished at the discrepancies between his and my results. I therefore repeated some of his experiments lately at the Cambridge University Pathological Laboratory, using guinea-pigs and rabbits. (*a*) A guinea-pig inoculated with 1 cubic centimetre of a cobra poison solution (sufficient to kill it in an hour), and at once treated by injecting 4 cubic centimetres of gold chloride all round the seat of inoculation, survived. (*b*) Four guinea-pigs were inoculated with 0·75 cubic centimetres of the same poison solution, and at once 2 cubic centimetres of 1 per cent. gold chloride injected into each pectoral muscle and 2 cubic centimetres into each leg, so that the animal got 8 cubic centimetres of the chloride. All died, practically as quickly as the control animals. (*c*) Two rabbits were treated in like manner, and with like result.

From these experiments, then, it follows that what we may call the "remote" treatment with gold chloride is useless. I cannot offer any theory why Calmette should have succeeded in a certain percentage of cases. There may have been some difference in the poison used by him.

The gold chloride used in my experiments was perfectly fresh, and small quantities of a 1 per cent. solution completely neutralised the poison *in vitro*. The solution of poison used in my recent experiments was of such strength that 1 cubic centimetre killed a guinea-pig in from one to two hours, and 2 cubic centimetres killed a rabbit in the same time.

The most important experiments of the French writer are those where he prevented and inhibited the action of the poison by means of *intravenous* injections of gold chloride (0·2 per cent.). He succeeded in saving the lives of two out of three animals used. I repeated his experiments carefully on four rabbits. They succumbed as quickly as the control animals. I desisted from repeating his further experiments—i.e., of injecting the chloride some time after the poison—as, from his own results and my previous experience, I was sufficiently convinced of the futility of such treatment.

To sum up, I am not in a position to explain the successes obtained by Calmette, but find that gold chloride is of no use whatever as a cure against an inoculation with cobra poison, unless it is *immediately* administered, and even then it is not a certain agent. When the animal was actually bitten by a cobra it always failed to neutralise the poison. If we consider the conditions of an individual bitten by the snake, the necessary delay that must always occur before any treatment can be applied, and further, that a delay of three minutes is already fatal, we see the necessity of being extremely cautious before we allow false hopes to be raised in our minds. Analysing Calmette's experiments, I find that he experimented on twenty-two animals, of which three died. Of those twenty-two, three were treated with a mixture of poison and gold chloride, and naturally survived, and these three cases must be subtracted, as they practically got no poison at all. Thus we have nineteen animals treated, with three fatal results. Again, in estimating the practical value of his method, ten cases must be subtracted in which the chloride was given *immediately* after the inoculation and all round the seat of inoculation. But even of these one died. Thus of nine animals treated two ended fatally. Now, in one of these nine cases Calmette had given a very small dose, and it would be fairer to exclude this case, so that there were eight cases, of which two died. Adding to this list his second series of experiments—i.e, in which he allowed some time to elapse before he applied his curative agent, there were five cases in which the gold chloride was injected all round the seat of inoculation; and of these four died—i.e., thirteen cases treated, with six deaths. Two animals treated by a "remote" injection of gold chloride some time after the inoculation survived, so that the final result is fifteen cases with six deaths. He relates one further case treated by means of remote injections, but on referring to the original it will be seen that this case is open to doubt, as the animal had previously been treated with gradually increasing doses of attenuated poison. Calmette's success, therefore, can hardly be considered a brilliant or convincing one; but it seems surprising

[2] Indian Snake Poisons.

Digitized by Google

that he had any successes at all with the remote and intravenous injections, which here invariably failed signally. I am inclined to think, after a careful repetition of his work, that some experimental errors must have crept in somehow or other, but do not hesitate to pronounce gold chloride to be quite useless as a remedy for, or preventive against, cobra poison.

Cambridge.

A FEW PRACTICAL OBSERVATIONS ON THE TREATMENT OF ULCERS OF THE LEGS.

BY J. M. FINZI, L.R.C.P. LOND., M.R.C.S., &c.

As it has fallen to my lot to have an opportunity of treating many cases of ulcers of the legs, and almost always with success, I think a few notes of my experience may be found of use to the readers of THE LANCET, more especially when it is found necessary to carry out the treatment without the usual routine method of confining the patient to bed. I will pass over the general treatment by remarking that it should be prolonged and regular, depending on the constitutional predisposing cause, and that in most cases of an indolent nature a persistent course of astringent iron tonic is of great use, with total abstinence from alcoholic stimulants. Coming now to the local treatment, the principal objects to be held in view are the promotion of a healthy circulation in the limb, the relief of pain, and the production and maintenance of complete asepsis. To obtain the first result it is necessary in every case that the leg should be satisfactorily bandaged, and in order to get good results this should not be left to the patient or friends, but should be done by the medical attendant himself daily, every alternate day, or every third day, as the case may require. Rest and elevation of the leg when possible are, of course, useful adjuncts to treatment in many cases, and in a few essential; but I wish to lay especial emphasis on the fact that in many persons ulcers of the legs can be cured without in any way interfering with their ordinary avocations, and in some cases they seem to progress more rapidly when treated thus than when kept completely at rest. In dealing with indolent chronic and callous ulcers the usual treatment recommended for promoting the absorption of chronic inflammatory products is pressure, and this is generally recommended to be applied by strapping the ulcer, or by the use of the rubber bandage. I have seen cases treated by both methods in which the results have been highly unsatisfactory. We are all aware of the rapid healing of an ulcer that follows—I believe invariably—after an attack of erysipelas; and, guided by this indication, I would advocate the systematic production of a similar condition, though not of a septic origin, in indolent and callous ulcers. I would suggest that our endeavour should be to produce, in almost all, if not in all, cases of indolent or callous ulcer an inflammatory condition of the ulcer and of the skin immediately surrounding it—in fact, an eczema—by some of the means to be afterwards enumerated. I have been led to the foregoing conclusions by observing how rapidly ulcers become amenable to treatment after eczema produced by causes other than erysipelas—such as putrefaction of the discharges, and by local irritant applications. In my hands this treatment has been attended by a considerable amount of success, rapid healing taking place under sedative applications after the induction of this condition. It is obvious that the replacing of the chronic congestion of the ulcer and parts around by an acute hyperæmia must promote the absorption of the products of chronic inflammation, and with satisfactory results, where the process can be kept under control by the surgeon. The local applications used in dressing ulcers of the legs may be considered under three heads: those in which the medicament to be applied is dissolved in water, those in which it is applied in the dry state, and those in which it is mixed with or dissolved in or emulsified with some oleaginous material. As a rule, those cases in which water is used as the menstruum require very frequent dressing, and cannot be carried out satisfactorily without rest in bed. There are two subdivisions of this method—one in which the water is allowed to evaporate, in which case it becomes practically a dry dressing until the renewal of the application. By this method I have seen some very brilliant results, in one case in particular, in which a large ulcer completely encircled the leg; a rapid cure was effected by applying dressings soaked in a weak solution of liquor carbonis detergens and keeping them frequently moistened with the same. I have also seen a case of perforating ulcer of the foot cured by the frequent injection of a weak carbolic lotion, while applying weak iodoform ointment to the apertures, in conjunction with appropriate constitutional treatment. Water or watery applications applied like this sometimes cause eczema.

The second subdivision of this method is where the applications are covered by an impermeable covering, as in the ordinary water dressing or poulticing. This method is very soothing in some cases; in others it produces eczema, especially when applied to a sore which has been previously dusted with iodoform; and in others œdematous granulations when continued too long. Under this subdivision comes the application of rubber bandages—a treatment apparently very much in vogue, and by many used as a routine procedure in treating ulcers of the legs. I would suggest that treatment by this method is unscientific, as keeping the whole limb in a continually sodden and relaxed condition, when we only want to produce that effect locally in and around the ulcer. As a matter of fact, the elastic compression produced by it can be equally well obtained by using over the water dressing elastic bandages which will allow the evaporation of the perspiration from the skin. My experience of these bandages has led me to condemn them as a rule.

Under the second and third heads, the dry and oleaginous applications, I would say that these are most useful when it is necessary for the patient to be about, and I generally make the applications to the ulcer direct, and cover with lint, or apply them to the lint before laying it on the ulcer; in either case several layers of lint are used, or else over the single layer of lint a mass of some absorbent and antiseptic material is placed, in all cases of sufficient thickness to prevent the discharge soaking through to the bandage during the interval between each dressing. Foremost among dry applications is the use of iodoform, and I find this one of the most useful applications for ulcers of the leg, especially when they are sloughing or spreading, and frequently when they are indolent. In a very large number of cases iodoform causes severe eczema of the surrounding skin, accompanied by much irritation and burning pain, with profuse watery discharge. This may come on after a single dressing, but very often does not appear till after several applications, and is the condition we require to produce in order to start the healing in callous and indolent cases. It is sometimes so violent, apparently in very intemperate subjects, as to promote the spread of the ulceration. In some cases iodoform causes an antiseptic scab at the edges of the wound where the discharge is not free enough to wash it away, and healing progresses rapidly underneath this scab. A thin coating of iodoform, and that in the crystalline form, is the best application. Iodoform immediately relieves the pain in cases of gangrenous ulcer. All ulcers in which there are exuberant granulation or a fungous condition require dry and absorbent dressings with or without the usual astringent applications, also firm bandaging.

Lastly, I come to consider the oleaginous applications, and these may be roughly divided into the stimulating and sedative—the former for cases in an indolent condition, the latter for those in a healing, inflamed, or eczematous condition. Of the former, the blister is one of the most powerful and rapid means of procuring the inflammatory condition previously mentioned, and is not so painful as one would expect in these cases. Then iodoform mixed with lanoline, vaseline, or lard is very irritating if used sufficiently strong. Carbolic oil or an emulsion of solution of coal tar with oil; the official ointments of tar, resin, eucalyptus, salicylic and carbolic acids, and red and white precipitate, are all very useful. The last two are also very beneficial in eczema. Among the sedative applications are emulsions of lime water or saturated solution of borax with olive oil or linseed oil, and of liquor plumbi subacetatis with oils, the ointments of zinc, oleate of zinc, calamine, boric acid, acetate and carbonate of lead, and especially bismuth. An ointment composed of equal parts of oleate of bismuth and paraffin molle I find one of the most soothing applications that I know of, and one that

Digitized by Google

will rapidly finish the healing of an ulcer which has become stationary under other methods of dressing. In the use of ointments it is necessary to spread them thinly on the lint, otherwise they cake and obstruct the flow of the discharge.

Sutherland-avenue, W.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

SOME BURSAL AFFECTIONS.

BY REGINALD H. LUCY, M.B. EDIN., F.R.C.S. ENG,
ASSISTANT SURGEON, SOUTH DEVON HOSPITAL, PLYMOUTH.

HÆMORRHAGES and sudden serous effusion into the cavities of bursæ have not received much notice or the attention they deserve. Hæmorrhage into a bursa is traumatic in origin, and may follow (*a*) contusion or (*b*) severe and sudden movement of a joint over which the bursa is situated. The sacs most liable to this injury are, in order of frequency, (1) the two pre-patellar, subcutaneous and subfascial; (2) that over the olecranon process; (3) that over the tuber ischii; and (4) the subacromial bursa. The position of these over bony surfaces or "points" favour the production of this condition.

In support of these statements I append the following cases as typical of the two chief causes:—1. An old man, aged seventy, a month before coming under notice fell and struck his buttock A swelling over the right tuber ischii quickly appeared, which has remained the same size, the skin over it now being red and œdematous. On incision the tumour was seen to consist of a glistening cavity lined with blood clot, which was turned out and drainage established. It would not close, so the bursa was excised, and the patient made a good recovery. (2) A coalheaver, aged forty, when lifting a weight, felt a "click" in the right elbow, and found a soft swelling at the point of the elbow. This "hardened" on the way up to the London Hospital, and on admission I found a tense, painless swelling in the situation of the olecranon bursa, which on palpation was felt to contain clot. The history here was so circumstantial that I regarded it as a case of hæmorrhage into a bursa following exertion. In a similar manner a fall on, or the impact of a falling body on, the point of the shoulder causes the subacromial bursa to fill; subsequent crackling on active or passive movement has led to the diagnosis of "fractured anatomical neck" &c.

Signs and symptoms.—The subject of hæmorrhage is important because the signs accompanying the presence of blood in bursal sacs are those which would lead us to confidently expect pus, and I have seen many cases of enlarged bursæ treated by incision when the sole contents were blood in various states of change, or merely serum more or less blood stained. Following a blow, fall, or severe strain, a swelling appears in the anatomical position of a bursa; this enlargement comes on rapidly—usually in a few minutes,—and patients tell you that the lump has been "the same size ever since the fall &c.," a most important point in the history. On palpation fluctuation is readily obtained with a certain amount of pain and tenderness, especially when caused by contusion; in a few days redness and œdema of the skin over and round the bursa appear, and we have the classical cardinal signs of inflammation ("tumor, dolor, rubor, calor") present, but as we shall afterwards see not pus but "cruor." The thermometer is here our best, though not an infallible, aid. In hæmorrhage pure and simple, although the signs of suppuration appear so unequivocal, we find the temperature rarely above normal. Relying on signs alone, I have seen many bursæ opened as abscesses, to find nothing but a blood clot or serum, with, in some cases, such as the pre-patellar bursæ, thin pus in the subcutaneous, but blood-clot only in the thick-walled subfascial, cavity, analogous to the so-called "reflex abscesses" outside a joint the seat of commencing disease. It is in these cases that ecchymosis is not present; when it is, no doubt exists as to what composes the tumour contents. Crackling or rubbing is a sign especially marked on palpating a subacromial bursa filled with blood-clot. The so-called "melon-seed bodies," so often to be demonstrated by palpation at the bottom of such bursæ as the olecranon and pre-patellar, are, I take it, evidences of former hæmorrhage, being composed of condensed decolourised (more or less) fibrin, either free in the cavity or moored by a longer or shorter pedicle to the interior; occasionally they are fixed and sessile. My object in calling attention to these points is to prevent bursæ being needlessly opened, for tedious suppuration almost invariably follows and the bursa has to be excised.

Treatment.—The limb should be immobilised on a splint, an ice-bag or evaporating lotion applied, and rest of the joint ensured for several weeks if the patient be anæmic or tubercular in order to prevent suppuration The swelling slowly subsides, leaving "melon-seed bodies" behind, and these seem to be the starting point of hæmorrhage following exertion. That hæmorrhage into bursæ is more common than it is supposed is proved by finding broken-down clot in the contents of abscesses caused by the bursting of a suppurating bursa into the subcutaneous tissues—e.g., round the knee-joint.

Another interesting condition, of which I have seen several examples in the subcutaneous pre-patellar sac, is the deposit of tubercle in bursal cavities leading to infiltration of the overlying skin, suppuration, and finally an ulcer of the size and shape of the bursa. These have been accompanied by other tubercular affections, and are most obstinate to treatment.

Plymouth.

TREATMENT OF A CASE OF CHRONIC PLEURISY BY CONTINUOUS DRAINAGE.

BY B. BASKETT, M.R.C.S., L.R.C.P. LOND.

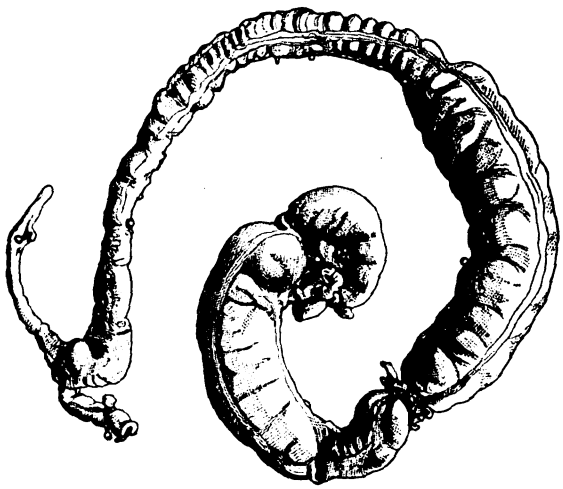
THE following case may be of interest to readers of THE LANCET, as I am unable to find any record of the disease having been so treated. The patient was under the charge of Dr. A. J. Harrison in the Bristol General Hospital, and it is by his permission that I am allowed to submit it for publication.

W. B——, a middle-aged man, a sailor by occupation, with a history of previous good health, was admitted to hospital on July 13th, 1891, suffering from very considerable pleuritic effusion on the left side. All the physical signs were well marked. There was absolute dulness on percussion all over the left side, breath sounds could not be heard, and the heart was displaced well over on to the right side. The symptoms had first been noticed about six weeks before admission, but he had not been tapped. As was to be expected, he was then in a very low state of health. Aspiration was at once performed, and forty-four ounces of serous fluid were removed; but, as he showed symptoms of faintness at this point, the operation was discontinued. There was no difference in the percussion resonance after tapping, and the only change observable in the physical signs was that ægophony, which could not be heard before, was perceptible at the level of the seventh dorsal spine, and that vocal resonance was present in the upper part of the cavity. The first tapping made no permanent difference, and the fluid began obviously to reaccumulate within a few days. Aspiration was accordingly done again, and then again, in all seven times—the amount removed at each sitting varying from two to six pints. Every effort was made to restore his strength by tonic medicines and nutritious diet; and later on in the case he was put on diuretics and counter-irritants applied to the chest wall. But he went steadily down hill, and after nine weeks of this treatment matters began to wear a very grave aspect. At this stage it was finally determined to drain the pleural cavity continuously. From the cachectic state at which he had arrived there was much reason to expect that the fluid, hitherto serous under the irritation of the constant presence of a drainage-tube and the frequent exposure to the air at the time of dressing, might become purulent, however rigidly the antiseptics were maintained; but if it did so, the inflammation thereby indicated might serve a useful purpose and close the cavity; while if it did not, the drainage, as in other serous cavities, might restore the balance between secretion and absorption, and so end the case. Careful examination of the fluid had been made and was hereafter made, but no tubercle was

Digitized by Google

ever found, nor was there any indication of its presence in the lung substance on either side.

Accordingly an incision was made in the fifth space in the anterior half of the axilla under chloroform, and a drainage-tube inserted as for empyema. To avoid the danger of syncope from the otherwise sudden relief of pressure, a small Southey's trocar was inserted, and was allowed to remain in the left side for twenty-four hours previously to the administration of the anæsthetic; in this way nearly seven pints had been removed. Secretion continued at an enormous rate, but we were rewarded from the first by an obvious tendency to expansion on the part of the lung; the breath sounds began at once to be heard. The case was a long one and uneventful throughout its whole course, save that the fluid gradually became purulent before three weeks had passed. The pus was always thin and watery, though very copious in amount. But in spite of the great drain on the system which so continuous and so abundant a discharge must necessarily have entailed, the man gained in health and strength gradually but distinctly. In about four months after the drainage-tube was inserted the discharge stopped, the wound healed, and he was completely restored to health. The lung has expanded as far as one could have reasonably ventured to hope. There is compensatory hypertrophy in the right lung to make up for the deficiences of the left. The dulness is still present all over the left side, but less marked in degree. The heart has nearly regained its position. He was so well when last seen that he was about to begin work again. At intervals in the case his temperature rose intermittently. It seemed generally to be due to the shortening of the drainage-tube, which every now and then appeared justifiable by reason of the lessening of the discharge. It was always remedied by reinserting a tube of the previous length, or, as once was done, by making a fresh incision further forwards in the axilla. There was no true hectic temperature throughout his illness.



Crossfield-road, N.W.

CONGENITAL CONTRACTION OF THE ASCENDING AND TRANSVERSE COLON.

BY ARTHUR H. DODD, L.R.C.P. LOND., M.R.C.S.

IN this case (J. P——, a male infant) unusual straining at stool was the earliest symptom which attracted the attention of the nurse, but the infant notwithstanding thrived noticeably during the first three weeks. At first there were one or two actions of the bowel each day, but very shortly only every other day. About the end of the third week sickness commenced, occurring from five to ten minutes after taking the breast, and at that time only, which was then thought probably due to too frequent suckling. This symptom, however, increased in severity, the amount rejected at first being only slight; but in a few days from its commencemens the mother thought the whole meal, or nearly so, was returned. I should mention that the character of this sickness was peculiar, the vomited matter not simply rolling over the edges of the mouth, but "shooting out" (if I may use the expression) beyond the mother's lap into the room. There was evidently now a good deal of pain, the child lying curled up, with the thighs flexed tightly against the abdomen, the feet crossed, and crying at very short intervals night and day. At the fifth week there was a cessation of all symptoms for about seven days, but then sickness, constipation, and pain returned. Throughout there was never any distension of the abdomen, but double inguinal hernia was produced at a later stage, as a result of the perpetuual crying and straining. At the seventh week Dr. E. G. Whittle saw the case with me, and chloroform was administered, but nothing was revealed by examination. No localised enlargement, tumour, or anything unusual could be detected, and we came to the conclusion that there was some congenital deformity existing in the bowel, and thought that no operation was justifiable. Constipation increased, drugs and enemata gradually becoming useless. The motions at first were normal in appearance, but in the later stage resembled thick yellowish-brown oil paint. It was curious that during the last fourteen days of existence no sickness whatever occurred, and yet there was not any distension of the abdomen and only very slight action of the bowels—in fact, I thought that during that period the little that did follow the enemata was simply from the lower part of the colon. Wasting commenced after the third week, the child gradually sinking from exhaustion at the end of the twelfth week.

The necropsy, at which Dr. E. G. Whittle kindly assisted me, was made twenty hours after death. Rigor mortis had not set in. It revealed congenital contraction of the ascending and tranverse colon, which was throughout but little larger than an ordinary lead pencil. The

head of the cæcum was normal; the vermiform appendix was about two inches and a half in length; the descending colon, sigmoid flexure, and rectum were distended, but normal, with the exception of partial contractions of an annular character of the sigmoid flexure; the small intestine was abnormally narrow; the ileum for a few inches before its junction with the cæcum was very much contracted; the stomach was peculiar in shape, resembling an hour-glass contraction near the cardiac end. All the other organs were normal.

The photograph taken for me by Mr. J. Williamson very well illustrates the condition found. Unfortunately in removing the descending colon from the body a slight injury occurred to it, preventing proper distension of the part removed for the purpose of illustration.

Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum propriss collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Procemium.

GENERAL HOSPITAL, WOLVERHAMPTON.

TWO CASES OF BILATERAL EMPYEMA.

(Under the care of Mr. KEOUGH.)

THE subject of effusions into the pleura in children is always of interest, especially in relation to the question of prognosis. Experience shows that the younger the patient the more is there likelihood of the effusion becoming purulent, and if promptly treated the chances of complete recovery are greater. Very few cases of bilateral purulent effusion have been placed on record. In the first related below pneumonia seems to have been the predisposing cause, and there was perhaps some association with a tubercular taint, for the child was delicate, and there had been trouble with both eyes. The immediate preliminary aspiration to relieve the pressure symptoms, followed later by resection, is a

Digitized by Google

plan of treatment which strongly commends itself, especially in cases in which the displacement of the heart is marked, as it minimises the chances of the supervention of dangerous symptoms which are apt to follow a too sudden evacuation of the pleural sac. In children a favourable result has in rare instances been obtained by aspiration alone; but these have been probably simple cases unassociated with visceral inflammation. Evacuation, mopping out the cavity, and drainage brought about a cure without irrigation; the latter has often proved quite inexplicably fatal, and as experience shows that recovery often follows without it, it should be abandoned as a rule. The early recognition of the loculus of pus on the right side no doubt contributed materially to the successful result, and its evacuation and drainage produced no increase in the respiratory difficulty—a fact which has been before noted. The tender age of the second case, coupled with the severity of the malady, militated much against the chances of successful treatment. In view of the fact disclosed by the necropsy that the empyema on both sides was general, it is a question whether it would not have been advisable to have aspirated a few times before resorting to resection and drainage. Though the presence of adhesions is favourable if the condition is bilateral, yet the loculated condition often contributes to an unfavourable result. Small or large collections of pus shut off from the general pleural cavity are often difficult to detect, especially when they are situated between the lobes or on their internal aspect. The cause of sudden death in some cases of pleural effusion with great cardiac displacement appears to be a "kinking" of the great veins produced by axial rotation of the heart, and giving rise to impediment to the venous flow. For the notes we are indebted to Dr. Edward Deanesly, house surgeon.

CASE 1.—L. W——, aged ten years, was admitted to hospital on Dec. 23rd, 1891. She was stated to have been taken ill three weeks previously with inflammation of the lungs, and to have gradually got weaker and thinner. On admission she looked very weak and ill. The face was flushed, the lips blue, respiration 64 per minute, gasping in character, pulse 144, and very weak. She had been a delicate child, and had lost the right eye from inflammation; the left showed an adherent corneal ulcer. There was some œdema of the legs and feet. The chest was flat, and badly developed. The left side was dull throughout, and the heart's apex beat felt in the right fourth interspace near the nipple. There was also dulness over the right base behind, as high as the seventh rib. Half an hour after admission twenty-two ounces of pus were removed from the left pleura by the aspirator. On the following morning chloroform was given, and three-quarters of an inch of the fifth rib resected in the left posterior axillary line. Thirty-eight ounces of pus and lymph were then evacuated, and the pleural cavity mopped out freely with cotton-wool sponges. A tube was inserted and an antiseptic dressing applied. On the sixth day after the operation the temperature, which had fluctuated between 98° and 101°, rose to 103·4°, and the dyspnœa, which had been relieved, increased. The right base behind was then explored, and three ounces and a half of pus removed by the aspirator. This gave some relief. Eleven days after the operation on the left side chloroform was given and the right empyema was opened and drained by free resection of the eighth rib in the scapular line. It was explored with the finger and found to be quite localised, being confined to the lower and posterior portions of the pleural cavity, reaching upwards to the seventh rib and forwards to the posterior axillary line. It contained only a few ounces of thick pus and lymph. The anæsthetic was taken well, and the opening of the right pleura produced no dyspnœa or other bad symptom, although the left pleura was still draining freely through its tube. After the second operation the patient made rapid and uninterrupted progress, and was discharged to a convalescent home on Feb. 1st, having been in the hospital forty days. A week later both wounds were soundly healed. When last seen—on April 28th, 1892, four months after the first operation—the patient was looking well and strong, and had gained considerably in weight. Both sides of the chest expanded fairly, and were everywhere resonant, though somewhat less so than those of a normal child. Air entered freely to the extreme bases of both lungs, the breath sounds being normal in character and free from adventitious sounds. Both scars were quite sound.

CASE 2.—H. W——, aged eighteen months, was admitted on March 21st, 1892, with a history of gradually increasing weakness and wasting of indefinite onset. On admission the child was fairly well nourished, but of a very marked opaque greenish-yellow colour. It had considerable dyspnœa. The left side of the chest gave the ordinary signs of general pleural effusion, the heart's apex being felt in the fifth right space in the nipple line. The right side of the chest gave no abnormal physical signs. The diagnosis of empyema was confirmed by a hypodermic syringe. The day after admission half an inch of the left eighth rib in the scapular line was resected and a large quantity of thin pus evacuated from the pleural cavity. The operation was performed without an anæsthetic. For eight days after the operation the temperature remained below 100°, and the symptoms were relieved. On the ninth day the temperature rose to 103°, and the respiration became quicker. Three days later a hypodermic syringe inserted into the right base behind revealed the presence of a second empyema. Dulness at that time reached only as high as the angle of the scapula, and symptoms were in no way urgent. It was resolved to open and drain the right empyema, but death occurred rather suddenly on the following day, before the operation could be carried out. At the necropsy the empyema, which had been opened on the left side, was found completely drained, but a second small loculus of pus was found in the lower and anterior part of the pleura, not communicating with the general cavity. The right pleural cavity was completely full of thin pus, and the whole lung collapsed and covered with patches of lymph. Heart and pericardium normal.

Remarks by Dr. DEANESLY.—Judging from the scanty reference to the subject in text-books and medical literature, bilateral empyema appears to be of somewhat rare occurrence. Mr. Godlee, in his article on Empyema in Heath's Dictionary of Surgery, refers to the condition as almost necessarily fatal unless one or the other be localised. The same surgeon, in THE LANCET of 1886, gives a second empyema on the opposite side as the cause of death in one of the cases in his list. These are the only references I have been able to find. I have, however, been informed by Mr. Godlee of a case similar to that reported above, in which a second empyema on the opposite side was opened and drained by him, with a successful result. The main condition which renders such a proceeding possible in cases of general empyema is, as might be expected, the presence of a considerable amount of adhesion of lung to chest wall on one side before the pleural cavity is opened on the opposite side. This condition was amply fulfilled in Case 1, where eleven days elapsed between the two operations—a time quite sufficient for the contraction of pleural adhesion. The fact that in this case the second empyema was a loculated one, and therefore shut off from the general pleural cavity, rendered the second operation free from danger, and no doubt contributed more than any other cause to the successful result. In Case 2 both empyemata were general and not localised, and the second one should no doubt have been aspirated as soon as it was discovered, although the collection at that time appeared to be a small one, and symptoms were not urgent. It was thought, however, that sufficient time had elapsed (twelve days) since the opening of the first empyema to render it safe to open and drain the second. Unfortunately the rapid increase of the effusion brought the case to a fatal conclusion before this resolution was put into practice. Whether the proposed treatment would have had a different result is an interesting moot point.

TIVERTON INFIRMARY.

A CASE OF HEAD INJURY.

(Under the care of Mr. MICHELMORE.)

THE clinical history of a case of head injury is given below, which appears to be one of concussion combined with cerebral irritation. The complete unconsciousness, the bleeding from the nose, and the very slow pulse and respiration, suggest the possibility of a fracture of the anterior fossa, with some limited extravasation of blood. Four days after the injury, when the patient had recovered somewhat from its immediate effects, the characteristic attitude and mental indications of cerebral

Digitized by Google

irritation became marked. The recovery was rapid considering the severity of the symptoms. The points of unusual interest were the persistence of the vesical trouble for nearly a fortnight and the excessive craving for food during convalescence. The particulars of the case are as follows:—

W. N——, aged seventeen, a groom by occupation, was brought to the Tiverton Infirmary on the evening of March 8th, 1892, having been thrown from a horse he was exercising. On admission, two hours after the accident occurred, the patient was found to be quite unconscious. There was a little frothy saliva at the right angle of the mouth, bleeding from the nose, conjunctival reflexes absent, face flushed, jaws clenched (but the tongue had not been bitten), no scalp wound, pupils normal in size but acting slowly to light, no paralysis. Pulse 50, rather bounding; respiration deep and prolonged; temperature 98°.

March 9th.—Patient still unconscious, and resists any attempt to rouse him; urine had to be drawn off with cathether; normal in reaction and appearance. Pulse 46; respiration 12; temperature 98·4°

10th.—Patient remains in much the same condition. Pulse 44, diminished strength; respiration 10; temperature 98·4°.

11th.—Partially recovered consciousness to-day, but is very drowsy, and takes time before he answers a question; retention of urine still. Pulse 44; temperature 97°.

12th.—Patient is still very drowsy, and lies principally on his right side, with the chin flexed on the sternum, and the knees drawn up towards the abdomen, and is very irritable if any attempt is made to alter his position. Pulse 42; respiration 10; temperature 97°.

13th.—He passed a quiet day, but late in the evening became delirious, the delirium being of a noisy character. The retention of urine from which he had been suffering up to this time gave way to complete incontinence. Bowels cannot be moved without enemata; pupils dilated, but act to light. Pulse 42, weak; respiration 12; temperature 97°.

14th.—The patient is somewhat better this morning, and conscious at intervals, but incontinence of urine is still present. The pupils are dilated. Pulse 44; temperature 97°.

15th.—He had a good night, and is much brighter this morning. Has regained control over his bladder. Pulse 42; temperature 97·4°.

16th.—The patient is not so well this morning. He passed his urine in the bed during the night. The pupils are still dilated. Pulse 50; temperature 97·6°.

17th.—Incontinence of urine still present, but general condition much improved. Is continually asking for food. Pulse 44; temperature 97·6°.

18th.—The patient has a most ravenous appetite, and is continually crying out for food; still has incontinence of urine. Pulse 48; temperature 97·6°.

19th.—Patient has not passed his urine in the bed so frequently to-day, and is very much brighter, and wishes to get up. Pulse 56; temperature 98°.

20th.—Improvement still marked, and there has been no incontinence of urine. Pulse 64, strong and regular; temperature 98°.

Patient convalesced rapidly, and was discharged on April 2nd quite recovered.

Medical Societies.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

MAY 16TH.

Mr. SHIRLEY MURPHY, President, in the chair.

The Working of the Infectious Diseases Notification Act.

THE evening was by previous arrangement devoted to the discussion of the above subject, and the expediency of including measles among diseases to be notified. Three short papers were contributed: the first by Dr. Woodforde, on the working of the Act in rural districts; the second by Dr. Armstrong, on the desirability of notifying measles; and the third by Dr. Campbell Munro, on the benefits derived from such notification in his districts.

Dr. WOODFORDE said that in his combination seven of the eight rural sanitary authorities had adopted the Act, one rural and the urban authorities still refusing to do so. The population of the districts under the Act was 114,000, and that of the others 44,000. In the years 1890–1 the total cases notified were 667, with 113 deaths, including 214 cases of scarlatina, 184 of diphtheria, and 88 of enteric fever, with 658 and 22 deaths respectively. The mortality from the notifiable diseases in the districts under the Act was 0·3 per 1000; in the others 0·6, or just double; but that from measles and whooping-cough was 145 deaths in the former and 41 in the latter, or 50 per cent. more than from all the other diseases put together. He thought there could be no doubt as to the immense aid to preventive measures afforded by notification, which ought to be everywhere made compulsory. The dual system met every objection, but he could not get his authorities to prosecute neglect on the part of parents. He would like to see erysipelas dropped, since the great majority of the 146 cases, none fatal, were nothing of the kind. But he made no objection to doubtful diagnosis, though many trivial sore-throats were reported as diphtheria; and he would have croup made notifiable, the designation "membranous" being dropped, for when the parents demurred to notification, deaths from diphtheria were returned as croup. The gossip of neighbours gave far more publicity than notification.

Mr. FOSBROOKE was satisfied as to the benefits of notification, though measles was often reported as scarlatina, and Dr. Dudfield agreed with Dr. Woodforde on the question of erysipelas.

Dr. ARMSTRONG said that in Newcastle they worked under a local Act, and did not pay the fees for "suspected" cases and others in which on admission to hospital the diagnoses proved to be erroneous; nor when delayed until a death had been returned. Notification on erroneous diagnosis often led to serious consequences, but was much less frequent through the activity of the sanitary authority. Indeed, prompt action as well as early information were essential to the successful working of the Act. The removal and disinfection of bedding &c. was invariably carried out, the objections raised by well-to-do families being met by the employment of first- and second-class vehicles; and, after ten years' experience, all opposition to notification had ceased.

Dr. PARKES was satisfied that during the past year the notification and removal of 100 cases of small-pox had averted an epidemic. So many cases of alleged erysipelas were reported that no action was taken. The cases notified as diphtheria were, he believed, in excess of the truth; but he feared that the reverse was the case with puerperal fever, notwithstanding its importance from a sanitary point of view. Dr. Sykes regretted the paucity of terms in the Act which gave opportunities for concealment. Puerperal fever was septicæmia, yet if called by that name or blood poisoning it was not notified. Varicella was suspiciously prevalent during epidemics of small-pox, and the police regulations enjoined in consequence the same action as regards disinfection &c.

Dr. SERGEANT would not drop erysipelas, if only from its being a frequent cause of puerperal fever, as he had himself seen. The President considered it of the highest importance for the opportunities it gave for sanitary improvements, while the cost of certificates was insignificant. He reminded the meeting that Mr. Ritchie had stated his intention to bring in a Bill to make the Act compulsory throughout the country, and proposed that the resolution in favour of such extension, which was put and carried unanimously, should be forwarded to the president of the Local Government Board.

The discussion on the Notification of Measles was then opened by Dr. ARMSTRONG, who described the mortality from that disease as awful. He hoped that it would soon be adopted in his town, the resolution having on the last occasion of his bringing it forward been lost by only a single vote. Not only was the mortality four times as great as that of scarlatina, but it led to much subsequent disease. The question was as to how it could be prevented; and it seemed to him that all the arguments against its notification were based on the fallacious notion that it differed essentially in some way or another from all other infectious diseases. But its very prevalence should urge us to more strenuous action, and if it were more infectious before it could be recognised it was not less so afterwards. Every objection would, he maintained, be found to break down on close examination. As

Digitized by Google

regarded diseases that were already notifiable, the mortality in the ten years 1880–90 had been reduced to one-fourth in the towns under the Acts, while in those where it was not in force it had greatly increased. Notification of measles would enable preventive measures to be taken by the sanitary authorities and school teachers conjointly to check its spread; it would do away with the concealment of scarlatina under the name of measles, and would inculcate on the public a true estimate of its gravity. He was always ready to certify for the Government grant when a school was closed so soon as an outbreak of an infectious disease appeared, but refused to do so when closure was delayed so long that the evil was already done.

Dr. MUNRO'S paper, a short abstract of which he read at the Epidemiological Society last year, was intended to demonstrate the effect of early information and school closure in checking the spread and reducing the mortality of measles. In Jarrow there had been between 1883 and 1891 inclusive five biennial outbreaks, and the notification having been respectively none, voluntary late, voluntary early, compulsory late, and compulsory early, the mortality had steadily declined from 4·0 to 0·7 per 1000 to nearly one sixth. On one occasion twenty-eight out of the first twenty-nine cases occurring simultaneously in one district were those of children in the infant department of a single school. Under such circumstances prompt closure led to the extinction of the epidemic in a fortnight or three weeks.

Mr. WIGHTMAN demanded hospital provision for severe cases. Among the poor, especially the Irish, in his district it was the cause of much blindness.

Mr. FOSBROOKE said that at Kidderminster the simple keeping of the children in-doors by order of the inspectors had reduced the death-rate to one-fourth; but Dr. SERGEANT had found that at Bolton the additional labour paralysed all other sanitary work until it was discontinued after two years' trial.

Dr. SYKES remarked that isolation covered exclusion from school as well as seclusion in hospital, but Dr. PARKES believed that measles spread at least as fast while the schools were closed.

Dr. DUDFIELD said that the 3000 deaths in London last year represented probably 100,000 cases, all other notifiable diseases numbering 30,000. To provide for such was utterly impracticable, though bad cases ought to be admitted into hospital.

Dr. ARMSTRONG again insisted that the magnitude of the scourge should act as an incentive to exertion, that much good might be done without hospital provision, except for really severe types of the disease, that the mortality was in the strictest sense preventable, and that, in view of the recurring wave periods, the period of trial of the Acts should not be less than ten years.

ROYAL ACADEMY OF MEDICINE IN IRELAND.

A MEETING of the Section of Pathology was held on May 13th, Mr. NIXON in the chair.

Chronic Tubercular Spinal Meningitis.—Dr. H. T. BEWLEY showed a spinal cord from a case of chronic internal tubercular pachymeningitis. The disease lasted four years, causing complete loss of motion and partial loss of sensation in the legs. At first there had been marked incoördination with increased reflexes, but afterwards the reflexes culminated in permanent rigidity. Four years after the paralysis showed itself the spine became curved, the tenth dorsal spine becoming prominent. This singular curvature became rather more marked. Finally he died of tubercular meningitis. At the post-mortem examination it was found that the external surface of the dura mater was healthy; the internal surface was thickened. This thickening was most marked in the lower dorsal region, where there was about one-sixth of an inch of tough, whitish tissue growing from the dura and attached to the arachnoid and pia mater. This tissue thinned off gradually above and below. On microscopical examination this structure was seen to consist of granulation tissue containing giant cells and tubercle bacilli, and in many places had become caseous. This tissue compressed the cord in the lower dorsal region. The cord showed ascending and descending degenerations above and below this point. The ninth, tenth, and eleventh dorsal vertebræ were carious, and there was cerebral tubercular meningitis. The disease had started in the internal surface of the dura mater, and the bone disease was secondary. That this was the course of the case is shown by the following facts: (1) The external surface of the dura was healthy, the internal diseased; (2) the spinal disease did not show itself till three years after the paraplegia had become complete.

Horny Epithelial Tumour.—Dr. ARTHUR BENSON showed a tumour which he had removed from the outer side of the left brow of a woman, aged about thirty, in St. Mark's Ophthalmic Hospital. It was not adherent either to the skin or the bone, and was removed under the impression that it was an ordinary dermoid tumour. It had been present all her life, and, except for the disfigurement, was no trouble to her, though she thought it was growing a little larger. The tumour was oval, and about three-quarters of an inch long and half an inch wide.—Dr. GRAVES showed microscopic sections of the horny epithelial tumour. The tumour was completely invested by a strong fibrous capsule which sent in many trabeculæ, dividing off the masses of epithelial cells of which the tumour was composed. The great bulk of these epithelial cells were horny. In one place these horny cells were seen to be directly connected with a mass of Malpighian cells. This tumour was precisely similar, in macroscopic and microscopic appearance, to a tumour removed from the neck by Mr. Wheeler, and exhibited last year at the Pathological Section of the Royal Academy of Medicine (vol. ix., page 428).

Artificial Dental Caries.—Dr. A. W. W. BAKER read a paper upon artificial dental caries, and showed microscopic specimens.

Perforating Ulcer of Stomach.—Dr. JOSEPH REDMOND exhibited a case of perforating ulcer of the stomach in a male aged sixty. On opening the stomach it was found to contain two solutions of continuity, the larger of which, situated on the posterior wall, measured four inches by two inches and a half. The floor of the ulcer was formed by the pancreas, to which it was intimately adherent. The smaller ulcer was situated about one inch to the lower and mesial side of the œsophageal opening, and separated from the larger by a distance of about one inch and a quarter. Its shape was nearly circular, and was about one inch in diameter. Its floor was irregular, without any trace of hæmorrhage, and at one corner was the perforation which had occasioned the fatal termination.

Pedunculated Sarcoma of Cerebellum.—Dr. M'WEENEY read a paper on a case of pedunculated sarcoma of the cerebellum which had occurred at the Mater Misericordiæ Hospital. The patient, J. S——, had been admitted to hospital on Jan. 11th under the care of Mr. Hayes, suffering from persistent vomiting and headache, and from debility and insomnia, the result of these symptoms. Twelve months previously he had been unconscious for two hours after a severe fall, but apparently recovered his usual health till about four months previous to admission, when the vomiting began to be troublesome. On examination the right side of the tongue was found insensible to impressions of taste, and there was almost complete deafness of the right ear, which he had noticed only three weeks before admission. The right pupil was larger than the left, and reacted to light. There was no optic neuritis and no facial paralysis. Cough was troublesome, and there was a certain amount of bronchitis. Urine small in quantity, of sp. gr. 1032–36. Urates present in abundance; no other abnormality. Bowels confined; temperature occasionally rose to 100°–101° F.; skin always dry. The patient became suddenly comatose, and died on Jan. 29th. Post-mortem: A disc-shaped pedunculated tumour was found on the right side of the under-surface of the cerebellum. Its inner aspect was closely in contact with the crus, pons, and medulla, which were flattened and distorted by the pressure. The tumour lay in front of the amygdala of the cerebellum. The exact shape of the tumour was that of a somewhat crumpled and convoluted roughly circular disc, of which one surface looked upwards and inwards, the other downwards and outwards. The diameter of the disc was one inch and three-quarters; its thickness averaged one-third of an inch. Its peduncle was very riband-shaped, and entered the cerebellum about the region of the flocculus, slightly posterior to the roots of the facial and auditory nerves. The bulging caused by the passage sideways of the superficial fibres of the pons was quite obliterated by the tumour, and the seventh and eight pairs of nerves were adherent

Digitized by Google

to the upper surface of the disc. The pneumogastric and glosso-pharyngeal nerves were adherent to the posterior edge of the disc, flattened and disintegrated into small bundles of fibres. The peduncle of the tumour seemed to run into the white centre of the cerebellum, and near the upper surface of that organ in the quadrate lobule was a remarkable vascular condition consisting of a plexus of large thin-walled veins (one-fifth of an inch in diameter), lying both in the medullary substance and in they gray matter of the sulci. Microscopic examination showed the tumour to be composed chiefly of sarcoma tissue, the cells being of various shapes, the nuclei close packed, oval, vesicular or epithelioid. There was no definite grouping of the cells, and round the large venous blood-spaces which abounded in the sections the cells were affected for some distance with hyaline degeneration. The cortical substance of the cerebellum, with its two layers and intervening Purkinje's ganglion cells, were found by serial sections to extend on the outside of the tumour for some distance, the nervous layer gradually becoming thinner and thinner. The cerebellar cortex in the neighbourhood of the peduncle of the tumour showed no microscopic change save thinning of the layer of granules and a certain amount of diminution in the number of medullated fibres. The area occupied by the venous plexus was, save for its presence, healthy, the nerve fibres coming right up to the margins of the large veins. Dr. M'Weeney demonstrated a series of sections from different parts of the growth, stained with Delafield's hæmatoxylin and eosin, picrolithic carmine, Weigert's and Pal's methods, and with Sahli's borax-methylene-blue.

Ovarian Cyst.—Mr. GRAVES showed an enlarged prostate, dilated ureters, and diseased kidneys, with microscopic sections, for the President of the Royal College of Surgeons in Ireland. Mr. Graves also showed a large multilocular ovarian cyst for Dr. Wheeler.

Dry Gangrene of Finger; Lacerated Wound of Heart.—Mr. F. A. NIXON showed these specimens. The dry gangrene of the finger was caused by an incised wound in a patient, a young lady, aged fifteen years. The lacerated wound of the heart was caused by a runaway horse. The patient was brought into hospital. There were four ribs broken on the left side without laceration of lung or pleura. The pericardium was filled with blood, which came from a lacerated non-penetrating wound of the left ventricle.

Reviews and Notices of Books.

International Clinics: a Quarterly of Clinical Lectures. Edited by JOHN M. KEATING, Philadelphia; J. P. CROZIER GRIFFITH, M.D., Philadelphia; J. MITCHELL BRUCE, M.D., F.R.C.P., London; DAVID W. FINLAY, M.D., F.R.C.P., Aberdeen. Volumes III. and IV. Philadelphia: Lippincott. Edinburgh and London: Young J. Pentland. 1892.

WITH the appearance of the fourth volume of this novel and singularly interesting serial its first year of issue is completed; and we cannot but congratulate both editors and publishers upon the general high standard of excellence that has been maintained throughout, and the manner in which the volumes have been produced. All branches of surgery and medicine are well represented, whilst the variety of style and the general practical tendency of the lectures afford an excellent review of the teaching of the present day on each side of the Atlantic. As each volume contains more than forty lectures, nearly all by different hands, the wealth of material must be obvious, and to the practitioner who desires to keep abreast of current doctrine such a collection should be invaluable.

It would be obviously impossible to deal in detail with each of the topics, treated with more or less thoroughness, in these volumes; but perhaps some idea of their contents may be gleaned from a brief notice of a few of the more important. Dr. Hirschfelder of San Francisco describes minutely the procedure for the clinical estimation of the gastric secretion, in a lecture upon a case of Acid Dyspepsia. Professor Gairdner of Glasgow discusses the question of Operative Interference in Acute Intestinal Obstruction—of value for the warning gained by his own experience against regarding stercoraceous vomiting as an absolute indication for resort to surgical measures. The subject of Hodgkin's Disease is reviewed by Dr. McDonnell of Montreal. A practically useful and well-compiled lecture is that on the Examination of the Sputum for Tubercle Bacilli and its bearing on Diagnosis and Treatment, by Dr. Percy Kidd, of the London Hospital. It affords strong testimony to the value of this "sputum test" in diagnosis; but Dr. Kidd points out that it is fallacious as a guide to prognosis. He wisely refers to the extravagant hopes arising out of the discovery of the bacillus as to the effect of bactericidal remedies in phthisis. Drs. Goodhart and Carpenter contribute a lengthy article upon Tubercular Peritonitis, from their experience at the Evelina Hospital. They distinguish three varieties: (1) Matting of bowels associated with tubercular ulceration and caseous disease of mesenteric glands; (2) miliary tuberculosis; and (3) tubercular tumour; and their paper is full of points to be remembered in diagnosis. It may be said that of the thirty-one cases dealt with in the article, fifteen are known to have died, six are "doubtful," and ten "are at present alive and, so far as is known, in fair health." Among surgical lectures in the third volume may be cited one by Dr. Carmalt of Yale University, on a Successful case of Excision of the Cæcum for Malignant Disease; one on Congenital Tumours of the Head and Spine by Dr. W. W. Keen—a Meningocele operated on successfully, two cases of Spina Bifida, and one of Coccygeal Tumour. Mr. R. W. Parker, of the East London Hospital for Children, writes on Chronic Glandular Enlargement in Children and its Treatment, a thoroughly practical paper. Tuberculosis of the Bladder, by Dr. Bryson of St. Louis, and Tumours of the Bladder, by Dr. Watson of Boston, are of much interest, collating the experience of the writers. The views of Dr. Champneys upon Removal of the Uterine Appendages are well known; but everyone will be glad to have his two lectures on this subject which form a dispassionate and careful study of the reasons for and against interference, and a protest against the abuse of an operation which in selected cases may be rightful and necessary. Dr. da Costa of Philadelphia supplies a lecture on Malarial Paralysis, and Dr. Weir Mitchell one on Permanent Headaches, and there is also an interesting study of Adult Chorea by Dr. Dercum. A remarkable case of recurrent exfoliative dermatitis is described by Dr. Blanc of New Orleans.

The fourth volume opens with a memoir of the late Dr. Charles Theodore Parker, whose portrait forms the frontispiece. Dr. Thomas Oliver has an interesting lecture upon the Various Forms of Purpura, containing a description of a fatal case of idiopathic purpura hæmorrhagica, one of purpura simplex, and two of purpura rheumatica. It is noteworthy that one of the latter patients eventually died of ulcerative endocarditis. Dr. Gilman Thompson of New York speaks favourably of the Brand method of treatment of typhoid fever. Dr. Bristowe discusses the subject of Hydronephrosis; and other lectures on renal disease are those on the Last Stage of Chronic Bright's Disease, by Dr. Baumgarten of St. Louis, and on Chronic Tubal Nephritis, by Dr. Danforth of Chicago. Sir Dyce Duckworth contributes a lecture on the Treatment of Acute Pneumonia. Dr. Dennis writes on Gangrene, which he divides into (1) traumatic, (2) idiopathic, (3) infectious, and his lecture closes with rules as to the performance of amputation for gangrene. The subject of Osteotomy for Curved Tibia is dealt with by Dr. F. Willard of Philadelphia; and Mr. John Morgan, of Charing-cross Hospital, speaks on Defective Gait. Mr. G. Peters of Toronto details a case of Tumour of the

Digitized by Google

Spinal Meninges localised in the lower dorsal region "Laminectomy" was performed and the tumour removed, but the patient died on the fourth day. Dr. Nancrede gives the details of a case of Traumatic Epilepsy for which trephining was performed, and sclerosed bone, as well as the centres for the lower face and left side of the tongue, removed. The operation was followed by some transitory aphasia. Dr. E. G. Davis describes the Destructive Operations upon the Fœtus, and the conditions calling for them. Amongst the lectures upon nervous diseases there is an excellent survey of Insanity by Dr. E. D. Fisher of New York; a case of Tumour of the Spinal Cord, described by Dr. J. S. Graham; Hysterical Paraplegia in Children, by Dr. N. Hun of Albany; whilst the Clinical Aspects of Chorea are reviewed by Dr. Carter Gray of New York. Dr. Sidney Coupland, of the Middlesex Hospital, revives Trousseau's term "cerebral rheumatism" in discussing the subject of Hyperpyrexia in Rheumatic Fever; Dr. Græme Hammond of New York writes on Migraine; Dr. Eskridge on Ataxia; Dr. Brown of Chicago on Reflexes of the Brain and Spinal Cord; and Dr. Morris Lewis of Philadelphia on Aphasia. There is an interesting survey of the present aspect of the Leprosy question by Dr. Van Harlingen of Philadelphia, in which it is clearly acknowledged to be a bacillary disease and communicable. "It may be," he says, "transmitted directly from one individual to another, or it may run through a stage of intermediate life, a spore condition, which may flourish in the soil, water, or food, but which can originate only in a leper."

The Practice of Hypnotic Suggestion, being an Elementary Handbook for the use of the Medical Profession. By GEO. C. KINGSBURY, M.A., M.D. Univ. Dub. Bristol: John Wright and Co. London: Simpkin, Marshall, Hamilton, Kent, and Co. 1891.

IN this volume Dr. Kingsbury proposes to give English readers a sketch of the practical applications of hypnotism to disease. As stated in the preface, "it has no pretension to do more than acquaint its readers with the rudiments of practical therapeutic hypnotism, and to warn them against its dangers and difficulties. The book is a general sketch of the entire subject, with special emphasis, however, on therapeutics and practice. It adds but little to the materials afforded by the works of Bernheim, Liégeois, Moll, Heidenhain, Wetterstrand, Krafft-Ebing, Luys, and the host of other recent writers on the subject. But the work is well written and clearly arranged, and will give a fair idea of the subject to those who are only beginning its study. The author writes as an adherent of the Nancy school; he is confident of the practical therapeutic usefulness of hypnotism, and believes that its dangers are comparatively trivial, and not greater than those that attend numerous accepted methods of treatment. It might be suggested that wider knowledge will convince him that in his book he has under-rated the difficulties of the subject and ventured upon dogmatism, when tentative inquiry would be the genuine scientific attitude. Dr. Kingsbury objects to the use of the word "hypnotism." We want, however, some word to indicate the condition on which this heightened receptivity of suggestion depends, and we can hardly hope for a less objectionable word than hypnotism, until we know the physiological basis on which the phenomena depend. We need not follow him through his account of the work of Braid, Liébeault, Bernheim, Forel, Charcot, and others, or dwell upon his description of the phenomena, stages, &c., of hypnotism. He is here upon very familiar ground, and his exposition, if somewhat unduly confident and roseate, is in the main clear and fair.

Dr. Kingsbury gives the following list of affections in which hypnotic treatment is said to have been followed by relief or cure—viz., sciatica, tic, pleurisy, insomnia, headache, indigestion, spasmodic cough, eczema, writer's cramp, constipation, diarrhœa, anæmia, hysteria, hystero-epilepsy, gastralgia, stammering, enuresis, neurasthenia. This strikes us as a rather curious catalogue. That the pain of pleurisy or the itching of eczema may be relieved by hypnotism is very probable, but with our knowledge of the pathology of these conditions it would be utterly futile to rely upon this method alone. The same remark applies *mutatis mutandis* to the case of anæmia. "In one case of apparently established habit of lying and thieving I have seen truthfulness and honesty as apparently rooted after a few hypnotic sittings"! We should be curious to know how the author would prove such an assertion. As regards the alleged dangers of hypnotism, Dr. Kingsbury "has no hesitation in saying that though he has induced hypnosis hundreds of times he has never yet seen any injurious consequences, moral, intellectual, or physical, follow." The last thirty-two pages of the work are devoted to the narration of fifty "illustrative cases," in which the value of hypnotism was, in the author's opinion, demonstrated. We have not space to discuss these cases adequately, but we have weighed them carefully and we must confess they have not made a favourable impression upon us. The evidence is rather loosely put together, conclusions are confidently drawn, and the *post hoc ergo propter hoc* fallacy is somewhat too apparent. The study of hypnotism seems likely to do some good by heightening our estimate of the psychical element in our nature, and giving us clearer views regarding the very real and potent influence of mind on body. That it will ever go beyond this point seems still doubtful, and the attempt at Nancy and elsewhere to erect it into an all-sufficing system of therapeutics seems to us to be a cardinal error which can bring nothing but discredit upon scientific medicine.

Text-book of Comparative Anatomy. By Dr. ARNOLD LANG. Translated into English by HENRY M. BERNARD, M.A. Cantab., and MATILDA BERNARD. Part I. London: Macmillan and Co. 1891.

THE translators in their preface state that this translation may be regarded as the first instalment of the second edition of Professor Lang's "Lehrbuch der Vergleichende Anatomie," as they have had at their disposal his notes, collected for the purpose of emendation and expansion. In a masterly preface which follows Professor Ernst Haeckel tells us that Professor Lang's book was founded on an older text-book by Oscar Schmidt, and was practically its ninth edition, although rewritten on a larger scale. Oscar Schmidt's work resulted from the transcription of Johannes Müller's lectures, and went through eight editions. The present work, therefore, has been in process of construction for over forty years—from the time, indeed, when Müller commenced to compile his famous lectures. The first volume, which alone has as yet been published, covers the ground from the protozoa to the arthropoda, and the plan adopted is to give a systematic review of each race or phylum, in which the various classes and subclasses are enumerated, with an epitome of the characteristic features of each and a list of the chief families of the class. After this some general remarks on each race are made, followed by an account of the body form, and then the various systems are treated in a definite order under the following heads:—Integument and its Appendages; Musculature; Digestive System; Nervous System; Sensory Organs; Vascular System; Excretory Organs; Respiratory Apparatus; Sexual Organs. The chapter is usually brought to a close by a description of the development and phylogeny of the race, followed by an enumeration of the bibliology bearing upon

Digitized by Google

it. Chapter I. commences with an introduction on the cell, and after that the protozoa are systematically described; the last part of the chapter being devoted to the early stages of reproduction and the building up of tissues from one cell, which leads up to a description of the various simple tissues in the animal body. Chapter II. commences with an introduction to the study of the metazoa, and discusses their origin; then the cœlenterata are described, and the chapter ends with an explanation of the law of biogenesis, and of egg segmentation and gastrulation, which prepares the reader to understand the ontogeny of the cnidaria. Chapter III. is devoted to a description of the platodes, and seems to us the best chapter of a very good book. Two or three pages at the end of it are devoted to the influence of parasitism on the structure and development of animals, followed by a definition of strobilation and segmentation. To students of human and veterinary medicine this chapter should be especially valuable. Chapter IV. contains an account of the vermes, or true worms, while V. and VI. are devoted to the arthropoda, the crustacea being dealt with in the first and the rest of the arthropods in the second of these. The illustrations are copious and judiciously selected, they are perfectly clear and in many cases highly artistic; all the letters indicating the different parts are placed at the margin, and do not obscure the drawings. Where diagrams are necessary they are inserted, but as a rule nature is closely adhered to. The type and paper are excellent, and the English clear and readable. The work is brought well up to the present date. Altogether we may congratulate the translators on their successful revision of Professor Lang's well-known work, and may recommend it to all who wish to acquire a scientific knowledge of modern comparative anatomy. We look forward with pleasure to the appearance of the second part.

Analytical Records.

FLUID COCA AND CUCA CHOCOLATE.

(HENSON & CO., BEULAH HILL, S.E.)

FLUID COCA (Henson) is a preparation containing all the essential principles of the coca leaf, and in the course of its production the indigestible and waxy constituents have evidently been carefully eliminated. It yields, on suitable treatment, an abundance of the alkaloid cocaine, contains no alcohol, and is miscible with water or with wines. The liquid is slightly acid to test-paper, is of a clear greenish-brown colour, and evolves, when warmed, a fragrant odour characteristic of the coca leaf. It is clearly a reliable preparation, and may be conveniently used for the extemporaneous preparation of coca wine, or for adding to tea, coffee, aerated water or milk. Cuca chocolate contains a definite quantity of the stimulating and restorative leaf principles in a palatable form convenient for the use of travellers and others.

DR. BANCROFT'S CONCENTRATED BEEF OR AUSTRALIAN PEMMICAN.

(JAMES GRAY, 116, QUEEN VICTORIA-STREET.)

Experience has shown that pemmican, if not tasty, is certainly nutritious. It consists, as is probably known, of a mixture of the best beef and fat dried together. All the nourishing and sustaining principles of fresh beef are, according to our examination, to be found in the above preparation, which in many respects resembles pemmican. Microscopical as well as chemical examination showed the presence of a large proportion of fat together with muscle fibre. Analysis gave the following results:—Nitrogen, 10·17 per cent.; fat, 40·00 per cent.; moisture, 2·12 per cent.; and mineral matter, containing of course soluble phosphate and but little common salt, 4·80 per cent. No objectionable preservatives were detected. From the small proportion of water present in the preparation it is, as might be expected, somewhat hard, and it requires to be stewed for some time and duly seasoned before its flavour can be fully appreciated. It is doubtless a valuable form of portable food. We must take exception to the inclusion of the name of a medical man in the designation of a commercial product.

MALTO-RICINE.

(BURROUGHS, WELLCOME, AND CO., SNOW-HILL BUILDINGS, E.C.)

As its name would imply, this is a compound of active malt extract with castor oil. Under the microscope the preparation is seen to be perfectly uniform and homogeneous until a drop of water is added, when instantly myriads of minute globules of oil separate. While the preparation is quite tasteless as regards castor oil, it affords an excellent and effective medium for the administration of one of the best and safest aperients. The action of diastase upon oils in emulsifying them, and upon many other substances, is still vaguely understood, and the subject might well be taken up as an excellent and interesting one for investigation.

MÉDOC, PAUL DURAND (BORDEAUX).

(HENRY DAUBER, JUN., 19, SWEETING-STREET, CASTLE-STREET, LIVERPOOL.)

A delicate, agreeable, and no doubt a genuine Bordeaux wine. It contains no antiseptics such as are sometimes used for the preservation of French wines, and yields on analysis the following normal results:—Absolute alcohol by weight, 6·65 per cent.; by volume, 8·35 per cent.; residue dried at 100° C., 2·12 per cent.; and mineral water, 0·23 per cent. It is a good, light dinner wine, and inexpensive.

ROSBACH MINERAL WATER.

(THE ROSBACH WATER COMPANY, 4, SUSSEX-PLACE, LEADENHALL-STREET, E.C.)

Natural sparkling waters are without doubt superior to those artificially produced. The carbonic acid gas contained in them is generally perfectly pure, and has probably been in contact with the water for a very long time and at a very great pressure; the water is consequently more permanently impregnated with the gas. Rosbach water is bottled at springs near Homburg; it is agreeably soft and clean to the palate, and belongs to the class of mineral waters known as mildly alkaline. On evaporation it yields 127·6 grains per gallon of mineral residue, consisting chiefly of carbonates of magnesium, calcium, and sodium, together with the chloride of the last-named metal. The solids are without change on ignition, so that the water may be taken to be free from organic matter or matter that readily undergoes charring.

MEDICINAL TOKAY.

(W. BURROWS, 243, BROMPTON-ROAD, S.W.

A choice wine of characteristic sweet, sherry-like taste, and exhibiting chemically the composition of genuine Tokay. The residue dried at 100° C. amounted to 19·85 per cent., consisting mainly of saccharine matter, and the mineral constituents to 0·45 per cent. The wine yielded on distillation 10·00 per cent. of absolute alcohol by weight, or 12·40 per cent. by volume. There is indication of the wine being of an honest kind, and it may accordingly be used, as recommended, for medicinal purposes.

MAIZE BREAD.

(THE NATIONAL FOOD REFORM SOCIETY, NEW-CROSS, S.E.)

Well cooked, beautifully white, of uniform texture, keeping moist for a longer time than, though not so palatable as, good wheaten bread, are our observations concerning this specimen. The loaf is said to contain 25 per cent. of malted maize, which has the property, it is claimed, of keeping the bread moist for a considerable period. It must not be forgotten, however, that the addition of maize flour must naturally reduce the proportion of certain valuable and essential constituents belonging to wheaten bread. Thus maize flour contains much more starch than wheat flour, far less nitrogenous and mineral matter, and no fat.

THE LANCET.

LONDON: SATURDAY, JUNE 11, 1892.

WE present to our readers to-day, by way of Supplement to THE LANCET issued in support of the Hospital Sunday Collection which is appointed to be made on Sunday, the 19th inst., a statement showing, as well as we are able to exhibit it, what has been in recent years, and still is, the growth of hospital work in the metropolis. The results, though striking enough for their magnitude and significance, will not surprise those of our readers who have been accustomed to keep their information abreast of the facts as to the movements of the population amid which we live. But they can hardly fail to arrest the attention of all, and to the great public, for whose information, and with the intention of securing whose active support our supplement is specially written to-day, our facts and figures will come home not less as matters of new than of strange and wonder-stirring interest. Among the subjects upon which we have this year sought information from our various correspondents, the hospital work of twenty years ago occupies a conspicuous place. The inquiry was one to which it must of necessity be impossible to obtain a full answer, as we indeed *foresaw*, and we desire to record our thanks to the various secretaries and other hospital authorities who have, at no small pains to themselves, supplied such information as was available for the purpose. Indeed, our acknowledgments are due not only to those who have dealt with this branch of inquiry, but also to all who have assisted us, and to whose support we have on this, as on former occasions, been indebted for the substance of our appeal. But notwithstanding the pains taken to further our purpose on the part of our various friends, it has proved quite impossible to compile anything that could afford a basis of statistical comparison between hospital work in the metropolis twenty years ago and now. There are gaps in our statistical tables which we regret, but which we feel sure are due to unavoidable causes and not to any unwillingness on the part of hospital authorities to coöperate in our work and assist our efforts. To judge from the general impression conveyed by a perusal and comparison of the reports sent to us, it must be admitted that private beneficence does not appear therefrom to have grown in proportion to the growth of population; and although, as we state elsewhere, there does not seem to be any general falling off in the private subscription lists, which, on the contrary, show upon the whole an advance, yet the advance is certainly less than the well-wishers of hospitals would desire, and less probably than might have been reasonably expected. On the other hand, it must be borne in mind that since the date specified there has been a very great increase in the number of new institutions. The Post-office Directory for 1872 contained the names of seventy-five hospitals and forty-eight dispensaries established in London. The same authority in the present year gives a corresponding list of one hundred and two hospitals and one hundred and nineteen dispensaries. Here, then, is an increase in point of number of thirty hospitals (nearly 50 per cent.) and seventy-one dispensaries (nearly 150 per cent.), and, as most of these institutions come upon the purses of the charitable, it is easy to understand that their competition keeps down the growth of subscription lists to the older institutions, and that any estimate of the amount of public beneficence which did not take account of this fact, but rested wholly on a comparison of the incomes of particular institutions then and now, would be apt to be exceedingly misleading. We are not, therefore, disposed to accede to the view that public charity has decayed, or is decaying. It is natural enough that those who are engaged in the anxious and often disappointing work of gathering in the offerings of the people should be apt to take this view; but if we can induce them by the presentation of these facts to take a more hopeful view, we shall ease their minds, and certainly not increase their difficulties.

Turning from the past to the immediate future it is not possible to avoid a certain anxiety for the success of the forthcoming collection. In the first place it must be borne in mind that the success of former collections—the record of which must be beaten before success can be registered in this present year—has been obtained at the cost of great efforts on the part of all friends of the Fund, and the present task cannot be discharged without at least an equal effort. Then, again, we must naturally remember at such a time the stalwart support which has for many years past been given to the movement by some whose strong and effective aid is no longer available. The names of Cardinal MANNING and of Dr. ALLON will at once suggest themselves as representing the ravages of death. Still, new years bring new men, and we trust that the successors of those whose services have been lost either by death or other causes will prove to be not less helpful than were those others whose places they have taken. And in this connexion we will venture to repeat an appeal which we made last year to our professional brethren in the metropolis to make this cause their own. We then reminded them that they, above all men, can speak with authority concerning the work and the claims of the hospitals and medical charities and that their advocacy will carry a very special weight. It is gratifying to us to know that to that appeal a most generous response was made, and that some of the very largest contributions which reached the treasurer's hands in 1891 were the direct results of the advocacy of members of our profession. It is, therefore, with a well-assured confidence that we renew the appeal to-day, and ask, not only for their personal contributions, which will be forthcoming in any case, but also for their good word and influence with patients and friends, a matter of scarcely, if at all, inferior practical importance.

IT is satisfactory to find that the Association of Members of the Royal College of Surgeons of England is not discouraged by the unfortunate termination of the action STEELE *v.* SAVORY. We say unfortunate not so much on account of the summary decision of Mr. Justice ROMER in favour of the defendants—for law is proverbially uncertain, and the best of causes may suffer temporary discomfiture,—but chiefly because the heavy costs incurred in carrying on

Digitized by Google

the suit are very disproportionate to the value of the action, and must tend to cripple the resources of the Association in the prosecution of more hopeful plans for the reform of the constitution of the College. Until the costs of the action are defrayed the Association cannot direct its undivided attention to the elevation of the constitutional position of the Members of the College, and we would again urge upon the Members of the College generally that duty and interest alike require some contribution, however small, towards the expenses of the action. A few of the most ardent reformers have contributed liberally to the fund, and the Association has found a most generous friend in the treasurer, Dr. DANFORD THOMAS; but it is not right that a burden of this nature should be borne only by a few, when its distribution amongst a large number of Members would not be felt by any. Three or four thousand subscriptions of half a guinea each would wipe off the obligation, and leave the Association with money in its coffers and free to prosecute the campaign in earnest. "Although," says Dr. DANFORD THOMAS, "in the law courts the Association of Members has been defeated, the justice and reasonableness of its claims remain the same, and efforts will now be directed to the furtherance of the Bill in Parliament with which the Members are familiar, and all other legitimate means used until success is ultimately secured." This is the proper course for the Association to pursue, and success is by no means so remote or so unlikely as some in the hour of defeat may have considered it to be. The Members of the Royal College of Surgeons of England in reality constitute the Corporation, and it is out of the funds which they have contributed and are contributing that the College is maintained. To the Members of the College, who number at the most moderate estimate 12,000, the College is indebted for the weight and importance which are attached to the deliberations and decisions of the Council of the College. Yet these 12,000 medical men—a highly educated and intelligent constituency—are as absolutely destitute of any voice in the management of the College and the election of the Council as medical men who have no connexion whatever with the institution. They are treated in the same way medico-politically as the occupants of gaols and the recipients of parish relief are treated in the body politic. It is not to be supposed that in the nineteenth century this condition of things will be permitted to continue. There will come a time when, under other conditions, the whole fabric of exclusion will fall like a pack of cards. It is not probable that the existing condition of affairs could survive very long after a full and fair discussion in Parliament, and it is undoubtedly the right policy for the Association of Members to pursue to promote a Bill in the next Parliament for the amendment of the constitution of the College. We cannot agree with Mr. LAWSON TAIT that the recent action of the Committee of the Association of Members has in any way rendered it impossible for him or anyone else to fight the battle of the Members. If the Committee had appealed against Mr. Justice ROMER'S decision, the probability is that the costs would have been increased and the decision confirmed. The abandonment of an appeal was the result of high legal advice, and coincided with the views of almost everyone who has thought and written on medical politics. The only means by which the grievances of the Members can be redressed are either the action of Parliament or the convictions of a majority of the present electoral body of the Fellows that the claims of the Members are just and reasonable. If Mr. TAIT wishes to help the Members he should secure a seat on the Council of the College; and it is by no means certain that he could not obtain even now votes enough to carry him into the Council whilst adopting the liberal platform which he has always professed. In 1889 justice to the Members was made a leading feature by Mr. TAIT and others, and he polled almost as many votes as he did last year. The too radical character of the Bill then promoted by the Members' Association aroused the fears of the Fellows, who evidently strongly objected to being swamped entirely by the Members of the College. Under the most discouraging circumstances from 150 to 180 Fellows voted in favour of the representation of the Members on the Council of the College; and it is very unlikely that the opinions of the Fellows will become less liberal as time rolls on; for whilst the position of the Fellows in relation to the Council and the College is sure to improve, the position of the Members must advance *pari passu*. We ground this opinion on the fact that as every individual belonging to the Corporation must be a Member, privileges cannot be granted to one section of the Members—the Fellows—without being claimed by the Members at large. If the Council consults the Fellows on any question it cannot legally refuse to consult the Members. If it did, there would be a distinct grievance, and the more grievances there are, the stronger will the case of the Members become. Absolute exclusion of the men who are the backbone of the College from all voice in the management and expenditure of the College is an anachronism so pronounced that only patience, perseverance, and determination on the part of the Association of Members are required to ensure the success of their reasonable and righteous cause at no distant date.

THE prospect of the International Medical Congress of 1893 in Rome is likely to direct the attention of the medical world in an unusual degree to Italy during the next twelve months. A brief survey of the condition of that country with regard to the prevalence of one of its chief scourges—malaria,—as revealed by the most recent official information, will not be without interest to our readers. The present generation of medical men are apt to forget that time was, and not so very long ago, when ague pressed heavily upon the population of these islands and formed one of the most serious items in the annual bills of mortality. The progress of agriculture, the drainage of marsh lands, the general elevation of the average standard of comfort amongst us, have done much to banish it; but there are still districts which are, at least by comparison, distinctly productive of ague, such as Huntingdon, Cambridgeshire, and parts of Kent and Surrey. In the main, however, the improvement in this respect in the British Islands is most notable, and no doubt many medical men in different parts of these islands pass many years of active practice without once seeing a case of indigenous malaria.

Very different is the state of Italy, which ranks among the

Digitized by Google

countries in Europe in which ague is most prevalent The deaths from malaria in that country amounted (according to Dr. DAVIDSON) in one year—viz., 1887—to 21,033, which would give the very high rate of 700 per million living. When we point out that this is *only* slightly below the mortality which scarlet fever causes amongst ourselves, it will be seen how important a *rôle* malaria plays in the pathology of Italy. The prevalence of the disease varies greatly in different localities and at different periods of the year. According to the authority just referred to, the most malarial districts are Basilicata (the region just north of the Gulf of Taranto), Calabria, Sardinia, Apulia, and Latium, while the disease is less prevalent in the districts of Liguria, the Marches, Tuscany, Lombardy, Umbria, and Piedmont. The variations are notable. Thus Basilicata shows a proportion of 822 deaths from malaria to 10,000 deaths from all causes; Latium, a proportion of 490; while the rate falls to 52 in Tuscany, 38 in Lombardy, and 7 in Liguria. This last figure is very reassuring to the vast numbers of invalids and tourists who annually seek health and relaxation in the Riviera and along the beautiful shores of the Gulf of Genoa.

The rates of mortality from malaria in the various Italian towns bring out many interesting facts. Rome indisputably takes the first place of all the large cities. The rate there is about 12 deaths from malaria per 10,000 of the population, which compares very unfavourably with the rate of 5 in Messina, 1·9 in Palermo, 1·2 in Milan, 0·9 in Venice and Naples, 0·2 in Florence, and 0·1 in Genoa. We were scarcely prepared to find the bad pre-eminence of Rome so decided, or for the remarkably good place taken by Venice, Naples, Milan, Florence, and Genoa. It will be seen from these figures that temperature alone will not account for the varying degrees of mortality from malaria, although on the whole the northern parts of the country suffer much less than the southern. We can imagine few more interesting problems in geographical pathology than the working out of the causes of this disparity. The salubrity of Venice is remarkable. Dr. DAVIDSON rather ingeniously suggests that it may be regarded as very much in the position of a vessel anchored out at sea.

There seems ample evidence of the good results which have accrued in various parts of Italy from drainage, and also from preventing the admixture of fresh and salt water in the lagoons of the littoral districts. Malaria has waxed and waned in many places just in proportion to the efficiency with which such measures have been adopted and kept in operation. Of the various forms of malaria in Italy, quotidian remittent fever is the most frequent amongst newcomers. Tertian takes the first place amongst residents, and quartan and other varieties are less frequent.

Very curious are the facts regarding the prevalence of malaria in Rome and the Roman Campagna. The most densely peopled and filthiest regions in the central parts of the city suffer least, while "the less densely peopled suburbs, where the houses are few, well built, surrounded by gardens, and apparently answering the conditions required for perfect salubrity, are extremely unhealthy. In the Campagna fever exists independently of any marsh. In this plain there are only a few cultivated spots. The danger of encountering the exhalations is such that the harvesting has to be done, as it were, stealthily, and with precipitation, in order that the sojourn in the plain may be as brief as possible. It seems as if each harvest were "a sort of larceny committed upon this murderous soil." Still worse than the dry plain are the neighbouring marsh lands of Ostia and the Pontine Marshes.

We confine ourselves at present to the mere question of the localisation of malaria, but we must not leave the subject without some acknowledgment of the excellent work accomplished by Professor MARCHIAFAVA and Dr. CELLI in investigating the pathological conditions present in these cases. The subject of melanæmia, the elucidation of which owes so much to their researches, is one of great interest and importance.

Italy must always possess supreme interest to the artist, the poet, the historian, and the student of human progress and development. Her "dono infelice di bellezza," of which FILICAIA sings, has contributed to make her the scene of many of the most stirring events in human history, and her attainment during recent years of an assured place amongst the great Powers of Europe has nowhere been more sincerely hailed than in Great Britain. She has still many great problems—social, economic, and political—awaiting solution, and amongst these few touch more closely the happiness and well-being of her people than the measures to be taken to abate in her midst the prevalence of the great, but preventable scourge of malaria.

THE reassembly in Paris of the late Venice Sanitary Conference gives some hope that the difficult question of the sanitary control of shipping in its passage from the Red Sea into the basin of the Mediterranean at last approaches a point when it bids fair to be solved. Again and again for the past thirty or forty years have the various European Powers assembled in conference on this subject, and although they have on each new occasion suggested restrictions which savoured less and less of severity, yet the adhesion to quarantine as the basis of such restrictions has always prevented this country from consenting to be a party to any convention dealing with the subject. The Venice Conference in January last was evidently intended by our Government to be, in the main, a work of diplomacy, and the delegates representing this country were chosen accordingly. But France at once flung down the gauntlet and demanded that the question should be controlled by considerations of public health, and the other Powers, finding that the French had already prepared a code on this basis which was much more acceptable to them than the diplomatic arrangement that had been contrived between Austria and England, at once determined to discuss the French proposals. These, after having been materially modified and improved in the direction of such leniency as England always aims at securing, were signed by all the Powers represented except England and Turkey. For awhile, it was hoped that England's assent was only temporarily withheld, but it soon became evident that there was no chance of securing it except as the result of a further substantial modification of the convention arrived at in Venice. Hence the present reopening of the confer-

Digitized by Google

ence in Paris. On this occasion the matters under discussion appear to be essentially medical ones, and though the three Powers that are represented at it—namely, Austria, France, and England—have each appointed a diplomatic delegate, yet it is generally understood that it is the technical delegates—namely, Dr. THORNE THORNE, Professor BROUARDEL, and Dr. PROUST—with whom it mainly rests to arrive at such conclusions as will be acceptable to the French and English Governments. Should such a result be attained, it is to be hoped that the other Powers will assent to the conclusions arrived at by the two countries whose interests in the Suez Canal and in the Mediterranean altogether outweigh those of the other European Governments. We have learnt from our Paris correspondent that, according to French views, the French delegates have done very much to meet the demands of England; and that the point on which this country is most sensitive is the detention at Suez of persons who, though as yet healthy, are looked upon as suspect because they happen to be on board a vessel on which there has been cholera between the date of its departure from Indian ports and its arrival at Suez. No one would pretend that, even were the safety of the passengers alone concerned, such vessels ought to be free from all restrictions; but we have a strong conviction in this country that absolute cleanliness and such disinfection as is capable of being carried out on a properly appointed vessel is practically sufficient to do away with such risk as attaches to the existence at some antecedent period of the journey of one or two odd cases of cholera. And, as a matter of fact, we know that for a long series of years so-called infected vessels have not constituted any danger to the Mediterranean or to our own ports, even when all the so-called suspected persons have been left on board. Under these circumstances it is but natural that England cannot consent to any wholesale landing from her vessels of these persons on the shores of the Red Sea, merely because other nations dare not admit their own vessels into their own ports under similar circumstances. The reopening of the Conference seems to suggest that the demands of France in this respect may be curtailed, and that England may make some advance with a view to meet them; and the visit of the British delegates to the Foreign Office last week to confer at home on the new points raised again implies that matters are proceeding more satisfactorily than at any previous Conference. Since the return of our delegates to Paris a further sitting of the Conference has been held. We learn that the most cordial relations exist between the several delegates, and that the French delegates are willing, beyond any former occasion, to give such facilities to England in the passage of the Suez Canal as is demanded both by her commercial interests and her well-known advance in public health, whether on shore or at sea. France is, we think, herself recognising as she never has done before how quarantine may without risk be superseded by efficient sanitary control. Years ago it was sought to abolish the word quarantine; but it was impossible, for the system was retained under a new title of "observation." Now, at last, there seems a chance that, as regards the Suez Canal, all semblance of the ancient system may disappear. England is not particularly discontented with the Egyptian restrictions as now imposed; but the Alexandria Board possesses powers far in excess of those she at present exercises, and on the advent of any cholera scare in Europe there is no knowing what severities might not be reproduced. For these reasons alone we shall be thankful to find that France and England are of one mind in this matter. Their joint influence on the remainder of Europe must certainly be considerable.

Annotations.

"Ne quid nimis."

METROPOLITAN HOSPITAL SUNDAY FUND.

WE would remind our readers that the annual public meeting at the Mansion House in support of the Hospital Sunday Fund has been convened by the Lord Mayor for Friday, June 17th, at 3 P.M. Mr. A. Egmont Hake will deliver the address, and be supported by several influential speakers. We trust that there will be a large attendance of the public in general and members of the medical profession in particular. Nothing can prove more strongly the deserving character of the movement than the interest taken in it by our professional brethren.

THE COUNCIL ELECTION AT THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

WE would remind Fellows of the College who are thinking of becoming candidates for the Council of the College that the 13th inst. is the latest date for sending in nomination papers. The advertisement of the meeting of Fellows for the election of councillors appeared on Friday, the 3rd inst., and every eligible Fellow desirous of seeking a seat in the Council should within ten days from the publication transmit or deliver "a duly signed notice to the secretary of the College." That this reminder is not superfluous may be inferred from the fact that last year one of the intending candidates forgot to send in his papers till the eleventh hour, when several Fellows met at the College to sign a nomination paper for the forgetful candidate, and telegrams and special messengers were despatched in every direction and extraordinary arrangements made for the reception of the declaration of the Fellows for the purpose of conforming to the letter of the by-laws. Up to the present time the names of eight intending candidates have reached us. In addition to Mr. Thomas Smith and Mr. A. E. Durham, who desire to be re-elected, the names of Mr. Cowell, Mr. Warrington Haward, Mr. McCarthy, Mr. Howard Marsh, Mr. Henry Morris, and Mr. John Tweedy have been reported to us. If all these candidates go to the poll, the election will be a very open one; but of course at the last moment some of the names may be withdrawn. It is to be hoped that candidates who intend to withdraw will not leave their retirement to the last moment, but will withdraw before their names are printed on the voting papers or published in the *London Gazette* and two London daily newspapers. This publication must take place not less than ten days before the day appointed for election. As the *London Gazette* is issued on Tuesday and Friday, the publication will probably be made on Friday, June 24th. Until the names of the candidates appear in the *London Gazette* it will not be possible to say positively what candidates will go to the poll, and we shall defer comments upon the claims of the candidates until the process of natural selection and survival of the fittest has worked itself out.

DISPARAGEMENT OF MEDICAL CERTIFICATES.

THERE is a disposition to make too much of Mr. Justice Hawkins' reflections on the value of medical certificates. Even judges sometimes speak in haste and make all the members of a body suffer for the sins of two or three of its members. This is, at any rate, not very judicial. If a judge is dissatisfied with a medical certificate or suspects it, he has the power to require an independent one. There is a disposition in some quarters to attribute all the financial embarrassments of benefit societies to the carelessness with which the medical officers give medical certificates, failing to detect malingering, and other deceptions. We should require better evidence of this than has appeared. We could have no sympathy with medical men who, to curry favour with members of benefit societies, give them false certificates of sickness. If the scale of such false certification is anything like that alleged as obtaining in a certain society, the authorities should prove it by a careful investigation of cases by an independent examiner. We should like to know more particularly from whom false certificates do proceed, whether from registered practitioners or from unregistered. It is only necessary to demonstrate such a breach of morals to the Medical Council or the examining board from which the practitioner holds his diploma to bring down on his head severe censure, and possibly to ensure the erasure of his name from the Medical Register. And in taking such a course the Medical Council or the examining bodies would have the full sympathy of the profession. Only there must be evidence. We deny that evidence on any such scale as to affect the general value of medical certificates has been produced. We shall hear from medical men their answer to these charges.

SUCCI'S MADNESS.

THE Italian fasting-man has succumbed to the fate which many of his compatriots anticipated for him—he has lost his reason and is now an inmate of the Asylum of Saint Anne in Paris. It is not so long ago that he was in London repeating, or attempting to repeat, the continuous abstention from food which had procured him such notoriety in Florence and elsewhere. He broke down, it will be remembered, and the failure to accomplish the self-imposed feat preyed on his mind, which, at the best of times, could never be called sound. From London he repaired to Paris, and there, it seems, such mental sanity as he preserved gave way, and, after comporting himself in an obstreperous and even wild manner on the Boulevard des Italiens, he was removed by the Commissary of Police, protesting that he was the "Emperor Cæsar." This was on the night of the 29th ult.; but some days before he had been observed by his Parisian neighbours to be dejected, taciturn, and troubled—in the state, in fact, which usually precedes an outburst of mania. At the infirmary of the depôt to which he was taken by the Commissary his demeanour became hourly more excited, and he passed the night in a furiously maniacal condition, shouting, gesticulating, and blaspheming in the polyglot dialect of which he is a master. Seen next day at noon by Dr. Garnier, he was pronounced to be labouring under the form of mania known as "religious persecution," not actually dangerous to himself or to bystanders, but apt, in all likelihood, to become so. This development of insanity is often a derivative from what Italian alienists classify as "megalomania"—the madness of self-exaltation, of which, in the spring of 1888, when he performed his great fasting feat in Florence, he betrayed the premonitory symptoms. Those who saw him at that time, watched night and day by relays of medical undergraduates in his room attached to the Istituto di Studi Superiori, could not fail to detect the diseased self-importance which characterised his demeanour and conversation, more particularly when he attempted, in the daily ride allowed him under surveillance, to cross the path of Her Majesty Queen Victoria, whose notice he did everything to attract. No doubt the nutrition of his brain was seriously affected by his abstinence from food, and the inhibitory paresis that must in any case have overtaken him was accelerated, if not actually invited, by the practice. We trust his fate will act as a warning to those who would follow in his footsteps, and deter them from a repetition of feats which have long ago yielded whatever scientific fruit they were capable of bringing forth. Certainly, of all the "careers" known to a century prolific in eccentricities the stupidest, if not the ignoblest, is that of the professional fasting-man—earning his bread by refusing to take it!

SIR GEORGE HUMPHRY ON THE NEW CAMBRIDGE SCHOOL.

SIR GEORGE HUMPHRY on the "Medical School of the University of Cambridge" is like Cicero "Pro Domo Sua"—discoursing on the subject of which he, of all others, is best qualified to treat. The great seats of learning on the Isis and the Cam, till late in the present century, maintained an attitude to the medical sciences by no means in keeping with their position as Universities, with the resources at their command, or, in short, with their duties as representatives and foster-mothers of post-Renaissance culture. Competition, however, an equivalent for "that blessed word compulsion," forced them, in self-defence, to recognise the daily growing claims of medicine as a science, and even as an art, and, not a moment too soon, they widened and deepened their curriculum so as to supply the training, professional and still more pre-professional, for which the young medical aspirant had had previously to repair north of the Tweed or across the Channel. At Cambridge a beginning was made in this direction sixty years ago, when a building for anatomy and medicine was established in Downing-street, and about the same date a nucleus of an anatomical and pathological collection was formed in the museum. At that time, however, the pupils were few in number—"no more than four or five annually," says Sir George Humphry—and not till a generation afterwards, when regular clinical teaching was made possible at Addenbrooke's Hospital, and practical anatomy, with physiology, minute anatomy, and comparative anatomy, received something like due attention, did the medical student find it worth his while to prepare for his profession on the banks of the Cam. It was the institution of the Natural Sciences Tripos in 1857, however, as an avenue to medicine that put Cambridge on the lines upon which she has continued to advance as a great medical school. With the increased influx of students her teaching became subdivided and perfected, her examinations were made more stringent and more practical, and fresh professorships, lectureships, readerships, demonstratorships, and assistantships were from time to time added to meet demands. At the present moment, indeed, she can point to an excellent medical teaching staff, and the education she can now supply to the student finds yearly a more extended appreciation, till in point of attendance in her class-rooms she ranks as one of the largest medical schools in England. To have "qualified at Cambridge," indeed, is about as valid a certificate of proficiency as the academic world can show, implying as it does a previous grounding in classics and mathematics, followed up by a superstructure of physics, chemistry, and biology, and thereafter by further courses of anatomy and physiology, such as no other seat of learning can surpass before "crowning the edifice" with strictly professional qualification in medicine and surgery. These pre professional studies she carries on

Digitized by Google

under peculiarly favourable auspices, away from the distractions and temptations of life in great cities during the "years of April blood," in surroundings which, according to Mark Pattison, should be those of "University and poet's garden" alike—"not wholly in the busy world, nor quite beyond it." The aroma of academic culture never leaves the professional man whose early impressionable manhood has been attained in "the ampler ether, the diviner air," of a fully equipped University, redolent of the *spolia opima* of centuries of moral and intellectual triumphs; and with the character, the mental tone thus formed, he enters on the specially qualifying course—that of clinical observation and research in the hospitals, of which London offers the largest and completest supply. Medicine proper, surgery, and gynæcology, the next stage in the Cambridge student's career, find him, therefore, in the metropolis, with formed habits of study, with a high standard of proficiency—with, indeed, all the pre-requisites of that "complete professional mind" on which Sir Henry Acland has so eloquently insisted. He is thus at a very considerable advantage over the student who, however able and enthusiastic, has had no University career or associations, but has simply passed from the public school to the teaching staff connected with an urban hospital. Still more is he fitted to profit by attendance at the great continental cliniques—such as Berlin, Vienna, or Paris—and to perfect himself by familiarity with the methods and the practice of European schools for the position of consultant in the most cosmopolitan of all professions. In summing up the opportunities and advantages Cambridge can afford the aspirant to the higher medical honours, Sir George Humphry gives reasons as cogent as they are candid for the attractions she yearly holds out to an increasing number of students; for admitting that London and the chief cliniques abroad are simply indispensable for the training which must precede all practice at the bedside, he makes it no less clear that the well-disciplined mind, such as a University has special means of forming, is equally indispensable for profiting by that training to the full. "A great physician is a great artist" is a true and a memorable saying; but, unless history belies herself, the great artist, whether in medicine or in any other professional calling, has incomparably the better chance of excelling if his native aptitude has been developed and reinforced by early proficiency in the culture on which his peculiar art depends.

SLEEPLESSNESS.

WHETHER, as appears likely, sleeplessness is more characteristic of our own days than those of our predecessors, or that, in accordance with a scientific fashion, it is now more noticed, we certainly hear of its prevalence with somewhat startling frequency. The nostrums proposed for the cure of this disorder are numerous. Many, if not most of them—we do not for the moment speak of narcotic drugs—are empirical, and are cast upon the public intelligence without any conscious reference to causes actually at work upon the brain and other nervous tissues. It does not necessarily follow that they are valueless, and we should no more think of repudiating their ordinarily legitimate exercise than of refusing the occasional aid of such medicinal agents as may be trusted safely to discharge the same needful function. It is to be understood, however, that we would, wherever possible, avoid, and replace by simpler non-medicinal methods, even such occasionally useful aid. This attitude is but rational, if we consider that the true object of treatment is never by choice merely palliative, but curative, and for cure there is needed the detection and removal of an active cause. The revelation of the causes of insomnia is, indeed, no simple matter. Thus much, however, we may say—namely, that just as the state of the brain in normal sleep implies a quiescent cerebral circulation somewhat reduced in volume, so in those whose nights are habitually restless we shall commonly find a condition of cerebral vascular tension. This, let it be noted, is not incompatible with general anæmia or with defective brain nutrition. There is, indeed, nothing so conducive to local vascular congestion as the constant exercise of a weakened organ. Mental worry thus acts upon the jaded brain, and we need not wonder, therefore, that it "murders" sleep. The true means of relief is as clear as it is often impossible. In such cases, however, and still more in others where adequate, or even more than adequate, nutrition is maintained, we find a simple and ready antidote in physical exercise. Muscular activity, in fact, may be employed to balance nervous irritation. In it we provide a means of counter exhaustion. There is a transference of vascular excitement, and of tension, with corresponding relief at the site first affected. Further, the same process implies a stimulation of the general metamorphic energy and the removal from the tissues of irritant excretable products. This brings us to another cause of insomnia, particularly of that which we sometimes observe in the gouty and rheumatic. It is probably on the ground of removal of such superfluous substances that we must explain the salutary action of the traditional "night-cap" of hot water, or the boiled onion, a stimulant of the kidney, at supper. Where mental over-activity or irritation has to do with insomnia, the influence of change—that is, of a change in thought—should have a trial. It is no doubt a blind groping after this remedy that induces some to read themselves asleep. Better in several ways is the practice introduced by the German Kant, who spent some time before he retired for the night in cutting off by an effort of thought each mental occupation of the previous working hours. We might, however, multiply the stock of remedies without meeting all possible needs. The desirable course for any sleepless unfortunate to adopt is obviously not to resort to sedative drugs to allay his distress, but to seek the advice of his trusted medical attendant and its remedy in the discovery and the removal of its cause.

THE HYGIENIC EXPOSITION AT MILAN.

EARLY in the year we drew attention to the "Esposizione Medico-Igienica," which it was proposed to organise in Milan in the ensuing summer, and we referred to the novel features which would make it in some important respects unique among exhibitions of the same kind. These anticipations have been fully realised, as the numerous public which has thronged its departments ever since its opening on the 30th ult. continues to attest. The Museo Civico has been set apart for it by the Municipality, while the coöperation of the Government, represented at the inauguration by the Prefect of Milan, has stimulated competition by the facilities placed at the disposal of exhibitors from all parts of the peninsula. No more significant proof of the advance Italy has made in hygiene, public and private, could be put *en évidence* than the ample and varied assortments of mechanical, chemical, surgical, and orthopædic appliances now on view in this her latest and best organised exhibition. She has profited by comparison of her own resources in sanitation with those of other States, European and transatlantic, and, while adopting and sometimes improving upon their special products, she has contributed others of her own, from which they, in turn, have not a little to learn. Notably is this the case in the sections devoted to the *armamentarium* of the Red Cross, a movement which, with justice, we believe, she claims to have suggested and set on foot, long before its international recognition by the Geneva Convention. In keeping with this parental pride in it, she has brought to the

Digitized by Google

amplification and the perfecting of its contrivances for raising the wounded from the battlefield, for transporting them to the stations of first assistance, and for their clinical tendance and treatment in ambulance, an ingenuity, a patience, and a success which recall the proficiency she displayed in surgery and medicine during the best years of the Renaissance. The "Sezione del Sotto-comitato Milanese della Croce Rossa" (Section of the Milan Subcommittee of the Red Cross) is, in fact, the most striking and attractive feature of the whole exhibition, as is evidenced by the full and continuous flow of visitors who gather round its novel and really artistic "objects of interest" throughout the day. Admiration seems divided between the new "Ospedali da Montagna" (mountain hospitals), fitted up for fifty beds apiece, with the most ingenious contrivances for combining convenience and comfort with lightness and mobility, and the hardly inferior ingenuity shown in the "Ambulanza Fluviale" (river ambulance), or means of transporting the wounded in war *viâ* the waterways, natural and artificial, by which Lombardy, for example, is intersected. A full description of this latter addition to the resources of the Red Cross has already been given in our columns; and now these resources are on the high road to completion by the contrivance of light hospital railways to run in correspondence with the network of transport by water, as already systematised from the Lago Maggiore to the mouth of the Po, and including ample canal communication between. Milan, indeed, has taken the initiative in utilising these "silent highways" for Red Cross mobilisation, as was fully admitted at the general assembly of the Croce Rossa Italiana held on the 30th ult. in Rome. But her supremacy in sanitarian and hygienic progress is not confined to that movement. Her "Esposizione" affords proof, enough and to spare, that the lead she assumes in commerce and industry has its counterpart in science—especially in the mechanical *matériel* of public health and its administration. Those of our readers who can command the time, or whose presence in Switzerland or at the Italian Lakes puts them within easy distance, might profitably devote a few days to this exhibition, worthy as it is of the best traditions of the Lombard capital under the fostering care of young Italy, united and independent.

EXCRETION OF UREA IN BRIGHT'S DISEASE.

IT has long been known that the daily excretion of urea is diminished in Bright's disease, but it is not a universally acknowledged fact that this symptom precedes the other positive evidences of the disease for a considerable period. In the *American Journal of Medical Sciences*, vol. xcii., p. 22, Dr. C. J. Bond, of Richmond, Ind., maintained three years ago that this was the case, and published fifty cases illustrating his views. Four of these cases, besides showing a diminished daily excretion of urea, passed large quantities of albumen, with casts in the urine. They proved fatal, and in three of them, in which post-mortem examinations were made, chronic interstitial nephritis was found. Three more of the cases showed diminished secretion of urea, but no albumen or casts were found in the urine; and one of these was proved after death to have been suffering from nephritis. Three other cases that died likewise had diminished urea excretion, but only passed albumen and casts in the later stages of the disease. A necropsy was obtained in one of these cases and showed chronic nephritis. The remaining forty cases recorded, were all living at the time of the report. All had symptomatic evidences of Bright's disease, eighteen had albuminuria, sixteen of them passed casts, but in all the excretion of urea was diminished. Upon these grounds Dr. Bond claims that diminished excretion of urea is an evidence of Bright's disease, and the earliest certain symptom. But for this sign to be of importance the patient must be upon a mixed diet, and the diminution of urea must exist during a considerable time as shown by frequent examinations. Extending his researches, Dr. Bond[1] has called attention to the relation of urea excretion to disease of the serous membranes. It is well known that Bright's disease is often complicated by a sudden effusion into the pericardium or pleural cavity. It occurred to Dr. Bond that inflammations of serous membranes might at times be caused by latent Bright's disease—that is to say, by the conditions preceding the manifestations of the disease; and if so, such cases could be differentiated by diminished urea secretion, and upon actual examination he found this to be true. One of the most interesting cases which he reports in this connexion is one of acute pelvic peritonitis in which no specific history, no previous pelvic troubles, and no traumatic or other cause could be found. The attack commenced with chilly sensations and acute pain in the abdomen, followed by serous effusion. The case terminated in recovery, the effusion being absorbed; but the patient still complained of headache, slight nausea, dyspnœa on exertion, and general weakness. Examination of the urine showed no albumen or casts, but the daily excretion of urea was considerably diminished. Six months later there was a relapse of the peritonitis, which was, however, cut short by treatment with pilocarpine and saline cathartics. In addition to this case, Dr. Bond refers to three more cases of pelvic peritonitis, to four of pericarditis, two of arthritis, and four of endarteritis which showed diminished excretion of urea. These observations of Dr. Bond are of considerable interest, and he has pointed out an important diagnostic sign. At least, diminished excretion of urea is an evidence of deficient elimination, and is a means of determining when certain conditions, particularly serous inflammations, are autogenetic.

"AN AMERICAN LEPER."

DR. MONTGOMERY, Professor of Pathology and Clinician for Diseases of the Skin in the University of California, Clinician for Diseases of the Skin, San Francisco Polyclinic, publishes in the *Pacific Medical Journal* for April, 1892, under the above heading, some particulars of a case of leprosy. The patient was a man forty-three years of age, born in Massachusetts of American parents. He had never been "out of the United States, excepting a few hours in passing from Buffalo to Detroit over the Canada Southern Railway." This man died a leper in the San Francisco Pest-house last February. Twenty years before his death he had a "sore on the penis" after having had connexion with a white woman. This occurred while he was living in the State of Navada, and "shortly after the acquisition of the sore, and while still in Navada, he had charge of a gang of Chinamen on the railroad." While in that position he had frequent connexion with Chinese prostitutes, who were inmates of the camp. He "did not remember that any of the Chinese" showed symptoms of leprosy. Also, he remarked that "he did not know anything about leprosy at that time." About thirteen years after these events "he noticed areas of brown discoloration on the body and limbs." These symptoms were regarded as due to syphilis, and were treated from that point of view. It was not until two years later that his real condition of disease was diagnosed by Dr. G. L. Fitch of San Francisco. Six months after that date he entered the San Francisco Pest-house, where he remained for two years, when he left the institution for about a year, and then returned and lived during his remaining year of life in the Pest-house. His

[1] Abstract in the Journal of the American Medical Association, vol. cii., p. 269.

Digitized by Google

leprous condition was a typical one, and the bacillus leprae was found in a leprous nodule which had been removed from the inner side of his left leg. Just now a certain amount of special interest attaches to this case, and the reason for this is stated in the opening sentence of the account of it from which we have quoted. It is this: "The contagiousness of leprosy, and the likelihood or unlikelihood of its spread in the United States, and especially in those States fronting the Pacific Ocean, and in active communication with countries where leprosy is endemic, such as China and the Sandwich Islands, is exciting so much attention now that any case of an American acquiring the disease in the United States becomes of uncommon interest."

FUNERAL REFORM.

FROM the *Morning Call*, a newspaper published in San Francisco, we learn that, thanks to the individual perseverance of a Captain George A. Raabe, great progress has been made there towards abolishing the dangerous custom of standing bareheaded at funerals. It would seem that there is every prospect of "hats off" becoming the exception. This is as it should be. The lamented death of the Duke of Clarence and Avondale followed by those of less illustrious persons shortly after attending funerals bareheaded called serious attention to this matter, and, what is of more importance, kept it there. At many funerals the officiating clergymen warned the attending mourners and friends of the deceased against the dangers of removing their hats, and the advice was followed. The winter and spring are passed and the summer is at hand. Still we would counsel the wearing of the hat at funerals in summer as in winter. Standing bareheaded beneath a burning sun has its own peculiar dangers, which need not be further specified. And even in hot weather colds may be very easily contracted. Our climate, in short, is one which does not admit of persons going about bareheaded, and those who do so must expect to pay the penalty.

THE LOCAL GOVERNMENT BOARD AND THE MEDICAL OFFICERSHIP OF THE CITY-ROAD WORKHOUSE.

WE quite agree with a guardian that the Local Government Board ought to know "the facts of the case"—the case being that of Dr. Yarrow, medical officer of the City-road Workhouse, in whose place several of the guardians wish to place a resident medical officer. Dr. Yarrow is an officer of many years' experience, against whom no compaint has been made till quite lately, and all that was serious in that complaint fell through. It is monstrous that such an officer should have his office determined except on good grounds and with such compensation as to remunerate him for the loss. The Local Government Board seem to have been satisfied that it is desirable to appoint a resident officer. But they have very properly pointed out to the board of guardians that Dr. Yarrow must be compensated. According to the account in the *Islington Gazette* of the report of the General Purposes Committee, a member of the committee was not content with recommending the board to determine Dr. Yarrow's appointment, but suggested to the Local Government Board that the compensation allowance should not be a large one, taking into account the fact that Dr. Yarrow is at the present time medical officer of health for the parish of St. Luke's, "and to which, it was understood, he should devote the whole of his time." At another stage of the debate it was stated that Dr. Yarrow got £80 as public vaccinator. We cannot doubt that the Local Government Board will ascertain the truth of these statements before agreeing to any inadequate compensation to Dr. Yarrow. Everybody knows that under the anti-vaccination craze the value of vaccination appointments has seriously fallen for the present, till sense and small-pox reassert themselves. As to Dr. Yarrow being expected to devote his whole time to a medical officership of health for £400 a year the idea is absurd. Dr. Yarrow was a man with many public appointments and a large private practice, and, if we are rightly informed, he gave up his private practice and his police appointment when he obtained the medical officership of health, but with the distinct understanding that he was to retain the officership of the workhouse and the public vaccinatorship. If this be so, the Local Government Board must see that they get accurate information with reference to the compensation of Dr. Yarrow.

LOW TEMPERATURE AND PHTHISIS.

OF all devices which, since its discovery, have been attempted to destroy the bacillus tuberculosis in the body none, perhaps, is more irksome—and, indeed, barbarous—than that of keeping the unfortunate victim of phthisis in a cold temperature, as if the normal temperature of the blood were in the very least affected by that of the atmosphere. Nevertheless, such views are held by the Russian physicians who have the care of the health of the Czar's second son, the Grand Duke George, who developed symptoms of pulmonary disease when on his Indian tour. He has, we learn, been spending the winter at Abbas-Tuman, in the Caucasus, dwelling in barely furnished rooms, with little bedding, only a very moderate fire, and the windows continuously open. No doubt the pure mountain air is the chief agent in the effort to keep the disease in abeyance, and not the cold, which has been so severe that his Royal Highness's attendants have suffered greatly from it; and we trust the hopes of the physicians that the Grand Duke will in two years' time have completely recovered may be realised. Very likely he would have done equally well at Davos or St. Moritz, without such a sacrifice of that comfort which phthisical patients so much need.

NEWSPAPER COPYRIGHT.

THE proceedings taken last week by the proprietors of *The Times* to assert their proprietary rights in copyright matter appearing in their newspaper has had the effect of eliciting from the judge who heard the cause a very important declaration as to the effect of the law upon this subject. There has gradually grown up a system of newspaper production by quotation which has received some very striking developments in recent times, and it is not unnatural that those who bear the cost of providing original matter should become increasingly desirous of monopolising, as far as possible, the commercial fruit of their enterprise. At the same time, it is easy to see that where current news is in question, the definition of a satisfactory copyright becomes exceedingly difficult. It was accordingly upon those parts of *The Times* case which related to paragraphs of this description that the counsel who appeared for the *St. James's Gazette* took their stand. Plainly the mere accident of being first to learn and publish a fact cannot be permitted to give to its publisher the right to forbid anybody else from communicating the fact, whether by print or otherwise. Inasmuch as in current news the fact is commonly everything, the literary form a matter of small or no account, it seems idle to assert a copyright in matter of this description. But Mr. Justice North did not dispose of the matter in any rough-and-ready manner of this sort. He held that the plaintiffs were entitled to a copyright even in these short paragraphs of news, but he took care to discourage litigation based upon any such minute grounds of complaint as the infringement of such rights could furnish

by refusing the plaintiffs' costs so far as these particular matters were concerned. Probably a right recognised in law, but in practice fettered by the risk of incurring incommensurately heavy costs is the best practical solution of the difficulty. It is not logical, nor is it quite easy to explain; but it is very easy to understand, and it has a tendency to make both parties desire to act well within their rights—a temper which, when such delicate matters as literary properties are concerned, is eminently worthy to be commended.

THE AFTER-CARE OF THE INSANE.

WE would direct the attention of all who take an interest in the welfare of their suffering neighbours to the work of practical kindness carried on by the London After Care Association. Instituted for the benefit of poor convalescents from mental disease, this Society is exercising alone, and under considerable pressure of adversity, functions as distinguished by their conservative utility as they are humane. Its objects are to provide for the boarding out in country homes of the class of convalescents already mentioned, and to find occupation for such of them as may be able to follow a calling. Gifts of clothing and the like are allowed in suitable cases. The total number of applicants during the year ending June, 1891, was seventy-three as compared with sixty-six in the year preceding. The number of working associates has considerably increased. Unfortunately we cannot say as much for the funds of the Society, which have undergone an appreciable, though not a great, reduction. In estimating the practical value of the Society's efforts, we have to take into account the fact that the afflicted persons whom it assists are, by the very nature of their illness, excluded from the majority of ordinary convalescent establishments. This circumstance alone should suffice to justify the claim for public support issued by the Association. If still further proof be desired, it is to be found in a report of the Council for 1890–91, published by E. A. Beckett, 111 and 113, Kingsland-road, N.E.

AMŒBIC DYSENTERY.

ATTENTION has already been drawn in these columns to a form of dysentery characterised by the appearance of amœbæ in the stools. An elaborate series of investigations on this subject was undertaken by Drs. Councilman and Lafleur, of New York, and their results are published in the Johns Hopkins Hospital Reports, vol. ii., Dec. 1891. We shall only refer here to the description of the pathogenic micro-organisms. The amœbæ have already been described by Lörch, Kartulis, and Osler. In searching for the organisms some choice had to be exercised in the portions of stools destined for examination. Thus they were rather more numerous in the small gelatinous masses which were often contained in the fæces than elsewhere. The numbers of them which were found in the different cases, and even in the same case, at different times, varied greatly. At times no single portion of the fæces which could be examined was free from them. In other cases single examples of them were only found after long and careful search. Their numbers in general were proportional to the severity of the lesions. They were most abundant in the cases in which the lesions were most acute and most extensive. The amœbæ differed somewhat in appearance according as they were active or inactive. In an inactive condition they were round or slightly oblong, and were more refractive than the other cells which surrounded them. In this resting condition there could frequently be distinguished no division into an ectosarc and an endosarc, but there appeared to be simply a body enclosing vacuoles of greater or less size. These vacuoles were clear, and their contents much paler than the substance which enclosed them. They varied greatly in size. Some were found one-third the diameter of the entire amœba; others were much smaller, and in some cases the whole mass was so filled with tiny vacuoles of equal size that the organisms resembled a compound granular body. In other cases there was a sharp division between the outer and the inner portions of the amœba. The outer portion was composed of a pale hyaline or homogeneous substance, and the inner contained vacuoles and was much more refractive. The amœbæ were difficult to recognise in this condition unless active ones were found at the same time, and so attention was directed to their presence, otherwise they were easily overlooked. Their appearance when moving was characteristic. The activity of their motion, however, varied greatly in the different cases, and even in different observations made on the same case. Every degree of activity of movement could be seen. At times the movements were so slow that the observer had to look carefully for some time to be sure that any change had taken place, whilst at others the movements were so rapid that certain of their phases could scarcely be followed. The movements consisted essentially of two kinds, a progressive movement and one limited to the thrusting out and retraction of pseudopodia. In some instances there seemed to be a certain rhythm in these movements, which occurred at regular intervals. An amœba in which no movement could be detected would suddenly make one or several quick movements, thrusting out large pseudopodia or even changing its position, then become perfectly quiescent, suddenly repeating the movements after an interval. The movements were increased when the examinations were made on a warm stage. Various bodies were frequently enclosed in the amœbæ. The most common of these were red blood-corpuscles, which were often found in considerable numbers. Many of them were perfectly preserved; others had lost their colour, and could be recognised only from their outline. Pus cells, well preserved, or in various stages of disorganisation, were also seen, either in the ectosarc or in the vacuoles. Both bacilli and micrococci and the spores of the former were sometimes seen in them. Blood pigment was occasionally found under two forms—as irregular brown masses or as distinct black granules. These granules were often arranged in the form of a distinct ring, but this formation was more often seen in the amœbæ in sections of intestine than in the fresh specimens.

MORE STREET DANGERS.

IF we were to examine the matter thoroughly, we should probably find that hardly any accident which occurs is the result of a single cause. This point is, at all events, clearly brought out in the history of a case recently decided in the Marylebone County Court (Nunning *v.* Peter Robinson). The plaintiff, while passing along a pavement one evening, struck his foot against the projecting metal of a wooden flap let into it, tripped, and fell. The plea of contributory negligence, on his part not being made out, the defendant, the owner of the flap, was cast in damages somewhat heavily for allowing the existence of a dangerous obstruction. It is easy to understand the meaning of this verdict. Its logical consistence is of course apparent. At the same time, we must admit a certain degree of sympathy with the defendant, more especially as the roadway in question is said to have been fairly lighted, and the obstruction by no means formidable or, indeed, other than trivial to persons walking by day, and using ordinary care. In this case the accident occurred after nightfall. Had it happened by day the suit might not unfairly have been dismissed. We would not, indeed, have any of the reasonable privileges of wayfarers encroached upon by those of property, but we are still of opinion that the former should not be altogether absolved from exercising the necessary elements of caution

Digitized by Google

required for personal security. All avoidable petty legislation is objectionable, and it would be the height of unreason to found a by-law on such an incident as this. Its most satisfactory result will doubtless be the removal of a number of prominent screws, nuts, and other obstacles from public footways; and we trust that, when these minutiæ are provided for, such relatively greater evils as the open trap-door which ought to cover the household coal-cellar or the store caverns of many City warehouses will also be considered and treated.

LEPROSY IN THE CAUCASUS.

IN a paper read before the Caucasian Medical Society, Professor Minkh gave a history of leprosy in the Tersk district. He showed that it must have been in existence there amongst emigrants from the borders of the Don and of the Volga during the latter part of the last century, and that though there are no statistics of the number of persons affected up to 1840, it must have been appreciable, as there were lazarets in a good many places for lepers. From 1841 to 1883 the disease seems to have been steadily on the increase, but after that the number of victims rapidly diminished. It is an interesting fact that in localities where lepers were kept apart from healthy persons in special buildings the numbers attacked diminished, while in other localities where segregation was not practised they increased.

INFECTIOUS DISEASE AND SCHOOL CLOSURE.

INDICATIONS are not wanting that sanitary authorities throughout the country are beginning to act upon the knowledge so abundantly gained as to the close relation of the prevalence of infectious disease and the factor of school attendance. Thus, in the Watford urban and rural districts schools are being closed wholesale owing to the prevalence of scarlet fever and measles, and it is currently reported that there are more than 1000 children absent from school owing to this cause. Again, at Hale and Tongham, in the Farnham rural district, the schools have been temporarily closed owing to the reappearance of diphtheria in that classic haunt of the disease. Similar measures have been taken at the remote village of Garton-on-the-Wolds, in Yorkshire, where diphtheria has broken out. We trust that these several hygienic precautions will prove of use to the authorities concerned in repressing the spread of the infectious diseases with which they have to deal. But they must be carried out in a firm and complete manner. No half measures are of use in emergencies such as these.

LONDON SEWAGE.

THE present system of dealing with the sewage of the metropolis by chemical precipitation is, significantly enough, regarded as a legacy from the Metropolitan Board of Works to the County Council. An enormous sum of money was expended on its establishment, and it is thought that the system should have a fair trial before deciding on one still more expensive. So far, the method is in reality totally inadequate to deal with the requirements of the metropolis. The effluent appears to be clear, but the water all around the outfalls of Barking and Crossness is black and repulsive, and although it does not seem to contain suspended matter, yet doubtless it contains plenty of dissolved organic substances that readily undergo putrefaction, and such that will give rise to an intolerable nuisance. That the condition of the river does not improve is borne out by the fact that the dredging expenses of the East India Dock Company have in three years risen from £13,000 to £40,000, and this increase is attributed mainly to the way in which the sewage is treated. Apart from the public health point of view there are shipping interests to be considered, for it appears that the navigation of the river is seriously interfered with by the deposition of sewage matter. During the last year or so complaints have not been so frequent, probably because the weather has been of such a character as to provide an abundant supply of water in the river; but as soon as we experience a period of hot and dry weather such as we are now promised, all the abominations of a sewage-polluted stream may be reasonably anticipated. The sewage works at Barking and Crossness were visited and inspected by a special committee appointed by the Chamber of Commerce on the 3rd inst., and they considered that although some improvements had been effected since the early part of the year, very much yet remained to be done to render the sewage system of the metropolis perfect.

PROGRESS OF THE CHOLERA.

CHOLERA appears to be still raging at Meshed, more than a hundred deaths occurring every day. The last news is that the disease has appeared amongst the English camps in the hills, and that *cordons sanitaires* are being formed to arrest the movement of pilgrims. We had hoped that the last had been heard of this antiquated mode of warfare against disease, and that the time consumed in forming *cordons* might have been more usefully employed in the direction of an improved system of sanitary defence.

THE ROYAL SEA-BATHING INFIRMARY.

WE regret to observe that unless additional contributions are speedily forthcoming the Royal Sea-bathing Infirmary at Margate will have to reduce the number of its beds from 220 to 80. Such a curtailment of the benefits of so meritorious an institution would be a calamity, and we trust that the appeal published on Monday last will be successful in warding it off. That appeal was most influentially supported, the Archbishop of Canterbury, the Lord President of the Privy Council, the Presidents of the Royal Colleges of Physicians and Surgeons and of the General Medical Council being among the signatories. The Sea-bathing Infirmary was founded in 1791, and is practically unique. After so long and useful a career, it would be pitiable were it suffered to fall into neglect. Rather should we be hearing of its extension and increase in accommodation than the reverse.

GLYCOSURIA FROM COAL-GAS POISONING.

THAT glycosuria is an invariable after-effect of poisoning by oxide of carbon is stated in text-books—mainly continental ones it must be admitted—as an irrefragable fact. Professor Jaksch, to instance one pathologist among many, gives currency to it in the last edition of his authoritative work. Dr. Garofalo, however, in a publication entitled "Glicosuria per Ossido di Carbonio e per Gas Illuminante," traverses this teaching in the most trenchant manner, grounding his criticism on data reached by himself after a careful series of experiments in Professor Colasanti's laboratory in Rome. Having reviewed the previous state of our knowledge on the question, as given in medical treatises and clinical memoirs, he proceeds to set forth the results he has independently obtained. He asphyxiated a number of dogs with vapour of carbonic oxide, and in no case found this mode of poisoning followed by the slightest vestige of sugar in the urine. Thereafter he made prompt and thorough examination of a clinical case of acute oxy-carbonic asphyxia, and again ascertained the urine to be totally devoid of sugar. From these observations, in which the search for sugar was conducted and checked by every test known to modern

Digitized by Google

analysis, he concluded that glycosuria, if really found in the renal excretion after carbonic acid or coal gas poisoning, is a purely accidental and variable phenomenon—a coincidence of two different processes set up in the system, certainly not a consequence of one condition upon another. He animadverts with apparent truth on what struck him in the observations of more than one experimentalist—viz., that these were based on methods in the reduction of alkalino-metallic solutions which could hardly fail to yield fallacious results.

THE POWERS OF COUNTY HEALTH OFFICERS.

AN important point has been raised by the Northallerton Local Board as to the power of the North Riding health officer to examine cases of suspected disease in their district in the absence of the medical officer of health of the district. Animated correspondence is already passing between the Local Board and the County Council. We refrain from comment on the matter, which will most likely be referred to the legal advisers of the Local Government Board for decision.

TERRITORIAL MONOPOLY OF QUALIFICATIONS.

WE are glad to notice that the territorial monopoly of qualifications has received a severe blow at Hastings. The rule of the Hastings Hospital has been altered, and now reads as follows:—"No person shall be elected to the office of physician or assistant physician unless he be a Fellow or Member *by examination* of the College of Physicians of London, *Edinburgh*, or *Dublin*, and be a Graduate in Medicine of one of the Universities of the United Kingdom, and be also duly registered under the Medical Acts." The italics represent the enlargement and liberality of the change made. We cannot go quite so far as Dr. Heath and say that the Medical Council, by doing its duty, shows the equality of their various examinations. The duty of the Medical Council is only to ascertain that the various examinations guarantee competency to practise. This does *not* necessarily involve fitness for hospital appointment, or equality of severity in the higher examinations in different divisions of the kingdom. The Medical Council is seriously defective in power and authority here. And the defect constitutes one great reason for some amendment of the Medical Acts; but, meantime, there is now no such ascertained inequality as to justify the monopoly of the London colleges, and it behoves all hospital authorities in the various divisions of the kingdom to act in the spirit of the Medical Act, and not argue, as one gentleman did, that men who have passed in Edinburgh and Dublin could not complain if, to gain an English appointment, they were called on to pass again in London.

BABY FARMING AT LINCOLN.

CERTAIN points connected with the history of a case of baby farming recently tried at the Lincoln police court are worth noting, if merely to remind us of the features most commonly characteristic of this form of crime. The child, which was illegitimate, had evidently died of starvation, not a particle of fat being found about the body at the post-mortem examination. It had been in the charge of two other persons prior to its arrival in the house where death occurred. The real significance of the word "starvation," as applied to such cases, may be noted. It need not here, as at a more advanced age, imply the want of food, since the mere mismanagement of this may easily be so contrived as to impoverish the system of the child while duly sparing the small sum allowed for its maintenance. The fact is familiar to most medical practitioners, and it is one which ought not to be overlooked. In the case already quoted conviction was obtained on the ground of failure to register on the arrival of the second of two nurse children. The authorities appear to have acted in the matter with commendable promptitude. We must, however, admit a degree of dissatisfaction that the practice of registration cannot as yet be carried out in still further detail than it is. It need not entail any meddlesome interference on the part of local authorities if even single nurse children are subject to registration. Their careful supervision would thus be better ensured, their transference from nurse to nurse rendered more easily traceable, and the farming system still practicable in their case exposed at its last remaining root. In conclusion, let us once more impress upon our readers an obligation incumbent upon all medical men—namely, that of refusing to certify, in the event of death, any cases which may be suspected of belonging to this class.

MIDWIVES REGISTRATION BILL.

THE Committee of the House of Commons on this Bill do not propose to hear more evidence, and will meet on Friday, June 17th, to consider their report.

THE SMALL-POX EPIDEMIC.

SMALL-POX continues to spread throughout the country in much the same proportion as has been the case recently. Some sixty cases a week are reported throughout the kingdom, of which the metropolis furnishes about a half, and Dewsbury and Batley the next largest proportion. There are signs of some recrudescence of the disease in these latter places, as well as in the Wakefield Rural District.

WATER POLLUTION IN THE RHONDDA VALLEY.

IT is alleged that the intake of the Ystrad Waterworks Company has been largely fouled by the entrance into the stream above the intake of a considerable amount of human and animal contamination from the Blaenrhondda Colliery levels. A representative section of the ratepayers in the district has requested the sanitary authority to institute legal proceedings against the Water Company unless the latter at once remove the intake to a point above the colliery levels.

A REMARKABLE VERDICT.

AN inquest was held at the Ordnance Arms, Chatham-extra, on June 4th, by Mr. W. H. Bell, LL.B., touching the death of a child aged seven months. The mother of the deceased deposed to its having been a sickly child, and that of late it had suffered from a bronchial affection. She consulted Dr. Jefferiss on several occasions, when he prescribed. Previously to the last visit some cough mixture obtained at a herbalist's had been administered. On this occasion Dr. Jefferiss noticed that the pupils were contracted, and he came to the conclusion that the symptoms were in part due to morphia poisoning. The wife of the herbalist admitted that she sold the mixture, and that it contained one drachm of chloroform and half a drachm of acetate of morphia to the gallon. The child had half a drachm of the syrup given to it, which would be equivalent to about $\frac{1}{16}$ grain of acetate morphia, a quantity certainly dangerous to an infant, especially when suffering from bronchitis. Dr. Jefferiss testified that the death was primarily due to morphia poisoning. The coroner's jury utterly ignored this, and returned a verdict of "Death from natural causes—viz., bronchitis." We are entirley at a loss to reconcile this verdict with the evidence. Surely there ought to be some means of preventing ignorant people from dealing in a deadly mixture which they seem to dispose of quite heedless of its dangerous nature.

SUCCESSFUL TREPHINING FOR TRAUMATIC EPILEPSY.

IN a recent number of the *Philadelphia Medical News* Dr. Binkley gives details of a case in which the removal of depressed bone from the skull in a case of traumatic epilepsy, some years after the injury, was followed by a most satisfactory result. The patient was a man thirty-seven years old, who had been struck on the head by a hatchet sixteen years ago. There was a good deal of exfoliation of dead bone some little time after the injury. The injury was four inches above the left orbital margin, over the prefrontal convolutions, and, beyond producing temporary unconsciousness, seems to have caused no symptoms, the man being able to resume work in a day or so. From this time, however, he began to suffer from epileptic fits (no detailed account of which unfortunately is given), at first occurring monthly, but becoming more frequent till during the four months preceding the operation he had from two to four fits every day. He was trephined over the site of the injury, and an area of depressed bone two inches in diameter was removed, the brain substance not being interfered with. The relief afforded seems to have been immediate and complete, and when the case was published, seven months after the operation, there had not been a single recurrence of the fits.

FOREIGN UNIVERSITY INTELLIGENCE.

Berlin.—Dr. von Coler, Surgeon-General of the Prussian Army, has been granted the title of Honorary Professor.—Professor Wilhelm Krause of Göttingen has settled in Berlin, and has been recognised as a *privat-docent*. Though he formerly taught morbid anatomy, he latterly confined himself to normal histology. His inaugural lecture had for its subject the Anthropology of Ireland.

Brussels.—The collection of apparatus, together with the library of the late M. Stas, has been purchased by M. Solvay, and presented to the University. The same donor has promised to build and equip laboratories for medical physics and physiological chemistry at a cost of 500,000 francs.

Freiburg.—Professor Hugo Muensterberg has obtained prolonged leave of absence in order to go to America and superintend the establishment of a psychological laboratory at Harvard University.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Dr. L. A. Krohn, Lecturer on Surgery in Helsingfors, at the age of fifty-five. He was employed by the Prussians as surgeon during the Franco-German war, and during the Russo-Turkish war he acted as chief of the Finnish ambulance.—Dr. Lesser, Sanitary Councillor, of Obernigk.—Dr. Leff Konstantinovich Ivanovski of St. Petersburg. He was formerly prosector to Professor Landtsert, and at one time taught anatomy to the female students. Latterly he had devoted himself to military medical work, and had taken a great interest in anthropological archæology.

UNDER the provisions of the 8th Section of the Factory and Workshops Act, 1891, Mr. Matthews has certified that the "processes carried on in factories and workshops, or parts thereof, in the manufacture of lucifer matches, except such as are made with red or amorphous phosphorus, are injurious to health." The clause under which the Home Secretary has taken action provides that "where the Secretary of State certifies that in his opinion any machinery or process or particular description of manual labour used in a factory or workshop (other than a domestic workshop) is dangerous or injurious to health, the chief inspector may serve on the occupier of the factory or workshop a notice in writing, either proposing such special rules or requiring the adoption of such special measures as appear to the chief inspector to be reasonably practicable, and to meet the necessities of the case."

THE *Jewish Chronicle* of the 3rd inst. announces that Dr. Leopold Casper has been elected to the much-coveted position of a member of the Senate (consisting of twelve) of the Faculty of Medicine of the University of Berlin. "Dr. Casper," our contemporary states, "has attained considerable eminence in his profession, having studied in England under Sir Henry Thompson, in Vienna under Dittel, and in Paris under Guyon. In the years 1886 and 1887 he published two translations of the principal works of Sir Henry Thompson, and he has also written several original works. The election of the first Jew to the Senate is of importance in the face of a somewhat strong anti-Semitic feeling."

THE Sub-committee of Nursing and Hygiene in connexion with woman's work at the Chicago Exhibion will meet at 53, Berners-street, W., on Monday, June 13th, at 5 P.M., to consider the most suitable furniture for a general hospital ward, and will welcome any suggestions concerning the construction of hospital beds, bedding, and cots.

COUNSEL on behalf of Mr. T. R. Allinson moved, on June 3rd, before a Divisional Court of the Queen's Bench, for a rule calling upon the General Medical Council to show cause why an injunction should not issue to restrain the Council from removing Mr. Allinson's name from the Medical Register. A rule *nisi* was granted.

THE Russian Government has directed Dr. Lunkiewitz, the director of the Caucasian Military Medical Laboratory, to proceed to Afghanistan and the Trans-Caucasian territory to study the question of cholera.

THE annual dinner of the Army Medical Staff will be held in the Whitehall-rooms of the Hôtel Métropole at 7.30 P.M. on Monday, June 13th, 1892.

A TELEGRAM has been received at Berlin containing what purports to be confirmation of the rumour of the death of Emin Pasha.

CAMBRIDGE UNIVERSITY LONG VACATION.—The Professor of Pathology during the long vacation will lecture upon Elementary Pathology on Mondays, Wednesdays, and Fridays, at 9 A.M., and on Thursdays, at 10 A.M., beginning Friday, July 8th. In connexion with these lectures Dr. E. Lloyd Jones, Demonstrator of Pathology, will conduct a practical course in Morbid Anatomy and Histology, at 2.15 P.M., on Tuesdays and Thursdays, and at other times, to be arranged when the class meets. This course will begin on Tuesday, July 12th. The fee for lectures and practical work will be £3 3*s.*, payable to Mr. Shipley at the New Museums. There will also be a complete course of lectures and practical work in Bacteriology, with special reference to the requirements of candidates for the diploma in Public Health, given by Mr. Adami, Mr. Kanthack, and Dr. Lloyd Jones. This will be held thrice weekly, beginning Friday, July 8th. The fee for this, including apparatus and the use of immersion lens, will be £6 6*s.* For fuller information concerning this course it is requested that application be made to Mr. Adami, Pathological Laboratory, New Museums. The accommodation will only suffice for a limited number of students.

THE INFLUENZA EPIDEMIC.

(*Concluded from p. 1267.*)

THE fifth section of the report is devoted to the general pathology of influenza, and is contributed by Dr. Hugo Ribbert. He commences with a description of the lesions so constantly met with in the respiratory tract. As regards the lungs, he points out that the forms of pneumonia which accompany or follow influenza are somewhat varied; often there is lobar pneumonia, in which the hepatisation has on section a peculiar smooth aspect, differing from the granular character of ordinary croupous pneumonia; or this condition may be commingled with areas of lobular hepatisation; or the latter alone may be present. Again, in some cases there is marked interstitial inflammation, a character which may account for the greater tendency to the supervention abscess and pulmonary gangrene observed in influenzal cases. Of course, pleurisy is a frequent concomitant; while pericarditis, and sometimes myocarditis, have been observed. Dr. Ribbert notes the enlargement of the spleen, upon which it may be remembered that some stress was laid (especially by Baumler) in the early history of this epidemic. There may be cloudy swelling of the kidneys or even glomerulo-nephritis. Cerebro-spinal meningitis and cerebral abscess have been met with. But the chief feature of the morbid anatomy of influenza is the inflammation of the respiratory organs, to which the main mortality is due. Brief reference is made at the close of the article to the discovery by Pfeiffer and Canon independently of a bacillus in the blood and bronchial secretion.

The symptomatology of influenza cases is described by three contributors. Dr. M. Litten deals with the symptoms of disorder of the circulation and respiration. The pulse, he says, is generally small, sometimes unduly slow, more often quickened, perhaps to an abnormal extent. In some cases there has been great cardiac weakness, terminating in sudden death from cardiac paralysis during the convalescent stage of the primary attack. Other patients have been liable to anginal attacks; whilst in some the symptoms of inflammation of the membranes of the heart and its wall have been manifest. In connexion with the tendency to cardiac asthenia, the records he gives of cases of thrombosis, venous and arterial, are of interest. The respiratory phenomena are dealt with fully. There is the frequent nasal catarrh—not perhaps so prominent a feature in this epidemic as in others on record—and associated therewith is the liability to epistaxis. Pharyngitis, tonsillitis, laryngitis, have all been observed. Bronchitis, with tendency to asthmatic seizures and sometimes croupous bronchitis, form a notable feature of influenza. As regards pneumonia, Dr. Litton thinks it was quite as prevalent as in former times, and calculates the proportion of influenza cases attacked with it to be as high as from 5 to 10 per cent. We should not have placed it so high as this. He notes the more sudden invasion of the croupous form as contrasted with the insidious onset of the equally common bronchial or catarrhal type, and states that the pneumonia was complicated frequently with pleurisy, and sometimes with pericarditis and meningitis. The pneumonia was frequently bilateral (especially the catarrhal form), or of a "wandering" type. Eleven cases are reported of "relapsing pneumonia;" eight cases of pulmonary abscess, and six of gangrene. The subjects of pulmonary phthisis were always made worse by an attack of influenza, which, doubtless, during its prevalence, added to the mortality from that disease. The derangements of digestion are described by Dr. L. Riess, who confines himself to a close analysis of the returns. Out of 3231 replies having reference to digestive symptoms only 275, or 8·5 per cent., give reliable answers; 6·8 per cent. allude to them as being of the nature of "dyspepsia;" 18·9 per cent. speak of "gastric catarrh;" 17·3 per cent. of "gastro-intestinal catarrh," and 7·2 per cent. simply of "intestinal catarrh." It is clear, therefore, that the majority refer the lesion to inflammatory disturbance analogous to that of the respiratory mucous membrane. It was observed that the gastro-intestinal disorders were more severe and complicated in South-west Germany than in North-east, where, although the number of cases was large, these affections were of milder type. Speaking generally, for the whole country the slighter disorders were very frequent, and about one-fourth were more severe, with varying predominance of special symptoms, as vomiting, diarrhœa, constipation, &c., and as to the duration of convalescence. It is clear that in one class the symptoms were almost purely gastric; in another gastro-intestinal. The symptoms of nervous type are analysed by Dr. W. Zülzer, who reports that 50 per cent. suffered from headache, and 27 per cent. from pains in the back, loins, limbs, and joints. Prostration is a constant feature. Vertigo occurred in 12·6 per cent.; insomnia in only 6 per cent.; delirium in 8 per cent. On the other hand, neuralgic affections, especially trigeminal neuralgia, were reported in 45 per cent. of the cases. Allusion is made to disorders of taste and smell, and a table is given of the rarer forms of nervous disease. Several articles follow on the complications and sequelæ of influenza. The first, by Dr. F. Stricker, reviews the whole subject, and shows by the aid of maps how the various affections for which influenza is responsible were distributed throughout Germany. Then follow articles on Pneumonia, by Dr. Litten; on Affections of the Larynx, by Dr. J. Lazarus; on Affections of the Eye, by Dr. Karl Horstmann; on Affections of the Ears, by Dr. A. Hartmann, who distinguishes two forms of influenzal otitis, one by direct extension from the nasal mucosa through the Eustachian tube, and the other of hæmatogenous (infective) origin. The same writer contributes an article on Affections of the Nose; whilst Dr. M. Jastrowitz writes on Mental Disorders. Under the general heading of "Course and Issue," there are two articles—one on Convalescence, by Dr. Paul Fürbringer, showing how in by far the majority recovery was rather slow than rapid; and one on the Causes of Death, by Dr. P. Guttmann. Out of 3625 returns, respiratory diseases are responsible for 68 per cent. of the fatal cases (and of these pneumonia was the chief), circulatory diseases for 13·3 per cent., digestive (gastro-intestinal) for 1·7 per cent., nervous for 6·4 per cent., acute infective diseases (influenza *per se*, typhoid fever, diphtheria, acute tuberculosis, pyæmia, septicæmia, puerperal fever, erysipelas) for 1·4 per cent., constitutional maladies (alcoholism, diabetes, leukæmia, pernicious anæmia) for 0·6 per cent., and a series of other affections (not classified) 8·0. All these are analysed under each Department and State of Germany, and form a valuable statistical summary.

The subject of treatment is dealt with by Dr. Paul Fürbringer. He says that the view that there is a specific remedy for influenza is only held by 2 per cent. of the reporters, whilst 200, or 6 per cent., term their treatment symptomatic or expectant, 400 advocate diaphoretic treatment, and 305 say that the essentials are warmth and rest in bed. A marked minority—viz., 123, or only 4 per cent.—advocate the use of cold; 1160, or 35 per cent., prescribed antipyrin; 606, or 18 per cent., quinine; 485, or 15 per cent., antifebrin; and 470, or 14 per cent., phenacetin. He finds that, whereas antipyrin was most in favour in Berlin, the Rhine provinces show a larger prescription of phenacetin; whilst in Saxony there was about an equal number of prescriptions of these two drugs. Salicylic acid and the salicylates were prescribed by 200; thallin hardly at all; calomel and iodide of potassium by a few. Cardiac tonics, sedatives, and alcohol were given by a considerable proportion, about 250 advocating a stimulant and restorative method by generous diet, gastric tonics, and alcohol as being especially useful in the convalescent stage. A few abstained wholly from the use of drugs, and found that confinement to the room during the attack and, for a week after it, was all-sufficient. A general summary of the remarks invited from the reporters is given by Dr. A. Hiller. The most interesting of these refers to the period of incubation of the disease. The majority place this between two and six days, the shortest being twelve hours given by Dr. Kockmann (Abenberg), the longest seventeen days, by Dr. Hennig (Leipsic). Some reporters explain the immunity enjoyed by certain people as being due to their comparative isolation—e.g., persons without families, the inmates of convents, &c. One writer thinks tobacco confers immunity. Some advocate the use of quinine as a prophylactic. In addition to these articles the volume contains, further, two

Digitized by Google

special articles—one on Influenza in Childhood, by Dr. Baginsky, and one on its occurrence in Prisons, by Dr. Baer. It is noteworthy that on an analysis of four prisons, having an average daily number of inmates equal to 1486, only 168, or 11·29 per cent., were attacked during the epidemic.

THE IMPERIAL INSTITUTE OF EXPERIMENTAL MEDICINE IN ST. PETERSBURG.

THIS institute owes its origin to the circumstance that an officer of the Imperial Guard was bitten by a rabid dog during the latter part of the year 1885; and also to the interest taken in the case by the commandant of the corps, Prince Alexander Petrovich of Oldenburg, who sent the officer to M. Pasteur in Paris, in order that he might undergo the treatment by inoculation, which was then just beginning to become known. The Prince also sent Dr. Kruglevski, with instructions to make himself familiar with the preventive treatment of rabies as practised by Pasteur; and he afterwards established at his own expense a laboratory in the veterinary infirmary of the Horse Guards. During the succeeding summer arrangements for the treatment were in full force. Two years later the Prince obtained from the Emperor authority to establish an Institute of Experimental Medicine, which should combine the functions of Pasteur's Institute in Paris with those of the Hygienic Institute of Berlin. It is not a mere collection of laboratories, but an organised series of departments, each of course in charge of an eminent professor, and the whole under a director who is responsible to the Prince himself, who is "curator." The grounds occupy 37,464 square metres, and are situated in the Aptekarski Island, a suburb of St. Petersburg. The principal building comprises sections for the anti-rabic treatment, for epizootology, for physiology, for chemistry, for general microbiology, for pathological anatomy, and for pathogenic microbiology, together with a lecture theatre, a library, and rooms for mechanical work and for small animals; another building is temporarily devoted to the chief of the section of syphilidology; a third building is occupied by animals of various kinds; a fourth is a kennel with thirty-two cages, four of which are intended for dogs suspected of having rabies; a fifth building is occupied by monkeys; a sixth is set apart for experiments on highly contagious diseases, such as glanders (this building consists of three isolated compartments, each having a special entrance); a seventh is intended for a human patient and his attendant, as it may sometimes be necessary to study the course of a disease in the human subject; an eighth building contains the hydraulic, electric, and other machinery. The illumination of the whole institute is carried out by means of 600 incandescent lamps, which are worked by two horizontal steam engines and two dynamos. There is, besides, an accumulator with a charge of 360 ampère-hours. The greatest care has been taken to prevent any contagion spreading outside, all solid matter, such as the dung and the litter of the animals, being burnt, and all the liquid sewage sterilised at 140° C., by means of an ingenious apparatus devised by Mr. Hanneken, the engineer, which is capable of sterilising fifty cubic metres in the twenty-four hours. The sewage from all sources is collected in a large iron reservoir, where the solid matter is separated by a special filter and afterwards burnt, the filtrate being passed through the sterilising apparatus before being allowed to flow into the town sewers. In addition to the buildings already mentioned, there are several others containing the apartments for the staff, also a chemical laboratory. A complete account of the institute and a plan constitute the first volume of the *Archives de Sciences Biologiques*, which has just appeared.

DOUBTFUL ECONOMY.—It is stated that the Devizes Urban Sanitary Authority has decided to abandon for the present an extension of the fever hospital, for which the Local Government Board had sanctioned an outlay of about £1200. The reason assigned for this decision is the heaviness of the present rates.

THE SO-CALLED VENEREAL DISEASES IN ANIMALS.

MUCH interest, from a comparative pathologist's point of view, attaches to these diseases of the domesticated animals, and especially to a syphiloid disorder affecting horses, which has for a considerable number of years attracted much attention and received a good deal of investigation.

A non-specific gonorrhœa is not unfrequently observed in the dog, in which there may be balanitis and posthitis, as well as urethritis, and which is sometimes troublesome to cure; but there is no evidence that it is communicable or productive of anything more than local lesions, though these are often very distressing to the animal. This condition is generally seen in pet dogs, though out-of-door animals—such as watch-dogs—are not exempt. It sometimes accompanies scabies, but is chiefly due to uncleanliness, over-feeding, and such-like causes. Urethritis is not uncommon in old rams, and is supposed to arise from over-copulation; it is at times so severe and persistent as to lead to stricture, but it does not seem to be very communicable to ewes. A similar disorder affects the bovine species, chiefly the male, and is known to those who have to deal with cattle as "bull-burnt." Its contagiousness has been denied by some authorities, though they admit that the acridity of the discharges will excite inflammation in mucous membranes with which they come in contact. But the majority of observers concur in the opinion that it is contagious, the contagium being very subtle. All the cows in a village may be contaminated by a diseased bull, and intermediate communication has been recorded, cows being infected by sponges that had been used to dress the affected bulls. In one instance a cow was the means of conveying the malady to nine others without the intervention of a diseased bull, contamination taking place by the affected animal rubbing against the healthy, and the continual whisking of the tail owing to the irritation in the vagina and urinary passages. The disease may attack the same animals several times; bulls have been known to receive the contagium from cows three times at short intervals. The symptoms in the cow are those of more or less acute vaginitis, with small vesicles or yellowish translucid pustules, the size of a grain of millet, studding the surface of the mucous membrane; this eruption is rapidly transformed into ulcers, when the exudate becomes purulent, the discharge being often rather copious. The ulcerations are frequently accompanied by local induration, their borders being irregular and thickened and their centre unhealthy looking. When they heal the cicatrices are whitish, smooth, and regular or stellate in shape. If there happens to be a sore in the vagina when infection occurs, then the case is more serious, as it may lead to sloughing of gangrenous patches. In rare cases the inflammation extends to the uterus and Fallopian tubes, and even beyond these. Slight fever is present in the majority of cases, and the appetite, rumination, and lacteal secretion are diminished. In exceptional instances pregnant cows abort, and frequently there remains a persistent vaginal catarrh. In the bull similar symptoms are noted; the urethritis causes frequent micturition, preceded and accompanied by violent expulsive efforts; phimosis is common; erection of the penis often causes the ulcers on it to bleed, and in exceptional cases gangrene occurs over a large surface. The animals become debilitated, while the appetite is diminished and rumination suspended. The disease runs its course in from eight to fifteen days, though it may occupy three or four weeks. In France it is known as the "éruption du coït" and "maladie aphtheuse des organes génitaux," and in Germany as "Aphtherausschlag" and "gutartige Beschälkrankheit," to distinguish it from another venereal disorder to be noticed presently. It may continue for some months in the same cowshed.

A similar infectious exanthematous disease of the genital organs is observed in the equine species, and the symptoms do not differ much from those noticed in cattle; while it is spread in the same manner, though it is not so common. For instance, in Prussia, in 1884–85, it was reported as affecting 784 cattle, but only 75 horses; in the various provinces of Germany, in 1886, it attacked 3944 cattle and 248 horses; in Bavaria, in 1885, there were 455 of the former

and 9 of the latter; and in Würtemburg, 362 cattle and 13 horses were diseased. This frequency in the bovines, however, is only relative, and is due to cattle being more numerous than horses. The malady is usually spread by coition, and it may assume an epizootic form, as one diseased stallion can contaminate a large number of mares. It is said that one attack does not confer immunity from another, and it has also been stated that a stallion is capable of infecting several weeks after having been apparently cured. Foals have received the disease from the mares while sucking, the ocular, nasal, and buccal mucous membrane becoming affected. The period of incubation is from three to six days. In serious cases the inflammation may extend to the limbs, involving the lymphatic vessels and glands, and giving rise to abscesses and ulcerations in the neighbourhood of the mammæ, anus, and tail, with metritis, high fever, and general disturbance. Sometimes death ensues in these cases; and when it does not, recovery is very tedious.

French veterinary pathologists insist that this exanthematous disease of the generative organs in the bovine and equine species is horse-pox transmitted to the former; and certainly the clinical and experimental evidence produced in France supports that view; while the Germans, who appear to deny or overlook this evidence, themselves furnish what might be accepted as proof, for they show that the exanthem is sometimes communicated to people, and most frequently to those who attend to the animals. Inoculation usually occurs on the hands, and the German pathologists admit that it produces a varioliform eruption, with tumefaction of the whole arm, swelling of the axillary glands, and febrile disturbance.

But the most interesting, as it is the gravest, of the venereal disorders of animals, is that designated by the Germans the "Venerischekrankheit der Pferde, Chankerkrankheit, bösartige Beschälkrankheit, Lähmungskrankheit"; and by the French the "maladie du coït, maladie vénérienne des solipedes, maladie paralytique du cheval, épizoötie chancreuse," &c.; while by the Arabs it is designated "el dourine" (the unclean disease). It has also been described as the "lues venerea equina." It has only come into notice at a comparatively recent date, and was first described by the German veterinarian Ammon, who saw it at the Trakehnen breeding stud, in North Prussia, in 1796, affecting the mares and stallions. From 1801 it disappeared in Prussia, but extended northwards, causing much loss in Lithuania, and returned again to Trakehnen in 1807. Such is the early history of the malady; but it may be remarked that it was supposed to have been seen in Southern Russia before this period, and Renner mentions that it prevailed among the horses of the Imperial stud at Skopin, and in the governments of Kazan, Pottchinkoof, and Nischni Novgorod. In 1815 it was noted in Austria, and had spread into Hungary and Bohemia in 1821, in which countries it became extraordinarily prevalent in 1859 and 1862 Switzerland was visited by it in 1830, and it inflicted heavy losses in the studs; in 1836 it invaded Italy, and it was observed for certain in Russia in 1843. It was reported in 1847 in the province of Constantine, Algeria, by a French military veterinary surgeon, who described it as an "epizootic paraplegia that had appeared among the horses of the Rigas tribe." Not aware of the existence of the malady on the European Continent, he designated it by one of its chief symptoms, and casually mentioned that it had appeared in a serious form every fifteen or twenty years; in this visitation it destroyed 600 horses, and subsequently, among those of this and other tribes, it has caused great havoc. Soon after it was reported from Algeria it was discovered in Syria; in 1851 it revealed itself in France, among the brood mares in the plain of Tarbes, and was soon found to prevail in thirty-one communes containing 1874 mares, of which 127 were diseased, and of these 52 died. In 1852 it manifested itself in the Valley of Lourdes, and since that time has spread and destroyed many horses. Its advent in France was traced to the introduction of a stallion from Syria in 1851, and two others in 1861; and its perpetuation in the southern portions of that country was ascribed to the climate resembling that of Syria, where it nearly always prevails. The disease has not yet been witnessed in this country, Belgium, Spain, Denmark, Australasia, or India; but three years ago it was carried to the United States of America by imported Percheron stallions. It is a chronic infectious, or rather contagious, malady, at first localised in the genital mucous membrane, but becoming more or less rapidly generalised. Its average duration is from six to twelve months, but it may take two, three, and even four years to run its course; during this time it may almost disappear and recur repeatedly, the local symptoms becoming ameliorated and then subsiding as general infection is accomplished. The mortality is at least 70 per cent. of those affected, and a cure is only possible at the very commencement; even then there is no certainty of absolute recovery, as the malady may reappear in two or three years and terminate fatally. In 1886, of 26 stallions attacked with the "dourine" at Blidah, Algeria, 16 died, 4 were sold after castration, and 6 appeared to be temporarily relieved.

The malady is more particularly observed at the period when mares are put to the horse, and it is almost exclusively transmitted in copulation, the stallion being mainly instrumental in diffusing the contagium, the mares having a less share in this, though the male is always infected by them; but a diseased stallion will convey it to all the mares he is put to. Owing to its chronicity, it not unfrequently happens that affected animals are able to spread the contagion for more than a year. Professor Thanhoffer, of the Buda-Pesth Veterinary Institute, who has published an interesting work on the subject, states that the infecting agent is a micrococcus existing in the vaginal secretions, semen, spinal fluid, medullary roots of the sciatic nerves, and the blood. Hertwig found the disease to be transmissible by inoculation with the vaginal mucus; and in a paper read by Professor Nocard, of the Alfort Veterinary School, before the French Academy of Sciences on Jan. 25th last, it appears that this able pathologist has ascertained that the spinal cord is virulent, and he has also assured himself that it is inoculable in dogs. Several of these animals, into the anterior chambers of whose eyes he had injected a small quantity of nervous matter from a softened portion of the spinal cord of a horse that had succumbed to "dourine," died in from six to eleven weeks, after being paraplegic or monoplegic, and undergoing progressive emaciation to an advanced degree. He has also noted that the virulence is retained for a long time in spinal cords immersed in pure neutral glycerine. Roloff, Jessen, and some others believed the disease to be hereditary.

The symptomatology is interesting, the clinical features varying with the stage of the malady. At the commencement, and after an incubation of from eight days to two months, there is inflammation, and usually ulceration of the genital mucous membrane; and when the infection has become generalised the spinal cord becomes affected, this showing itself in paraplegia commencing in the dorsal region, with muscular wasting, until at last the animal cannot stand, but persistently maintains the recumbent position, and finally dies from hypostatic pneumonia, or septicæmia consecutive to extensive bedsores. Accompanying these symptoms there is a peculiar syphiloderma that merits notice. There is remarked on the surface of the skin, especially in the stallion, well-defined rounded patches from the size of a florin to that of a five-shilling piece, and projecting uniformily from a quarter to half an inch. This cutaneous vaso-neurosis is evidently due to infiltration into the papillæ of the derma in the spaces corresponding to the smaller cutaneous arterioles. The patches are frequently rapidly developed, and sometimes disappear as quickly; but in the majority of cases they persist for several weeks, gradually become denser, and are slow in going away. Their usual seat is on the croup, shoulders, chest, and abdomen.

Besides the lesions observed on the mucous membranes, Thanhoffer has remarked indications in the spinal cord of myelomycosis, central hæmorrhagic myelitis or a syringomyelitis, or localised degenerative processes. The cord is thinner at certain places, and on section it is found to be asymmetrical, softened, and studded with hæmorrhagic points; while the grey substance is atrophied and shows small patches of softening. The meninges of the cord and brain are altered, generally congested, and contain effusions; the brain substance is frequently œdematous, and the ventricles contain a larger quantity of serum than usual. The ganglionic cells are also altered in their bodies and nuclei, as well as the axis cylinder, the bloodvessels and the neuroglia, which is increased in quantity. There is enlargement of the lymphatic glands of the generative organs, and they are pigmented, and have caseous foci of various sizes. The mesenteric glands are also sometimes enlarged to the size of an apple; and the intermuscular

Digitized by Google

connective tissue and neurilemma of the large spinal nerves are the seat of a gelatiniform infiltration.

The origin of the malady is involved in obscurity. Some authorities have imagined it is human small-pox transmitted by syphilitic Arabs to the female ass, which communicates it to the male ass, and this in its turn conveys it to the female horse. The Arabs themselves believe it to be human syphilis, transmitted by diseased persons to mares with which they have intercourse, from a notion that this will free them from their disease. But there is no evidence whatever that the human disorder can be so transmitted to animals, and there are grave doubts as to whether it can be conveyed by inoculation. Though positive results are said to have been obtained by certain authorities with the monkey, rabbit, guinea-pig, cat, dog, horse, and pig, yet a series of experiments carefully performed by equally competent men on dogs, cats, cattle, pigs, mules, rabbits, and guinea-pigs have yielded only negative evidence. There is certainly no instance recorded of the so-called horse syphilis being communicated to man, and though between the two affections there are several points of resemblance, yet there can be no doubt that they are essentially distinct.

The same sanitary police measures are applicable to both; and it is a somewhat remarkable fact that in Germany, where the horse disease caused heavy losses, since the promulgation and strict enforcement of the law against contagious maladies in animals it has almost disappeared; indeed, for some years it has not been mentioned in the reports of the sanitary officers of that country.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 6522 births and 3506 deaths were registered during the week ending June 4th. The annual rate of mortality in these towns, which had been 19·3 and 19·4 per 1000 in the preceding two weeks, declined last week to 17·9. In London the rate was 17·4 per 1000, while it averaged 18·4 in the thirty-two provincial towns. The lowest rates in these towns were 10·8 in Portsmouth, 11·8 in Croydon, 12·8 in Plymouth, and 12·9 in Gateshead; the highest rates were 21·9 in Liverpool, 24·2 in Halifax and in Manchester, and 25·9 in Burnley. The 3506 deaths included 455 which were referred to the principal zymotic diseases, against 469 and 478 in the preceding two weeks; of these, 189 resulted from measles, 106 from whooping-cough, 51 from diarrhœa, 48 from diphtheria, 32 from scarlet fever, 26 from "fever" (principally enteric), and 3 from small-pox. No fatal case of any of these diseases occurred last week in Croydon or in Norwich; in the other towns they caused the lowest death-rates in Bolton, Bradford, Wolverhampton, and Gateshead, and the highest rates in Sunderland, Manchester, Preston, and Halifax. The greatest mortality from measles occurred in Huddersfield, Manchester, Birmingham, London, and Halifax; from scarlet fever in Plymouth; from whooping-cough in Manchester, Salford, Swansea, Sheffield, Nottingham, Preston, Derby, and Sunderland; and from diarrhœa in Preston. The mortality from "fever" showed no marked excess in any of the large towns. The 48 deaths from diphtheria included 40 in London. Three fatal cases of small-pox were registered in London, but not one in any of the thirty-two large provincial towns; 89 cases of this disease were under treatment in the Metropolitan Asylum Hospitals, and 11 in the Highgate Small-pox Hospital, on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 1820, against numbers increasing from 1226 to 1741 on the preceding ten Saturdays; 215 cases were admitted during the week, against 226 and 202 in the previous two weeks. The deaths referred to diseases of the respiratory organs in London further declined to 240 last week, and were 41 below the corrected average. The causes of 73, or 2·0 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Croydon, Portsmouth, Oldham, Leeds, and in five other smaller towns; the largest proportions of uncertified deaths were registered in Bristol, Birmingham, Norwich, and Sheffield.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 21·5 and 22·1 per 1000 in the preceding two weeks, declined again to 20·2 during the week ending June 4th, and exceeded by 2·3 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 13·1 in Aberdeen and 14·1 in Leith to 22·3 in Perth and 23·9 in Glasgow. The 563 deaths in these towns included 34 which were referred to measles, 20 to whooping-cough, 11 to diarrhœa, 7 to scarlet fever, 3 to diphtheria, 1 to "fever," and not one to small-pox. In all, 70 deaths resulted from these principal zymotic diseases, against 78 and 80 in the preceding two weeks. These 76 deaths were equal to an annual rate of 2·7 per 1000, which exceeded by 0·4 the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of measles, which had been 32 in each of the preceding three weeks, rose to 34 last week, of which 31 occurred in Glasgow. The deaths referred to whooping-cough, which had been 26 and 25 in the preceding two weeks, further declined to 20 last week, and included 15 in Glasgow and 3 in Edinburgh. The 11 fatal cases of diarrhœa showed a further increase upon recent weekly numbers. The 7 deaths from scarlet fever exceeded by 2 the number recorded in the preceding week, and included 5 in Glasgow. The 3 fatal cases of diphtheria corresponded with the number in the previous week, and included 2 in Paisley. The deaths referred to diseases of the respiratory organs in these towns, which had declined from 140 to 120 in the preceding three weeks, were 123 last week, and 19 below the number in the corresponding week of last year. The causes of 67, or nearly 12 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 34·6 and 29·1 per 1000 in the preceding two weeks, further declined to 28·6 during the week ending June 4th. During the first nine weeks of the current quarter the death-rate in the city averaged 33·3 per 1000, against 19·7 in London and 18·7 in Edinburgh. The 192 deaths in Dublin during the week under notice showed a decline of 3 from the number in the preceding week, and included 21 which were referred to measles, 3 to whooping-cough, 3 to "fever," 1 to diarrhœa, and not one either to small-pox, scarlet fever, or diphtheria. In all, 28 deaths resulted from these principal zymotic diseases, equal to an annual rate of 4·2 per 1000, the zymotic death-rate during the same period being 3·0 in London and 1·4 in Edinburgh. The fatal cases of measles, which had been 28 and 23 in the preceding two weeks, further declined to 21 last week. The deaths referred to different forms of "fever," which had been 1 and 4 in the preceding two weeks, were 3 last week. The fatal cases of whooping-cough, which had been 3 and 6 in the previous two weeks, declined again to 3 last week. The 192 deaths registered in Dublin last week included 36 of infants under one year of age, and 46 of persons aged upwards of sixty years; the deaths both of infants and of elderly persons exceeded the numbers recorded in the preceding week. Nine inquest cases and 5 deaths from violence were registered; and as many as 73, or more than a third, of the deaths occurred in public institutions. The causes of 12, or more than 6 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

DR. MATTHEW KANE, Deputy-Inspector-General of Hospitals, Madras Army (Retired List), died on the 27th ult., at the residence of his son-in-law, 147, Newport-road, Cardiff.

MEDICAL OFFICERS IN WAR.

We called attention some time ago to the gallantry o Surgeon-Captain Melville, of the Indian Medical Service, during the revolt in North Lushai, and the circumstance

Digitized by Google

serves to prove that the application of the term "non-combatant" to medical officers is entirely misleading. A medical officer has to take his part with the rest of the expedition of which he forms a part. He is subjected to all the risks and dangers of any fighting just like other officers, and when an engagement is over for other officers his responsibility and work only begin again. The every-day occurrences of military life in the field show that such distinctions cannot be drawn.

ARMY MEDICAL STAFF.

Surgeon-Captain H. E. Deane has taken over the charge of the Hospital for Soldiers' Wives and Children at Aldershot; Surgeon-Lieutenants E. M. Pitcher and E. M. Morphew have been appointed to the Cambridge Hospital, Aldershot; Surgeon-Lieutenant J. F. M. Kelly to the Second Station Hospital, Aldershot; Surgeon-Lieutenants G. S. Crawford and H. P. Johnson to the Third Station Hospital, Aldershot.—Surgeon-Captain C. R. Tyrell has been appointed Assistant Instructor at the Depôt and Training School, Aldershot.—Brigade-Surgeon-Lieutenant-Colonel Charles Stratherne Close is placed on retired pay (dated May 29th, 1892).

YEOMANRY CAVALRY.—Middlesex (the Duke of Cambridge's Hussars): Surgeon-Lieutenant William Duncan, M.D., to be appointed Captain (dated June 4th, 1892).

INDIAN MEDICAL SERVICE.

Surgeon-Major Salaman, Superintendent, Yerrowda Central Gaol, will, it is understood, officiate as Inspector-General of Prisons, Bombay, for three months, during the absence of Mr. Filgate, who goes on leave from the 21st inst.

Brigade-Surgeon-Lieutenant-Colonel George Bainbridge, M.D., I.M.S., has been appointed Honorary Surgeon, Sind Volunteer Rifle Corps.

The services of Surgeon-Captain T. D. C Barry, I.M.S., have been placed at the disposal of Government for permanent employment in the Civil Department.

The services of Surgeon-Captain T. E. Dyson, M.B., I.M.S., have been placed permanently at the disposal of Government for employment in the Civil Department.

Government of India Orders.—Medical: With effect from the date on which Brigade-Surgeon-Lieutenant-Colonel K. McLeod, M.D., retired from the Service, Brigade-Surgeon-Lieutenant-Colonel D. O'C. Raye, M.D., is appointed Professor of Surgery, Medical College, Calcutta, and *ex officio* First Surgeon to the College Hospital.—Surgeon-Lieutenant-Colonel J. O'Brien, M.D., Civil Surgeon, Darjeeling, is appointed Professor of Surgical and Descriptive Anatomy, Medical College, Calcutta, and *ex-officio* Second Surgeon to the College Hospital, vice Brigade-Surgeon-Lieutenant Colonel D. O'C. Raye.—Surgeon-Captain J. Scott, M.B., 6th Infantry, Hyderabad Contingent, is granted leave in India (p a) for forty-two days.—Surgeon-Major E. S. Brander, Civil Surgeon, Etawah, is appointed to officiate as Superintendent, Central Prison, Bareilly, during the absence on deputation of Surgeon-Major E. Mair.—Surgeon-Captain H. J. Pocock, M.S., is appointed to the civil medical charge of Roorkee, in addition to his military duties, from the date of taking charge and during the absence on leave of Surgeon-Major J. Young, I.M.S.—Surgeon-Captain L. G. Fischer, Civil Surgeon, Manipuri, is appointed to hold visiting medical charge of the Etah District, in addition to his own duties, during the absence on privilege leave of Surgeon-Captain H. E. Drake-Brookman.—Mr. H. R. Warner is appointed to officiate as Assistant District Superintendent of Police, and to be posted to the Lucknow District.—Surgeon-Major J. Anderson, Civil Surgeon, Bareilly, is appointed to be in visiting medical charge of the Pilibhit District from March 27th, 1892.—Surgeon-Major H. Seymour, M.B., of the Medical Staff, is appointed to hold charge of the civil medical duties of Moradabad, in addition to his military duties, during the absence on furlough in India of Surgeon-Major P. J. Freyer, Civil Surgeon.

Ghazipur Volunteer Rifle Corps.—Honorary Surgeon J. H. Maclaren, M.B., I.M.S., is granted twelve months' leave of absence, on private affairs out of India, from April 23rd, 1892.

Surgeon-General Rice, who has recently been granted an extension of office, will probably proceed on leave shortly, in which case Deputy-Surgeon-General Richardson will officiate for him.

Surgeon-Colonel F. W. Wade, Administrative Medical Officer, Allahabad, has been granted sixty days' privilege leave.

Surgeon-Major Robertson acts as British Agent during Colonel Durand's visit to India.

Surgeon-Captain F. P. Maynard is appointed to officiate as Civil Surgeon of Burdwan during the absence, on furlough, of Surgeon-Major G. Price, or until further orders.

Surgeon-Captain Narendra Prasunna Sinha, Civil Surgeon of Faridpur, is allowed leave for one month and fifteen days, under Art. 291 of the Civil Service Regulations, from May 15th, 1892, or such subsequent date as he may avail himself of it.

Surgeon-Captain W. J. Buchanan is appointed to officiate as Civil Surgeon of Midnapur, during the absence, on deputation, of Surgeon-Major A. Tomes, or until further orders.

Surgeon-Major P. J. Freyer, M.D., Civil Surgeon, Moradabad, furlough in India for twenty months, from May 10th, 1892.

Honorary Surgeon A. R. W. Sedgefield, M.B., I.M.S., is granted twelve months' leave of absence, on private affairs out of India, from April 30th, 1892, or subsequent date.

NAVAL MEDICAL SERVICE.

Until the beginning of last year, when a ship with a post-captain or senior commander was commissioned, a staff surgeon was appointed; and failing that, or if through death or invaliding a vacancy occurred, the surgeon appointed received the acting rating, and pay of the higher rank. This was an equitable arrangement, as he had heavier duties to perform and had charge of more valuable stores, the loss of which would be made good out of his pay. It has lately been the custom, however, to appoint a surgeon to a post-captain's command in lieu of a staff surgeon. There are a number of surgeons on the list holding these positions, and doing the heavier work, for which they receive no extra pay. We are given to understand that a circular has been received from the Admiralty ordering surgeons in future to be considered as part complement of commanders' and of nearly all captains' commands, by which acting vacancies will be done away with. As acting vacancies are the rule in other branches of the service we do not see why medical officers should be put upon a different footing.

The undermentioned Fleet Surgeons have been promoted to the rank of Deputy-Inspector-General of Hospitals and Fleets in Her Majesty's Fleet:—James William Fisher, M.D., and Thomas Henry Knott (both dated May 30th, 1892).

VOLUNTEER CORPS.—2nd Volunteer Battalion, the East Surrey Regiment: Brigade-Surgeon-Lieutenant-Colonel E. Pocklington is made Supernumerary in place of being seconded (dated June 4th, 1892).—2nd Volunteer Battalion, the Loyal North Lancashire Regiment: Surgeon-Captain A. Kershaw resigns his commission; also is permitted to retain his rank, and to continue to wear the uniform of the Battalion on his retirement (dated May 24th, 1892); Surgeon-Lieutenant J. F. Scowcroft, M.D., to be Surgeon-Captain (dated May 24th, 1892).—2nd Volunteer Battalion, the Queen's Own (Royal West Kent Regiment): Mowbray Taylor, M.B., to be Surgeon-Lieutenant (dated June 4th, 1892).

IRISH MEDICAL ASSOCIATION. — The following office-bearers have been elected for the ensuing year:—President: David R. Jacob. Vice-Presidents: G. E Greene, W. W. Leeper, Thomas Hayes, Richard O'Kelly. General Council: Sir J. T. Banks, Arthur Benson, R. Browne, Sir Charles Cameron, H. Chapman, F. Davys, J. Delahoyde, N. Falkiner, F. C. Fitzgerald, Kendal Franks, J. Gray, E. Hamilton, W. J. Hepburn, A. H. Jacob, Dillon Kelly, W. G Jacob, R J. Kinkead, R. Leeper, Austin Meldon, H. Minchin, J. A. MacCullagh, P. J. Macnamara, George Mackesy, H. Oulton, J. R. Phillips, John Ringwood, P. C. Smyly, Sir William Stokes, W. T. Stoker, and W. J. Wheeler.

PRESENTATION.—The officers of the Holborn Union Workhouse, on May 30th, presented Mr. Oscar B. Shelswell with a handsome silver egg-stand as a mark of respect and esteem on the occasion of his marriage.

Correspondence.

"Audi alteram partem."

THE ELECTION TO THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS.

To the Editors of THE LANCET.

SIRS,—With Mr. Lawson Tait's conduct towards the Association of Fellows, I, as a member, have little concern. I have already stated what the "circumstances" were to which Mr. Tait still mysteriously alludes as his reason for deserting his colleagues in both Associations, and apparently neither the Fellows nor the Members can see in them any justification for the course which he has taken. I desire, however, to protest against Mr. Tait's assertion that "the fight for the Members' rights has become perfectly hopeless." That it was so while conducted on the lines dictated by him I fully admit; I admit, further, that his interposition has probably delayed the realisation of the Members' aims for several years, but that the present generation will see an entire change in the mode of government of the College I no more doubt than that the sun will rise to-morrow. Mr. Tait has passed as a disturbing influence across the path of College reform, which will, I trust, now return to its proper orbit.—I remain, Sirs, faithfully yours,

June 6th, 1892. W. G. DICKINSON.

DEATHS UNDER ANÆSTHETICS.

To the Editors of THE LANCET.

SIRS,—I forward you an account of a case of death under an anæsthetic.

L. W——, a well-developed and healthy woman, aged thirty-five, applied to me in March last suffering from chronic sinuses in right axilla, following an abscess about eighteen months ago. I sent her to Evesham Cottage Hospital, where she was given A.C.E. mixture by my brother, Mr. Frank Gilpin, M.R.C.S., and without any abnormal symptoms she remained under it from twenty minutes to half an hour, while I opened up and scraped out eight large sinuses, these afterwards healing well. She was discharged at the end of the third week practically cured, with the exception of a small surface about a quarter of an inch long, which cicatrised over in about a fortnight from her discharge. About the middle of May she again applied to me, with this last named spot broken down, and, after dressing it for ten days or so, on May 29th I again advised her to go into hospital for a few days, and ordered her admittance before 12 o'clock. But on the 30th I found the woman in a most excited state, and the matron informed me she had not appeared until 9.30 P.M., decidedly the worse for drink, having been detained at a police-station. I declined to do anything until the next day, May 31st. On my arrival I found her quite composed and most anxious to get the operation over. About 12 o'clock the matron and nurse had the patient ready (she had had her breakfast soon after 8 o'clock). I did not consider an anæsthetic necessary, but at the last moment yielded to her express wish that I should give her some. Her pulse was 72, regular and of fair tension. I used the flannel inhaler (after Middlesex Hospital pattern), A C E. mixture in a two-ounce glass stoppered bottle, which I had freshly opened the day before to give another case some for purpose of abdominal examination. She was slightly excited at first, and soon showed some signs of faintness, when I got the matron to give a hypodermic injection of about one drachm of brandy, but within a minute or so she became slightly cyanosed and her respiration became irregular. I stopped, and injected half a drachm of ether, when she seemed better, but within another minute she seemed to get worse. I immediately commenced artificial respiration, the patient's tongue being kept well out of her mouth with tongue forceps. As she did not improve, I ordered hot fomentations over the præcordia and two more hypodermic injections of ether in the same region, and sent for Mr. J. S. Slater, M R.C.S., he being the nearest medical man, who kindly came in about ten minutes or so; but on his arrival the patient was practically pulseless and the heart sounds were scarcely audible. We performed the artificial respiration for some five minutes or so longer, but found she was then dead, I having kept the artificial respiration going for just half an hour. I had no galvanic battery at hand. At my request the coroner ordered a post-mortem examination by Mr. Slater. We found the lungs hypostatically congested with a few scattered old adhesions. The pericardium was markedly adherent, especially in front. The heart was of average size, slightly dilated; the muscular walls of the left ventricle were flabby; the valves were normal. Liver and kidneys seemed healthy. As to the cause of death, I would suggest whether the excited state of the woman's mind the few days previously, she turning out to be a known chronic alcoholic, together with the state of heart and pericardium, would not sufficiently account for it.

I am, Sirs, yours faithfully,

R. HARRISON GILPIN, L R.C.P. &c.

Evesham, June 7th, 1892.

To the Editors of THE LANCET.

SIRS,—The following are notes of a case of death under chloroform:—

The patient, a boy aged twelve years, was admitted into hospital, March 15th, with a large psoas abscess (right). Two days later this was opened and explored under chloroform, which the patient took well. A few days after this he had signs of pneumothorax, and later hydrothorax, of left chest. This was aspirated, and after a few days the chest signs began to clear up and his general condition improved. For the next six weeks he went on in much the same condition, with discharging sinus in the right groin, but health improving a little. At the end of this time—i.e., May—a large abscess had formed over the right sacro iliac joint, and was about to be opened when death occurred. The chest had been examined every week, and the following was the condition of lungs and heart a few days previously to May 27th:—Heart: Impulse in fifth space close in to left edge of sternum. Both sounds normal; no bruits heard. Pulse usually about 85 Lungs: Dulness at left base behind from eighth rib downwards, with impaired voice and breath sounds and loss of tactile fremitus. He had been prepared for the anæsthetic, and had only had a little milk and bread four and a half hours previously. The following is the report of the assistant house surgeon, who acts as anæsthetist to the hospital, and was administering chloroform when the death occurred:—"It was administered on a piece of lint (doubled) held in front of the face. Patient was not at all nervous. Administration had been continued for between two and three minutes, when the respiration, which had been regular but shallow, became deeper. About three such had been taken when breathing ceased suddenly. The pulse was found to be imperceptible at the wrist, and the corneal reflex gone, and pupils widely dilated. Artificial respiration (Sylvester's method) was commenced at once. Two inspiratory gasps only were taken. Hypodermic injections of ether, hot sponges to præcordium, raising extremities, and galvanic current to heart were all tried without success, artificial respiration being kept up for half an hour. Altogether one drachm of chloroform had been given." A post-mortem examination was made the following day. Below are the notes Lungs: Right quite healthy; left, upper lobe healthy, lower carnified. There was an empyema on this side which contained about sixteen ounces of pus. The heart was lying rather more to the right side than normal. The muscles and valves were healthy.

I am, Sirs, yours faithfully,

NORTON CLOWES, House Surgeon.

Reading, June 7th, 1892.

"STEELE *v.* SAVORY" FUND.

To the Editors of THE LANCET.

SIRS,—Dr. Danford Thomas's appeal in your last week's issue will, I feel sure, commend itself to the Members of the College of Surgeons, and provide at once the necessary funds to defray the costs, amounting to £2000, in the above action. Up to the present date £800 has been received; £600 of this has been subscribed by the twelve members of the committee, an average of £50 each. I feel confident the Members of the College will not allow these gentlemen to be saddled in this manner. The Council of the College would not abate their costs one farthing, and like Shylock

Digitized by Google

determined to have the pound of flesh, and distrain if necessary on the goods of the four plaintiffs. I hope that the Members will at once respond to Dr. Thomas's appeal, not only to pay the £2000 owing for costs, but also to place the Association on a strong footing, so that Parliamentary action may be taken to secure for the Members that reform in the management of the College affairs which I feel confident they all desire. Subscriptions, however small, will be thankfully received by Dr. D. Thomas, Park Lodge, Paddington.—I am, Sirs, yours faithfully.

JOSEPH SMITH,
Vice President, Association of Members of the Royal College of Surgeons.

June, 1892.

RHEUMATOID ARTHRITIS AND RHEUMATIC ARTHRITIS.

To the Editors of THE LANCET.

SIRS,—I have just read, in the account of the meeting of the Royal Medical and Chirurgical Society, held on May 24th, the report of Mr. Hugh Lane's paper on the above subject, and there are some points with regard to it about which I should like to be allowed to make a few remarks. Not having been present at the meeting, I must consequently depend upon the necessarily somewhat abridged report in the medical press. If, therefore, I should put words into Mr. Lane's mouth which he did not make use of, I hope that he will forgive me, and recognise the cause of my error. Now, in the first place, speaking of rheumatoid arthritis, Mr. Lane says that "it is a constitutional disease of debility, invariably having a history of phthisis or gout, or both." Apparently he holds that it is a tubercular disease, and the obvious question which indeed was asked was, "Has Mr. Lane ever demonstrated the presence of the tubercle bacillus?" Unfortunately the answer to this question was not reported, which is a pity; for it would be interesting to know, first, if the bacillus has been found in those cases in which there is a marked tuberculous history; secondly, whether it is present in other cases; and finally, what method of staining Mr. Lane finds most convenient. In my own experience at the Mineral Water Hospital I find that in this mysterious disease there is a family history of phthisis in a large number of cases; but I also find that there is a still larger class in which it is absent, and "invariably" is hardly the word which one would use to express the frequency of the connexion between the two. If Mr. Lane maintains that a history of phthisis or gout is invariably present, of course he would not recognise any cases in which such a history was absent as being rheumatoid arthritis. What will he call these, and where will he class them? A history of phthisis is probably found as frequently as it is in rheumatoid arthritis by virtue of the fact that it is a debilitating disease, and a very common one, and, moreover, one in which the debilitating influence is transmitted to the offspring; but beyond this I do not believe that there is any relation between the two. There are other causes which predispose to rheumatoid arthritis, as Mr. Lane allows, but there is one of considerable importance which he does not recognise, and this is acute rheumatism. I certainly think that this disease should be given greater prominence as a predisposing cause; for there are a large number of cases of rheumatoid arthritis where the symptoms have started from an attack of rheumatic fever, and I hope before long to be able to show in a tabulated form my grounds for this statement.

Next, with regard to differentiation. In rheumatoid arthritis Mr. Lane finds that the reflexes are normal or subnormal, whilst they are increased in rheumatic arthritis, "especially late in the disease." Now, it would seem, on the face of it, more probable that they would be absent in rheumatic arthritis "late in the disease," when, to use Mr. Lane's own words, "the resulting ankylosis is very firm." I have especially noticed the point of the reflexes for a long time, and I am quite certain of this: that, as a general rule, in rheumatoid arthritis they are distinctly increased, and that it is the exception for them to be subnormal. I quite agree with Mr. Lane in saying that rheumatoid arthritis is a disease of all ages; but it is rather comic that he should emphasise the point that in chronic rheumatic arthritis the young seldom suffer. There is one thing more. As a minor point in the differentiation, Mr. Lane says that "anti-rheumatic treatment never did any good" in cases of rheumatoid arthritis. In my own experience, I find that in this disease the patient is liable to frequent attacks, accompanied by increased pain and swelling of the affected joints. Under these circumstances salicylate of soda is of great benefit, both for reducing the temperature and also relieving the joint troubles. But the fact that a case was benefited by salicylates would, of course, cause Mr. Lane to cease to recognise it as rheumatoid arthritis; it would be removed from the category of that disease, and, like others that have already been mentioned, would have to seek shelter in the class of the unknown. In conclusion, I trust that Mr. Lane will excuse my differing from him on a few somewhat important points; and I hope that he will believe that I am approaching this subject from a purely scientific standpoint.—I am, Sirs, your obedient servant,

PRESTON KING, M.D. Cantab.,
Resident Medical Officer, Royal Mineral Water Hospital, Bath.

May 30th, 1892.

REGISTRATION OF MIDWIVES.

To the Editors of THE LANCET.

SIRS,—The following are a few of the reasons against the establishment of an order of "registered midwives":—1. All women *bonâ fide* practising at present must be admitted to the Register at commencement; hence no good can result for many years. 2. No women who choose to act as midwives can be prevented from doing so because not on the Register, provided they omit the word "midwife" from their cards or plates. 3. Any registered midwife would be able, if she think fit, to abstain from calling in medical aid in all cases; because, being legally qualified to attend "ordinary cases" without such aid, it would be practically impossible to decide where self-confidence begins to be culpable. 4. Experience proves that the education required of medical practitioners is too little always to ensure competent obstetric practice, and hence any lower standard of training is greatly to be condemned. 5. Obstetric practice, when in the hands of midwives alone, was unscientific in character and horrible in its results; and the establishment by law of a profession of midwives will hinder the gradual disappearance of a class dangerous to the community. 6. The establishment of a register will lower to an utterly insufficient minimum the training regarded necessary for competent obstetric nurses, and will thus render a lower standard prevalent generally. 7. The establishing of a new register conferring legal privileges and powers on those so registered will be unjust to those already entered on the registers of the British Nurses' Association and other bodies, which require a very high standard of training, and restrict the practice of those registered to the proper duties of nurses, acting under medical supervision. 8. The giving of legal sanction to the untrue and dangerous doctrine, that a very moderate amount of skill and training are sufficient for the due management of parturition, will lead to neglect in providing properly against the sudden, insidious, and frequent dangers which plunge so many homes in mourning. 9. The elevation of ignorant midwives into the position of "obstetric practitioners" will cause the obstetric art to be regarded with contempt, and lead to its neglect by the more highly educated members of the medical profession. 10. Every woman can at present obtain the skilled attendance of qualified medical practitioners at rates no higher than the wages of competent midwives, and hence there is no need for the less skilled attendants. 11. The demand for registration of midwives comes entirely from a number of West-end consultants and nurses whose knowledge of general practice is small, and whose motives are obviously not entirely disinterested; while there is no demand for it on the part of the public. 12. The mass of the medical profession (who are the best judges in the matter) regard the proposal as retrograde and dangerous to the public health, and they view the suggested legislation with the utmost abhorrence.

I am, Sirs, yours faithfully,

HUGH WOODS,
Master of Obstetric Art (Dublin).

June, 1892.

EXCISION OF CANCER HIGH UP THE RECTUM.

To the Editors of THE LANCET.

SIRS,—In your issue of the 4th instant Mr. W. H. Brown details an operation for the above purpose, in which the

Digitized by Google

sacrum was sawn through at the level of its fourth vertebra. While congratulating Mr. Brown on his success, I cannot help thinking that as good a result might have been attained, without the preliminary formation of an artificial anus, by a much more simple procedure, involving neither shock nor troublesome hæmorrhage. When a malignant growth is found beyond the reach of an ordinary proctectomy, yet freely movable, a posterior incision from the margin of the anus to the tip of the coccyx should be made through the sphincter. Free access being thus gained, the tumour should be dragged down, encircled by the wire loop of the galvanic écraseur, and removed. Two cases successfully treated in this way have been already reported.[1] In neither has there been recurrence; one patient, an old lady, now over eighty, and in the best of health, had a considerable mass of pendulous fungous growth, seemingly higher up than in Mr. Brown's case, as the upper limit could not be touched except under anæsthesia. Such heroic measures as resection of the sacrum or coccyx are rarely admissible in persons enfeebled by malignant disease; and, even if temporarily successful, are still more rarely productive of any benefit commensurate to the attendant risks.

I am, Sirs, your obedient servant,

Gloucester-place, W., June 7th, 1892. HERBERT SNOW.

LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

The Midwives' Bill.

ALLUSION has been made in a previous letter to the efforts towards improving the status and education of midwives in this city ever since the institution of the Ladies' Charity nearly a century ago. It was even then at least a step in the right direction, the midwives attached to the Charity being educated in their duties, subject to the supervision of the surgeons, and liable to dismissal, with the loss of what was to them a considerable income, if they were guilty of any serious neglect. More recently still greater efforts have been made in the way of improvement and by the amalgamation of the old Ladies' Charity with the Lying-in Hospital the value of each of these kindred institutions has been greatly enhanced. The fusion took place in 1869, since which date a new lying-in hospital has been erected, having all the most recent improvements, with every means for securing, so far as is possible, the perfect recovery of each patient. The candidates, after being duly educated, commence their duties as midwives should they have proved themselves worthy of the trust under proper supervision. I consider that nothing can be more reasonable or praiseworthy than this endeavour to raise the midwives of the present day to the same level, so far as practicable under the different circumstances, as that of the hospital nurses, and with much success. That no woman should be allowed to practise as a midwife for gain unless she shall have been trained in her duties under competent medical supervision is too reasonable to be seriously disputed.

The Assizes.

The only case of murder tried at the May Assizes, before Mr. Justice Cave, was that of a married woman who strangled her two children. It was proved by the evidence of Dr. Wiglesworth, of the County Asylum, Rainhill, that the unfortunate prisoner was of unsound mind at the time and not responsible for her act. She was therefore ordered to be detained till Her Majesty's pleasure should be known. There were also some cases of severe wounding and of brutal violence, for which very severe sentences were awarded.

A Coroner on the Removal of Bodies.

An inquest was held on the 4th inst. by Mr. Smith, the coroner for the Manor of Prescot, upon the body of a miner who had been killed by a fall of roof which had been found to be properly timbered shortly before its fall. The manager was rebuked by the coroner for removing the body from the district of the coroner in which the accident occurred into that of another coroner. It was a proceeding not only attended with much inconvenience, but it was also very unfeeling to send the body home without any previous intimation to his widow. Under the Coroner's Act, 1887, the coroner within whose district the body is lying must hold the inquest.

Whit Monday Bank Holiday.

The glorious weather has made this year's Whit Monday an ideal Bank Holiday. Some notion of the advantage taken of it may be gathered from the fact that close upon 170,000 passengers were in the course of the day conveyed across the four Mersey ferries—Birkenhead, Seacombe, Egremont, and New Brighton. Not one single accident is recorded, a fact most creditable to the management of the ferries, which indeed is most excellent all the year round, but especially on such occasions as Bank Holidays &c. The traffic by the Mersey Railway, the Lancashire and Yorkshire, Cheshire lines, and London and North-Western was very heavy, but no accidents are reported.

St. James's Cemetery.

A visit is to be made to this cemetery on Saturday next, the 11th inst., by Dr. Hoffman, the medical inspector of the Burial Acts Department of the Home Office. The cemetery is situated in the centre of the city, and is surrounded on all sides by dwelling-houses. Complaints have been made sometimes of unpleasant odours, more frequently of the lugubrious sight of hearses, mourning coaches, &c., appearing there, when, in the opinion of some residents, they should all be relegated to cemeteries outside the city. Both those who wish to have the cemetery closed and those who wish to see it still used will have an opportunity of stating their respective cases on Saturday. The cemetery occupies eleven acres of ground and the interments number upwards of 45,000.

June 8th.

MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

Model Dwellings for Labourers.

A LARGE block of model dwellings for labourers was opened on May 30th in Ancoats. The block had been made by reconstructing an old mill, and about 150 tenements have been arranged in the building, and at the time of opening the great majority of these were already occupied. The building has been undertaken by a private society, the Manchester Labourers' Dwellings Company, and, so far as can be judged from the opening success of a new attempt in this direction, the efforts of the company are appreciated by those whose condition it seeks to benefit. Among the promoters of the scheme are a number of influential citizens, and many people interested in the matter attended the opening ceremony. It was stated by the chairman that this was the first of the company's undertakings, and that they hoped to complete many more buildings of the kind. The tenements will be let at rates yielding a moderate interest on the capital expended, and the company will thus be self-supporting. In subsequent speeches by the mayor and the chairman of the sanitary committee of the corporation, it was stated that the corporation would help as much as possible the efforts of the company, and would welcome the latter as purchasers of suitable land at moderate prices rather than themselves erect labourers' dwellings. Incidentally the great amount of useful work done by the sanitary committee in closing and ordering repairs and alterations to be made in unhealthy houses was pointed out. Manchester is very scantily supplied with tenement houses of this sort, and everyone taking an interest in the improvement of the housing of the labouring classes must heartily congratulate the Labourers' Dwellings Company on the spirit of their enterprise and on their manner of carrying out their first work.

Baths.

A new public bath—the fourth belonging to the Salford Corporation—was opened last week. The number of persons using these baths is very great, but nevertheless a slight pecuniary loss in working them results, and this has to be recouped out of the rates.

New Fever Hospital for Salford.

Next week there will be opened a new fever hospital for the borough of Salford. The old "Wilton" hospital has been found insufficient for the requirements of the town,

[1] Brit. Med. Jour., Oct. 11th, 1890.

Digitized by Google

and was, moreover, situated in a densely populated neighbourhood. The new one is near Eccles, surrounded by plenty of open space, and will have accommodation for about 100 patients, which is calculated to be sufficient for all reasonable needs of the borough.

Manchester, June 8th.

NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

North Shields and Tynemouth Dispensary.

THE annual meeting—the ninetieth—of the North Shields and Tynemouth Dispensary has been held. The number of patients admitted by ticket was 966, being a considerable increase; the number of casual patients was 6758, showing the large increase of 2663. This, it was pointed out, was owing to the influenza epidemic. The house surgeon had also made 3520 visits to the homes of patients. The committee were of opinion that a more commodious and larger central dispensary was required for the borough.

South Shields.

The Mayor of South Shields, in reference to the resignation by Dr. Eustace Hill of the office of medical officer of health for the borough (having been appointed health officer for Durham County), said it was a source of deep regret that they had to part company with him. Dr. Hill had won the confidence not only of the county, but of the entire town. He was a comparatively young man, and they might congratulate him on receiving such an important appointment.

Ambulance Work in the North.

At Hexham, last week, Surgeon-Major Hutton examined a large class of over fifty males and females who had been instructed by Mr. Duncan Stewart, assisted by Major J. P. Gibson, in ambulance work. At the close of the examinations Surgeon-Major Hutton addressed the students, and encouraged them to hold regular practices. He remarked that if it were necessary he would undertake to place a thousand ambulance men at a short notice on any part of our coasts. The oldest student was Mr. W. Stokoe, who is in his seventy-sixth year, and who had been engaged in the work of giving first aid to the injured at the Fallowfield mines for forty years. The county police, railway servants, and Volunteers were represented in these classes.—At Darlington, too, a highly successful concert was given last week, at the conclusion of which Miss Fry presented certificates to the students who had passed in the recent examinations, and a presentation was afterwards made to Dr. Petter by the class as a slight token of their appreciation of that gentleman's services during the session. The chairman expressed his satisfaction with the success of the ambulance work, and hoped that next session another class might be formed.

Carlisle.

The outbreak of typhus fever at Carlisle may now be considered at an end. I regret to say that the nurse who attended the patients in their convalescent stage contracted the disease and died after a short illness. The medical officer of health has made some practical suggestions to the health committee, in which he shows that the disease, when it appears in Carlisle, usually breaks out in the month of April. This he accounts for by the fact that typhus fever is a disease of poverty and overcrowding, and that poor people are more susceptible to the infection when their scanty stock of health is reduced to the lowest ebb by the privations of the previous winter, and that Carlisle, being on the highway in connexion with Newcastle, Whitehaven, and Liverpool, is liable to the importation of the infection. I believe, however, as regards Newcastle, it is not so liable; for I have heard of no cases for the last few months. The medical officer makes a very useful recommendation to the committee, to establish a block hospital for the reception of doubtful cases of continued fever, so that when practitioners are uncertain as to the type of the malady patients may be sent there until its nature is cleared up.

The late Mrs. Wilson of Dallam Tower, whose will has been proved at Carlisle, left, amongst other charitable bequests, £100 to the Royal Albert Asylum at Lancaster.

Newcastle-on-Tyne, June 8th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENT.)

The Admission of Women as Medical Students to the Edinburgh Royal Infirmary.

IT is understood that the managers of the Royal Infirmary have decided on holding a conference with the staff with a view to trying to arrange for the clinical instruction of the twelve women who have applied for it.

The Pathological Department of the Royal Infirmary, Edinburgh.

As was mentioned here last week, proposals were under the consideration of the managers of the infirmary regarding the pathological department. The proposal was to have a senior pathologist who would devote his time to the work, and that he should receive a fair remuneration for doing so; and that there should be two assistants, who might be junior men, and would assist in the investigation of cases and in other work in the department. Nearly the whole staff, always excepting the University professors, were in favour of this, and it was felt that the arrangement would probably give a stimulus to pathological work, and would greatly enhance the opportunities for original work in the department. The scheme has been opposed by the University for a very curious reason—namely, that the senior pathologist might become so strong that he would attract students from the professor's classes. Whatever the reasons may be, the University thought it worth while to fight strongly against the proposals, and the result is that they have been thrown out, and the *status quo* is adhered to.

The Health of Edinburgh.

The mortality last week was 87, and the death-rate 17 per 1000. Diseases of the chest accounted for 40 deaths, and zymotic diseases for 6 The intimations for the week were typhoid fever 3, diphtheria 1, scarlet fever 14, and measles 45.

June 7th.

IRELAND.

(FROM OUR OWN CORRESPONDENT.)

Royal College of Surgeons.

THE annual elections took place on Whit Monday, Mr. Hamilton being elected President, and Mr. Thornley Stoker Vice-President, without opposition. There were three candidates for the post of Secretary, Sir Charles Cameron being successful. The office is an honorary one, and since 1784 only four members have been elected. As has been pointed out, the first holder was Mr. Henthorne, who held office for the long period of sixty years. Mr. James Cusack succeeded Mr. Henthorne, his tenure lasting for seventeen years; and was followed by Mr. Hutton, who occupied the post for four years. The last was Mr. William Colles, who resigned recently, and retained office for twenty-seven years. The changes in the old Council are as follows: Mr. Croly, late President, and Mr. Carte, late Vice-President, go on the Council; Messrs. Stoker, Colles, and R. F. Tobin resign, while Mr. Hamilton becomes President. The two vacancies are filled by Messrs. Alcock Nixon and A. H. Benson. The annual meeting of the Fellows to consider the report of the Council was fixed for Saturday, the 4th inst. The accounts for the year show a decrease in the ordinary expenses of the College amounting to £488 12*s.*, while there is an increase of £40 11*s.* 10*d.* in the receipts during the same period. In connexion with the proposal to establish a new university in London, and to exclude from its medical degrees all candidates save those who have studied in London schools and hospitals, the suggestion was made by the Conference Committee of the College and the Royal College of Physicians, that communications should be opened with the Senate of the Royal University, with the object of effecting such conjunction of its examinations with those of the Colleges as would enable the diplomates of the Colleges to obtain the degree of M.D. without passing through a separate curriculum and series of examinations. The proposal, however, came to nothing, as the Senate of the Royal University refused to have anything to do in the matter. Dr. Davy, one of the professors

Digitized by Google

of medical jurisprudence, last month sent in his resignation, which has been accepted by the Council. The subjects of exclusion of Irish diplomates from hospital appointments in England, the enlargement of the College school buildings, and the abolition of the visiting physiciancies of Irish lunatic asylums are also fully considered in the report.

Rotunda Lying-in Hospital.

At a meeting of the governors last week the plans for the proposed new auxiliary hospital were adopted, and a committee appointed to carry out the proposed scheme. In addition to the proceeds of the bazaar held last year it is estimated that a further sum of £4000 will be absolutely necessary to complete the new building, and an account has been opened at the Bank of Ireland to receive contributions for the desired purpose.

Irish Medical Association.

The annual meeting was held last Monday, presided over by Sir Charles Cameron, and afterwards by the newly elected President, Dr. Jacob of Maryborough. The report of the Council as regards its financial position was satisfactory, a considerable increase having taken place in the income of the Association, owing to 107 new members having been elected since the previous year. Several members who were in arrears for their annual subscription were struck off the list. The chief place in the programme of the Association was accorded, by the wish of the members and the Council, to the promotion of a Bill to secure pensions as of right for Poor-law officers, medical and non-medical, whenever they shall have become incapacitated from duty. The Council approached the Chief Secretary to obtain the support of the Government for the Superannuation Bill, but met with scant encouragement from that official, the interview accorded after one refusal to receive a deputation being strictly private, no reporter being allowed to take notes of the interview; and the attitude of the Chief Secretary to the proposals of the delegates was one of hostility. The Council have constructed a skeleton Bill to provide for safeguarding the issue of tickets, for much greater facilities for cancelling such tickets, and for a declaration that the issuer or the recipient may be held liable to pay the fees of the medical officer if the ticket shall have been knowingly or negligently issued to an improper recipient. The Council, however, do not intend to complete the proposed measure or introduce it into Parliament, being of opinion that no legislation on the subject should be actively promoted until the Superannuation Bill has been disposed of. The following resolutions were adopted by the meeting:—

"That we, the members of the Association, declare the claim of the Poor-law officers of Ireland to superannuation whenever they shall have become incapacitated for the performance of duty to be an equitable principle, and indispensable to the efficiency of the Irish Poor-law system. That, inasmuch as the services rendered by Poor-law officers are strictly obligatory, and are much more onerous than those performed by most civil servants, there is no just reason why the grant of pension, which is assured in the case of civil servants, should be left to the caprice of any body, as is the case of Poor-law officers. As experience has abundantly proved that the discretion vested in boards of guardians to refuse or grant pensions has operated as a great hardship towards Poor law officers, and very much to the disadvantage of the service, it is therefore a matter of policy, apart from justice to the officer, that the grant of a pension in old age or infirmity shall be a matter of right. We therefore, while approving of the steps taken by the Council to obtain legislative authority for the necessary change of law, urge the Council to persist in the demands which they have put forward, and to relax no effort to bring the matter to the notice of the next Parliament."

"That the dispensary medical system of Ireland can never be satisfactory nor its medical officers contented until the method of the issue of medical relief tickets shall have been altered, so that persons of independent means may be prevented from availing themselves of the gratuitous services provided by the ratepayers for the relief of the poor. Such abuses not only operate as an encouragement to pauperism, but they burthen Poor law medical officers with work for which they are not paid, and, by withdrawing from those officers the private practice which is their legitimate means of livelihood, impose upon the ratepayers a much higher charge for Poor-law medical services than would otherwise be necessary. For these reasons a change in the law and regulation governing the distribution of Poor-law medical relief tickets is urgently needed; and the Council is hereby requested to press the matter upon the notice of Parliament, whenever a favourable opportunity shall arise, without delaying the settlement of the superannuation question; and that this Association cordially approves of the movement to secure direct Parliamentary representation with a view to obtaining redress of the above mentioned grievances."

"That the cordial thanks of the Association be, and they are hereby, returned to the Parliamentary Bills Committee of the British Medical Association, to the Irish Medical Schools' and Graduates' Association, to the Royal Colleges of Physicians and Surgeons, and to the Poor-law Officers' Association, for the valuable countenance and assistance given to this Association in its efforts to promote measures for the redress of the grievances of the Poor-law medical officers, and that these thanks be conveyed by the secretary to the representatives of the bodies named."

"That the thanks of this Association are hereby gratefully tendered to the professional and general press for their constant advocacy of the claims of the medical profession, as well as for having given publicity to the proceedings of the Association."

The officer-bearers for the ensuing year having been appointed, the proceedings terminated. In the evening the annual dinner took place in the Royal College of Surgeons.

At a meeting of Convocation of the Royal University of Ireland the Rev. M. Leitch, Professor Sinclair of Belfast, and Mr. Thomson, M.D., F.R.C.S.I., of Dublin, were elected members of Senate.

The Medical Board of the Mater Misericordiæ Hospital have elected Mr. O'Sullivan, M.B., B.Ch., resident surgeon for the ensuing year.

June 7th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

The Influence of Incubators and "Gavage" on the Mortality of the Newborn.

AT the Paris Maternity there are born annually an average of 400 infants before term. As may be imagined, the mortality amongst this premature addition to the infant population was very great before the introduction of the system of incubation combined with "gavage." The beneficent effect of this system may be gathered from the perusal of the following figures: Mortality in the ante-incubator period:—Infants born in the sixth month, 100 per cent.; at six months and a half, 78·5 per cent.; at seven months, 61 per cent.; at seven months and a half, 46 per cent.; at eight months, 22 per cent.; at eight months and a half, 12 per cent. The incubator and "gavage" have converted these figures into 84, 63·4, 50·2, 23, 11·2, and 4 per cent. respectively. Comment is superfluous. It is, however, only right to recall the predominant part taken by Professor Tarnier in popularising this method of saving to the world a not inconsiderable number of human beings who would, under the old *régime*, have had hardly the time to make their bow to the family circle before quitting it for ever.

Precautionary Measures against Hydrophobia.

The walls of Paris are now covered with posters signed by the Prefect of Police, enjoining all owners of dogs either to muzzle their pets or lead them by a string during their peregrinations through the streets of this capital. Any infringement of this edict will be punished in a manner very unpleasant to the master, and still less pleasant to the poor beast, the police having orders to conduct it to the pound, where it will be killed. It will astonish no one who is familiar with the slovenly way such orders are carried out there when I state that this very day I noticed in the streets, wandering at their own sweet wills, numerous unmuzzled dogs.

The Paris Water-supply.

As usual, at this time of year, certain districts of Paris are obliged to consume water derived from the Seine, the *eau de source* being, owing to the continuance of dry weather, insufficient to supply the whole of the town. It is only right to explain that the parts of Paris most frequented by visitors are spared this dangerous infliction as much as possible, spring-water being supplied to them; while the inhabitants of the more populous arrondissements have to drink the fever-laden liquid known as *eau de Seine*. But since in the course of their wanderings tourists might wish to assuage their thirst in one of the infected areas, I should strongly advise them to make inquiries of the landlord of the hotel or pension at which they are staying as to the distribution of this polluted water. Only the other day, being seated at a *café* near the Panthéon, I was the means of preventing the absorption of this dangerous stuff by a fellow countryman who, although resident in Paris, was not posted up in these matters. A practical proposition has been recently adopted by the Municipal Council to the effect that all public fountains found in the less-favoured parts of Paris be fitted with *filtres hygiéniques*. I very much doubt, however, if anything short of boiling would induce me to drink Seine water. I again repeat that early next year we are promised

Digitized by Google

a supply of pure water equivalent to 100 litres per diem per inhabitant, which will render this city independent of drought and its regrettable corollary—recourse to Seine water.

Election to the Academy of Medicine.

Death has been very busy of late, and has caused many vacancies in the ranks of those eminent medical men who compose the Academy of Medicine. At the last election Dr. Desnos was successful against three competitors for the coveted honour—Drs. Dumontpallier, Laveran, and Hallopeau.

Professor Benjamin Ball.

The numerous friends of our distinguished compatriot, Dr. Ball, professor of mental medicine at this faculty, will regret to hear that illness has, for some time past, compelled him to discontinue his admirable teaching at Sainte Anne Asylum and at the Laennec Hospital. His kindness and courtesy to English practitioners visiting Paris for educational purposes are traditional, and I am sure that in wishing him an early recovery I am only echoing the sentiments of all who have come in contact with him.

Paris, June 8th.

BERLIN.

(FROM OUR OWN CORRESPONDENT.)

The Langenbeck House.

THE annual surgical congress will be opened to-morrow in the new Langenbeck House, which is now finished. The building stands close to the Surgical Clinic of the University, fronting the Spree. The entrance is from the Ziegel Strasse. It is a plain brick building of three storeys, containing a fine assembly hall capable of seating 700 persons, a smaller hall to accommodate several hundred, a library, a reading-room, a museum, and custodian's rooms. The large hall is to be adorned by a portrait and a marble bust of Langenbeck, and the names of great surgeons are to be painted on the walls under the gallery. In the main corridor will be placed a marble bust of the late Empress Augusta (who took a keen interest in the project), flanked by portraits of the present Emperor and Empress. In the wall opposite these works of art are doors leading to the large hall, between which marble busts of Bardeleben, Billroth, Bruns, Busch, Taiersch, and Volkmann are to be erected. The site and the entire building cost about £27,500. This sum was raised by the German Surgical Society, aided by the Berlin Medical Society and the friends, pupils, and admirers of the great surgeon whose name the building bears. The ground behind the building is to be laid out as a garden.

Children's Hospitals on the German Coasts.

The Society for Children's Hospitals on the German Coasts, of which the Empress Frederick is patroness, held its twelfth annual meeting last Friday evening, Professor Leyden in the chair. The number of children received last year by the hospital which bears the Empress Frederick's name in the North Sea island of Norderney was 744. The number of children cared for there during the winter was 104. At Wyk, in the island of Föhr, also in the North Sea, 157 children were received; at Grossmüritz, on the Baltic, 206; and at Zoppot, also on the Baltic, 68. Of the total number (1175), 483 were cured, and 610 improved, some of them very considerably.

Statistics.

In the week which ended on the 21st ult. 2 persons died in Berlin of puerperal fever, 2 of typhus fever, 4 of quinsy, 5 of erysipelas, 8 of scarlet fever, 8 of whooping-cough, 9 of measles, 12 of cerebral apoplexy, 17 of gastro-intestinal catarrh, 17 of senile decrepitude, 22 of diarrhœa, 24 of diphtheria, 50 of diarrhœa with vomiting, 59 of pneumonia, and 86 of pulmonary phthisis. Twenty died by violence, including 8 suicides. Of the German cities, Hanover had the lowest death-rate (13·1), Chemnitz the highest (28·5). The death-rate of Leipsic was 18·1, of Berlin 20·8, of Breslau and Frankfort-on-the-Maine 22·4, of Hamburg 24·2, and of Munich 28·3.

Miscellaneous Items.

The German naturalist, Hermann Burmeister, died at Buenos Ayres on the 22nd ult., aged eighty-five. His main advice to science was the investigation of the climate, soil, and fauna of Brazil and Argentina. He founded the Natural History Museum in Buenos Ayres.

The magistrates of Berlin have appointed Professor Moeli director of the new lunatic asylum of Herzberge, near Lichtenberg, a large village east of Berlin.

Dr. Paul Guttmann, director of the internal department of the hospital belonging to the city of Berlin in the suburb of Moabit, celebrated his twenty-fifth anniversary as a private lecturer in Berlin University yesterday.

Berlin, June 7th.

AUSTRALIA.

The Sydney Cancer Curers.

THE trial of the two Hoods—father and son—for the manslaughter of a woman named Cohen was concluded last week, and resulted in a verdict of "guilty" being found against both the prisoners. The facts elicited at the trial were of a most startling nature, and furnish most convincing proof of the "gullibility" of the general public. In February, 1891, a Mrs. Cohen applied at the Sydney Hospital for treatment, and was seen by the medical superintendent, Dr. Hull. He diagnosed the case as one of epithelioma of the lower lip, and advised the woman to have it excised. She went away promising to return, and no more was seen of her until the following Christmas, when she again sought hospital treatment. Then it was found that the growth had extended widely and had involved the tissues of the neck, that the woman was in a very depressed condition, and that she was beyond all human skill. It was elicited from her that she had been under the treatment of the Hoods, who had applied caustics and poultices to the cancer, and for eleven months had lured her on with promises of a cure. The woman died in February of this year, and, Dr. Hull having refused a certificate of death, the matter passed into the hands of the coroner. The case went on for several weeks, and ended in the committal of the Hoods for manslaughter, of which they have just been found guilty. The evidence showed that the unfortunate woman had had Hood's "secret cancer cure" applied to her lip, and that shortly after the application Hood had taken the growth between his fingers and dragged part of it away, causing her most intense agony. A poultice was then applied, and the wretched patient sent home. During the operation some of the "specific" fell on the woman's dress, and it was of such a nature that "it burned holes in the cloth." Both the prisoners showed themselves profoundly ignorant of everything appertaining to medicine and surgery. Neither had had any training, and the elder man was not able to say what the M.D. and B.A. which he wrote after his name meant. In accordance with the law which obtains in this country both the accused were allowed to go into the witness-box and give evidence in the case. This gave the Crown Prosecutor an opportunity of finding out what they really knew about cancer. Here is their definition of cancer: "A parasitic spongy tumour containing cells growing from the glands and bloodvessels, and infested with microbes of the size of a louse's egg. The parasite has a mouth and a body, and takes its nutriment from the surrounding bodies by 'exorption.'" Hood had never seen the parasites, but had felt them as hard bodies; it required a microscope to see them. Hereupon the prosecuting counsel produced a microscope and some slides, and asked the accused to demonstrate the parasites to the jury. The man had evidently never used a microscope, and was utterly unable to use it. It is a clear gain to the public that two such shameless charlatans are safely within the gaol walls, and both the public and the profession owe a deep debt of gratitude to Dr. Hull for the manliness and public spirit he showed in bringing about that result.

The Windsor and Rainhill Murderer.

The trial of Deeming, or Williams, for the murder of his wife in one of the suburbs of Melbourne is of more than local interest because of the allegations made against him by the English police, and of the suspicion entertained by the authorities that he is the perpetrator of the Whitechapel outrages. On the first day of the trial an attempt was made to have it postponed, and two medical men who had examined the prisoner gave evidence to the effect that he had had fits, probably epileptic, that he had had syphilis, and that he was possessed of the belief that his deceased

Digitized by Google

mother visited him every morning at 2 A.M. to counsel him to murder his wife and the woman who infected him with syphilis. On these grounds time was asked to investigate Deeming's mental state, and to prove, if possible, that he was an epileptic, and that instead of being tried for murder he should have been sent to a lunatic asylum. The judge pointedly asked the medical witnesses whether, supposing they got all the family and personal history they desired, they would be able to say whether Deeming was sane or insane on the day on which the murder was committed. The doctors having replied in the negative, the judge ordered the trial to proceed.

Anæsthetics in Sydney.

The Colonial Treasurer tabled in the Assembly a return of the number of persons to whom anæsthetics were administered in the metropolitan hospitals of Sydney during the year 1891, together with particulars of the fatal cases. The return shows that in the Sydney Hospital 503 persons were anæsthetised during the year, but that no deaths resulted. In the Moorcliff Eye Branch of the Sydney Hospital forty-six persons were anæsthetised, and of these one person died, the anæsthetic used being chloroform. At the Prince Alfred Hospital 897 persons were treated, resulting fatally in one case, this person having been placed under a mixture of chloroform and ether. Two hundred and ninety persons were treated at St. Vincent's Hospital, 1 at the Coast Hospital, 165 at the Children's Hospital, Glebe Point, 32 at the Children's Hospital, Lewisham, 37 at the North Shore Hospital, and 15 at the Balmain, but in no case did the treatment have a fatal effect. Thus it would appear that last year there was one death in every 993 anæsthetisations. As the estimated average in the Sydney metropolitan hospitals for the seven years 1885–91 is one death in about 700 anæsthetisations, there is something to be thankful for in last year's returns. Seeing, however, that the Berlin mortality is only one in 4000 anæsthetisations, the profession in Sydney has yet some advance to make.

The Intercolonial Medical Congress.

This Congress will open in Sydney next September and last a week, but I doubt whether it is likely to be as successful as the previous congresses held in Adelaide and Melbourne. A meeting of the profession was held recently in Sydney, to which the press was not admitted. An official report has been published, however, which, seems to show that great dissatisfaction exists. As a leading Sydney doctor puts it, "the constitution of the officials and the executive committee is one-sided and injudicious, and appears to be the outcome of favouritism combined with the old cliquism, which is a lamentable blot on medical professional life in Sydney."

April 30th.

NEW ZEALAND.

(FROM OUR OWN CORRESPONDENT.)

Annual Meeting of the New Zealand Medical Association.

THE seventh annual conference of the New Zealand Medical Association was held at Wellington on March 15th and following days. Delegates from the various cities of the colony were present, and members of the several local branches also put in an appearance. The Congress was, from every point of view, a decided success, chiefly owing to the tact, promptness, and business capacity of the president, Dr. Grace of Wellington, who made an ideal master of the ceremonies. The president, in an eloquent speech, drew the attention of the members to the fact that we are educating at the Dunedin School of Medicine a great many general practitioners, and it becomes important to consider what is the character of the education imparted, and to search out the most effective means by which we can strengthen the hands of the professors and clinical teachers. The law which regulates the general management of hospitals is unfortunately of such a nature that the election of medical officers and teachers is entirely vested in trustees, a body of gentlemen elected by the ratepayers. It is hardly necessary to state that such a body may easily err in the election of really competent teachers. (As a matter of fact, Dr. Brown of Dunedin, later on in the Congress, and speaking on this point, stated that the present trustees at Dunedin always acted on advice given regarding the elections, and that fortunately no trouble had arisen in this way in Dunedin.) It would be too absurd to allow such a law to remain in existence when it becomes known that such a state of things might possibly mean the letting loose of a band of practitioners who had not been taught to "observe" correctly. The New Zealand University alone grants degrees in medicine, which by Imperial statute is recognised all over the empire; but at the same time the colony, by its laws, deprives the University of even a voice in the selection of its clinical teachers. There is no doubt that this subject requires immediate and serious consideration to prevent any difficulty in the future. The president also threw out the suggestion that the Association should petition the Senate of the New Zealand University to frame a statute enacting "that no student shall take an M.B. degree in the New Zealand University without first passing the B.A. examination." The Congress subsequently passed a motion embodying Dr. Grace's views, and introduced by Dr. Mackenzie, to this effect after a brief discussion. The president drew attention also to the existing system of medical registration, which is essentially faulty, in the following words: "That wholesome patriotism which teaches men to think of their fellows in preference to strangers should teach this colony to take steps rigidly to exact proof from each candidate for registration of a standard of proficiency equal to that required by the New Zealand University from colonists. I know that the present system fails to afford sufficient safeguards, and I think such instances will be in the knowledge of each one of you as will justify you in supporting my contention." Several valuable contributions were read on various subjects by the following medical gentlemen: Mr. Garland on "The Creasote Treatment of Tuberculosis;" Dr. Fell on "Intestinal Obstruction." Dr. Collins, of Wellington, gave some very interesting notes on cases under his care for the radical cure of hernia, after the method of Mr. Bennett, of London, all of which turned out eminently successful. Dr. Gillon, on "Supra-pubic Lithotomy," too, has to be congratulated on the successful issue of his cases. These papers elicited considerable discussion. They are, with the exception of Dr. Collins' notes, published in the April number of the *New Zealand Medical Journal*. Altogether the meeting has been, perhaps, the most practical and useful that has yet been held, for rules and regulations as to procedure have been adopted which have cancelled many difficulties. The visiting members were entertained right royally by their Wellington brethren, and their thanks are due for a delightful visit coupled with good companionship and hearty hospitality. Mr. Knight, on behalf of the Auckland Branch, invited the Association to meet at Auckland next year, which invitation was unanimously accepted.

The Sanitary Condition of Wellington.

It is no wonder that Lord and Lady Onslow shunned Wellington, or that the new Governor should have stipulated for special sanitary provisions being undertaken in respect of the residence set apart for him and his family, for dirt, disease, and death have given this city an unenviable notoriety among the cities of the colony. From its natural formation and surroundings generally, Wellington should present no difficulties in the way of proper sanitation, and it is a great pity that typhoid fever, which has raged in this city from time to time, has never been really efficiently attacked from a sanitary aspect. Dr. Chapple, who, by request of the City Council, has made a special investigation into the causes of the prevailing epidemic, has presented details which reflect disgrace upon the authorities and upon the residents of the special localities to which his remarks apply. For years past slaughter-yards and dairies have been attacked as the origin of this disease; but the report proves that the disease has arisen from preventable causes at the very doors of the inhabitants themselves. Dr. Chapple "found no connexion between the milk-supply and typhoid, for members of individual families who constantly drank milk escaped infection, whilst those who seldom or never took milk were laid low with fever." The yearly outbreaks of fever have been confined to a small area in the Te Aro end of the city. In Holland-street Dr. Chapple "found the traps foul from the accumulation of filth at the bottom. The grating top is movable, and in one case the people had been in the habit of lifting it and putting down anything that would go, including bedroom slops. In an adjoining house a gully, half under the scullery wall, received everything

Digitized by Google

from the sink inside the house. This gully was completely stopped by accumulation, chiefly fæcal, and was abominably foul, and the semi-liquid overflow could be traced far under the house." The above is but a mild description of the general condition of affairs in this particular locality, for Dr. Chapple has in no measured terms brought before the public gaze the horrible condition of sewage contaminations. Dr. Chapple states that he has found that there is a pretty constant relationship between sudden heavy rainfall and the prevalence of typhoid fever. Dr. Ewart, resident surgeon to the Wellington Hospital, also bears out the fact "that after heavy rainfalls typhoid cases crowd into the hospital, and the nurses fully anticipate this influx, which is always invariably realised in from ten to fourteen days after rainfall." For the last two years typhoid fever has been largely confined to the part of the city mentioned. As there is no system of safe disposal of typhoid fever excreta, most of which find their way to the drains, it is quite to be expected, Dr. Chapple thinks, that a displacement of sewer gases in this district would be followed by an epidemic, while the other parts of the city enjoyed comparative immunity. As the outfall into the harbour is unprotected, prevailing winds blowing up the sewer increase enormously the gas tension. I recently visited the Wellington Hospital, and was most courteously shown over the wards by Dr. Ewart. Fifty-two cases of typhoid fever were located in the hospital at that time, and the number has, I understand, increased in the meantime. Surely the city authorities must now bestir themselves—in at least so far as the drainage of the Te Aro end of the city is concerned. If this report is only half true, it is simply horrifying. The marvel is, not that in each case two or three members of the householder's family have been attacked, but that any one escaped. I think it is high time that a law is passed which will throw the expense of making houses fit for habitation on the owners of the property. Too frequently now it falls upon the unhappy tenant, who, to save his life, has to spend money upon another man's property. And, further, I consider that it should be made illegal for any landlord to sell or let any house without first receiving a certificate from some responsible body that it is in a proper sanitary condition, and not a mere death-trap.

April 21st.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

AN ordinary meeting of the Council was held on June 9th.

The Minutes of the Quarterly Council on May 7th were read and confirmed.

The report, dated May 23rd, from the "Committee on Advantages to Fellows" was approved, adopted, and entered on the minutes.

The following are the principal points which the Committee have had under their consideration, viz.:—(1) Meetings of Fellows; (2) Common Room for Fellows; (3) Admission of Fellows as visitors to meetings of the Council. With regard to the first point, viz., Meeting of Fellows, the Committee recommend: "That Meetings of Fellows, apart from the Members, at which the President or other Member of the Council acting for him shall preside, be summoned by the President and Council for consultative purposes at such times and for such objects as may by the Council be thought desirable, either with or without a requisition from the Fellows." In making this recommendation the Committee think it desirable to state that, in the event of its adoption by the Council, it would not in their opinion be reasonable to refuse to summon a similar meeting of Members upon the same conditions. With regard to the second point—viz., Common Room for Fellows—the Committee find that, legally, there might be some difficulty in permanently assigning any part of the corporate premises to the exclusive use of any section of the Corporation, and are not therefore prepared to recommend the provision of a Common Room for the exclusive use of the Fellows as suggested to the Council by certain Fellows of the College, but would recommend: "That the room adjoining the Secretary's office, now forming a part of the Library not used by readers, be furnished as a Common Room for the use of Fellows and Members of the College." With regard to the third point—viz, admission of Fellows as visitors to the meetings of the Council—the Committee are not prepared to make any recommendation in favour thereof.

An addendum to the following effect was also received and entered on the Minutes:

The following members of the Committee—viz., Mr. Macnamara, Mr. Willett, and Mr. Rivington—consider that in the preamble of the report, after the words "have held three meetings," should be inserted the words "at which they have only considered proposals not involving changes in the Charter and By-laws."

A report, dated May 30th, 1892, of the "Committee on Advantages to Fellows," was likewise approved, adopted, and entered on the Minutes.

The report stated that the Committee have, in pursuance of the instructions of the Council, also taken into consideration the best means of giving effect to the proposal adopted by the Council, "That it is desirable to celebrate in some suitable manner the fiftieth anniversary of the institution of the Fellowship of this College (the Charter creating this order being dated Sept. 14th, 1843)," and the Committee recommend the Council to adopt the following suggestions, viz.:—That the jubilee of the Fellowship be celebrated on Thursday, July 6th, 1893, the date of the annual meeting of Fellows for the election of members of the Council. That a conversazione be held at the College on the previous evening, Wednesday, July 5th, 1893. Cards of invitation, admitting ladies, to be sent to the Fellows of the College; Members to be invited on applying for cards of invitation. That an address be given by the President in the theatre of the College at 1 o'clock P.M. on the Thursday before the opening of the ballot for the election of members of the Council. That a Fellows' dinner be held on the Thursday evening at some convenient place.

The Council recommended Dr. Luff as a candidate for the post of Official Analyst to the Home Office.

A letter of the 4th inst. from the President was read, reporting the proceedings of the General Medical Council at their late session. The letter was received and entered on the Minutes, and the best thanks of the Council were given to the President for his services as the representative of the College on the General Medical Council.

The President stated that he had accepted, on behalf of the Council, a plaster bust of Mr. T. H. Huxley, presented to the College by Mr. W. H. Flower, late Conservator of the museum. Mr. Flower was thanked for his gift.

Messrs. Hulke and Howse were appointed to confer with delegates of the Royal College of Physicians as to the Gresham University Royal Commission, and to give evidence if they thought it advisable.

A motion was carried to the effect that the Fellows of the College be invited to meet the President and Council on July 7th, at 5 o'clock.

Medical News.

THE Government of India have decided that as officers of the Indian Medical Service of less than three years' full-pay service have now the rank of subaltern only, they are entitled, under the provisions of para. 282, Army Regulations, Vol. X., Part I., to a free passage by sea when proceeding to England on leave on medical certificate.

GENERAL HOSPITAL, CHELTENHAM.—At the recent quarterly meeting of the governors it was recommended that a special wing should be erected for the accommodation of additional trained nurses. The scheme includes the formation of a staff of twenty-four nurses available for private nursing, and the estimated outlay is about £2000. The board favourably entertained the proposal in consequence of the increasing demand for skilled nurses.

BIRMINGHAM MEDICAL BENEVOLENT SOCIETY.—The annual meeting of this Society was held at the Grand Hotel, Birmingham, on Friday, May 27th, when the director's report and the financial account were presented and the officers for the ensuing year elected. Founded in 1821, the Society has been doing good work, and affording relief to those of its members or the widows of late members who have been urgently in need of assistance. The inducements to join are such as should secure a much larger number of members than are at present on the list; indeed, when appealed to on the twofold ground of providence and benevolence, it is difficult to understand why all within the area of its operation do not join. There must be a large number of men, at any rate, during their earlier years of practice to whom, from the nominal subscription, the Society offers great advantages for making provision against a possible breakdown, while to those few whose position is apparently secure the opportunity of helping others less fortunate should not be neglected. Any registered practitioner "regularly practising his profession," and residing within fifty miles of Birmingham, is eligible for membership; members do not lose their privileges by subsequent removal beyond the area prescribed for their admission. It is to be hoped that the Society may receive a more general support from medical men in the Midlands, so that its good work may be increased. The honorary secretary, Mr. W. F. Haslam, will gladly give any information to applicants for membership.

HAYDOCK COTTAGE HOSPITAL.—This hospital was erected six years ago to meet the requirements of this large mining centre. Additional accommodation being necessary, the committee have decided to build a ward to provide for four more patients, and to add several small rooms. At present there are two wards and ten beds.

METROPOLITAN OPEN SPACES.—Last week Avondale Park, Notting-hill, was formally dedicated to the public as an open space. The land was purchased at a cost of £9200. On Monday the ceremony of declaring Brockwell Park open as a public recreation ground was performed by Lord Rosebery. It contains seventy-eight acres of land well situated between Brixton, Tulse-hill, Herne hill, and Norwood.

NORTH-EASTERN HOSPITAL FOR CHILDREN, HACKNEY-ROAD.—The twenty-fourth annual report shows that the number of in-patients treated during the past year was 508, and of out-patients 13,722, the latter showing 48,909 attendances. In the twelve months, 36 patients had been sent to the Convalescent Homes at Northwold and Cardington. The Samaritan Fund had provided 102 trusses and 68 other instruments. Alterations and improvements had involved an outlay of £741 14*s.* 3*d.*

LINCOLN COUNTY HOSPITAL.—On Tuesday, in the presence of an influential assembly, Mrs. Joseph Ruston formally opened the children's ward and the new building given by Mr. J. Ruston, D L., to this hospital. The Earl of Yarborough presided on the occasion. The cost, upwards of £4000, of the new building has been entirely provided by the generous donor. The old out-patients department has been converted into a ward for the children, and a new pavilion erected for the out-patients, with a board room and other needed additions.

ROYAL COLLEGE OF SURGEONS IN IRELAND.—At a meeting of the Fellows held on June 6th the following office-bearers were elected for the ensuing year:—President: E. Hamilton. Vice-President: W. Thornley Stoker. Secretary: Sir Charles Cameron. Council (in order of Fellowship seniority): Sir George Porter, Bart., G. H. Kidd, Rawdon Macnamara, J. Kellock Barton, Edward Hallaran Bennett, Henry Gray Croly, Philip Crampton Smyly, Henry R. Swanzy, W. Ireland Wheeler, Austin Meldon, William Carte, Sir Charles A. Cameron, F. Alcock Nixon, Kendal Franks, Charles Bent Ball, J. B. Story, Henry FitzGibbon, A. H. Benson, and Thomas Myles.

BEQUESTS AND DONATIONS TO HOSPITALS.—The Duke of Rutland has sent a donation of 300 guineas to the Derby Infirmary.—The late Mrs. Anna A. Salisbury, of West Brighton, bequeathed £500 to the British Home for Incurables and £1000 to the Royal London Ophthalmic Hospital.—Mr. J. G. Barclay has forwarded a donation of £200 to the treasurer of the North-Eastern Hospital for Children, Hackney-road.—The treasurer of the Beckett Hospital, Barnsley, has received £200 bequeathed by the late Mrs. A. M. Smith, Sheffield, to that institution.—Mr. Frederick W. Bigge, late of Knightsbridge, bequeathed £100 to the St. George's Hospital, Hyde-park-corner.—The Leathersellers' Livery Company has voted 50 guineas to the Poplar Hospital for Accidents.—The Clothworkers' Livery Company has made a grant of £50 to the Grosvenor Hospital for Women and Children, Vincent-square, S.W.—The London Court of Common Council has voted 50 guineas towards the building fund for the extension of the Richmond Hospital.—The Grocers' Livery Company has granted £500 to the rebuilding fund of the Poplar Hospital for Accidents.—The committee of the Yorkshire Rugby Football Union has made grants amounting to £1700 to the Yorkshire charitable institutions, of which £350 was apportioned to the Leeds Infirmary, £150 to the Bradford Infirmary, £120 to the Huddersfield Infirmary, and £100 to the Clayton Hospital, Wakefield.—It was announced at the meeting last week of the Rural Hospital Committee, Tewkesbury, that the late Mrs. Elizabeth Surman had bequeathed to the hospital £1000, reducible to £500 in the event of the residuary trusts' fund not being adequate to pay other legacies contained in her will.—Mr. J. P. Cairnes has given £100, Mr. C. Martin £50, Mr. S. Adair £25, and Mr. R. Boyd £20, to the building fund of the Rotunda Auxiliary Hospital.

CHILDREN'S HOSPITAL, PADDINGTON-GREEN.—Mr. George Hanbury, the treasurer, presided at the annual meeting, held on the 25th ult. The report submitted showed a decrease in the subscriptions and donations, amounting to £252 compared with the previous year, which was much to be regretted in view of the extension, which, for sanitary reasons, must be proceeded with without delay. The site had been purchased, and it only remained to raise funds to commence building. For this object £3062 had been collected, and the sum still required was £5000, for which the chairman made an earnest appeal.

GENERAL PRACTITIONERS' ALLIANCE.—A meeting of this Society was held at the offices, 11, Adam-street, Strand, W.C., on Wednesday, June 1st, Mr. George Brown (president) in the chair. The subject of the proposed Midwives' Registration Bill having been discussed, it was moved by Mr. J. B. Cook, seconded by Mr. W. E. Dawson, and resolved: "That Messrs. Campbell Boyd, George Brown, F. H. Corbyn, and Hugh Woods, M.D., be requested to give evidence before the Commission on the subject of registration of midwives." The annual general meeting of the General Practitioners' Alliance will be held on Wednesday, June 29th.

NORTH SHIELDS AND TYNEMOUTH DISPENSARY.—The annual report for the past year (the ninetieth) showed that the year's total income from all sources was £301 4*s.* 3*d.*, and the expenditure £278 14*s.* After investing £100, a surplus of £94 0*s.* 3*d.* remained in hand. The admissions by ticket show an increase of 351 on 1891. The casual patients relieved at the dispensary were 6758, an addition of 2663, attributable chiefly to the influenza epidemic in the district. A more commodious and central dispensary is necessary for the increasing wants of the borough, and the committee recommended that the present building be sold and more central premises purchased or rented.

POPLAR HOSPITAL FOR ACCIDENTS.—The thirty-seventh annual festival of this institution took place last week at the Holborn Restaurant, Mr. John Coles presiding. The chairman, in proposing the toast, "Success to the Poplar Hospital and the Medical Staff," remarked that the institution was doing an excellent work under great difficulties, the present building being wholly unfitted for the purposes to which it was devoted. In consequence, since 1881 the committee had endeavoured to set aside a reserve fund, which now amounted to £12,000, and it was intended to erect a new wing to enable the staff to carry on the work more efficiently. A large sum was still required to complete the necessary extensions, and he made an urgent appeal for funds. The subscriptions and donations amounted to upwards of £5000.

THE BRITISH INSTITUTE OF PUBLIC HEALTH.—The first general meeting of the British Institute of Public Health was held on Friday, June 3rd, at King's College, London, Sir Charles A. Cameron in the chair. The Provisional Council presented a report, in which they detailed the work undertaken since the incorporation of the Public Health Medical Society. The Institute is receiving the hearty support of medical officers of health and other gentlemen holding public health qualifications. After payment of expenses, the Institute has a balance of £140 to its credit at the Bank of England. The scheme for the examination of candidates for certificates of their efficiency to act as sanitary inspectors is now complete, and the first examination will be held in October. The first number of the Journal of the Institute will appear in July. The following gentlemen were elected as officers for the ensuing year:—President: Sir Charles A. Cameron, M.R.C.P.I., F.R.C.S.I., D.P.H.Camb., Medical Officer of Health for Dublin. President-elect: Henry Duncan Littlejohn, M.D., F.R.C.S. Edin., Medical Officer of Health, Edinburgh. Treasurer: Francis J. Allan, M.D., D.P.H. Camb. Hon. Secretary: Charles A. James, L.R.C.P., D.P.H. R.C.P.Lond. The annual meeting of the Institute will take place in Dublin at the end of August, under the auspices of the Irish branch, when an address will be delivered by the President. The following subjects have been chosen for special discussion—viz., the Etiology of Typhoid Fever and the Notification of Infectious Diseases. Papers on other subjects have been promised.

Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.*

ANDREW, J. GRANT, M.B., C.M. Glasg., has been appointed Surgeon to the Victoria Infirmary Dispensary, Glasgow.

ARNISON, W. C., M.D. Durh., M.R.C.S., has been appointed Professor of Surgery to the University of Durham, vice G. Y. Heath, deceased.

BIERNACKI, J., M.B., C.M., L.R.C.S., L.R.C.P. Edin., has been appointed Assistant House Surgeon to the Bootle Borough Hospital.

BRADBURY, J. A., M.R.C.S., has been appointed Medical Officer to the Workhouse, Wigan Union.

BURDWOOD, JAS. W., L.F.P.S., L.M. Glasg., has been reappointed Medical Officer of Health for the Bourne Rural Sanitary District of the Bourne Union.

BUTLIN, HENRY TRENTHAM, F.R.C.S., has been appointed Surgeon to St. Bartholomew's Hospital, vice W. Morrant Baker, F.R.C.S., resigned.

CLEMMEY, W. N., M.R.C.S., L.R.C.P. Lond., has been appointed House Surgeon to the Bootle Borough Hospital, vice T. Gilcriest, resigned.

COLLUM, ARCHIE T., L.R.C.P., M.R.C.S., has been appointed Surgical Registrar to Charing-cross Hospital.

COLWELL, J. K., has been appointed Public Analyst, Board of Works District of the Holborn Union, vice Redwood, deceased.

COONEY, JOHN E., L.R.C.P. Edin., L.F.P.S. Glasg., D.P.H. Camb., has been reappointed Medical Officer of Health for Fulham.

COUPER, DAVID, M.D., C.M. Glasg., has been appointed Surgeon for Diseases of the Skin to the Victoria Infirmary Dispensary, Glasgow.

FOSTER, M. B., M.R.C.S., L.R.C.P., has been appointed House Surgeon to Charing-cross Hospital.

GARLAND, E. C., L.R.C.P. Edin., M.R.C.S., has been reappointed Medical Officer of Health for Yeovil.

GOWING, B. C., M.R.C.S., has been reappointed Medical Officer of Health for the Penistone Urban Sanitary District of the Penistone Union.

GRACE, HENRY, L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer of Health to the Kingswood Local Board.

HAMILTON, JAMES, M.B., C.M. Glasg., has been appointed Physician to the Victoria Infirmary Dispensary, Glasgow.

HARPER, JOHN W., M.R.C.S., has been reappointed Medical Officer of Health for Stowmarket.

HASWELL, J. F., M.B., C.M. Edin., M.R.C.S., has been reappointed Medical Officer for the First Sanitary District of the Penrith Union.

HIRST, WALTER, L.R.C.P., L.R.C.S. Edin., has been appointed Resident Assistant Medical Officer to the Leeds Union Infirmary.

HUNTER, GEO., L.F.P.S. Glasg., has been appointed Surgeon for Diseases of the Eye to the Victoria Infirmary Dispensary, Glasgow.

JENKINS, T. W., M.D., C.M. Glasg., has been appointed Physician to the Victoria Infirmary Dispensary, Glasgow.

JOHNSTON, EDWD. C., M.R.C.S., has been reappointed Medical Officer of Health for Leckhampton.

KELLY, A. BROWN, B.Sc., M.B., C.M. Glasg., has been appointed Surgeon for Diseases of the Throat, Nose, and Ear to the Victoria Infirmary Dispensary, Glasgow.

KENNEDY, ROBT., M.B., C.M. Glasg., B.Sc., has been appointed Surgeon to the Victoria Infirmary Dispensary, Glasgow.

LIMRICK, WM. S., L.R.C.P., L.R.C.S. Edin., has been appointed Medical Officer of Health for Great Crosby.

MACKAY, W. J., M.B., C.M., Sydney, has been appointed Resident Medical Officer to the Hospital for Women, Soho-square, London.

PALMER, W. M., L.S.A., L.R.C.P., M.R.C.S., has been appointed Resident Obstetrical Officer to Charing-cross Hospital.

PRIESTLEY, JOSEPH, M.D., C.M. Edin., M.R.C.S., D.P.H. Camb., has been appointed Assistant Medical Officer for Camberwell.

SAMUELSON, GERALD S., M.B. Edin., Surgeon Gundagai Hospital, N.S.W., has been appointed Government Medical Officer and Public Vaccinator for the District of Gundagai.

SENIOR, H. D., M.R.C.S., L.R.C.P., has been appointed House Physician to Charing-cross Hospital.

SHANNON, R. A., L.R.C.P., L.R.C.S Edin., has been appointed Medical Officer for the Second Sanitary District of the Bromley Union.

SMITH, PERCY, M.R.C.S., L.R.C.P. Lond., L.D.S. Eng., has been appointed Dental Surgeon to the Victoria Hospital for Children, Queen's-road, S.W.

SWAIN, JAMES, M.D. Lond., F.R.C.S., has been appointed Honorary Assistant Surgeon to the Royal Infirmary, Bristol.

WALDO, F. T., M.A., M.D. Camb., M.R.C.S., D.P.H., has been appointed Medical Officer of Health to the Parish of St. George the Martyr, Southwark.

WATSON, WM. T., M.D. Oxon., M.R.C.S., has been reappointed Medical Officer of Health for Tottenham.

WILLS, CHARLES, M.R.C.S., has been reappointed Medical Officer of Health for Mansfield.

YOUNG, EDWD. H., M.D. Durh., L.R.C.P. Lond., M.R.C.S., D.P.H., has been reappointed Medical Officer of Health for Okehampton.

YUNGE-BATEMAN, M. G., M.R.C.S., has been appointed Medical Officer of Health for Folkestone.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement.

BRADFORD EYE AND EAR HOSPITAL.—Special Assistant Surgeon. Honorarium 100 guineas per annum.

BRIGHTON AND HOVE LYING-IN INSTITUTION AND HOSPITAL FOR WOMEN, West-street, Brighton.—House Surgeon. Salary £150 per annum, with rooms and gas.

WESTMINSTER GENERAL DISPENSARY, 9, Gerrard-street, Soho, W.—Honorary Physician.

WESTMINSTER HOSPITAL, Broad Sanctuary, S.W.—Assistant Ophthalmic Surgeon.

WOLVERHAMPTON AND DISTRICT HOSPITAL FOR WOMEN, Wolverhampton.—Two Honorary Acting Gynæcological Surgeons.

WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL, Wolverhampton.—House Physician. Salary £100 per annum, with board, lodging, and washing.

Births, Marriages, and Deaths.

BIRTHS.

ADENEY.—On June 3rd, at 3, Mount Sion, Tunbridge Wells, the wife of E. Leonard Adeney, M.D. Lond., of a daughter (Armorel).

GORDON.—On June 5th, at Witheridge, N. Devon, the wife of H. Laing Gordon, M.B., C.M. Edin., of a son.

Digitized by Google

GREENFIELD.—On May 31st, at Heriot-row, Edinburgh, the wife of W. S. Greenfield, M.D., F.R.C.P., of a daughter.
HANDCOCK.—On June 2nd, at Girlington, Bradford, the wife of George Handcock, M.R.C.S., of a daughter.
LANGRAN.—On June 7th, at Belle Vue, Axminster, Devon, the wife of W. Langran, L.R.C.P. Edin., of a daughter.
MOLSON.—On June 1st at Montreal, Canada, the wife of J. Elsdale Molson, M.B., B.C. Cantab., M.R.C.S., of a son.
PATTERSON.—On June 2nd at 353, City road, E.C., the wife of Charles S. Patterson, M.B., M.R.C.S., of a son.
ROBERTSON.—On June 3rd, at Mayfield, Western Parade, Southsea, the wife of Dr. J. R. S. Robertson (late A.M.S.), of a son.
SHACKLETON.—On May 16th, at Georgetown, Demerara, the wife of T. F. Shackleton, M.R.C.S., of a daughter.
SINCLAIR.—On May 30th, at Osborne-road, Clifton, Bristol, the wife of Surgeon-Lt.-Col. D. Sinclair, H.M.I.A., of a daughter.
TAIT.—On June 7th, at Lincluden, Sunnyside-road, Hornsey-lane, the wife of Henry Brewer Tait, F.R.C.S., of a son.
THORESBY-JONES.—On June 1st, at Sutherland-avenue, W., the wife of Dr. James Thoresby-Jones, of a daughter.
WICKS.—On June 4th, at Newcastle-on-Tyne, the wife of Charles Wicks, L.R.C.P. Edin., L.R.C.S., of a son.
WILLAN.—On June 1st, at Albert House, Esher, the wife of Leonard James Willan, M.R.C.S. Eng., L.S.A., of a son.
WRIGHT.—On June 6th at Coltishall, Norfolk, the wife of Bernard Zorapore Wright, M.R.C.S., L.R.C.P., of a son.

MARRIAGES.

BOURNE—ALLEN.—On June 1st, at Leamington Parish Church, Edmund Kemp Bourne, M.D., only son of the late William Kemp Bourne, M.D., of Fisherwick, Lichfield, to Nina Maud, daughter of the late Barton Fletcher Allen, Esq., Liverpool.
BROWN—JONES.—On June 1st, at Stoke Parish Church, Coventry, F. Lenox Harman Brown, M.B., C.M. Edin., eldest son of Major Harman Brown, of Norwich, to Dora Annie, eldest daughter of Vickers H. Jones, Esq., of Stoke, Coventry.
CADDY—CLATER.—On June 1st, at St. Cuthbert's Church, Earl's-court, London, Duncan James Caddy, M.B., second son of James Caddy, Esq. (late of H.M. Civil Service), to Florence, youngest daughter of William Clater, Esq., J.P., of The Laurels, Retford, Notts.
CARTER—BLAKISTON.—On June 1st, at St. James's Church, Brighton, H. F. Carter, M.D., to Miss Clara Blakiston.
HOWELL—HART.—On June 4th, at St. Leonard's Church, Streatham, Thos. Arthur Ivest Howell, L.R.C.P. Lond., M.R.C.S. Eng., of Cleeve House, Wandsworth, eldest son of Thos. Symonds Howell, of the Old Vicarage, Wandsworth, to Frances Elizabeth Margaret, widow of Wm. Hamilton Hart, M.R.C.S. Eng., and elder daughter of E. P. Berthon, of Portswood, Southampton.
MCCAUSLAND—HELSHAM.—On June 1st, at the Parish Church of Wiggenhall St. Mary the Virgin, Norfolk, Albert Stanley McCausland, M.D., of Swanage, Dorset, son of the late Rev. R. McCausland, of Gloucester-place, Hyde-park, to Miss Emily Blunt Helsham, only daughter of Gustavus Helsham, Esq., J.P., of St. Mary's Hall, Norfolk.
MCNEAL—VIVIAN.—On June 1st. at the Wesleyan Church, South Norwood, James McNeal, L.R.C.P. Lond., M.R.C.S., of South Norwood-hill, to Ada Louisa, daughter of the late C. T. Vivian, of South Norwood.
NASH—RUSSELL.—On June 1st, at Holy Trinity, Milton-next-Gravesend, Charles Nash, L.R.C.P., of Horndean, Hants, to Constance, eldest daughter of J. Russell, Esq., J.P., Glenthorne, Gravesend.
OSBURN—CLARKSON.—On June 2nd. at St. Andrew's, Ashley-place, Harold Burgess Osburn, M.R.C.S., D.P.H., of Bagshot, Surrey, second son of Commander Francis Osburn R.N., to Mabel, sixth daughter of Captain Clarkson, of Ashley-gardens, S.W.
ROSS—MILLBOURN.—On June 1st, at the Parish Church, Sutton-at-Hone, Alfred John Ross, M.D., Scarborough, to Isabel Millbourn, eldest daughter of J. T. Millbourn, Esq., Hawley, Kent.
WILSON—SANDERSON.—On June 2nd, at Holy Trinity Church, Hastings, Archibald Scarlyn Wilson, M.A., M.B., D.P.H. Cantab., St. Leonards-on-Sea, to Sybil Mary, youngest daughter of the Rev. R. E. Sanderson, D.D., Canon Residentiary of Chichester, and Vicar of Holy Trinity, Hastings.

DEATHS.

COOKE.—On June 2nd, at Warrior-square, St. Leonards-on-Sea, John Cooke, Esq., M.D., aged 55.
DAVIES-COLLEY.—On June 3rd, at Newton, Chester, Thos. Davies-Colley, M.D., J.P., in his 81st year.
DYMOCK.—On April 20th, at his residence, at Malabar-hill, Bombay, William Dymock, Brigade Surgeon, Retired, late Principal Medical Storekeeper to the Government, eldest son of the late Rev. T. F. Dymock, Rector of Hatch Beauchamp, Somerset, aged 59.
EDWARDS.—On May 31st, at his residence, 98, Gloucester-crescent, Hyde-park, W., Thos. Edwin Edwards, L.R.C.P. Lond., M.R.C.S. Eng., aged 64.
GOODRIDGE.—On May 7th, on his homeward voyage from Australia, Edward William Gostwyck Goodridge, Surgeon-Superintendent in the Queensland Government Emigration Service, second son of the late John Octavius Goodridge, Surgeon R.N., of Child Okeford Dorset, aged 37.
KERSHAW.—On June 2nd, at Eastfield, Farnworth, Bolton-le-Moors, aged 10 years, Margaret Alice (Daisy), youngest child of Alfred Kershaw, L.R.C.P.I., and M.R.C.S., and the late Mary Alice Kershaw. Friends will kindly accept this intimation.
STORY.—On June 2nd, at his residence, Westbourne-terrace-road, John Story, M.R.C.S., in his 84th year.
TEMPLETON.—On June 2nd, at Boscombe-road, Shepherd's-bush, W., at an advanced age, Robert Templeton, M.D., F.R.C.S.I., Deputy Inspector-General, late Royal Artillery.

N.B.—A fee of 5s. is charged for the Insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, & Answers to Correspondents.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

All communications relating to the editorial business of the journal must be addressed "To the Editors."

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET to be addressed "To the Publisher."

We cannot undertake to return MSS. not used.

ASSAULT ON A MEDICAL MAN BY A RECTOR.

ON Mr. Tronson taking out a summons against his rector, the Rev. John Charter Blackmore, for an assault, which resulted in the defendant having to pay a fine of 40*s.* and costs, the rev. defendant is alleged to have threatened, after the hearing of the case, to punish Mr. Tronson with the most severe "boycotting" in the parish of which he is not only rector but lord of the manor. It is unusual to see in rectorial minds such high tempers; but we must not judge them too seriously, or take the threats they lead to too literally. We trust that by this time the feelings which generally dominate Christian ministers have reasserted themselves in the rev. gentleman's mind.

Anxious.—Our correspondent must judge for himself in the light of the case he refers to and the rules and reports of the General Medical Council which we published last week.

Sinapis.—Our correspondent should apply to the Registrar of the General Medical Council.

Mr. Gustav Ernest.—In THE LANCET of May 7th, 1892.

MEDICAL AID ASSOCIATIONS.

To the Editors of THE LANCET.

SIRS,—As a medical officer connected with a Medical Aid Association, permit me to ask a question arising out of the report of a case heard before the Medical Council, as reported in THE LANCET of June 4th. Is it lawful for me to accept a salary in lieu of services rendered to one of these associations, and at the same time be cognisant of the fact that the said association converts a portion of the income received owing to my services to its own private use? This is a serious question, affecting the interests of very many like myself, and it is well that a clear understanding should exist. There is not the slightest shadow of doubt that many of these associations are carried on for profit, and the system seems to be daily increasing, one of the evils, I presume, of the overcrowding of the profession, because if there were not very many ready to accept these appointments, the abuse could not very well flourish. Medical officers, as in my own case, are generally men without capital, and accept these appointments in many cases "as a means to an end." The question arises, Is there any risk by so doing? In looking through the annual reports of these associations, there are many striking things to be observed. I shall take one or two, which may be regarded as typically illustrative of many. In that of the —— Association for 1892, a copy of which I enclose, I find that the committee of management pay themselves an annual stipend of £30, although it is generally understood that all committees are of an honorary character. The secretary's, treasurer's, trustees', and auditors' annual salaries and expenses amount to £70. There is for purchase of land £550 &c. Where does the money come from for all these items? Simply from the money earned through the services of the medical officers, and which, I contend, ought legally to belong to them after the working expenses of the Association are defrayed. Although the income of this particular Association exceeds £1800 per annum, how much do the medical officers receive? The former medical officer, who resigned last September, had, after five years and a half's service, an annual salary of £250. His successor only receives £200. The former, in addition, was allowed 10*s.* 6*d.* for each midwifery case attended. His successor has to submit to the humiliating indignity of having 5*s.* of his midwifery fee for every case attended collared and turned into the general fund of this flourishing Association. In —— I find from the annual report the committees help themselves in like manner. In some of the associations they claim all the midwifery fees earned by the medical officers. In —— and a few others they seize half. Now, I wish to know, Do medical officers to these associations, who in many instances (like my own case) are victims to circumstances, and cannot very well help themselves, run any risk in holding these appointments, which enables unqualified persons to convert money earned by medical practitioners into other channels of profit? As regards the class of members who join these associations, I am well aware that the system is much abused.

I am, Sirs, yours truly,

June 6th, 1892. A MEDICAL OFFICER.

TREATMENT OF CONVULSIONS IN CHILDREN.

To the Editors of THE LANCET.

SIRS,—I wish to call the attention of the readers of THE LANCET to a method of treating convulsions which I devised some fifteen years ago, and which has been employed by me since that time with most satisfactory results. It is the administration of enemata of chloral hydrate. When summoned to one of these cases, I take with me a 1½-oz bottle containing sixty grains of chloral hydrate dissolved in water, and a small glass male syringe, which holds two drachms; I prefer that the nozzle of this shall have been shortened and rounded by heating in the gas or spirit lamp. As the child lies on the nurse's lap, it is turned on one side, the syringe introduced into the rectum, and one, two, or three drachms of solution injected, according to age A child between one and two years old will take one drachm, one three or four years old will take two drachms. When withdrawing the syringe, press the buttocks firmly together to prevent the solution escaping, and keep up this pressure for about five or seven minutes, by which time the convulsions will have greatly moderated—they generally cease altogether within ten minutes. I find that a solution of this strength causes no irritation. I have tried the same hypodermically, but with less success, and parents object to the repeated punctures which are necessary for injecting the required quantity. In no case has any evil result happened in my experience.

It has always appeared to me that the ordinary treatment is very feeble in these cases, for it is impossible to get the child to swallow any medicine while the convulsions are going on, and warm baths are of very doubtful service, besides being tardy in their action, while the treatment described above is simple, rapid, and certain. While the enema is being retained various necessary particulars can be ascertained with a view to future treatment, but it appears to me that in these cases the first thing to do is to stop the convulsions.

I am, Sirs, yours faithfully,

Gateshead, June, 1892. A. WOOLSEY BLACKLOCK, M.D.

"THE USUAL BOND AND FRIENDLY SOCIETIES' AGREEMENTS."

To the Editors of THE LANCET.

SIRS,—In reply to "Assistant Medical Officer," allow me to say I think it would be interesting to the profession at large were this subject of bonds finally settled, as there seems to be so much doubt in the matter. I am of opinion that no bond can be enforced without the prohibited time is in proportion to the amount paid over and above the ordinary salary. Simply, salary is no "consideration" (which is one of the essentials to the validity of a bond). THE LANCET would be conferring a great favour on the profession were it to set this vexed question at rest. If a penalty is enforced (say, £500), can that be claimed for every offence against the bond or only once? Bonds seem to destroy the liberty of a subject. Surely a man cannot be prevented from practising his profession if he is qualified so to do, unless he has been paid very handsomely by another man not to do so. Hoping others will take this subject up,

I am, Sirs, yours truly,

June 8th, 1892. ASSISTANT.

BENZONAPHTHOL.

F. W. N.—Dr. Le Gendre, according to the *Gazzetta degli Ospedali*, has frequently applied benzonaphthol in typhlitis, in appendicitis, in colitis (simple and dysentiform), and, generally speaking, in conditions of the lower tract of the intestine in which excessive or abnormal fermentations have been set up. In the adult he has found good results from the exhibition of doses gradually increased from three to five grammes—the antisepsis obtained being equivalent to that induced by a considerable dose of naphthol and benzoine given separately.

R. H.—No person may, under a penalty of £5, act as assistant to an apothecary in compounding and dispensing medicines without first passing an examination and obtaining a certificate from the Apothecaries' Company.

Mr. J. Mars—We think our correspondent can claim. The institution of which he is a surgeon is not one of those the officers of which are excluded from receiving fees for inquests.

"THE USE OF PESSARIES."

To the Editors of THE LANCET.

SIRS,—The letter of Mr. R. J. Kennedy in THE LANCET of June 4th reminds me of two cases of "retained pessary"—if I may use such a term—which have occurred in my practice during recent years.

The first case was that of an aged woman, who suffered from a most horribly fetid vaginal discharge; so much so that it affected her general constitutional condition. Upon making a vaginal examination I discovered a spherical boxwood pessary, of antiquated construction, encrusted with the products of secretion, and hardly recognisable; it was removed with some difficulty. According to the patient's statement it had been in position for a considerable number of years.

The second case, which also occurred in an aged woman, was if anything more remarkable. A foreign body was found in the vagina, which eventually proved to be a wire pessary covered with indiarubber. At first all attempts at removal failed. I then discovered that it had at some period of its retention ulcerated its way through the mucous membrane of the vaginal wall, which had healed over the pessary, thus effectually fixing it by a membranous band. Removal was effected by tearing through the band with the thumb nail. Owing to the vascularity of the parts, and the probability of hæmorrhage, I deemed the knife less suitable for the operation.

I am, Sirs, yours faithfully,

Clare, Suffolk, June 6th, 1892. EDWARD A. PIGGOTT.

To the Editors of THE LANCET.

SIRS,—The letter of your correspondent, Mr. R. J. Kennedy, in THE LANCET of the 4th inst., reminds me of a case I admitted some years ago into the Richmond Hospital, S.W., under the care of Mr. Bateman. In this instance the patient, an elderly and cachectic-looking woman, came to the hospital complaining of a very offensive discharge and complete inability to retain her urine. Before making a vaginal examination I thought it was a case of cancer which had caused by ulceration a utero- or vagino-vesical fistula, but a digital examination at once revealed the stem end of a Zwancke's pessary completely encrusted with lithates. The winged end, also similarly encrusted, had ulcerated through into the bladder and was removed by Mr. Bateman under an anæsthetic. This patient stated that something had been placed there also fourteen years previously, and no directions had been given as to the necessity of its ever being removed.

I am, Sirs, yours faithfully,

Ilfracombe, June 8th, 1892. ARTHUR L. COPNER.

CORONERS' JURIES.

To the Editors of THE LANCET.

SIRS,—The following case, in which I had to give evidence at an inquest, appears to me to be instructive from many points of view.

A baby had been ill with measles, the rash having been out for three days before its death. I was sent for to see it about half an hour before the child died. In the evidence the mother stated that she had given the child saffron tea and brandy, and had not thought it necessary to call in a doctor; that she had noticed the child to have gone "blind" the day before its death; and that on the day it died the child had been breathing heavily and quickly. After hearing her evidence, one of the jury remarked that he considered the mother had done everything that could be expected of her, and the rest concurred, and expressed themselves as "perfectly satisfied." No further questions were asked.

In the light of such cases one cannot be surprised at the high mortality there is from measles; and when coroners' juries take upon themselves to stamp with approval the "brandy and saffron" treatment of the complaint, what chance is there that a medical man will ever be called in to see such cases in the poorer districts, excepting when a certificate of death becomes inevitable? Coroners' juries have been very energetic of late in censuring medical men and their unqualified assistants; but surely the harm done by the latter is infinitesimal compared with the incalculable harm inflicted on helpless babes and children by such verdicts.

I am, Sirs, yours faithfully,

Mile-end-road, E., June 7th, 1892. W. F. GRANT, M.D.

"BONONIA DOCET."

OUR columns have recently indicated the advance effected by the Bologna school on the Pasteurian prevention of rabies; and it may be useful to recapitulate the pathological researches by which the experiments that led up to that advance were suggested if not inspired. For some time the Italian medical schools, principally those of Turin and Bologna, had been on the track of the "tetanigenous bacillus," with distinctly positive results. The therapeutic application of these, however, attracted most attention at Bologna, where Professor Tizzoni, assisted by a lady pathologist, "la dottoressa Cattani," set himself to render animals proof against the virus of tetanus. They began by isolating the liquid produced by the tetanic bacilli; they then examined the effects it caused in the animals in which it had been inoculated; and, finally, ascertained that in consequence of these injections the said animals acquired a resisting power against repeated inoculations of the tetanigenous virus. The substance to which this immunity was attributable they then separated from the serum of the blood, and found it to be endowed with characteristic properties. In fact, after inoculation with this matter, it was no longer possible to transmit the infection to animals by means of the blood or the urine of another animal that had died of tetanus, while the infection in an animal which had not been thus inoculated never failed to be followed by marked tetanic spasms, resulting fatally. In other words, the "antitoxine," when introduced into a tetanigenous circulation, deprived the latter of its toxic power. These experiments, verified and confirmed over and over again, Drs. Tizzoni and Cattani felt justified in repeating on the human subject; and they can now point to a *catena* of cases of tetanus—one of them a case in which amputation had already been performed—all of which, thanks to the injection of the "antitoxine," were completely cured. Further experiments made still more recently by the Bolognese pathologists have demonstrated how the immunity thus imparted to animals, rabbits and rats, becomes hereditary, and may be transmitted to their young, the latter, when born of parents rendered proof against tetanus, having been found to resist without evil effects of any kind tetanigenous inoculations to which the young of parents who had not been thus made virus-proof succumbed invariably. These results, we learn from Professor Tizzoni, led up to the advance on the Pasteurian treatment of rabies already described, and form a necessary link in a pathological and therapeutic chain reflecting the highest credit on Bologna, and fraught with developments of which it is hard to foretell the limit.

Mr. F. W. Langston Day (Reedham, Norfolk) should consult our Students' Number (Sept. 5th, 1891, page 581), where he will find very full particulars on the subject with regard to which he requires information.

PAROCHIAL AND COUNTY MEDICAL OFFICERS IN SCOTLAND.

To the Editors of THE LANCET.

SIRS,—I should be greatly obliged if you can answer the following queries in an early number of THE LANCET. Both apply to Scotland.

1. Is a parochial medical officer in Scotland entitled to extra fees for surgical operations on paupers—e.g., reducing a fracture of the radius? In the case in point no reference is made in his agreement with the parochial board to such cases. 2. A medical officer of health was appointed for a county (by the County Council), who does not hold a registrable qualification in sanitary science. He agreed to obtain such a diploma within a reasonable time, and was appointed on this understanding. Will he have to be reappointed by the new Council after its election in December next? And, if so, is he eligible in the event of his not having obtained a diploma in public health prior to that date?

I am, Sirs, your obedient servant,

May 24th, 1892. DELTA.

*** 1. In parishes which participate in the medical grant the salary covers attendance on paupers in every form. Fees in lunacy are, of course, additional. In parishes which do not participate the Board may make with their medical officer any contract they please as to special fees. The cost of medicines and medical appliances is usually kept separate, though not invariably.—2. The election of the new County Council in December cannot affect the legal tenure of office of the officials. Our correspondent does not state whether the "understanding" formed part of the written agreement, or whether the "reasonable time" was defined. If a conditional appointment were made by the County Council and sanctioned by the Board of Supervision, then, in the event of the conditions not being fulfilled, it would be open to the Council to approach the Board for removal of the officer under Section 54 (4) of the Local Government (Scotland) Act; and it would also be open to the Board to call the Council's attention to the matter, and to refuse, if it thought fit, to allocate to the Council part of the sum placed by Parliament at the disposal of the Board to aid in payment of such officers.—ED. L.

"AN APPEAL."

DR. JOHN LOWE asks to be allowed to acknowledge through THE LANCET the receipt of a subscription of £5 from "Anon.," and also of £3 3s. from Mr. T. Smith, F.R.C.S., in response to his letter under the above heading in our issue of May 14th (p. 1116).

Dr. M.—We are not prepared to condemn the use of the titles as mentioned by our correspondent, and he is not likely to be challenged for so using them in any court of law.

R. O. W.—The details given are not sufficient to form a basis of censure on a medical man.

A QUESTION OF FEE.

To the Editors of THE LANCET.

SIRS,—I should be obliged if you would give your opinion as to whether a fee is due to me from the guardians or not in the following case.

Yesterday I was called to see a man whom I found suffering from fracture of fibula (Potts' fracture). The man had no fixed abode, and the person with whom he was living applied to the relieving officer. The relieving officer sent me an order to treat the case, and at the same time got a certificate from me stating that the patient was able to be removed to the workhouse. I then went down, after getting the relieving officer's order, put on a splint &c., and the man was shortly afterwards removed to the workhouse. Now, the fee for treating such a case is £3. Am I entitled to this? Of course, if the man had had any fixed residence, I should have had to treat the case all through, and then there could be no question about the matter. If I am not entitled to the fee, it seems hard that I should have to diagnose the case, fix it up ("set it")—these two things being the essence of the treatment,—and then have nothing for it, not even the splint and bandages returned. It will, of course, be understood from the foregoing that I am district medical officer.

I am, Sirs, yours faithfully,

June 7th, 1892. CONSTANT READER.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. A. G. Auld, Glasgow; Mr. Branthwaite, Twickenham; Messrs. Bishop and Sons, London; M. Berthier, Paris; Mr. C. F. METROPOLITAN HOSPITAL SUNDAY FUND.

"THE LANCET" SPECIAL SUPPLEMENT.

Published in aid of the Appeal to be made on Sunday, June 19th, 1892.

THE GROWTH OF HOSPITAL WORK IN LONDON.

ONCE more the return of the season at which the Hospital Sunday Fund collection is annually made in the various places of worship throughout the metropolis demands from us a restatement of the case which we have now for many years past submitted under various aspects to the charitable public. If the work in question were less extensive or less multifarious than it is there might be a difficulty in avoiding mere repetition in an appeal so frequently renewed, but in fact the topic is not easily exhausted, and the particular phase of it to which we propose on the present occasion to draw attention is one that has been suggested by the circumstance that the publication in part of the census returns for 1891 enables us to make an instructive comparison between the London of to-day and that of twenty years ago, when the Hospital Sunday movement took its rise. It would be difficult in any other way to give so striking a view of the great work actually accomplished by means of the Fund, and of the still greater work which awaits accomplishment by the same means.

POPULATION IN 1871.

ADDITION DURING TWENTY YEARS.

POPULATION IN 1891.

PRIVATE CONTRIBUTIONS AND THE FUND.

It may be well before proceeding to the more statistical part of our subject to deal with a criticism frequently passed upon the Sunday Fund collection, and usually received with an acquiescence which it ought not to command. The criticism is that an organised effort like that in question has a tendency to diminish the income received by the hospitals from private subscriptions and donations, and thus to take away with one hand what it gives with the other. This is so plausible a proposition that few people have any disposition even to call it in question, and it passes current on the strength of being almost self-evident. But as it is not quite self-evident it may be called in question, and we have, with the object of putting it to proof, obtained from such of our hospital correspondents as have been able to supply them copies of their several accounts for the year 1872 or some date thereabout. A comparison of these statements with the corresponding figures for last year does not confirm the dictum. It will be easily understood that the materials with which we have been supplied are very meagre, since reports twenty years old are naturally rare even in the offices from which they were originally issued. But in almost every instance in which the comparison can be made it turns out that the income from annual subscriptions and from donations is greater now than it was at the earlier date, and that these sources of income, instead of being strangled by the Sunday Fund collection, have continued to thrive side by side with it; so that public interest in particular institutions, as manifested by subscription lists, is stronger and more widespread now than ever. We do not wish to generalise too widely from the comparatively small basis of comparison, which is all that we have been able to secure; but we are at least entitled to say that, so far as the ascertainable facts are concerned, it seems to be a sounder conclusion that this annual appeal has stimulated public charity than that it has diverted the benefactions of the charitable into a new channel. The old streams flow in their old beds and with increased volume, and the new is so much additional power brought to bear upon the problems to which in our vast city sickness and accident give rise.

TWENTY YEARS' GROWTH OF LONDON.

The establishment of a fund which produces upwards of £40,000 a year has undoubtedly made a magnificent addition to the charitable resources of the metropolis, and if it were—as it certainly is not—the only useful outcome of the Hospital Sunday movement, it would abundantly justify the foresight of the promoters and the zeal of those who have supported the annual collection. But great as this achievement is, it is but small in comparison with that overwhelming phenomenon—the growth of London. In 1871 the metropolis had 419,642 occupied houses and a population of 3,266,987 inhabitants. In 1891 the houses had become 557,134 and the inhabitants 4,231,431. Such

Digitized by Google

figures convey but little information, because by reason of their magnitude they produce no definite impression. A better apprehension of the fact may be arrived at by establishing comparisons with smaller places. Thus the mere addition to the population of the metropolis within the period covered is equal to the aggregate population of Manchester, Leeds and Norwich taken together.

In order to present this astonishing phenomenon of the growth of London in a more intelligible form to our readers we have caused a series of small maps of the London County to be prepared which make manifest to the eye the proportions between the London population as it was in 1871 and as it is at the present time. These maps have been carefully drawn to scale, the scale of every map being such that its area is proportioned to the population which it represents. Thus the first map is drawn to a scale which gives a little less than eight miles and a quarter to the inch, and it has an area of slightly more than one and three-quarters square inches. The second is on the scale of just under fifteen miles and a sixth to the inch, with an area, therefore, slightly exceeding one-half of a square inch. The third is on the scale of seven and a quarter miles to the inch, and it has an area of two and a quarter square inches. The areas, therefore, are proportional to the populations represented, and enable the reader to judge at a glance of the relative magnitudes in question. It thus becomes much easier than by a mere perusal of provinces, and to settle according to their business or other requirements, but chiefly in the less crowded districts. Both these tendencies carry people to the suburbs, and hence a rapidly growing region lying about the margin of the map, where the vast development already considered is chiefly concentrated. In a word, London may be said to grow like the trunk of a tree. If the centre represents the heart wood, and the circumference the bark, it will be found that between the two there is a region of great functional activity, where a rapid deposit of new material is continually taking place. The analogy must not, however, be pressed too hard for it soon breaks down. Thus the region of new formation is by no means a narrow belt evenly distributed all around the central core. On the contrary, its distribution is exceedingly irregular. At one place, for example, it comes much nearer to the centre than elsewhere; at another place it will be carried much farther afield. To enable our readers to judge for themselves of the complexity of these movements, we have prepared a fourth map, showing the way in which the growth of population, represented by the smallest map in the above series, has been distributed over the ground.

In this map the outline of No. 3 is filled in by tracing the boundaries of the various parishes—or rather groups of parishes,—the grouping being that adopted in the census reports. They are divided under four heads, as follows:

numbers to realise the astonishing growth which has taken place and is still going forward within the metropolis, and, by inference, to judge how rapidly—though without consciousness of the fact on our part—the problem of providing for the sick poor grows and accumulates upon our hands.

DISTRIBUTION OF THE POPULATION.

It is not only the great increase of population within the metropolis which gives rise to an ever-growing demand for new hospital accommodation. The problem is aggravated by the exceptional growth of particular places within the metropolitan area. The space represented in our map is of pretty wide extent, including something like 120 square miles. There is therefore room for a considerable movement of population within these limits, and such movements necessitate corresponding movements and developments on the part of the hospitals; for it is only, for example, to a very limited extent that a hospital in Poplar can serve the needs of Fulham, or one in Hampstead supply medical aid to the residents in Woolwich. Now, broadly speaking, two movements may be traced in the population of London. First, there is a tendency to leave the central districts and settle for residence in the outskirts; and next, there is a tendency on the part of new comers to crowd in from the (1) Parishes that have suffered loss of resident population; (2) parishes that have remained stationary; (3) parishes that have increased in a less proportion than the whole of London; (4) parishes that have increased in a greater proportion than the whole of London.

The second of these heads has been taken to cover all cases in which the loss or gain, whichever it happened to be, during the twenty years did not exceed 10 per cent. Losses, therefore, have only been reckoned when the falling-off exceeds this proportion, and gains upon a corresponding rule.

To portray this classification the engraver has employed four tints. Parishes of the first group are left white, parishes of the second group are lightly shaded. Those of the third group are of an intermediate tone, while the fourth class is represented by his strongest colour. With this explanation in mind, the reader will gather more information upon this important topic from a glance at the map than from a column of mere disquisition. But even the map gives a very inadequate impression of the vast diversity of facts. Thus we have Lambeth and Battersea both represented by the same depth of tone, because both experienced large increases of population during the period in question. In Lambeth, however, the increase fell short of 50 per

Digitized by Google

cent., whereas the population of Battersea was very nearly trebled. Other instances of enormous growth are Wandsworth, Camberwell, and Hampstead, in all of which places the population was more than doubled, and Fulham, where, as in Battersea, the increase alone was equal to nearly twice the original population. It will easily be understood how greatly the problem of providing medical relief is complicated by such vast sporadic growths of population.

DISTRIBUTION OF THE ADDED POPULATION.

CHARACTER OF POPULATION.

The instances just cited serve to bring into view another condition of the problem not less important or less worthy of consideration than those already referred to, for it is plain, without discussion, that the necessities of the various new localities—if we may so describe the principal seats of this remarkable urban growth—in respect of hospital accommodation, will vary greatly; hardly less, indeed, than do the several quarters of the town among themselves. Hampstead and Camberwell may be compared by way of illustration. The northern suburb is almost entirely residential; the southern is largely industrial. The necessities of the one are not to be compared with those of the other; and for a just estimate of the requirements of a district, it is, therefore, as clearly necessary that the occupations and social position of its residents should be taken into account as that the residents themselves should be numbered, and their numbers compared from time to time. We gave our readers last year some account of the way in which the hospitals of the metropolis adapt their resources to the par-

ticular needs of their several localities; it is, therefore, the less necessary to expatiate now upon the theme. Suffice it here to remark that what holds of the old localities holds also of the new. Every district has its local needs, and these local needs can only be supplied by local institutions, which are not only readily accessible by reason of their being local, but also adaptable for the same reason to the purposes which best subserve the interests of their neighbourhood.

THE CASE OF THE LONDON HOSPITAL.

These conditions are well illustrated in the history of what is now the largest hospital in the metropolis—that is to say, the London Hospital in Whitechapel. The parish of Whitechapel is one of those (lightly tinted in the map) in which the population has remained practically stationary, the numbers having, in fact, suffered a slight diminution from 76,500 in 1871 to 74,400 in 1891. But the hospital no less markedly out of proportion to those which are recorded in the immediately following years. At the present time the work of a normal year brings into the wards of the institution three-fifths as many again, and to the out-patient department nearly twice the number of patients who at the earlier date flocked to the doors of the hospital in a period of plague.

GREATER LONDON.

There is yet another fact which should be borne in mind in this connexion—that Greater London is really a larger area than the London County represented in our maps and our statistics. On every side of the municipal boundary there stretches a belt of suburbs not distinguishable save by artificial limits from the suburbs within the official bounds. How great this adjacent population is may be judged from the circumstance that the Metropolitan Police area, which includes the greatest part of this out-

draws its patients from a much wider area than the parish in which it is located, and all around it are parishes that have experienced great development. Shut in somewhat by the city on the west and by the river on the south, its territory extends eastward as far as Poplar, and northward well into Hackney. Within this district there has been during the past twenty years an addition of at least 120,000 persons to the population, and of course a correspondingly increased demand upon the resources of the institution. Thus, in 1871 the number of in-patients received was 4781, the number of out-patients treated was 66,448. In 1891 these numbers had grown by gradual increments year by year to 8842 and 112,092 respectively. Carrying the comparison a little further back to the year 1866, which was a cholera year in London, we find a record of 5000 in-patients and 45,000 out-patients, a marked advance upon the numbers of preceding years, and a number lying territory, contains a population larger by a million and a quarter than that of the County of London itself. All these thousands of persons are for the purposes of hospital relief Londoners, and they add their contribution to the problem which the hospital authorities are called upon to solve; for it is manifestly impossible to apply to hospital patients the same strict rules as to local qualification which are applied to the claimants of municipal privileges. Thus on every side the problem grows under examination, and the only practical result of our best attempts to take its measure is to produce a sense that it is a problem of overwhelming proportions, too vast to be capable of presentation in such a form that the mind can adequately realise its magnitude and complexity.

HOW THESE PROBLEMS ARE DEALT WITH.

These are some of the problems of hospital administration

Digitized by Google

in the metropolis. How are they, in fact, solved? That is a question very difficult to answer except in a vague manner. Broadly, they may be said to solve themselves, for of course, in a sense, the existence of a hospital is dependent upon local needs. Two great general hospitals, for example, do not grow up next door to one another. Twenty years ago no better answer than this could have been given to the question, for there was no body, public or private, having jurisdiction to entertain questions of this kind; but at the present time a very effective oversight of all that concerns the good administration of the moneys committed to their hands is exercised by the Council of the Hospital Sunday Fund, and the questions now under consideration come, together with numberless other questions of a similar kind, before that tribunal. It is plain that it closely affects the outcome of their distribution that it should result in the allotment of the Fund in accordance with a just estimate of the comparative needs of various institutions. An undiscriminating bounty like the donations and subscriptions of the charitable public is apt to starve one institution while it overdoes the needs of another, in this way squandering resources which a wiser and more painstaking administration would economise, and, by merely economising, turn to greatly improved account. In this way the office of almoner is one of the very greatest practical importance; and although until twenty years ago it was wholly neglected so far as the medical charities of London were concerned, it is now discharged, and discharged with a large measure of success, by the Council over which the Lord Mayor of London presides. In consequence of the care which is taken to examine in the temper of a wise and kindly criticism the claims of applicants for a share of the Fund, it may be confidently affirmed that no part of the public expenditure of the metropolis produces equally happy results at so small an outlay. Not only is a large return in actual relief afforded and positive results secured, but the public scrutiny which has by this means been established into what was formerly the wholly inscrutable subject of hospital management, has reacted upon the whole system, and caused an improved administration to prevail throughout, so that enhanced results are now obtained not less from the means which private charity contributes than from those which the coöperation of the religious communities of the metropolis places at the sick service of the poor. The aggregate income of the metropolitan hospitals and medical charities averages nearly three-quarters of a million pounds a year. Of this great total the £40,000 realised by the Hospital Sunday collection is but a small part. Yet it has produced a marked effect upon the whole, and it is safe to say that the balance of £700,000 is better administered because of the conditions which are attached to the Hospital Sunday gifts. It may easily be supposed that by promoting economy this movement has produced an effect not less influential and not less beneficent upon the condition of the medical charities than its direct effect in augmenting their incomes by £40,000 a year. Unfortunately the materials for a direct comparison upon these lines do not exist. But certain it is that both results—the direct and the consequential—are at the present moment of unquestionable advantage and first-class importance to the institutions benefited. Yet the movement is in its infancy at the present time. The amount of the collection increases from year to year, and when it becomes commensurate with the wealth and charity of London it will be much nearer to £100,000 than to its present figure. The influence of the Council tends to increase in like manner, and, without taking any coercive form, to become more and more an authority which all concerned are glad to recognise. So, little by little, a slow advance is being made towards the solution of problems which have hardly been apprehended until now. A Parliamentary Committee has recently sat and taken evidence bearing on the condition of the hospitals of London, and in due time a report may be expected as the result of its labours upon which legislation may probably be based. But nothing that the Legislature can do will affect the condition and prospects of these institutions in anything like the same degree as that in which they have been affected by the spontaneous action of the religious world. The task is indeed one well worthy of the hands by which it has been undertaken, and one which fittingly unites in a common effort and a common aim those whose oneness in the great effort of seeking after God is too often obscured by the diversity of the paths in which the quest is pursued. Thus does this annual act of mercy vindicate its quality and claim to be "twice blessed." To "him who takes" it brings a benefit in his time of need which no statistics can exhibit, and upon the system itself by which that need is supplied it takes an effect great out of all proportion to the mere munificence of the gift. On "him who gives" it reacts in a way too subtle to be defined, yet too plain to be called in question. With claims like these to the goodwill of the good it is not strange that the Hospital Sunday collection should have commanded a large and growing

measure of support since its establishment in 1873; and although the work has in recent years, and notably in 1891, been done in such a way that a great effort will be required to maintain its rate of progress in the present year, yet we are confident that the great effort will not be wanting, and that while our vast metropolis continues to grow with the amazing rapidity to which the census returns bear witness, the resources not less than the needs of its medical charities will also continue to "grow with its growth and strengthen with its strength."

THE PAST YEAR'S RECORD OF HOSPITAL WORK.

In the foregoing chapters of this article we have directed the attention of our readers to the difficulties that have to be faced and the work that has to be done by the hospitals of the Metropolis. In conclusion, we have to lay before them in a summary statement the broad results of the work actually done during the past year, as shown by the reports issued by the various institutions. It is not possible to ascertain these results with accuracy, because many of the reports are for various reasons imperfect, and some are altogether wanting. In these instances estimates have to supply the defect of returns, and to that extent of course our results are open to criticism; but it is a criticism which does not destroy the value or affect the broad significance of the result. First, then, as to the numbers treated. The total number of in-patients received has been about 99,000; the total number of out-patients' visits nearly two and a quarter millions. The results of treatment, so far as out-patients are concerned, cannot be exactly stated. The out-patients of a hospital come and go in such a way that it is impossible to keep systematic records—such as are usual in the case of in-patients—of their medical history. They exhibit, of course, as a whole the less serious maladies which come under treatment; and of those out-patients who develop serious symptoms, a large proportion are admitted eventually into the wards, and are recorded among in-patients in their turn. Others of course are cases

of chronic and intractable disorders, which can be relieved, but not radically cured. The great bulk of out-patients, however, are effectively treated, and discharge themselves from further attendance because they are cured. Upon the whole, therefore, these large total figures may be taken to represent a very successful part of hospital work.

The in-patient totals can be dealt with in a somewhat more exhaustive manner. The whole number discharged cured was 44,000; the number of those relieved but not cured, 39,000. This latter total includes a considerable number of patients whose cases are beyond the power of medical skill to cure, and who can only be assisted by treatment which affords relief to the more distressing symptoms. Among these partially successful cases are some which, if they could be adequately explained to the general reader, would awaken the strongest sympathy of the charitably disposed, for, although the success of a perfect cure is that which patient and physician both chiefly desire, it is in these incomplete cases that the factor of skilful treatment is most important. In the cases of curable disease much is left to natural processes which tend to recuperation; but in a case of incurable disease the exact measure of the relief afforded and the precise limit of the territory to which the enemy is confined are determined almost exclusively by the treatment of the case. It is here therefore that the work of charity is most urgently required, and here accordingly that the triumph of charity is most complete. Paradox though it may seem, it is profoundly true that the greatest successes of hospital work are to be sought amid these partially successful cases. Of those remaining under treatment at the end of the year and of the deaths recorded it is not necessary to say more than merely to give the numbers, since the facts are self-explanatory. The former class numbered 7000; the deaths numbered 7700.

Such then, in meagre outline, is the work in which at this season the religious bodies of the metropolis are called to take part. The experience of twenty years is proof enough that no words are now needed to bring its claims home to the heart and the conscience of all good men, but it is none the less desirable on that account that the truth, in its length and breadth, should be brought to their knowledge, in order that they may appreciate both the greatness of the opportunity that is set before them and the pressing nature of the need which exists for help to be given, with no niggard hand, but in the spirit which finds that the blessedness of giving is his who gives.

TABLE NO. III.—COTTAGE HOSPITALS AND CONVALESCENT HOMES.

* No sufficient returns as to Dispensaries.

Note.—It may be observed by some of our readers that a return covering to some extent the same ground as the foregoing is issued by the Council of the Hospital Sunday Fund, the figures differing slightly from ours. It may therefore be convenient to explain at once that the ground covered by the two returns is not quite the same. The Mansion House return includes only those hospitals and institutions which are actually located within the metropolitan area; our return includes all such as receive grants from the Hospital Sunday Fund. The result is that our figures cover about thirty eight more institutions than do those issued from the Mansion House.

Extract from THE LANCET.

"Of all the pocket companions now essential to the practitioner, none is more indispensable than a good Thermometer. It is a gratifying circumstance to find instrument-makers taking pains to make the instrument more useful by making it more reliable and more easy of use. The Messrs. ARNOLD & SONS have attempted to make the scale more legible by colouring it red and indelibly, and the attempt has been successful. The instruments also have been carefully tested as to accuracy."

Every Clinical Thermometer manufactured by ARNOLD & SONS is tested by their new apparatus, which has the Kew verification for ascertaining and confirming the correctness of these Instruments.

NOTICE.—The greatest care is taken in packing these delicate instrum from their fragile nature they are easily broken; therefore it must be distinctly understood we do not hold ourselves in any way responsi for damage sustained in transit.

These Thermometers are so accurately constructed that Kew Certificates are quite unnecessary.

SQUIRE'S CHEMICAL FOOD.

The Original "Parrish." **Sold for 30 years by Squire & Sons.**

A PHOSPHATIC FOOD TONIC.

The preparation as formerly made by Edward Parrish can now only be obtained from Squire & Sons, TO WHOM HE TRANSFERRED BY DEED THE MANUFACTURE.

To avoid any excuse for substitution, orders should be written SQUIRE'S Chemical Food.

SQUIRE & SONS,

HER MAJESTY'S CHEMISTS,

413, OXFORD STREET, LONDON. W.

VINACOCA

TONIC WINE.

EMBRACING THE THERAPEUTIC PROPERTIES OF THE COCA PLANT, BLENDED WITH THE BEST MADEIRA.

COCA FOR TROUBLESOME THROATS.

Testimony is not wanting from specialists in diseases of the throat, and dramatic and lyric artists, to show that Coca has a wonderfully invigorating effect upon the voice. The preparation in most common use is the Wine of Coca, which, in order to yield the characteristic effect, must be made "upon honour." To be of any decided value it must be made from the Coca Leaves. Very much of the Coca Wine on the market is merely a solution of cocaine, which cannot be too severely condemned. Hence, those with troublesome throats who desire to use this tonic should be exceedingly careful in purchasing, patronising dealers only of known reliability.

The VINACOCA is carefully prepared from the best COCA LEAF ONLY (no addition of Cocaine).

Many Medical Men prescribe its use in preference to quinine or any bark wine. *It is a direct stimulant of the most active kind*, supporting life in a manner almost miraculous without disturbance of the vital functions. For the voice, a wineglassful before any ordeal is sufficient. It is of great value to Public Speakers, Professional and other Singers, and Lecturers. **Sold in Bottles at 3s. 6d. each, or 40s. per Dozen.** *COCA is prepared in various forms:—*

COCA LOZENGES, COCA TABLETS, COCA ELIXIR, COCA TOBACCO, COCA TEA, COCA CHOCOLATE, STAMIN (Coca & Beef Extract), **&c. &c.**

All the FRENCH HYGIENIC SOCIETY'S Preparations of COCA are from selected Leaves, and only the very choicest ingredients are used in their Specialities, which are very highly recommended by the Medical Profession.

Crude drugs, without greatly differing in physical character, may contain widely different quantities of alkaloids; consequently Tinctures made from such drugs must necessarily vary considerably in strength. Tinctures made from Standardised Drugs, owing to different methods of manufacture, also vary considerably in strength; hence the necessity for Standardising the finished product.

TO PHYSICIANS

who, in prescribing, wish to administer remedies of known and unvarying strength,

SOUTHALLS' STANDARD TINCTURES

ARE INVALUABLE.

They are of B.P. strength—are all assayed after preparation—contain a definite amount of alkaloid or other active principle, and can therefore be relied on to produce the same effect under the same conditions.

TRADE SAMPLES of Potent Tinctures from leading houses analysed by us SHOW EXTREME VARIATION; the strength to the "Standard" Tincture is shown also for the purpose of comparison.

	TRADE SAMPLES.			"STANDARD" TINCTURES always contain:
e.g.	Aconite	·046 to ·068	per cent. of Ether Soluble Alkaloids	·05 per cent.
	Belladonna ...	·007 ,, ·026	,, ,, Alkaloids	·025 ,,
	Conium	·026 ,, ·093	,, ,, Coniine and other alkaloids ...	·060 ,,

In the "Standard Tinctures" the active principles are not added as such after each assay, but in the form of crude drug; thus the natural condition of these principles is retained.

Physicians are requested, when prescribing, to order the Tinctures as follows:—"TINCT. CONII (SOUTHALL)."

PAMPHLETS GIVING PRICES AND PARTICULARS SENT POST FREE.

SAMPLES OF ANY TWO OF THE TINCTURES FREE ON APPLICATION.

The TINCTURES, either B.P. Strength or Concentrated,

May be obtained at the Ordinary Wholesale Price from all Wholesale Chemists and Druggists, or direct from the Manufacturers—

SOUTHALL BROS. & BARCLAY (Manufacturing Pharmaceutical Chemists), BIRMINGHAM.

Telegraphic Address—"SOUTHALL, BIRMINGHAM."

THE IDEAL NUTRITIVE BEVERAGE.

ESSENTIA MALTI (KEPLER

WE have recently introduced a new food agent and aid to the digestion of farinaceous substances under the above name. This preparation is manufactured by a modification of the KEPLER process for making the well-known **Kepler Extract of Malt.**

The Kepler Essence of Malt contains a large amount of **Diastase** and natural mineral phosphates, and a considerable amount of tissue-forming substances. *The immense superiority of this preparation over ale and stout* is at once apparent when the process of manufacture is considered in detail. In making ale and stout the carbo-hydrates (so valuable as nutrient material) and the diastase (a most important principle of Malt, being of special service in errors of nutrition accompanied by digestive derangement) are sacrificed for the production of alcohol; whereas *in the Kepler* **Essence of Malt** *these are carefully preserved intact.* This Essence is therefore an ideal aid to digestion and nutrient agent. **A wine-glassful of the Kepler Essence of Malt contains more elements of nutrition than a pint of the finest alimental stout.**

The flavour of the ESSENCE OF MALT is delicious. It is admirable as a table beverage when diluted with aërated water, and as an addition to milk for infant and invalid dieting; for it sweetens it and facilitates its prompt and perfect digestion. The Essence may be taken in coffee, gruel, aërated or plain water, wine, or mixed with any farinaceous pudding. As an addition to the food for young children its value cannot be over-estimated. It increases the value of all farinaceous food, and prevents the starch in such food, and large clots of curd in milk diet, overtaxing the power of the digestive functions.

For Lactating Women the ESSENCE OF MALT (KEPLER) contains many desirable properties; it quickly increases the flow and enriches the quality of the milk. It is serviceable as a laxative for young children, especially when constipation depends upon the defective digestion of starch. As a food beverage, it cannot fail to be productive of the highest benefit, either in **acute disease** or during **convalescence**; in fact, wherever there is defective nutrition, the KEPLER ESSENCE OF MALT is useful as a nutritive food.

As a Linctus, the Essence of Malt food, swallowed slowly, in the troublesome dry, laryngeal cough, and the hacking cough of puberty or consumption, is pleasantly grateful and soothing, aids digestion, and builds up the tissues.

The KEPLER ESSENCE OF MALT is supplied to the medical profession in champagne pints at 1s. 2d. each. Retail 1s. 6d. each.

The Croonian Lectures

ON THE

CHEMISTRY AND THERAPEUTICS OF URIC ACID GRAVEL AND GOUT.

Delivered before the Royal College of Physicians of London,

BY SIR WM. ROBERTS, M.D. LOND., F.R.S.

LECTURE I.

CHEMISTRY OF URIC ACID AND THE URATES.—COMPARATIVE PHYSIOLOGY OF URIC ACID.

MR. PRESIDENT AND GENTLEMEN,—The morbid phenomena associated with uric acid divide themselves naturally into those which have reference to gravel and calculus and those which have reference to gout. In the former uric acid is thrown down in the free state from the urine as concretions in the urinary channels; in the latter uric acid is thrown down in a state of combination, as sodium bi-urate, in the interior tissues of the body. In both conditions the precipitated substance necessarily acts as a foreign body, and tends to cause inflammatory incidents and obstructions in the parts implicated. In regard to gravel and calculus the whole of the morbid sequences are thus accounted for; no suspicion is entertained that uric-acid concretions lodged in the kidneys or bladder produce any disturbances above and beyond those which are due to mechanical injury; but in regard to gout uric acid is supposed to play a double part. It is commonly believed that, besides the irritation consequent on the precipitation of crystals of sodium bi-urate in the joints and elsewhere, uric acid floating in solution in the bodily fluids acts as a true poison; and it is assumed that a large part of the symptoms associated with the gouty state are directly due to this poisonous action. The soundness of this assumption will be hereafter called in question. It will be shown to be more probable that uric acid does not possess any inherent poisonous quality, and that when mischief arises from it that mischief is consequent on the acid being precipitated in the solid form as sodium bi-urate in the fluids or tissues of the body. The substantiation of this view would bring gout and uric-acid gravel into closer parallelism. Gout would then become, like gravel, in so far as its phenomena depend on uric acid, but of course no further, a disease of which the manifestations are proximately due to mechanical injury. On this view it becomes evident that the chemical reactions of uric acid and the urates, and especially those reactions which govern the holding in solution of these substances, have a more direct bearing on clinical and pathological problems than those conditions which have reference to the mode of origin of uric acid. In either case, whether uric acid be poisonous or not, the pathological history of uric acid is intimately bound up with its chemical properties, and a knowledge of these properties is an essential pre-requisite for a scientific apprehension of the problems that arise in connexion with uric-acid gravel and the uratic phenomena of gout.

The amorphous urate deposit of human urine forms a convenient starting-point for the study of the pathological chemistry of uric acid. This is the most familiarly known, and yet, perhaps, the least understood of all the urinary deposits. The amorphous urate is frequently deposited in the urine of perfectly healthy persons, especially during the colder seasons of the year, and at all seasons after sharp exercise and severe sweating. It is also habitually seen in the urine of persons suffering from slight catarrhal conditions or trifling dyspeptic derangements. Lastly, it is a common accompaniment of pyrexia, and of grave organic wasting diseases of all kinds. The amorphous urate deposit coincides with an acid reaction of the urine, and is never thrown down in a neutral or alkaline urine. It is recognised clinically by its disappearance when the urine is warmed. It is always more or less stained with the proper pigments of the urine, and its tint varies accordingly. Under the microscope it presents a granular appearance without any obvious crystalline structure. All this is matter of common knowledge. When we carry our inquiries further and ask, what is the chemical nature of this substance? and what are its physiological analogies and pathological relations? no clear answers are forthcoming. Indeed, such questions are nowadays scarcely asked at all. The amorphous urate deposit has for some time past been relegated almost to the position of a clinical curiosity, devoid of any real bearing on pathological and physiological questions. But if it can be shown that this substance is a representative body; that it typifies the exclusive mode in which nitrogen is eliminated in vast tribes of the animal series; that it represents the chemical combination, and the sole combination, in which uric acid subsists normally in the healthy organism; and that, moreover, the pathological troubles connected with uric acid are due to deviations, in one direction or other, from this normal combination,—then it becomes obvious that the chemical composition and reactions of the amorphous urate possess a very real interest both for the physician and the biologist. Before entering on this inquiry it is necessary to recall to your memories what is already known and established in regard to the chemistry of uric acid and its combination with bases. Uric acid is regarded by chemists as a bi-basic acid—that is to say, as an acid containing two atoms of replaceable hydrogen. It is represented by the formula $H_2(C_5H_2N_4O_3)$, or more simply as $H_2\bar{u}$. It forms, like other bi-basic acids, two regular orders of salts—namely, neutral urates, with the general formula $M_2\bar{u}$, and acid urates, or bi-urates, with the general formula $M\bar{H}\bar{u}$. These two orders of uric-acid salts were elaborately studied in Liebig's laboratory nearly half a century ago by August Bensch, in collaboration with an English student, Dr. James Allan.[1] So reliable and so complete have these researches been regarded that no chemist has, so far as I know, thought it necessary to repeat and verify them; and they still constitute our principal source of information with regard to these two classes of salts.

The *neutral urates*—$M_2\bar{u}$—were prepared by Allan and Bensch by dissolving uric acid in cold dilute solutions of the caustic alkalies, free from carbonates, and then boiling down the solutions in a retort until crystals made their appearance. The neutral urates are very unstable; they are decomposed by carbonates, and even by the carbonic acid of the air. Of late years these neutral urates have been made to figure prominently in certain theories of gout. Such theories, however, are on chemical grounds untenable. The neutral urates can only be produced in the presence of caustic alkalies and in the absence of carbonic acid and the carbonates. Caustic alkalies cannot, however, exist in the living organism, and carbonic acid and the carbonates are everywhere present. It would therefore seem impossible that the neutral urates should ever arise or subsist in the living body, or that they should ever play any part in the physiological or pathological history of uric acid; and until it can be demonstrated that these salts do actually exist in the body, or at least that they can be formed under conditions which are known to be possible in the living body, it is futile to frame theories in which these compounds are made to intervene. With these remarks, the neutral urates may be absolutely dismissed from our consideration, as having neither part nor lot in the vital history of uric acid, whether in health or in disease.

The acid urates, or bi-urates ($M\bar{H}\bar{u}$), are the most stable salts of uric acid, and tend strongly to assume the crystalline form. They are encountered pathologically in gouty concretions, of which the sodium bi-urate forms the distinctive constituent. The bi-urates do not occur in the unchanged urine, neither in health nor in disease; and when bi-urates are artificially introduced into normal urine they fail to maintain their integrity, and at once undergo a change of composition.[2] Nor is there any actual proof that uric acid ever exists as a true bi-urate in the healthy blood and interstitial juices; and it will be hereafter shown that when uric acid is brought into contact with these fluids it is not taken up as a bi-urate. It may therefore be affirmed that the bi-urates, although known to us as pathological products in gouty deposits, are not, strictly speaking, known to us as physiological constituents, neither in the blood nor in the urine. But inasmuch as uric acid, in some form of combination or other, does exist normally in minute quantities in healthy blood, and exists in much larger quantities in healthy urine, the question arises,

[1] Liebig's Annalen d. Chemie u. Pharm., vol. lxv., p. 181.

[2] For proof of this statement see my paper on the History of Uric Acid in the Urine, Medical and Chirurgical Transactions, vol. lxxiii., p. 260.

Digitized by Google

What, then, is this other form of combination, this normal and physiological combination, which is neither neutral urate nor bi-urate, in which uric acid exists in the healthy body? This question brings us back to the consideration of the amorphous urate deposit.

REACTIONS OF THE AMORPHOUS URATE DEPOSIT: IDENTITY OF IT WITH THE URINARY EXCRETION OF BIRDS AND SERPENTS.

The amorphous urate deposit, as we find it in the urine, is not a chemically pure article, and not only so, but the urine with which it is mingled entirely masks its most important reactions. In order to study the properties of this substance it is necessary, first of all, to separate it from the urine. This is effected by filtering off the sediment, and washing it thoroughly on the filter with rectified spirit, and then drying it. The deposit is still contaminated with pigment; but it is sufficiently pure for the display of its most striking reaction, and that is its behaviour with pure water. When the amorphous urate, thus purified, is mixed with a considerable volume of distilled water it is speedily disintegrated. A portion passes into solution in combination with the bases, and the remainder falls down as an insoluble precipitate of crystalline uric acid. This remarkable transformation may be witnessed in progress, under the microscope, in the following manner. A speck of the purified deposit is intimately mixed on a glass slide with a drop of distilled water, and protected with a covering glass. To keep the preparation thoroughly moist fresh supplies of water are from time to time insinuated under the covering glass. In the course of five or ten minutes beautiful ovoid crystals of uric acid begin to make their appearance. These grow and multiply until, in the course of half an hour or an hour, the entire field of vision is thickly studded with crystals; and the process goes on, provided the preparation be kept from drying, until the amorphous matter seems to be entirely changed into crystals of uric acid. The reaction here described may, according to my experience, be always demonstrated with every freshly collected sample of amorphous urate deposit. The rate of transformation varies a good deal. With fawn-coloured deposits the change is usually completed in from fifteen to twenty minutes; with the more deeply tinted deposits the time is longer, and extends to half an hour or an hour. The interest attaching to the amorphous urate deposit is greatly enhanced when we learn that the urinary excretion of birds and serpents displays identically the same reactions as the amorphous urate. The white mortar-like substance which constitutes the urinary excretion of birds and serpents is usually described as consisting of bi-urate of ammonia. This view is, however, based on a fallacy. The misapprehension has arisen from the excretion having been examined, not in the unaltered state, but after it had undergone secondary changes subsequent to its emission, either through bacterial decomposition or through contact with water. If the excretion be examined in the fresh and uncontaminated state, it is seen under the microscope to consist of minute spheres about the size of the white corpuscles of the blood. Some are twice this size, and a great many are much smaller. These spheres exhibit a radiated crystalline structure, and display a black cross with polarised light. When tested under the microscope with a drop of distilled water in the manner before described in the case of the amorphous urate, the spheres are seen to gradually melt away with abundant emission of colourless tablets of uric acid. When the excretion is treated with a large volume of water in a beaker, a portion goes into solution as bi urate and the rest falls down as crystals of uric acid. In short, the urine of birds and serpents reacts with water precisely in the same way as the amorphous urate sediment, except that the transformation takes place more rapidly. It can, moreover, be shown that the difference in physical form between the two substances is a mere accident of molecular aggregation. For under certain conditions the amorphous urate deposit can be obtained in regular crystalline spheres scarcely distinguishable from the spheres of the urine of birds and serpents, and, conversely, if the urine of birds or serpents be dissolved in hot normal urine, and the solution be then rapidly cooled, the substance is reprecipitated as an amorphous tinted deposit undistinguishable from the amorphous urate sediment. These observations point to the conclusion that the amorphous urate deposit of human urine and the solid or semi-solid urinary excrement of birds and serpents are essentially one and the same substance. Now the question arises, What is the constitution of this substance Is it merely a mechanical mixture of bi-urate with varying quantities of free uric acid, or is it a definite chemical combination, representative of a new and third order of uric-acid salts, differing essentially from the two regular orders previously recognised? The elucidation of this question involved a difficult and somewhat protracted inquiry, to which I must now ask your patient attention.

CHEMICAL CONSTITUTION OF THE AMORPHOUS URATE DEPOSIT AND OF THE URINARY EXCRETION OF BIRDS AND SERPENTS.—THE EXISTENCE OF A THIRD ORDER OF URIC-ACID SALTS, OR QUADRI-URATES.

We are indebted to a former distinguished Fellow of this College, Dr. Bence Jones, who was, moreover, one of my predecessors in this office of Croonian lecturer, for the first real light on the chemical constitution of the amorphous urate deposit. His researches were published in the *Journal of the Chemical Society* for 1862. He there describes the action of water on the sediment. He shows that the portion of the sediment which is not dissolved by the water is pure uric acid, and that the portion which goes into solution is true bi-urate. He next gives the results of a quantitative analysis of three samples of the amorphous urate sediment, made especially with the object of ascertaining the proportion of uric acid to the quantities of the bases contained in them. He found in each sample that the uric acid was in excess of the quantity required to form bi-urates with the bases present. The proportion of this excess varied greatly in the three samples; but when the three analyses were thrown together, and the average struck, the mean amount of uric acid was found to be almost exactly double that required to form bi-urates with the sum of the bases present. He also calculated the corresponding proportions in four similar analyses previously made by Scherer. Here likewise the separate analyses gave the most discordant proportions; but again it so fell out that the average of the whole four analyses yielded a proportion of uric acid which was very nearly double the amount required to form bi-urates with the sum of the bases. These closely approximating averages, although drawn from numbers so divergent that their agreement could obviously only be due to a fortuitous coincidence, seem to have inspired Dr. Bence Jones with the happy conjecture that there existed a third order of uric-acid salts, of more complex constitution than the two previously known, and in which an atom of bi-urate was loosely combined with an additional atom of uric acid. He drew the inference that the amorphous urate deposit consisted of, or at least often contained, such a combination. In order to test the soundness of this conjecture he sought to form an artificial sediment of urates, which, when treated with water, would, like the amorphous urate deposit, be disintegrated into free uric acid and bi-urate. In this attempt he succeeded both with potash and soda. By dissolving uric acid in potash or soda ley, and then carefully adding acetic acid until the liquid became slightly acid, he obtained a dense white precipitate. This was caught on a filter, washed with alcohol, and dried. This substance was found to possess the characteristic properties of the amorphous urate deposit. It was granular in character, and was decomposed by water with abundant emission of uric-acid crystals. He made a quantitative analysis of two samples of the potash compound thus obtained. He found that the portion that went into solution when the substance was treated with water corresponded exactly with the theoretical formula of potassium bi-urate, and that the uric acid which remained undissolved approximated in amount to that which went into solution as bi-urate. Commenting on these results, he says: "It appears from these experiments that an artificial granular deposit may be formed—which is decomposed by washing with cold water or by boiling—into uric acid and acid urate of potassium. This granular substance may be considered to resemble the quadroxalate of potassa, which differs from the acid oxalate by containing double the amount of oxalic acid; and, following this nomenclature, it may be called "*quadrurate* of potassa." The general formula for the quadrurate—or, as it may be more euphoniously expressed, *quadri-urate*—following the analogy of the quadroxalates, would be $H_2(C_5H_2N_4O_3)$ $MH(C_5H_2N_4O_3)$, or, more simply, $H_2\bar{u}$, $M\bar{H}\bar{u}$. According to this theory the action of water on the amorphous urate deposit and kindred compounds is to split them up into free uric acid, and bi-urates of the bases contained in them. If this theory be correct, the

Digitized by Google

quantity of uric acid thrown out by water should of course exactly equal the quantity retained in solution as bi-urate. With regard to this point, however, Dr. Bence Jones's analyses of the potash compound did not come out with the desired exactness. In the first analysis the proportion of uric acid separated by water as compared with that retained in solution as bi-urate was not as 1 to 1, as required by the theory, but as 1·27 to 1, and in the second analysis as 1·12 to 1. This discrepancy is considerably greater than could be accounted for by the necessary limits of error in the methods of analysis adopted; and it was impossible to avoid the impression that the proof adduced by Dr. Bence Jones of the existence of a true and definite chemical combination, corresponding with the hypothetical formula of a quadri-urate, was altogether inadequate. These substances, which were disintegrated by water, might, after all, be only intimate mechanical mixtures of bi-urates with varying quantities of free uric acid, and the action of water upon them might be explained simply as that of a solvent separating a more soluble ingredient from a less soluble ingredient.

Thirty years have elapsed since the publication of Dr. Bence Jones's researches. So far as they have had any influence on current views of the pathology of uric-acid they might as well have never been made. For although these researches have received formal mention in works on urinary chemistry, the deductions and inferences indicated by them have received no recognition, and have been entirely ignored in the numerous inquiries and discussions which have since taken place on the etiology of uric-acid gravel and gout. Until the subject was taken up by myself, no attempt had been made to repeat and verify the observations and experiments. Yet the main suggestion of Dr. Bence Jones's investigations—namely, that there existed a third order of uric-acid salts—is obviously one of high scientific and practical interest. The cause of this surprising neglect lay probably in the halting and even ambiguous terms in which he expressed himself in regard to his results. After giving a clear experimental proof of the disintegrating effects of water on the amorphous urate deposit, he qualifies his statement, without any attempt at explanation, in the following unsatisfactory manner: "In other experiments, the deposit, when frequently washed with cold water, gave no uric-acid crystals at all. Hot water also frequently dissolved only the urates, and caused the whole deposit to pass rapidly through the filter without leaving any uric-acid crystals behind." In the final summary of his "Results" he writes: "In conclusion, then, it appears that the amorphous deposits of urates in the urine has no constant composition. It is a mixture of different acid urates modified in crystalline form by other substances in the urine. ..... Moreover, uric acid is occasionally found in combination with these acid urates, forming quadrurates, and thus rendering the deposit still more liable to vary in its composition." Dr. Bence Jones did not return to the subject, though he continued for some years in active scientific work. I can only explain his abandonment of so promising a vein of inquiry on the supposition that he was deterred by the difficulty of obtaining a due supply of material for his experiments. He had to collect the amorphous urate deposit in small parcels at different times and from different sources, as opportunity offered. A supply of material gathered in this way of a changeable substance could not possess the purity and homogeneity necessary for the purposes of quantitative analyses. In taking up and continuing the investigation thus prematurely dropped by Dr. Bence Jones I was able to reach a point of vantage in regard to these difficulties. I soon learnt that the urinary excretion of the large serpents furnished an abundant source of material which was identical in reactions with the amorphous urate. I also succeeded, by a method to be presently described, in preparing at will from human urine plentiful and fresh supplies of the amorphous urate deposit. The questions I had to decide were these: Is the amorphous urate deposit, together with the urinary excretion of birds and serpents, a true and definite chemical compound? and does there exist a third order of uric-acid salts differing essentially from the two urates already known, and having a composition corresponding to the hypothetical formula of a quadri-urate? As the main argument of these lectures rests on the establishment of an affirmative answer to these questions, it is necessary for me to lay before you the experimental evidence on which I rely as sufficing for the purpose. The materials used in the investigation consisted of: (*a*) the amorphous urate deposit of human urine; (*b*) the urinary excretion of birds and serpents (both of these are natural products); and (*c*) artificially prepared imitations of these natural products, made in the laboratory. Two lines of analysis were pursued in each case. The first was to estimate quantitatively the amounts of the bases and of uric acid in the samples. The second was to proceed by way of what may be termed "water analysis"—that is to say, to decompose the substance with a large volume of water, and then to estimate respectively the amount of uric acid which was thrown out in the free state, and the amount which went into solution as bi-urate. If the quadri urate theory be correct, these two amounts should be exactly equal.

I now proceed to lay before you the results of these analyses.

A.—Analyses of the Amorphous Urate Deposit.

It was found that samples of the amorphous urate deposit obtained from hospital wards or from private patients yielded on analysis results so inconstant that no conclusion with regard to the points under consideration could be drawn from them. In most samples the quantity of uric acid separated by water was larger than that retained in solution, but this excess presented no uniformity of amount. The explanation of this discrepancy lay in the fact, to be more fully noticed in my next lecture, that the amorphous urate, as it is found in the urine, exists under conditions of change, which tend to progressively liberate its uric acid; and as the sediment had to be collected in separate portions from different urines on different days until a sufficient quantity had been gathered for analysis, it is no wonder that gross variations in its composition were observed. It soon became evident that reliable data could not be obtained from materials collected in this way. This difficulty was, however, surmounted; and I succeeded, by the following process, in obtaining and having always at command an adequate supply of the amorphous urate in a fresh and unchanged state. Healthy urine of medium density is treated with successive additions of bicarbonate of potash or soda until it becomes slightly alkaline. It is next heated in a flask to the boiling point, and then shaken up for about a minute with excess of pure uric acid. The mixture is now thrown on a filter and the filtrate is cooled under a running tap of cold water. As cooling proceeds a dense voluminous precipitate forms, which is an exact counterpart of the natural amorphous urate sediment. The precipitate is separated by filtration, thoroughly washed on the filter with rectified spirit, and dried at blood heat. To obtain a product of uniform composition by this process requires a somewhat nice adjustment of the reaction. If the quantity of alkaline carbonate added be too small, and the alkalescence thereby induced be too faint, the precipitate is apt to be contaminated with free uric acid. On the other hand, if the alkaline carbonate be added too freely, and the resulting alkalescence be excessive, the precipitate is apt to be contaminated with bi-urate. These risks are greatly minimised by using the acetate of potash instead of the alkaline carbonate. The commercial acetate of potash has a slightly alkaline reaction, and it possesses a considerable power of conserving the integrity of the amorphous urate. I obtained a very uniform product by employing normal urine charged with acetate of potash to the extent of 3 per cent. The other steps of the process were the same as those above described. It was observed that if the filtrate was cooled rapidly the resulting precipitate had a finely granular character, just like that of the natural amorphous urate; but if the cooling was allowed to proceed slowly at the temperature of the room the precipitate fell in regular spheres with a radiated crystalline structure, resembling closely the spheres of the urinary excretion of birds and serpents. Samples of amorphous urate deposit prepared in these ways yielded to analysis very constant results. The water analysis was carried out in the following manner: The dried deposit, usually about 0·4 grm., was mixed in a beaker with 1000 times its weight of distilled water; the mixture was next slowly heated to about the boiling point, with constant stirring, until the whole went into solution. The beaker was then set aside for forty-eight hours. On cooling, the liberated uric acid fell out in large crystals. The clear supernatant liquor was then nearly all syphoned off, and the remainder, together with the deposited crystals, was thrown on a weighed filter. The crystals were washed very sparingly with cold water, and

Digitized by Google

then more freely with rectified spirit. Finally, the filter was dried and weighed. This gave me the weight of the uric acid separated by water.[3] The syphoned-off supernatant liquor, together with the washings from the filter, was then heated to near boiling, and strongly acidulated with hydrochloric acid, and then set aside for forty-eight hours.[4] The precipitated crystals were collected, dried, and weighed, as in the preceding case. When the analyses were conducted in this way, the amount of uric acid separated by water was found to be almost exactly equal to that retained in solution, as is shown in the following two sample experiments:—

TABLE I.—*Showing the Results of Water Analysis of two Samples of Amorphous Urate Sediment prepared by the Acetate of Potash Method.*

	First sample.	Second sample.
Uric acid separated by water ..	0·080 grm.	0·164 grm.
Uric acid dissolved as bi-urate ..	0·077 „	0·159 „

These results agree closely with the requirements of the quadri-urate theory. A complete quantitative analysis of a sample of amorphous urate sediment obtained by the bicarbonate of potash method gave the following results. The substance did not contain any lime or magnesia.

TABLE II.—*Quantitative Analysis of a Sample of Amorphous Urate Deposit prepared by the Bicarbonate of Potassium Process.*

Weight of substance used = 1·328 grm.

Uric acid	1·113 grm.
Potassium	0·065 „
Sodium	0·027 „
Ammonium	0·008 „
Moisture, organic matter, and loss	0·115 „
	1·328 „
Uric acid required to form quadri-urates with the bases present	1·102 „
Total uric acid found	1·113 „

These results agree in the closest manner with the supposition that the deposit was composed entirely and exclusively of quadri-urates of potassium, sodium, and ammonium.

B.—ANALYSES OF THE URINARY EXCRETION OF BIRDS AND SERPENTS.

1. *Urine of Birds.*—During a period of dry summer weather my servant collected for me a quantity of the excreta of a number of fowls kept in a large run. The pieces were gathered freshly day by day, and were at once dried in the sun on a sheet of paper. When quite dry the chalk-like stuff encrusting the fæcal masses was carefully chipped off with the point of a penknife and preserved in a stoppered bottle. In this way, in the course of a week, about four grammes of urinary excrement were obtained in a state of approximate purity. Qualitative testing showed that the substance contained ammonia. On incineration it yielded 8·68 per cent. of a strongly alkaline ash. This ash consisted almost entirely of potash and soda, with a small quantity of iron. There were also found in it minute traces of lime and silica and sulphuric and phosphoric acids. These traces, it was conjectured, were derived from contamination with the sandy materials strewn on the floor of the fowl run. For this reason the substance was not judged to be sufficiently pure for the purpose of a complete quantitative analysis, but it was perfectly suitable for water analysis. A number of the cleanest-looking pieces were picked out and divided into two parcels of about half a gramme each. These were finely powdered, and subjected to water analysis by the method already described. The results are exhibited in the following table.

TABLE III.—*Water Analysis of Fowls' Urine.*

	First sample.	Second sample.
Uric acid separated by water ..	0·160 grm.	0·136 grm.
Uric acid dissolved as bi-urate ..	0·165 „	0·133 „

It is seen that the results come out with great exactness in agreement with the requirements of the quadri-urate theory.

2. *Urine of Serpents.*—The urinary excretion of the large serpents is easily obtained from our Zoological Gardens in massive pieces, quite unmixed with the fæcal discharges and other extraneous impurities. Still it is difficult, or even impossible, to obtain the secretion in an absolutely unaltered state—as eliminated by the kidneys. It is liable after being voided to come into contact with the water used for cleansing the cages in which the creatures are confined; and water, as we have seen, speedily disintegrates it. Again, if the substance be not at once completely dried on the hot-water bath, it undergoes bacterial decomposition, and is thereby transformed into bi-urate of ammonia. This is the condition in which "serpents' urine," as supplied by the dealers, is generally found. Even if both these sources of change are avoided by taking proper precautions, there is yet another which no care can obviate. The large serpents void their urine at long intervals, varying from a week or ten days to six or seven weeks. During this long sojourn in the urinary passages the secretion undergoes slow changes which affect its chemical constitution. I have always found serpents' urine, when examined in the fresh state, to have a sharply acid reaction. Under these conditions a certain amount of decomposition of the urates, with liberation of free uric acid, is inevitable.[5] Accordingly, when samples of serpents' urine were subjected to water analysis, however carefully the samples had been collected and preserved, the amount of uric acid separated by water was always found to be considerably in excess of that which went into solution as bi-urate. The invariable presence in the secretion of free uric acid was thus demonstrated. The subjoined table exhibits some of the results obtained by water analysis of freshly gathered specimens of the urinary excrement of the boa:—

TABLE IV.—*Water Analysis of Four Samples of Serpents' Urine.*

	I.	II.	III.	IV.
Uric acid separated by water	0·128 grm.	0·110 grm.	0·204 grm.	0·215 grm.
Uric acid dissolved as bi-urates	0·117 grm.	0·085 grm.	0·141 grm.	0·140 grm.

It is seen that in each experiment the quantity of uric acid separated by water was in excess of that which went into solution as bi-urate; and that, moreover, the proportion of this excess bore no constant relation in the several samples. The urine of the serpent, when at length voided, would thus appear to consist of quadri-urates contaminated with a variable admixture of free uric acid. The explanation above offered to account for the discrepant results obtained by water analysis of serpents' urine would, however, not apply to a quantitative estimation of the uric acid and the bases found in the excretion. For although the changes indicated as occurring during the lengthened sojourn of the secretion in the urinary passages would produce a partial displacement of the relations between the uric acid and its attached bases, the quantities of these would remain unaltered, and they would still form in their due proportions part and parcel of the semi-solid excrement as finally voided. The following quantitative analysis of a massive and very pure specimen of the urine of the boa justifies the correctness of this explanation. The material used for the analysis was taken exclusively from the interior portions of the mass.

TABLE V.—*Complete Quantitative Analysis of the Urine of the Boa.*

Ten grammes yielded:—

Uric acid	8·280 grm.
Potassium	0·333 „
Sodium	0·106 „
Ammonium	0·192 „
Moisture, organic matter, iron, traces of lime, and loss	1·089 „
	10·000 „
Uric acid required to form quadri-urates with the bases present	8·471 grm.
Free uric acid	0·209 „
Total uric acid found	8·280 „

The results of this analysis came out closely in accordance with the requirements of the quadri-urate hypothesis. The quantity of uric acid over and above that required to form quadri-urates with the bases present, and which might be

[3] To get a true result it was necessary to take account of that small portion of liberated uric acid which was still retained in solution after complete precipitation. This was experimentally determined to be, at the usual temperature of the room, 0·0055 grm. per 100 cc. This amount was added to the quantity actually found on the weighed filter.

[4] The advantage of adding the acid when the solution is hot is that the precipitated crystals are much larger, and therefore more easily and perfectly collected, than when the acid is added in the cold. In the latter case the crystals were sometimes so exceedingly minute that it was impossible to avoid serious loss in the processes of filtration and washing.

[5] Herein no doubt lies the remarkable difference in the results of water analysis of the urine of the fowl and that of the boa. The fowl discharges its urine many times a day. There is no detention of it in the urinary passages, and therefore no time for the occurrence of appreciable secondary changes.

Digitized by Google

regarded as existing in the free state, did not exceed 2·5 per cent. of the total uric acid found.

C.—Analyses of Artificially Prepared Quadri-urates.

As already stated, Dr. Bence Jones succeeded in preparing compounds of uric acid with potassium and sodium, which were decomposable by water, by adding acetic acid to cold solutions of uric acid in potash or soda ley until a precipitate was produced. This method was, however, found to give very uncertain results. If the acetic acid was added too freely, the precipitate was contaminated with free uric acid; and, on the contrary, if too little acetic acid was added, the precipitate was contaminated with bi-urate. It was almost impossible to hit the mark with precision. The following process was found to yield much more uniform results: 300 cc. of a 3 per cent. solution of acetate of potash was heated to boiling in a flask, and then shaken up with 2 grammes of uric acid for about a minute. The mixture was filtered hot, and the filtrate rapidly cooled under a running tap of cold water. A dense voluminous precipitate formed. This was thrown on a filter, and washed first with rectified spirit, and then thoroughly with absolute alcohol, and finally dried at blood heat. The substance thus obtained had a coarsely granular appearance under the microscope, and it was rapidly decomposed when treated with water. If the cooling was allowed to take place more slowly in the warm chamber, or even at the temperature of a warm sitting room, the precipitate fell down in regular spheres, possessing a radiated crystalline structure, resembling very closely both in size and appearance the spheres of the birds' and serpents' urine.

The following table exhibits the results of analyses of this compound.

TABLE VI.—*Water Analysis and Quantitative Analysis of a Sample of Potassium Quadri-urate prepared by the Acetate of Potash Method.*

Water Analysis.

Uric acid separated by water	0·84 grm.
Uric acid dissolved as bi-urate	0·85 grm.

Quantitative Analysis.

		Proportions per cent.	
		Found.	Calculated.
Uric acid	0·198 grm.	89·75	89·60
Potassium	0·0226 grm.	10·25	10·40

The numbers in both these analyses of the potassium compound come out with almost perfect exactness in agreement with the quadri-urate theory of its composition.

The corresponding sodium compound was prepared by shaking up 1 grm. of uric acid with 100 cc. of a boiling hot 5 per cent. solution of acetate of soda, filtering hot, cooling the filtrate rapidly on ice, collecting the resultant precipitate at once on a filter, washing with absolute alcohol, and drying at blood heat. The operations have to be carried out as rapidly as possible, otherwise free uric acid is thrown out. Analysis of the sodium compound thus prepared yielded the following results.

TABLE VII.—*Quantitative Analysis of a Sample of Sodium Quadri-urate prepared by the Acetate of Soda Process.*

		Proportions per cent.	
		Found.	Calculated.
Uric acid	0·329 grm.	94·00	93·58
Sodium	0·021 ,, ...	6·00	6·42

Here, again, the quantities of uric acid and sodium found agree closely with the calculated amounts required to form a quadri-urate. The series of analyses just detailed furnish an adequate proof that the compound of uric acid which is decomposable by water is no mere mechanical mixture, but is a true and definite chemical combination, having a centesimal composition corresponding to that of a hypothetical quadriurate with the general formula $H_2\bar{u}$, $M\bar{H}u$. In deference to the authority of Dr. Bence Jones I propose to adhere to the designation quadri-urate, without, however, prejudging the question whether in reality the analogy with quadroxalate be a chemically sound one.

General Characters and Reactions of the Quadri-urates

The quadri-urates present themselves usually as amorphous powders; but the spheres of the birds' and serpents' urine are distinctly crystalline, and display a black cross when examined with polarised light. The quadri-urates are difficult to obtain in a state of chemical purity; they are apt, when produced artificially, to be mixed with traces either of free uric acid or of bi-urates and, when obtained from the urine, to be contaminated with pigment or with traces of extraneous saline matters. They cannot be dissolved unchanged in any simple menstruum. They are insoluble in absolute alcohol, ether, glycerine, chloroform, and the volatile and essential oils. When treated with hot water the quadri-urates first pass into solution in their integrity; but this integrity is only maintained for a brief moment, and they forthwith disintegrate into free uric acid and bi-urate. It is therefore impossible to purify them, as most other substances are purified, by repeated solution and reprecipitation. They are extremely unstable; and they tend to change in two opposite directions. In weak solutions of the alkaline carbonates or of the di-metallic phosphates they slowly take up an additional atom of base and are converted into bi-urates. On the other hand, in water, and in watery solutions of the neutral salts they are split up into free uric acid and bi-urate. These two reactions cover the behaviour of the quadri-urates in the blood and the urine respectively, and furnish a key to the chemical processes which culminate in the formation of gouty deposits and calculous concretions, as will hereafter be more fully explained. The only appropriate solvent for the quadri-urates is healthy urine. In acid urines they dissolve freely with the aid of heat, and are again precipitated unchanged on cooling. Such solutions are, however, not quite stable; after a time their uric acid is slowly, and at length completely, liberated. The quadri-urates are still more freely soluble in hot alkaline urines; and in these media they continue permanently unaltered if guarded against septic changes. When such solutions are made at boiling heat, and are saturated, they throw down on cooling bulky deposits which are identical in appearance and reactions with the natural amorphous urate sediment.

Comparative Physiology of Uric Acid.—The Evolution of Mammalian Urine.

The study of the amorphous urate, and of the urinary excretion of birds and reptiles, suggests some interesting reflections. We have seen that the amorphous urate deposit is substantially the same thing as the solid or semi-solid urine of birds and serpents; all these consist of the quadri-urates of potassium, sodium, and ammonium. But whereas in the urine of man and mammalia the quadri-urates are only an insignificant item amid a host of other ingredients, the quadri-urates constitute practically the whole of the renal excretion of birds and serpents. The urine of these creatures may be said to be exclusively composed of a substance identical with the amorphous urate sediment of human urine; or, to put it in another way, the amorphous urate is the physiological homologue of the entire renal activity of birds and serpents. The kidneys of birds and serpents are anatomically composed of the same structures as the mammalian kidneys; they are provided with the same kinds of secreting tubes and epithelial elements, the same curious Malpighian tufts and capsules—and yet how widely different is the product of their functional activity. It is not merely that there is a substitution of uric acid for urea as the final term of nitrogenous metabolism, but there is also the strongly contrasted simplicity of the urine of birds and serpents with the complexity of mammalian urine. In birds and serpents the renal function is presented to us in its primitive simplicity. In these creatures the kidneys perform one single and simple physiological act—namely, the elimination of nitrogen as uric acid. For, although the uric acid is excreted in union with bases, the quantity of these bases is the absolute minimum requisite to bring uric acid into a state of chemical combination, and thereby to deprive it of that strong crystalline character which otherwise would make its passage along the delicate exit tubules of the kidney a physical impossibility. The chlorides, phosphates, and sulphates, the lime and magnesia, the pigments, the large volume of water—all of which figure as prominent and even essential components of mammalian urine—are either wholly absent from the urine of birds and serpents, or are only present in such minute traces as might be derived from the lubricating mucus and epithelial débris with which the secretion is incidentally admixed. It would be interesting to trace the successive steps along which the evolution of the complex mammalian

Digitized by Google

urine took place from this simple beginning. We are familiar with much that has been said and written of mammalian descent from simpler types. The eyes and thoughts of biologists have, however, been chiefly fixed on the anatomical evolution. But there is assuredly also such a thing as a functional evolution. The anatomical evolution of the kidneys seems to have reached its term in the lowest vertebrate forms; the mammalian kidney presents structurally no essential advance on that of birds and serpents; but an immense functional evolution has taken place; and an examination of its progress through the tribes of fishes, amphibia, marsupials, and lower mammals, up to man, would prove an instructive biological study. The results of such a study would probably show that the evolution of mammalian urine turned mainly on the point that the mammalian plan required that the renal excretion should be voided, not in the solid or semi-solid form, but in the liquid form, as a watery solution. This modification would at once necessitate the discarding of uric acid as a vehicle for the elimination of nitrogen. Uric acid and its compounds are strongly characterised by sparing solubility, and on no terms compatible with the conditions prevailing in the animal economy could the requisite quantity of uric acid be got into solution in a watery urine. Urea, on the contrary, is an extremely soluble substance. In regard to the prime function of the kidney, therefore, nature solved the problem easily by substituting urea for uric acid. But why was not the problem solved completely? Why was there left in mammalian urine this small and apparently purposeless, but to man very mischievous, residuum of uric acid? No satisfactory answer can at present be given to this question. It seems not impossible that the explanation lies in the fact that the mammalian type—the most recently evolved of the vertebrate types—has not yet, in this particular, reached its ideal perfection. A good deal may, I think, be said in favour of this conjecture. The occurrence and proportion of uric acid in the urine of the various tribes of mammalia are remarkably inconstant. Meissner states that the urine of the carnivora does not always contain uric acid; in the urine of dogs and cats it was repeatedly found to be altogether absent. According to the same authority uric acid is only found regularly in the urine of these animals when fed on flesh and in the fasting state; it disappears when they are fed on food poor in albuminoid matters. Stadthagen found that in the urine of dogs fed on flesh the proportion of uric acid to urea ranged between 1 to 280 and 1 to 800. In the urine of rabbits uric acid is sometimes present and sometimes absent. Salomon found it always present in the urine of the pig, but only in small quantity; and its proportion to urea was only in the ratio of 1 to 150. In the case of man the quantity of uric acid excreted presents great individual variations both in regard to its absolute quantity and in regard to its proportion to urea. The ratio of uric acid to urea in human urine appears to range between 1 to 30 and 1 to 50, and the ratio, according to Marès, is special for each individual. Dr. Haig estimates this ratio as 1 to 33, and he regards any deviation in the direction of *plus* or *minus* from this ratio as due either to temporary retention of uric acid in the body or to elimination of previously stored uric acid. If we look broadly at the renal function throughout the animal series, we see that in essence it consists in a provision for the elimination of waste nitrogen. This is a function of capital importance and necessity in the nutrition of animals, comparable to the excretion of carbon by the lungs; and, according to all physiological analogies, it must be at bottom one and the same throughout the animal kingdom. Starting from the highly complex albuminoid molecule, and descending by a train of intermediate steps, the histolytic process ends in some comparatively simple crystalline azotised body. The precise nature of the final term in the histolytic transformation is apparently of small significance, and seems to depend on what may be described as the general convenience of the economy. It may be urea, uric acid, hippuric acid, or guanin, or a mixture of all these. And it is reasonable to assume that all these bodies are physiologically homologous, and that their broad physiological relations are identical. What urea is to the mammal, uric acid is to the bird and serpent; what urea is to man, urea with hippuric acid is to the horse and ox. The office of the kidneys is to separate the final term of proteid metabolism, whatever that final term may be. These considerations point to the idea that the residuum of uric acid in mammalian urine may be something in the nature of a vestigial feature, analogous with the vermiform appendix, the ductus arteriosus, or the ear-point. These rudimentary structures are now regarded by biologists as indications of the line of ontological descent. On this view the presence of uric acid in the mammal's urine should be regarded as a "memory" of some ancestral form which eliminated its nitrogen as uric acid. The extreme inconstancy of uric acid, both in regard to its presence and its proportion in the urine of different species and of different individuals of the same species, agrees perfectly with this theory, for all vestigial structures are conspicuous for their inconstancy. Such structures also, like uric acid, although impotent for good, are sometimes powerful for evil.

AN ABSTRACT OF

The Hunterian Lectures

ON

CERTAIN DISEASES OF THE BREAST.

By H. B. ROBINSON, M.S., M.D.LOND., F.R.C.S.ENG.,

HUNTERIAN PROFESSOR OF SURGERY AND PATHOLOGY, ROYAL COLLEGE OF SURGEONS; ASSISTANT SURGEON TO THE EAST LONDON HOSPITAL, SHADWELL; DEMONSTRATOR OF ANATOMY AT ST. THOMAS'S HOSPITAL.

LECTURE I.

MR. PRESIDENT AND GENTLEMEN,—My first duty is to thank you for the honour you have done me in placing me in the position to address you. "Diseases of the Breast," as far as these lectures at the College are concerned, have been quite an untrodden path for many years. For some time my attention and interest have been directed to certain little-known affections of this most important organ and to the difficulty often experienced in their diagnosis. Hence the choice of my subject; and I will endeavour to bring before you some of the more recent observations that have been made to help us to overcome these obstacles. Since the days of Sir Astley Cooper, Sir Benjamin Brodie, and Mr. Birkett, whose names are indelibly bound up with these diseases, pathology has made such strides that their terminology is considerably altered; but the foundations laid by these observers remain unshaken, and we look back with reverence on their work, which remains uneffaced by time.

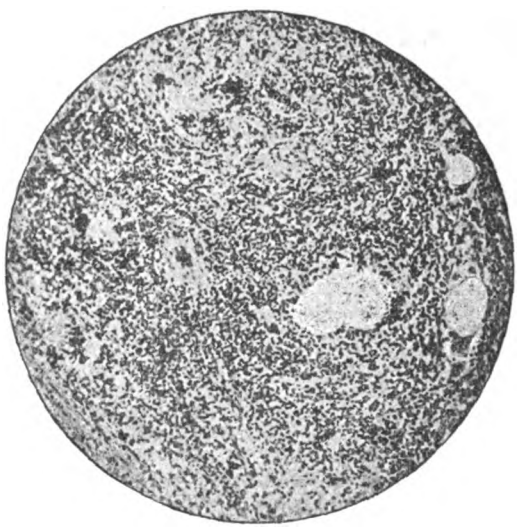
Chronic mastitis develops usually in relation with lactation, and is of very great interest because of the difficulty in diagnosis. In many cases suppuration takes place, forming the "chronic encysted abscess." About the period of weaning these indurations are usually met with, and they may remain quiescent for a long period, suppurating in a later pregnancy or lactation. Injury may be a cause, and Lucas-Championnière considers that the pressure of stays is responsible for some of these inflammatory thickenings. The evidence is rather against this supposition, as we find that the upper half of the gland is more often affected. The clinical forms vary considerably. The inflammatory swelling may be first manifest as a small, hard, lobulated thickening, occurring towards the periphery of the gland, with a well-defined outline, and the skin quite free over it. It may be a little painful, but there will be deep tenderness on pressure. This may resolve or remain for an indefinite time as an induration, but without any marked tenderness. Many of these swellings are probably the same as Sir Astley Cooper's chronic mammary tumour, where absorption has ensued at a subsequent pregnancy. The usual sequel is for the induration to enlarge, with an increase of tenderness on deep pressure, a symptom laid great stress upon by this observer. If deeply placed towards the periphery, there may be no adhesion of the skin or retraction of the nipple, but, if central, the latter is very commonly present. Castex and Reclus comment upon its well-defined margin, and consider this sign absolutely diagnostic. Should softening become more marked and the swelling more superficial, there may

Digitized by Google

be some œdema and adhesion of the skin, but redness is quite the exception; the pus evacuated is thick and creamy. These inflammatory swellings may occur in several lobules, the cavities produced by suppuration inter-communicating and connected with the exterior by sinuses. The axillary glands may enlarge, but this is rare. Lucas-Championnière quotes a case where the axillary glands enlarged with one of these indurations, and suppurated without any change taking place in the breast. If injury is the exciting cause, suppuration is unusual. The interest of this lesion is in its diagnosis, which has to be made—(1) from a localised chronic interstitial mastitis (this has not œdema of the skin or adhesion, and has not the characteristic tenderness; the tendency to be bilateral may be an additional factor in confirmation); (2) from tuberculous mastitis (in tubercle the margin is not so well defined, there is less tenderness on pressure and glandular enlargement is more constant; the pus, instead of being creamy, will contain cheesy masses, and there may be a history of tubercle); and (3) from tumours. Errors in diagnosis have led to the sacrifice of the gland on the supposition that a solid tumour was being removed. It may be perhaps more often confused with a scirrhus, especially if the inflammatory swelling be accompanied by glandular enlargement, as in both we may have a localised hard tumour following a blow, with adhesion of the skin and retraction of the nipple. Sir Astley Cooper describes two such cases sent to him as "scirrhus," but he found deep-seated elasticity, with tenderness on pressure, confirming his opinion by evacuating pus on incision. In making the diagnosis we must take into account (*a*) whether the tumour has formed in relation with lactation; (*b*) the presence of deep tenderness on pressure; (*c*) the age of the patient and the rate of growth; (*d*) the margin of the growth, whether well defined or not; (*e*) the resistance of the tumour, if elastic, or of a wooden hardness. Reclus gives the following to illustrate the difficulty:—"A woman of twenty-nine, in good health, had a lump the size of an egg, with a well-defined margin, but a granular condition of the gland over it. There was no elasticity or fluctuation. The axillary glands were enlarged. The skin and nipple were normal, and there was no pain or tenderness on pressure. The points against carcinoma were the age, absence of adhesion of the skin, and although the tumour was large, it had well-defined limits and the nipple was natural. In favour of carcinoma was its extreme hardness. Pus was obtained on an exploratory tapping. The history was that the patient had been confined six years previously, and the infant had been suckled for nineteen months. After weaning the child a lump was noticed, which had persisted and increased in size recently." If deep seated and well defined, it may be considered a cyst; but here there would be no history of lactation, and other evidence pointing to mastitis would be present. It is possible for the swelling to strongly suggest a cysto-sarcoma.[1] "A. D——, aged thirty-seven, was under the care of Mr. Clutton. Three years before she noticed a small lump in the right breast during lactation, which remained stationary for two years. Then it increased in size, especially in the last three months, but without pain until the last few weeks. The right breast was very prominent and large, and its margins sharply defined; it was lobulated, particularly at the upper and outer part. The skin over it was smooth and glistening, rather dusky in colour, but not at all adherent, and there were large veins coursing over its surface. It moved freely on the deep tissues, was very elastic, but fluctuation was not certain. There were no enlarged glands. On tapping pus was drawn off, and after incision the lump proved to be a large loculated abscess cavity, with creamy, somewhat offensive pus."

As regards treatment, the moral to be drawn from the above facts is that no breast, where there is the possibility of a chronic abscess, should be removed until an exploratory puncture has been made. If pus is obtained, it should be evacuated by incision. Should no pus be got, and yet there is still a likelihood of the mass being inflammatory, an exploratory incision should be performed.

Tuberculous mastitis is not nearly so rare as has been supposed. It has been described by Sir Astley Cooper[2] as "scrofulous tumour"; by Velpeau[3] as "lymphatic or tuberculous tumour"; by Billroth,[4] Ohnacher,[5] Klotz,[6] and especially Dubar.[7] About half the cases occur secondary to other tuberculous lesions, especially pulmonary. If the disease is primary, there is as a rule a strong hereditary taint. Of eight cases, one had suspicious signs at the apices, and another had had a pleurisy eight years before. In six of these there was a strong tuberculous family history, in another the woman's husband died of phthisis, and in the other there was no history. Among other causes, the malady may arise from injury; one case was dated from a squeeze received eighteen months before, and another from a blow six weeks before.[8] Pregnancy and lactation are considered by many (Mandry, Park, Dubar, and Delbet) to be the chief exciting causes. In the cases of Orthmann and Habermass it developed during lactation, and seemed progressive along the ducts. In two cases I have found that the deposit has arisen in relation with indurations, which have persisted through several pregnancies without becoming absorbed. The disease usually affects women. In English literature I cannot find one in a male; but Delbet,[9] out of thirty-seven collected cases, found two in men. Of these cases, he knew the ages in thirty-two, more than half of which were between twenty-five and thirty-five. Of twelve others I have collected, ten were between twenty and forty. Of the whole number (forty-nine), there is not a single instance of the disease occurring under puberty. Eight of my collected cases were married women, and of these three were sterile. A larger proportion of cases have been met with on the left side. Velpeau, in his account of tuberculous tumours, describes "disseminated tubercles" and a "purulent lymphatic tumour." Most modern observers practically endorse this statement, and agree that the lesions are found under two forms—the confluent and the disseminated. The confluent is the more frequent of the two, having the form of a single, ill-defined, bossy tumour, moving with the breast on the chest wall. Its edge, instead of having the well-defined boundary of the last iorm, very often sends off processes into the rest of the gland like a carcinoma. The skin may or may not be adherent. The nipple may be retracted, especially when the disease is centrally placed. The disseminated type is rarer, existing in the form of scattered nodules between which the tissue may or may not be sound. The nodules tend to run together, ultimately becoming the confluent form. Ohnacher considered that this form was secondary to the confluent, and was due to new foci springing up around the primary centre. Mandry[10] describes two forms of primary tubercle: 1. A low inflammation with induration, caseation, softening, &c.—very chronic,—abscesses with retraction of nipple and enlarged glands. This agrees with the confluent type of others. 2. The intra-mammary cold abscess, generally combined with tubercle elsewhere.



Miliary tubercle of the breast, up to the present date, has not been described. In the confluent form the rate of increase is very variable, in some chronic, in a few running quite an acute course. Before long softening takes place, leading to the formation of curdy pus, which makes its exit, leaving sinuous tracts, which communicate by inter-communicating ragged cavities. No case has so far been recorded of calcification occurring. A general fibroid change may ensue, which I have seen in a case (under the care of Mr. Pitts) in association with a well-marked cheesy nodule. Of course, here it is possible that the tubercle was secondary to the fibroid change, but the fact of the latter being unilateral allows us to think that it was induced by the tubercle. Delbet has shown that the outer segment of the breast is more often affected, and in my small number of observations there is to be noticed about the same proportion. The axillary glands are usually involved, and in some cases softening takes place much more rapidly in them than in the breast. The onset of the disease is generally insidious, and is therefore not noticed. Sir Astley Cooper remarks on this indolence developing without pain and scarcely any tenderness on pressure. Delbet says there is little or no pain, but in all the cases I have noted there has been complaint of pain, one describing it as a stabbing pain, most of them laying

stress upon its intermittence. There may or may not be localised tenderness. Loss of flesh may occur, and other symptoms, as cough or hæmoptysis may be present. If the disease is primary, the virus may be introduced either through some fissure causing tuberculous infection of the connective tissue, or, what is commoner, it enters by the ducts, setting up epithelial changes, these being attended by connective-tissue infiltration. Krammer quotes a case where there was a tuberculous ulceration of the nipple

FIG. 1.

succeeded by disease of the ducts. Histologically we find the acini and small ducts surrounded by small round cells, and the epithelium multiplying with some dilatation of the acini. The peri-acinous infiltration increases in amount, and at the same time there is a gradual breaking up and disappearance of the gland elements; we have now a tuberculous nodule in which giant cells, which vary in number, never being numerous, are to be seen. (Fig. 1.) Degenerative changes soon ensue in the centre, while the

FIG. 2.

infiltration progresses at the margins. The tubercle is not met with in the "miliary" form, but only as an infiltration. Dubar has described changes in the endothelium of the vessels, causing blocking and subsequent necrosis, as in syphilitic gummata. In the walls of some of the larger ducts we may find localised nodules. (Fig. 2.) In a case where the connective tissue is first involved we have almost the same changes as before, without necessarily the epithelial proliferation. Bacilli are rarely to be found, but I do not think their absence prevents us from diagnosing a case as "tuberculous" when there is a marked family history and characteristic caseous pus from the softened mass. The diagnosis has to be made (1) from a simple chronic mastitis, (2) from some cases of chronic interstitial mastitis, and (3) from carcinoma. From the latter it is very difficult in some cases.

"L. B—— (admitted under Sir William MacCormac), aged thirty-eight and married, whose mother was said to have died of phthisis, had an abscess in the left breast ten years before, and as a consequence had not used it since for suckling. Her youngest child up to within a few weeks before had been suckling the other breast. At this time she noticed there was some thickening in the left breast; this was hard and nodular, infiltrating at its margins. It rapidly increased in size, the skin becoming adherent, but there was no enlargement of lymph glands. The nipple was retracted, but this was of no value, as it had been so for years." The acute development and thickening strongly suggested carcinoma, and the gland was amputated; but on section it proved to contain small broken-down cavities which, histologically, were shown to be tuberculous.

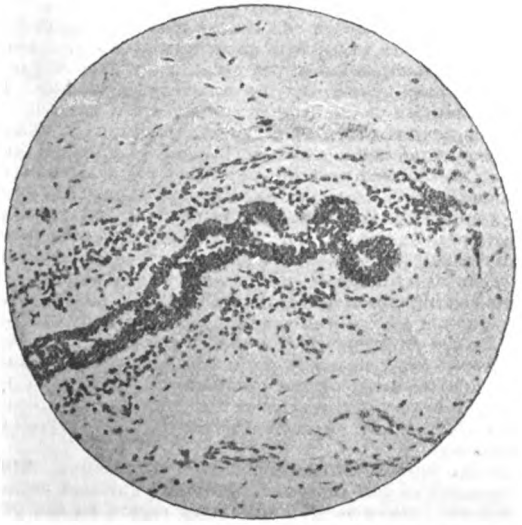
Reclus[11] quotes three cases, of which the following is very characteristic:—"A woman aged forty had a bossy tumour about the size of an egg, very hard, and with no definite margin. The skin was involved and puckered, and the glands were enlarged. So certain was the diagnosis here of cancer that the operation had actually been fixed when suddenly hæmoptysis supervened. The tumour later softened and discharged curdy pus." In none of the cases was there any fluctuation. Habermass describes a case showing a mistaken diagnosis in the other direction, where what he considered tubercle proved to be carcinoma, with many spots of softening. If the disease be primary, we may consider that it will progress locally and involve lymphatic glands, or be followed by other lesions, particularly of the lungs. Whether it is succeeded, if left alone, by acute miliary tuberculosis there is no evidence, such a thing not having been recorded. Judging by analogy from what happens in other organs, such a sequel is very unlikely. Knowing that the disease is progressive, we should not hesitate to remove the organ. Of six cases (quoted by Delbet) after operation two remained under observation a long time without recurrence, one recurred after nine months, and another after three years. Two of them died of pulmonary phthisis. I can only speak of one of the cases I have observed. Here recurrence took place in the scar after a few months, but she has since remained for one year quite well. If the breast is secondarily affected, it is useless to operate, except in those cases where the local destruction is hostile to the patient's welfare, the disease elsewhere being quiescent.

Chronic interstitial mastitis may be met with at all ages, but especially between forty and fifty. It is rare in young women; but I have seen two well-marked cases at nineteen and twenty years of age. It is rarely seen in man. One very typical case recently came under my notice in a man of thirty-six, where both breasts were involved. The disease may be due to: (*a*) Injury; (*b*) disorders of menstruation, many of the cases giving a history of dysmenorrhœa, the breasts at the same time being painful and tender; (*c*) celibacy appears to be a potent factor (of seventeen cases twelve were in single women, of the five married three were sterile, one had four children, and the other not known); (*d*) previous inflammatory trouble seems to have little or no relation to this chronic disease.

The course of this disease is very slow: König says that it is rarely acute. One breast becomes affected first, to be followed by the same change in the opposite one. There may be pain in the breasts at the menstrual periods, and tenderness. The skin and nipple are not affected. The axillary glands are not enlarged. The changes in the breasts may be diffuse or circumscribed. Of the diffuse forms we have: (1) Abundant development of soft fibrous tissue uniformly distributed, and at the same time almost complete disappearance of true breast substance; (2) the formation of firm fibrous tissue, the glands being small, cake-like, and very hard, and associated with small cysts scattered through this new formation.

[11] Clin. Chir. de l'Hôtel Dieu, 1888.

Digitized by Google



Although the change may be diffuse through the gland, we have localised nodules, up to the size of a walnut, very hard. These have been described by Phocas as "maladie noueuse." If they are of any size, they are probably cystic with thick walls. These hard fibrous nodules resemble the benign tumours, fibromata and adeno-fibromata. König and Kennedy think that the latter are actually due to chronic inflammation, the nodules becoming encapsuled, and so isolated; but such a view is very doubtful.

FIG. 3.

Phocas makes a special form of "diffuse mastitis," which occurs about the climacteric, and resembles "diffuse cancer." Most of the gland is involved, and radiating processes are set into the tissue around. The circumscribed variety is perhaps more frequent, and is known by a number of names: "chronic lobular interstitial mastitis" (Beck), "chronic mammary tumour" (Sir Astley Cooper), "partial hypertrophy" (Velpeau), &c. It has somewhat the form of a wedge, with its apex to the nipple, and

FIG. 4.

may be smooth or nodular. Its edge is usually well defined, and there seems to be a predilection for the outer half of the gland to be affected. The terminations in both the diffuse and circumscribed forms may be: (1) Complete atrophy of the whole gland or part affected from the formation of the fibrous tissue, *sclerosing mastitis;* (2) the production of different forms of *cysts.* Histologically the first change is a multiplication of the epithelium lining the acini and small ducts with some dilatation, particularly of the latter. (Fig. 3.) The acini tend to disappear, as is normal, at involution of the gland. In relation with the epithelial proliferation there is a localised round-celled infiltration in the connective tissue. This epithelial increase is supposed by Nocard to be due to an organism allied to the streptococcus which he has isolated in the infective mammitis of cows. In the soft diffuse form there is to be found only a soft fibrous tissue arranged in a meshwork of bundles of fibres, the gland part

FIG. 5.

almost completely disappearing except for a few dilated ducts. In the firm, diffuse, and the circumscribed forms the tough fibrous tissue compresses the glandular part, so that the cells are contained in quite narrow spaces. The sclerotic changes begin in the situation of the basement membrane (Fig. 4), and it may seem in sections that this new fibrous tissue is arranged in the form of rings with a looser connective tissue between them. (Fig. 5.) By addi-

FIG. 6.

tions to this fibrous tissue distinct nodules may be formed. (Fig. 6.) In other cases this nodulation is not very evident, the whole breast being made up of coarse bundles of fibres with scanty nuclei. The sclerosed tissue may undergo calcification, converting the gland into a stony mass. Gross has seen two cases in elderly women. Bryk, in Langenbeck's *Archives*, records a petrified breast due to the deposit of lime salts in the stroma causing atrophy of the

Digitized by Google

ducts and acini. Pillet has described a bony or calcareous formation in relation with a fibrous and cystic tumour in the gland, the cysts being filled by vegetations and the calcareous material in the fibrous tissue round. A case almost like the above came under my care, in a woman of forty-eight, where there was a calcified nodule in the upper part of the right breast, and a symmetrical one in the other breast, the lumps being patches of chronic lobular interstitial mastitis. Specimen 4747 C in the College Museum shows calcareous changes in the connective tissue around small cysts Although described as "scirrhus," its appearance strongly suggests that it is non-cancerous, but due to chronic inflammation.

Lectures

ON THE

OPERATIVE TREATMENT OF ENLARGEMENT OF THE PROSTATE.

BY C. W. MANSELL MOULLIN, F.R.C.S. &c.,
SURGEON TO THE LONDON HOSPITAL.

LECTURE III.[1]

THE earliest record of McGill's operation, or supra-pubic prostatectomy, is in the year 1827, when Amussat excised a valvular median lobe during the performance of lithotomy. As, however, I have not been able to ascertain any particulars with regard to the result, I have merely retained the case for its interest, and have not included it with the rest. Of these, the first two were performed by Dittel in February, 1885, and February, 1886, respectively; Trendelenburg came next in May, 1886, and Belfield in the following month; then Benno Schmidt in August of the same year, and Belfield, Trendelenburg, and Benno Schmidt again. McGill's first case was in March, 1887. After this, and as a result of his communications to the Clinical Society and to the British Medical Association in August, 1889, the operation was performed much more frequently.

Thanks to the kindness of the many surgeons to whom I have written, and to whom I owe a deep debt of gratitude for the trouble they have taken and for the valuable information they have freely given me, I have been able to collect particulars of ninety-four cases. Of these, nineteen have died, upwards of 20 per cent.; but it is worth noting that while twelve deaths occurred in the first forty-seven (in point of time), there were only seven in the second. Moreover, the immediate causes are of some consequence. One of the fatal cases, it is believed, was due to corrosive sublimate poisoning. In a second the operation was of an exceptionally extensive character, involving resection of the pubic symphysis. A third, who was eighty years of age, died suddenly on the fourth day from what is called "acute irritative urinary fever," the temperature rising rapidly to 106° F. without any apparent reason. Three died from pneumonia or purulent bronchitis, one from hæmorrhage, and the rest from exhaustion, or pyelonephritis. With wider experience it is probable the mortality will be much further reduced. The percentage of failure is more difficult to estimate, as many cases, in which complete control over the bladder was never regained, certainly do not deserve to be included in the list. In one, for example, complete recovery followed the perineal operation performed a month or two later, the division of the obstructing bar had not been carried out sufficiently. In another—a man eighty-seven years of age—no attempt was made to close the supra-pubic wound; but at the present time, four years after the operation, he is—so I am informed by Mr. Buckston Browne—going about still, thoroughly enjoying his life. In a third there was already a fistula, consequent on the previous removal of a vesical tumour, and in several others there were reasons for which allowance should be made; but this is better considered with the conditions that render operation advisable.

As regards the technique of the operation there is but little variety. Trendelenburg is in favour of a transverse incision through the soft parts, which may be advisable in the case of a large pendulous abdomen, following the fold that hangs over the pubes, but does not really give more room, and certainly predisposes to hernia. Langenbuch's subpubic incision is much too contracted, and interferes with the prostatic plexus. Helferich, as already mentioned, resected the pubic symphysis, and Watson has written to me saying that in a suitable case he would not hesitate to adopt the same method. According to McGill, enucleation of the growth after the mucous membrane over it has been divided is the most satisfactory method. Others have employed the cautery or an écraseur; and Keyes makes use of what he terms a "rongeur," to cut a channel through the obstruction. Bleeding is rarely serious, although in one case it proved fatal, and in another contributed largely to the result. The amount removed must depend in each case upon what exploration reveals. In two instances McGill removed only a fragment the size of a pea. On the other hand, Buckston Browne in the case already mentioned excised four ounces by weight. Certainly if a satisfactory result is to be ensured the whole vesical portion must be enucleated, a low level channel cut through, and unless the tissues around the neck of the bladder are perfectly soft and flexible (which is practically impossible in such cases), a smooth and straight funnel-shaped route made down the urethra. Belfield lays especial stress upon the thorough exploration of the urethra with the finger. In one of his cases, after removing a tumour the size of a walnut from the left lateral lobe through a supra-pubic incision, he found that there was still some obstruction in the prostatic urethra, preventing the entrance of a catheter. Perineal urethrotomy was performed, an incision made along the floor, and a rounded mass shelled out into the bladder. There is no doubt, too, that one of the earlier cases (Meinhardt Schmidt's) failed from this not having been done, for the bladder recovered completely after perineal *prostatotomy*, and the patient was perfectly well two years and a half afterwards.

Trendelenburg, Helferich, and others have made use of the cautery, instead of a separate perineal opening, sinking it deeply into the tissue of the prostate in the middle line behind; but, as Belfield points out, the addition of the boutonnière increases but slightly the injury to the tissues and the duration of anæsthesia, while it enables the operator to feel much more accurately what he is doing. It may also be pointed out that it is of great assistance afterwards in draining the bladder. It is true that after supra-pubic lithotomy all the urine will come out of its own accord through a tube inserted in the wound; but this only holds good so long as the operation is confined to the bladder. The prostatic portion of the urethra cannot drain itself in this way, and when the operation has extended into it, unless a perineal opening is made as well, it becomes a conical receptacle at the lowest part of the wound filled more or less continuously with decomposing blood and urine. The lateral lobes are quite as important as the median, and require to be dealt with as thoroughly. McGill recommended removing the salient portions with scissors, and then enucleating the rest until a funnel-shaped passage was established. So long as the bladder is of fair capacity, this is not so difficult as it appears to be—the greater the size and the more irregular the enlargement the easier enucleation becomes. Hard fibroid growths rarely project in this way; but unless Helferich's resection of the pubic symphysis (which very seriously increases the gravity of the operation) is performed as well, it is almost impossible if the bladder is small and its walls rigid.

Such are the operations proposed for the radical cure of enlargement of the prostate. Provided suitable methods are selected, there is no doubt with regard to the possibility of removing the obstruction. The first question is whether it will return and render the operation useless? the next, whether the bladder will regain its power of expelling its contents wholly and effectually? and then what is the risk to life? Mercier's operations there is no doubt are failures. If a larger amount is removed, is the prospect much better? Definite recurrence has been noted in one instance (Benno Schmidt's first case), and that within nine months. It is true it has been suggested that the

[1] Delivered at the Royal College of Surgeons of England on June 3rd, 1892.

Digitized by Google

growth in this case was of a malignant character, but as the symptoms had already lasted seven years at the least, this is hardly probable. In another (Guyon's case, reported by Vignard), a few days after the operation the introduction of a catheter became as difficult as it was before; but this must have been caused by imperfect removal, for, though there might possibly have been an impediment to the passage of the urine, the growth could not in the time have spread sufficiently to prevent the entrance of an instrument. On the other hand, I have notes of four cases in which, on the bladder being opened and examined at a later period (three months, eighteen months, one year, and two years and a half respectively), the cicatrix was perfectly smooth. The clinical evidence bears this out. A very large proportion of the patients who were operated upon, and regained power over their bladders, retained it as long as they were under observation, and in many it continued to improve. It is noteworthy that in some instances the prostate has undergone an actual diminution in size after operation. Harrison has recorded a remarkable example of this in his Lectures on the Surgical Disorders of the Urinary Organs; Packard of Philadelphia mentions another. I have met with a third in which the shrinkage was proved post mortem, and there are several others on record. The change is much greater than can be accounted for by the subsidence of congestion and the contraction and absorption of thrombi. I incline to the opinion myself that it is the result of the fibroid consolidation which sets in sooner or later in most of these cases, and not, as Harrison suggests, of simple atrophy. But whether this is the case or not, there can be no doubt about its occasional occurrence, and it is certainly encouraging that, although many of the cases operated upon are now four years old, definite recurrence has only been noted in one. The question of the recovery of the bladder depends partly upon the condition of the patient as regards general nutrition, partly upon the extent to which the muscular coat has been ruined by over-distension, cystitis, and the repeated use of catheters. Nineteen cases in all failed; but in four of these either the whole obstruction was not removed, or no attempt was made to close the supra-pubic opening; in two others there was already a fistula owing to the previous removal of a vesical tumour, and another was a very feeble old man who became insane shortly after. These, at least, must be deducted, and in several others there were mitigating circumstances which ought to receive a certain amount of consideration. It cannot, however, be too plainly stated that the real reason why the bladder in some never did regain power was that the operation was performed too late, when the muscular coat was already hopelessly involved. Sir Henry Thompson has written that habitual catheterism for retention in enlarged prostate for two years will destroy permanently the power of the bladder to empty itself; and although McGill has shown that this is by no means so invariable or so positive, and that cases have recovered even after so long as seven years, it is certainly one of the strongest arguments in favour of early operation that the chief palliative measure that replaces it may within two years—will, according to Sir Henry Thompson—so ruin the bladder that it can never recover.

The final question is whether the operation does not involve too great a risk to life, and how far it will compare in this and in the degree of comfort it confers with palliative measures, such as supra-pubic and perineal drainage. For it has been said that nearly the whole of the benefit derived from it is due to the temporary relief from cystitis, or to the extraction of calculi, and not in more than the remotest degree to the removal of the obstructing mass. In answering this the perineal operation must be considered separately from the supra-pubic. It is not a matter of option which of the two should be performed; one may be required, or the other, or both; and fortunately in the majority of instances it is fairly easy to tell beforehand which should be selected. Even, however, if owing to some misleading feature there does happen to be a mistake in the diagnosis, and the perineal operation is performed in a case better suited to the other, exploration with the finger can do no harm, and the presence of the incision, supposing it is not wanted for drainage, adds little or nothing to the gravity of the operation. Of the thirty-eight cases of perineal operation undertaken with this object, and not as an afterthought during lithotomy, three died. One of these was eighty years of age already, and in another the method tried was unsuitable. Simple division is not, I grant, of much value, unless followed up by prolonged drainage; but undoubtedly in suitable cases perineal prostatectomy, without causing an appreciably greater risk, confers upon the patient a degree of relief with which that following mere cystotomy or drainage offers no comparison. The patient in a large proportion of cases recovers complete control over his bladder; and even in the failures, even in those instances in which the sole benefit gained is the easier introduction of a catheter, he is no worse off than if the formation of a permanent fistulous opening and nothing more had been the object in view. The supra-pubic operation stands on different grounds. Taking all the cases together, the mortality is approximately 20 per cent. (if the last half only, it is still 15 per cent.); and although it is highly probable that this will fall lower, especially in the hands of those who are practised in the performance of the operation, it will always remain higher than that of the other. On the other hand, the condition of these patients beforehand must be remembered, that they were practically *in extremis*, suffering from the worst complications of intense cystitis; and it may well be asked if the operation is to be judged by the results of the first hundred cases, taken indiscriminately, before any definite opinion has been formed as to when and under what circumstances it is advisable, what would have been the duration of their lives, and in what condition would they have lived had the operation not been performed. The real issue lies between supra-pubic prostatectomy and palliative measures, such as simple cystotomy with the continuous wearing of a cannula; for those cases in which patients have been able to dispense with this are too rare to deserve consideration. That when the more serious operation does succeed the condition of the patient is infinitely better there can be no question. Wearing a drainage-tube permanently in either situation may be tolerated, but, in spite of the enthusiastic comments of those who were suffering tortures before it was introduced, it is scarcely preferable to micturition by the natural route; and it must always be remembered that it does not always convey even this moderate degree of comfort—a certain number of patients, those especially who suffer from the irritation caused by vesical outgrowths, cannot tolerate it. Each has, I believe, distinctly its own field. Enlargement of the prostate by itself requires neither, and fortunately the majority of patients suffering from this complaint pass through life without its ever becoming necessary to raise the question. In a certain proportion, however, complications set in sooner or later; and to many patients there comes at length a time when their constitutions are still sound, but there are clear indications that the local conditions are surely and rapidly growing worse. The catheter has to be passed more and more often; occasionally there is a little difficulty, and what is still more important, it no longer gives relief. The desire to pass urine is as great after the instrument is withdrawn as it was before; cystitis breaks out every now and then; attacks of congestion causing hæmaturia and retention occur with greater frequency; the urine is becoming offensive; the residuum is growing larger; and the night's rest is seriously broken. For these and such as these prostatectomy by one route or the other, according to the special conditions present, certainly affords a far better prospect than either cystotomy or drainage, and without sensibly greater risk. Permanent cure is possible, and even the failures are as successful as the successes claimed for the other methods.

On the other hand, if this chance is lost; if, as only too often happens, the patient has allowed himself to drift on, using a catheter more and more frequently, without realising what the end must be, until his kidneys are diseased or cystitis has destroyed the muscular power of the bladder, and made it small, hard, and rigid, the conditions are entirely different. When the capacity of the bladder is much reduced and it cannot be distended; when it has lost its power, whether this arises from prolonged retention, repeated inflammation, or the persistent use of catheters; and when under careful treatment and watching it shows no sign of recovery, it is useless attempting to remove the obstacle; cure is impossible, and the risk, if there is the least degree of nephritis, much too great. Palliative measures only can be employed; as much benefit will be derived from drainage as from the most complete enucleation; and no surgeon would undertake a grave operation when one less dangerous to life would answer equally well.

CLINICAL REMARKS ON FRACTURE OF THE UPPER END OF THE ULNA ASSOCIATED WITH DISLOCATION OF THE HEAD OF THE RADIUS.

ADDRESSED TO THE STUDENTS OF THE CALCUTTA MEDICAL COLLEGE.

BY BRIGADE-SURGEON-LIEUTENANT-COLONEL K. M'LEOD, M.D. EDIN., F.R.C.S. EDIN.,
PROFESSOR OF SURGERY, CALCUTTA MEDICAL COLLEGE.

A HEALTHY strong Mahomedan sailor, aged fifty-eight, was admitted to hospital with a compound fracture of the upper fifth of the ulna, which had been sustained in the following manner. He was working on a dredger, and a chain accidentally slipped off a wheel and struck his left forearm violently near the elbow-joint, on its posterior aspect. Compound fracture of the ulna was detected about three inches below the head of the olecranon process. The wound was dressed antiseptically, and the arm put on a rectangular splint. I saw the man next morning, about twenty-four hours after the accident had occurred. Guided by previous experience I considered it necessary to examine the part, and I found that, in addition to the compound fracture of the ulna, the man had sustained a forward dislocation of the radius, the head of which was found lying beneath the skin of the front of the elbow-joint, between the two masses of muscle bounding the triangular hollow in that region, or, to speak more accurately, just within the belly of the supinator longus. The patient was at once put deeply under chloroform. An unsuccessful attempt was made to reduce the dislocation by extension and manipulation. Extreme flexion was then tried, and the head of the bone slipped into its natural position, and remained there on straightening the joint. The fracture was at the same time reduced. Antiseptic dressings were applied, and the limb placed on a rectangular splint. The dressings were changed after a week, and then after a fortnight. The wound has almost healed, the broken ulna is undergoing satisfactory union, and the head of the radius remains on the capitellum. The movements of the elbow-joint are free, and the man will regain perfect use of his left upper extremity.

This case illustrates a combination of fracture and dislocation at the elbow of which I have seen numerous examples, both recent and old, and which present several points of considerable practical interest and importance. My attention was first drawn to this injury in 1879 by two cases which were admitted into the hospital about the same time. A child of six years had fallen from the roof of a house and broken the left ulna at its upper fourth and dislocated the head of the radius forwards. The dislocation was detected and reduced, and the fracture set. The final result was perfect. The other case was that of a young man aged twenty-eight, who had some four months previously to admission been kicked by a horse on the left forearm. On examination an old fracture of the ulna at the upper fourth was detected which had united angularly, and the head of the radius was found in the same position as we found it in the case under consideration—namely, lying in front of the external condyle of the humerus and inside of the supinator longus and flexor carpi radialis longior muscles. The limb had lost in bulk and power, and its movements were considerably impaired. Since then I have seen several old cases of this injury in which the nature of it had not been discovered nor the proper treatment applied. A certain amount of deformity, of permanent lameness, and disability existed in all these cases. By rubbing and passive movements some restoration of function and power can be obtained, but perfect recovery is quite impossible in such cases. In the year 1883 I treated a recent case which I made the subject of a clinical lecture at the time, the facts of which I shall briefly recapitulate. A middle-aged man fell off a stair, and his arm came into violent contact with a brick. A fracture of the ulna was detected and put up. I examined the limb three weeks after the accident, and found that the ulna had been broken at its upper fourth and the head of the radius dislocated forwards. The characteristic deformities were well marked and the movements of the elbow-joint much impaired. I made a careful and prolonged endeavour to reduce the dislocation, but without avail. Passive movements were subsequently resorted to, and the joint and limb were restored to a fair degree of efficiency; but considerable deformity and limitation of movements remained. About the time that I first noticed the injury I performed some experiments on the dead body in order to study its causation and anatomy. I placed the prone forearm on a table with a block under the arm just above the elbow, and brought the edge of a heavy block of wood down with force on the back of the limb so placed and supported. In two instances the block came down on the middle of the forearm and broke both bones; in two others it came down on the upper third of the forearm, fracturing the ulna and neither breaking nor dislocating the radius; and in two more the double injury which I have described was produced—namely, oblique fracture of the upper fourth of the ulna about three inches from the upper end, and dislocation forwards of the head of the radius. In one of these last instances I dissected the parts. I found that the head of the radius had slipped forwards through the anterior ligament of the elbow-joint, the orbicular ligament having slid on to its neck, and lay in the cellular interval between the brachialis anticus and supinator longus and radial extensor muscles. The upper fragment of the broken ulna had been displaced forwards and outwards, and had torn the flexor profundus muscle. The statistics of fractures of the bones of the forearm collected by Hamilton and Agnew show that the radius is seldom broken in its upper third, that the ulna is pretty equally liable to be fractured throughout its whole length, and that when both bones are broken the fracture is much more frequently situated at the middle and lower thirds than at the upper. Hamilton states that eleven out of thirty-three cases of fracture of the ulna were complicated with dislocation forwards or forwards and outwards of the head of the radius, and he mentions that he had seen seven instances in which the radius had not been reduced in an injury of this kind. From these cases, experiments, and statistics the following conclusions may fairly be drawn: 1. That the injury in question is by no means infrequent. 2. That it is generally due to direct violence, the point of application and degree of violence determining whether one or both of the double injuries result. 3. That the deformity is characteristic, the upper fragment of the ulna being pushed or pulled forwards and outwards, causing angularity of the shaft and some bulging at its upper end, and the head of the radius lying in front of the external condyle of the humerus and giving rise to some abnormal fulness there. 4. That the characteristic displacement of the upper fragment of the ulna is due to the effect of the violence and to traction exercised by the oblique and orbicular ligaments and the supinator brevis muscle. 5. That when the displacement of the radius is not detected and remedied, the ulna undergoes union in its distorted state, and the limb loses considerably in efficiency as regards both movement and power. From these considerations I would strongly insist upon the following practical precepts:—1. Whenever we find a fracture of the upper end of the ulna examination should be very carefully made for a dislocation of the head of the radius. 2. Should such a dislocation be found, it must be reduced at once, and endeavours made at the same time to rectify the displacement of the upper ulnar fragment. 3. In view of the clinical fact that it is found sometimes very difficult to retain the head of the radius in position after reduction, examination of the part must be made from time to time in order to be sure that the head of the bone is in its proper place.

Calcutta.

CONVALESCENT HOMES FOR MOTHERS.—The Rev. Canon Palmer presided at a public meeting held at Newington on the 9th inst. in aid of the Mothers' Seaside Convalescent Home at Herne Bay. The report submitted stated that during the twelve months which the home had been opened there were 169 visitors, of whom 39 were infants. The house would accommodate 35 inmates, but it was proposed to increase the accommodation as soon as the necessary funds were forthcoming. A special feature of the institution is the permission for mothers to bring infants under two years of age with them, a nursery being provided for that purpose. A resolution was adopted in favour of establishing a Samaritan Fund to enable poor convalescents to obtain the benefits of the homes.

INTRAVENOUS INJECTION OF "NORMAL" SALT SOLUTION FOR THE GRAVE HÆMORRHAGES OF MIDWIFERY.

By HERBERT R. SPENCER, M.D., B.S. LOND., &c.,
ASSISTANT PROFESSOR OF MIDWIFERY IN UNIVERSITY COLLEGE, LONDON, ASSISTANT OBSTETRIC PHYSICIAN TO UNIVERSITY COLLEGE HOSPITAL.

(*Concluded from page 1291.*)

CASE 4. *Accidental hæmorrhage; transfusion; recovery.*—Mrs. ——, aged twenty-eight, had had five previous pregnancies which terminated at the twelfth week, sixth week, term, sixth month, and sixth month respectively. On the last occasion, in September, 1887, she had severe post-partum hæmorrhage. The obstetric assistant, Mr. E. A. Barton, was called to see her at 10 P.M. on Feb. 24th, 1889, and obtained the following history and notes. On the evening of the 23rd (when six months and a half pregnant) the patient had had "words" with her husband. She slept well that night; but at 3 P.M. on the 24th, without any apparent cause, she was seized with sudden great pain in the abdomen, felt sick, and soon afterwards vomited; she noticed how "hard" she had got in the abdomen. Soon she was obliged to lie down on account of the pain, and she felt faint and "wanted to breathe more." The vomiting and retching continued till 10 P.M. At 10.30 she passed (for the first time) blood to the extent of an ounce. On the obstetric assistant's arrival the woman was in great pain, was retching, and pale even to the lips, and constantly sighing and yawning. The pulse was 90, very weak, but regular. The uterus reached to just below the ensiform cartilage, and was continuously tense and hard; the fœtus could not be felt, nor its heart-sounds heard. The os was high up and far back, of the size of a florin, and soft. No placenta could be felt. A mass, presumed to be the vertex, could just be felt floating in the waters. The membranes were punctured, and a gush of blood occurred, and was followed by a continuous flow. Forty drops of liquid extract of ergot were given, and the os was dilated easily with the fingers and hand sufficiently to apply forceps to the breech. By this time the patient was completely blanched, and breathing deeply and slowly. The forceps slipped, and the child was delivered without any difficulty by traction on the groin, and bringing down a leg. The uterus still felt as if there were another child in it. On expression an enormous clot was passed. The placenta was extracted by the hand. Three grains of ergotin were injected hypodermically, and an intra-uterine injection of iodine solution given. There was no post-partum hæmorrhage. At this time (12.30 midnight) the pulse varied from 120 to 130, was of a very bad character, extremely small, but regular, and all the signs of extreme anæmia were present, and the tendons of the wrist were twitching. At 1.30 she was pulseless at the wrist. She was in a state of apparent stupor, but when the pulse disappeared she roused, tossed her arms over her head, gasped and twitched the facial muscles. She then tried to move about in bed. This lasted half a minute, when the pulse returned, and she "curled up again stupid." From 1.30 to 2.30 the patient continued in the same grave state, several attacks of syncope occurred, and the pulse was often completely absent, and when present lasted only a few seconds, at a rate of 128 to 140 to the minute, and could only just be felt. As she showed no signs of rallying, in spite of brandy and elevation of the limbs, at 3 o'clock I transfused into the median cephalic vein, the patient not feeling the incision. At 3.10 the pulse was fuller. The patient woke up and wanted to know what was going on. She complained of cold. The colour returned to her cheeks. The pulse diminished in frequency and increased in force until, at 3.30, when twenty-five ounces had been injected, she had a good pulse of 102; at 3.50 the pulse was 114; at 4 5, 106. For the next six hours the rate of the pulse, noted every few minutes, was mostly from 100 to 110; it rose once to 130, at 4.25, under an act of vomiting, the only time after the operation. At 10 A.M. the pulse was 100, and the patient was asleep and warm. Since the operation the pulse, though varying a little in strength from time to time, never disappeared or gave rise to anxiety, and the general condition of the patient was markedly improved. She took small doses of beef-tea, milk, and brandy at frequent intervals. In the after progress there was nothing specially to note. On the fourth day the temperature reached the height of 103·2° (no ascertainable cause); on the fifth, 100·6°; after this it kept below 100°. On the eighth day the patient, though weak, was practically well, and was regaining her colour. On the twelfth day the patient got up, and at the end of a month she was in good health, and had almost recovered her usual good colour. The after-history of this case has a melancholy interest. On Feb. 2ad, 1891, the patient, when pregnant at term, was seized with the same train of symptoms of accidental, followed by post-partum, hæmorrhage, and before my assistant could arrive or I could be summoned the patient died.

CASE 5. *Contracted pelvis; old scar in cervix; induction of premature labour; version; laceration of lower segment into broad ligament; transfusion; death.*—Mrs. —— had had three children; the first and third had been delivered by cephalotripsy; the second was born alive after version at the seventh month, but breathed only a few times. On Jan. 30th, 1889, labour was induced by the introduction of a bougie, the pregnancy having advanced to the seventh month. The cervix had a tough scar extending into the lower segment on the right side; on the fourth day the cervix was still very rigid; on the fifth day a Barnes' bag was introduced and left in for two hours and three-quarters; pains feeble. On the sixth day chloroform was administered; three fingers could be passed into the cervix; it was dilated by the fingers till it admitted the half hand and bipolar version performed; but as the cervix was still rigid the case was left to nature for two hours and a half. The patient felt a little faint and thirsty. As the cervix appeared now sufficiently dilated to admit the passage of the small head, slight traction was made, and the body and head easily delivered. The child was stillborn. A little bleeding occurred after the child was born; after the placenta was expressed there was a slight gush of blood and some trickling; under ergotin and hot injections this soon ceased. There was found to be a laceration of the cervix on the left side, but this was not thought to be extensive. The condition of the patient was very grave, although she had lost but a moderate amount of blood. In spite of injections of ether and brandy by the mouth the pulse rose to 140 and was very weak, and the patient was thirsty and faint. The limbs were raised, but the pulse rose to 165, and was extremely small and weak. At 3.15 P.M. (an hour and a half after delivery) the patient was evidently sinking. The uterus kept fairly hard, and there was but little loss of blood. Nearly two pints of saline fluid were injected in about twenty minutes. The general condition of the patient was not improved by the operation. In ten minutes the pulse had fallen to 140, and was rather stronger; but fifteen minutes later it was imperceptible, this in spite of hot bottles, ether injections, raising of the legs, and brandy. She became restless and talked a good deal, saying how queer she felt, and begged to be allowed to sit up and to have her legs put down. At 4.15 P.M. she commenced tossing about, the legs moved convulsively once or twice, and after a few shuffling movements of the body she became unconscious, with half-closed eyes, and died at 4.40 P.M. During the transfusion it was found that the patient had lost nearly half a pint of blood from the vagina. At the post-mortem examination a laceration four inches and a half long was found in the left side of the cervix, and extending up into the lower segment. It had extended into the broad ligament without lacerating the peritoneum, but had severed a large branch of the uterine vein. There was a scar three-quarters of an inch wide, evidently due to a similar laceration in the right side at some previous labour. There were several ounces of blood in the broad ligament.

CASE 6. *Complete placenta prævia; first hæmorrhage (very severe) at term; external version; embryotomy; transfusion; death.*—Mrs. ——, aged thirty-five, had had six children and one miscarriage; her last pregnancy was four years ago. On Oct. 3rd, 1889, being pregnant at term, while attempting to pass a motion into a bucket a terrific flooding suddenly occurred. The patient thought the waters had burst, and sat over the edge of the bucket until she fainted and fell back on the bed. Her husband then

Digitized by Google

found "a gallon" of blood in the bucket; the blood was still "squirting from her in all directions," and the petticoat was so heavy from the blood that he thought it must contain the child. When I saw the patient at 10.30 A.M. I found her in an exceedingly dangerous state, colourless in the face, with ashen lips, thirsty, somnolent, with dim vision; pulse 80, extremely small and weak; extremities cold. On abdominal examination the placenta was felt on the left side, and extending to the front and back, the anterior edge passing from the middle of the uterus on the left side to the outer fourth of Poupart's ligament on the right; child in first vertex position. The os admitted two fingers, and was completely occupied by placenta. There were some clots in the vagina. I performed external podalic version, separated the placenta for an inch and a half on the right side, ruptured the membranes, and brought the knee through the cervix with difficulty and with a loss of some blood. Patient felt faint; pulse 100, extremely weak. At 11.15 the pulse began to disappear at times, and the patient felt worse, and became more and more faint; no sickness; extreme pallor, extremities cold, in spite of hot blankets. Her condition appearing desperate, it was decided to perform embryotomy, and to transfuse the patient. There was no post-partum hæmorrhage, except a little trickling from a laceration of the cervix, which was stopped by plugging. The heart was beating 112 to the minute, the pulse either absent or only just perceptible. I injected thirty-five ounces of saline fluid into the right median basilic vein. After ten ounces had been injected the pulse had a fair quality and regular rhythm, and it gradually improved, until, at the end of the transfusion, it was 90 to the minute, the beats being full and constant, and, for the first time, she had a tinge of colour in her lips. At 12.15 I really thought she might recover. A little oozing occurred from the vagina to the extent of two or three ounces. This was stopped by a new plug. The pulse rose to 112, and got gradually weaker. The patient became restless, wanted to sit up, and suffered from air-hunger. I decided to transfuse her again, but before the apparatus could be prepared a tonic contraction of the muscles of the face occurred, and with a few slow, gasping breaths the patient died at 1 P.M. The pupils were moderately contracted till just before death; there was no vomiting throughout; the pulse never rose higher than 112. At the post-mortem examination the placental site was found in the situation diagnosed by abdominal examination, and was covered with thick clots of blood. The anterior lip of the cervix was lacerated up to its insertion into the vagina.

CASE 7. *Adherent placenta; post-partum hæmorrhage; transfusion; relapse; second transfusion; recovery.*—Mrs. ——, aged forty-seven, has had fifteen children, the last in 1885, at which time "the afterbirth grew to her side," and she had a severe flooding, fainted, and "was unconscious on and off for three weeks." On Feb. 13th, 1891, she was delivered before the attendant's arrival (at 1.10 A.M.), who found her lying in a pool of blood, the bedding soaked, a pool of blood on the floor, and about a quart of blood in a vessel by the bedside. It being impossible to express the placenta, the obstetric assistant, Mr. S. H. Bates, was summoned, and, in my unavoidable absence from town, performed the operation and conducted the case throughout. The patient was found to be faint, and complained that she could not see; the skin and mucous membranes were extremely pale; there was delirium, throwing of the arms, and frequent sighing. Pulse 150–160, very feeble. All bleeding had ceased. The patient's head was lowered; ether was injected into the arm, and the placenta, which was firmly attached to the uterus at the upper part, was with difficulty detached by the fingers except at one or two places, where it was impossible to remove the adherent organ, and further manipulations were not carried out owing to the alarming state of the patient, the pulse being 160, and with difficulty felt, in spite of the administration of brandy and ether. At 2 A.M. a pint and a half of hot saline solution was injected into the rectum and the elevated limbs tightly bandaged; but this produced no improvement in the pulse, and the general condition of the patient became worse. At 3 A.M. the pulse could not be counted and was flickering. Thirty ounces of saline fluid were injected into the median [illegible]. The pulse gradually improved. At 3.30 [illegible] full, 140 per minute. The [illegible] at 4 o'clock when the [illegible] irregular, and fifteen ounces of saline fluid were again transfused, and at 4.20 the general condition and the pulse had again improved. From 5 A.M. till 9 A.M. the patient vomited at intervals, and this seemed to depress her, and the pulse was at times imperceptible, but the general condition was better. Not till the afternoon was she in a satisfactory condition. At 3 P.M. the pulse was 120 and the patient warm. At 5 P.M. and at 7 P.M. the pulse was 112. During the puerperium fourteen intra-uterine injections of iodine water were administered. The temperature reached its highest point (101·2°) on the sixth day, and did not return to normal till the 17th. For the first nine days the pulse varied between 124 and 100. The patient remained anæmic for a long while. She was seen by me on Jan. 29th, 1892, and was in good health, had an excellent colour, and had menstruated regularly.

CASE 8. *Severe accidental hæmorrhage; patient moribund one hour and a half after delivery; transfusion of forty ounces of saline fluid; death.*—Mrs. ——, primipara, aged twenty-six, at full term, had a severe hæmorrhage in the early morning of Sept. 11th, 1891. She lost "half a gallon" of blood, and felt faint; the bleeding soon ceased and did not recur; she had no abdominal pain. The blood was cleared away by the patient's mother, and the fact of the hæmorrhage having taken place was carefully concealed from the nurse and from the student in attendance until after the death of the patient. During the labour, which lasted eight hours, the woman was pale, but made no special complaint and was fairly cheerful; unfortunately, the condition of the pulse was not noted. There was no hæmorrhage. The child was stillborn, the perineum only notched. A few minutes afterwards the placenta and a clot as big as a large fist were expelled. There was no other hæmorrhage. Half an hour later the patient had all the symptoms of severe loss of blood, and gradually became pulseless, restless, and unconscious. An hour and a half after delivery I saw her. She was then *in articulo mortis*, completely blanched, unconscious, motionless, pulseless, and no heart sounds could be heard. The only sign of life was a faint flickering pulsation in the neck and an occasional gasping respiration. Nearly forty ounces of saline fluid were transfused without any benefit, the patient having died before the operation was completed. The post-mortem examination showed the uterus to be uninjured, and failed to explain the death. Afterwards the mother mentioned the fact of the accidental hæmorrhage, which she had carefully concealed at her daughter's request from motives of false shame.

Remarks.—Of the eight cases, it will be seen that four recovered and four died. Of those that died, two (cases of accidental hæmorrhage) are of no value in estimating the effects of the treatment, for in one case the patient was in a hopeless condition, and in the other was practically dead; both died when a few ounces had been injected. Of the other two cases, one had an extensive laceration of the lower segment of the uterus and a hæmatoma of the broad ligament, and died rather from shock than loss of blood; the other (a case of central placenta prævia) had also a lacerated cervix, and I think might possibly have recovered if a second injection had been made. Of the cases that recovered, two were examples of adherent placenta, with post-partum hæmorrhage, and two were cases of accidental hæmorrhage; one of these women died in her next labour from a repetition of the accident. In two patients the operation was performed a second time, making six successful operations in all. The eight cases described above bear but a small proportion to the number of cases treated for hæmorrhage. During the last five years I have endeavoured to see all cases of acute ante-partum and all grave cases of post-partum hæmorrhage occurring in the hospital maternity. Of the former alone (excluding miscarriages) I have seen about 100 cases, including forty cases of placenta prævia. Many patients I have seen almost pulseless and in a serious general condition after the loss of large and small quantities of blood; twice I have seen patients recover without transfusion after hæmorrhage so severe as to cause convulsions; all except the above-mentioned have recovered with the ordinary remedies, and in no case has intra-venous injection been resorted to until the ordinary methods of treatment have failed. Before performing the operation the bleeding should be definitely controlled. The apparatus I have employed for the purpose of injecting the fluid is shown in the engraving. It consists of a glass bottle holding two pints, with an india-rubber stopper, through which pass a thermometer, a thistle-

headed tube (for the purpose of replenishing and for the admission of air) filled with antiseptic wool, and a delivery-tube, to which are attached about four feet of india-rubber tubing and a cannula made of vulcanite or glass.[1] The apparatus, having been washed with a 5 per cent. solution of carbolic acid and with boiled water, is filled with hot boiled distilled water containing one drachm of sodic chloride to the pint. Instead of using the solid salt, time and trouble may be saved by employing a preparation of Mr. Gerrard's, the dispenser to the hospital, which consists of sterilised and stoppered glass tubes containing two drachms of pure salt in solution. When the bottle is filled, the solution is maintained at a temperature of 105° by placing the bottle in a vessel, into which hot or cold water is poured from time to time. The solution is made to run by blowing with the mouth through the wool-stoppered tube, and raising the bottle about two feet above the patient's arm. A longitudinal slit is then made in the skin over the median cephalic or basilic vein; if assistance is not at hand, it is better to make a transverse slit through a fold of skin, as the elasticity of the skin then makes the wound gape; the vein is isolated, and three fine silk ligatures are passed under it. The lower of these is tied, the vein picked up with forceps and opened by a scalpel, and, the solution having been set running, the cannula is inserted and tied in with the middle ligature. The solution should be allowed to flow slowly, and the bottle should not be raised too high. Thirty or forty ounces will in nearly all cases be sufficient to inject, and the operation should take from twenty minutes to half an hour. In case of relapse the operation may be repeated on the other side. After the operation the cannula is removed, the vein tied with the upper ligature, and the wound closed and a back splint applied. If necessary stimulants may now be administered with greater benefit than before the operation. In conclusion, I would express my belief that the operation properly performed is neither attended by danger nor followed by evil consequences; that it will afford remarkable relief in cases of severe hæmorrhage, which are not complicated by "shock," after all the ordidary methods of treatment have failed; and that in the gravest cases of ante-partum hæmorrhage it would be well to inject the solution before delivery is effected.

Mansfield-street, W.

NOTE ON THE

FEVERS PREVALENT ON THE SHORES OF THE MEDITERRANEAN AND RED SEAS.

BY G. HUTCHINSON MILNES, M.D. CANTAB.,
FORMERLY SURGEON IN HER MAJESTY'S FLEET.

THE LANCET of May 28th, 1892, contains a review of a work entitled "Studio Etiologico e Clinico delle Malattie Febbrili più Comuni a Massaua," by Dr. Pasquale. This book describes the research officially entrusted to its author on account of the difficulties experienced by the Italian doctors in dealing with fever at Massaua. Dr. Pasquale's conclusions are summarised in THE LANCET as follows:—"1. Massowah is not a seat of palustral infection, though malaria may be evoked in its climate when already existing as a cachexia due to previous attacks. 2. There is no fever infection *sui generis*, such as the 'climatic remittent' which some classifiers have called it. 3. There are febrile maladies which might be confounded with common continued fevers (such as those arising from typhoidal infection), principally of the so-called 'abortive' and minor types." I am not in a position to refer to Dr. Pasquale's work, and am therefore unable to pass an opinion upon the thorough and exhaustive research which he appears to have conducted into the nature of the fevers occurring at Massowah; but the conclusions as stated in THE LANCET seem to me unsatisfactory and lacking in distinctness, especially as no indication is given of the nature of the fevers mentioned in conclusion No. 3. During a turn of service as a naval surgeon in the Mediterranean and Red Sea in 1887, 1888, and 1889, I paid considerable attention to the study of the clinical characters of the fevers prevalent on the shores of those seas, and arrived at certain conclusions, which, though by no means original, represent, I think, fairly and distinctly the views of men who have had most experience of these diseases. The important point in my conclusions is that the same kinds of fever occur in all parts of the basins of these two seas; a case of fever at Sawâkin or Massowah will not present features essentially different from those of a case treated at Malta or Naples. These fevers, excluding the exanthemata, typhus, and influenza, comprise typhoid, malarial fevers, as well as a febrile disease which is called by some local name in nearly every district of the area under consideration, and is regarded by the inhabitants as peculiar to each locality, but which is, I feel convinced, actually the same throughout the whole region. This is the Malta fever of Malta, the Rock fever of Gibraltar, the Cretan fever of Crete, and the local fever of the Red Sea ports, including Massowah. It has been thought by many to be malarial, by some to be closely allied to typhoid fever, or, indeed, typhoid fever itself in a masked form, and by others to be a compound of typhoid fever and malaria which they have called "typho-malaria." It is evidently this disease that has puzzled the doctors at Massowah, and has been made the subject of his research by Dr. Pasquale. In the consideration of this fever it is most important to remember that real typhoid fever is a common disease throughout this region, and that malaria occurs wherever the usual conditions of soil and climate give it an opportunity. Hence, it is necessary to judge every case upon its own merits, and to distinguish carefully the diagnostic features of each disease. It will then be apparent that in a series of cases some show the characters of typhoid fever, and some perhaps those of malaria; but a large proportion present features agreeing with neither one nor the other. Cases of the latter class vary widely in their duration, and to some extent in their symptoms, but the varieties overlap each other at so many points that lines of demarcation can hardly be drawn between them. An attack may begin with flushed face, full bounding pulse, dry burning skin, and other "sthenic" symptoms; or it may start with a slight sense of illness, debility, loss of appetite, clammy skin, quick feeble pulse—in fact, evident "asthenia,"—and in either case the duration may be long or short without reference to symptoms. Cases sthenic at the invasion do not always recover in a few days, and the asthenic cases do not always last for weeks or months; but if the duration be more than about a week every case will assume the asthenic type and retain it to the end. For my own part, I am inclined to call both the short and the long cases—both the sthenic and the asthenic—varieties of the same disease; for I know no distinction between them, except duration, and any attempt to distinguish between them by means of this feature alone must end in the drawing of an arbitrary line at a certain date in the course of an attack. If the date be passed, we have one disease; if recovery occur earlier, we have another. Such an artificial method would be foolish and impracticable.

A very short review of the principal symptoms will serve to show the eminently negative characters of this fever. The invasion is always marked by loss of appetite, often by headache or backache, but seldom by rigor or vomiting. The rise of temperature, sudden or gradual, reaches its highest point early generally in the first three days. There may be some slight pulmonary or pleuritic congestion; slight jaundice occurs in rare cases; rheumatism is not an uncommon complication at a late stage; but, except the sign noted in the next sentence, the disease has no features of its own. The tongue is covered with a dead-white moist fur, which persists throughout the attack, and whose disappearance I regard as the sign of recovery. The bowels are nearly always constipated, and there are no abdominal symptoms like those of typhoid fever. Enlargement of the spleen can very rarely be detected during life. In

Digitized by Google

forty cases of which I kept careful notes, it was sought for constantly and never found. I never discovered it in many other cases of which no notes were kept, although I made a habit of examining the spleen in every case. Some observers have, however, found it enlarged at post-mortem examinations. If recovery do not occur within a week or ten days the main features of the disease are progressive febrile debility and emaciation, accompanied by irregular temperature without rigors, a condition which may continue for weeks and months, for which return to England seems the only cure, and which may recur on slight provocation even after the return home. I saw cases of this disease in most parts of the Mediterranean, at Malta and Naples, in Sicily and Crete, as well as in the Red Sea ports of Sawàkin, and Massowah. During a stay of about a week at Massowah several cases occurred on board H.M.S. *Starling;* they did not differ in any respect from cases seen at other ports, and in the Italian military hospital at Massowah. I saw typhoid fever in all these places and ague in some, and I have no hesitation in saying that this disease is neither ague nor typhoid fever, nor nearly related to either. It is not typhoid fever, because it neither presents the characteristic spots, abdominal symptoms, and lesions of that disease, nor does it run a definite course like typhoid. I am aware that in certain fatal cases post-mortem examination has revealed ulceration of the ileum, till then unsuspected; but I am also aware that surprises of the same kind have occurred in large metropolitan hospitals, where pneumonia, meningitis, and other diseases have been confused with typhoid fever. I have, however, never heard anyone argue from these mistakes that pneumonia and meningitis are nearly related to typhoid fever. The same may be said of typhoid fever spots, which are said by some to occur occasionally in these cases. I have seen spots in supposed cases of this malady, but the after-progress of the disease satisfied me that it was unquestionably typhoid fever. I have never heard of a fatal case in which real typhoid fever spots were seen and where no intestinal lesions were found on examination after death. Neither is this disease a kind of ague or malarial fever, because it occurs where malarial conditions do not prevail. There are no marshes at Malta, for instance, and real intermittent fevers do not occur there; but Malta is never free from the fever I am discussing. It abounds in towns and thickly inhabited places, such as are notoriously avoided by malarial diseases, while it does not prevail in open deserted districts which are known to be most favourable to ague. Rigors, exacerbations, and remissions take no part among its symptoms, such as they play in malaria. The prolonged attacks are familiarly called remittent, and in them the temperature is often irregular, but rigors are absent, splenic enlargement is absent, and in their other features these cases do not agree with the description of true malarial remittent fevers observed in any part of the world. Finally, all patients suffering from this fever may be dosed with quinine in every way and to any extent without the slightest beneficial result.

With the first of Dr. Pasquale's conclusions, as tabulated in THE LANCET, I am quite prepared to agree—namely, that "palustral infection" does not exist at Massowah; it is certainly absent from Sawàkin and many other places (e.g., Candia in Crete) where this fever abounds. The second and third conclusions are too indistinctly stated to admit of precise argument; if they mean that fevers occur at Massowah that are neither malarial nor typhoid, I agree again; but if they do mean this, why say "there is no fever infection *sui generis* such as the climatic remittent," &c.? My opinion, and I believe that of other observers, is that a fever exists whose prevalence is not confined to Massowah, which always presents the same features, which is endemic in certain places, which differs from the usually recognised forms of continued fever, and which may very well be supposed to result from an "infection *sui generis*," if by that term be understood some poison capable of producing this disease and no other.

It only remains to mention the simple method of treatment I used in all the cases that I treated. Patients were kept in their hammocks and on liquid diet till the tongue became clean. A dose of calomel was given at the start, and a saline mixture containing nitrate and bicarbonate of potash and soda, with or without sulphate of magnesia, according to the state of the bowels, was taken thrice daily throughout the attack. In twenty-three cases out of the forty above mentioned quinine was given in addition, generally in large doses (from twenty-five to forty grains), and in seventeen cases no quinine was given. Out of a ship's company averaging sixty-four more than fifty suffered in the course of two years from fever, some had several attacks. No case was invalided, and only one death occurred from typhoid fever (known and treated as such from the first) on the fifty-first day of the disease. Most of the fever patients returned to duty in a fortnight or three weeks. High temperature lasted on an average a day longer in the cases treated with quinine than in the others, a fact explicable, perhaps, on the grounds that quinine would sometimes be given if the attack seemed unusually severe, and withheld if it seemed slight. The results were particularly good when compared with those of other ships engaged on similar service at the same time, and this in spite of the fact that the men were reckless with regard to health considerations.

Derby.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

A CASE OF SPASMODIC TORTICOLLIS TREATED BY AVULSION OF THE CENTRAL END OF THE SPINAL ACCESSORY NERVE.

BY A. PEARCE GOULD, M.S. LOND., F.R.C.S. ENG.,
SENIOR ASSISTANT SURGEON TO THE MIDDLESEX HOSPITAL.

A LADY aged twenty-eight was brought to me in August, 1885, by the late Dr. Troutbeck, for very troublesome spasm of the left sterno-mastoid muscle. She first experienced trouble in the neck eight years before, soon after the death of a near relative; the jerking of the head had persisted ever since, gradually getting worse. The patient was a tall, thin girl, and delicate looking. There was no history of fits; she had had facial neuralgia, but not severe migraine. The spasm appeared to be entirely limited to the left sterno-mastoid muscle, and was so severe and constant as entirely to preclude the patient from mixing in society, and at night it was some time before she could get to sleep. Dr. Angel Money applied the constant current to the muscle on nine occasions, but with no benefit; indeed, the spasms appeared to be increased in severity. So on Sept. 10th, 1885, with Mr. Hudson's assistance, I exposed the spinal accessory nerve by means of an incision along the anterior border of the upper part of the sternoid-mastoid muscle, intending to stretch it and excise a considerable portion. In stretching it from the central end I felt the nerve gradually give way, and I pulled out a long, slender nerve from the jugular foramen and excised four inches and a half of it. No special symptoms were noticed from the tearing of the nerve roots. The wound healed without complication, and the patient returned home on Sept. 23rd. She called on me on Sept. 8th, 1886. She was then in much better general health, her head was held erect, and was quite steady. She could turn it freely to the left and about half the distance to the right, and she was gaining power in it. The left sterno-mastoid muscle had completely atrophied, and the cervical portion of the left trapezius muscle was markedly smaller than the right. The patient was able to mix again in society, and was very pleased with the result of the operation. A year later (October, 1887) Dr. Troutbeck saw her, and reported to me that she was "quite well, except for occasional fatigue felt in the neck; no jerks."

The satisfactory result of this operation was, in my opinion, chiefly due to the fact that the spasm was limited to the one muscle—the sterno-mastoid. I have on two subsequent occasions intentionally removed the central end of the spinal accessory nerve in the same way for spastic torticollis. The operation is quite a simple one, the delicate roots of the nerve rupture and a long tapering filament is drawn out from the spinal canal. These two cases were treated last year and it is too early to pronounce with certainty upon the result of the operation in them.

SPASMODIC TORTICOLLIS AND OTHER SPASMODIC MOVEMENTS OF THE HEAD.

BY NOBLE SMITH, F.R.C.S. EDIN., L.R.C.P. LOND.,
SURGEON TO ALL SAINTS CHILDREN'S HOSPITAL.

I AM able to report continued relief from spasm in both the patients whose cases I have previously recorded.

In the first instance the patient had had severe spasms for sixteen years. I removed a piece of the spinal accessory on the left side, and subsequently of the posterior branches of the second, third, and fourth cervical nerves, as well as every branch of nerve that I could find entering the splenius capitis muscle. This patient has remained well now for over two years. The other case was that of a gentleman aged fifty-seven. He had spasmodic movements of the neck, head, and face. This affection had commenced in the right sterno-mastoid, and he was cured by excision of a piece of the right spinal accessory and has remained well. Since this I have had two other cases.

A lady aged about forty-five suffered from spasmodic wryneck to the right, commencing fourteen years ago. It had been most assiduously treated with drugs of all kinds, galvanism, and blisters to the spine. Nothing had given her relief. In this case the external rotators on the right side were acting more strongly than the left sterno-mastoid, therefore I decided to operate upon the posterior branches of the cervical nerves in the first instance. Upon the first occasion I could not complete the operation, because the anæsthetist (Mr. Davis) warned me that the patient was showing signs of faintness. The wound was rather long in healing in consequence (I thought) of the patient's very weak state of health. I advised change of air to recruit her health. Six months later I operated upon the left spinal accessory, removing half an inch of it. The wound healed in a few days by first intention. This removed all the spasm from the sterno-mastoid. Subsequently, on April 23rd, I removed pieces from the second, third, and fourth posterior branches of the cervical nerves on the right side. The wound healed by first intention in a few days. The patient first sat up on the eighth day. On May 2nd I found the spasms had practically ceased from the splenius, and what were left seemed to be confined to the deep rotators supplied by the suboccipital nerve which I had not operated upon. On June 10th the patient was very much better, although not quite free from spasm; but as the improvement is still going on I hope this patient will be cured without further operation.

The second case is that of a lady over fifty years of age, who had suffered for over fourteen years from severe spasms. She was sent to me by Dr. Gowers, who had come to the conclusion that any benefit to be obtained from drugs was only of a very transitory character, and that operation was the only treatment likely to do positive good. Excision of a piece of the left spinal accessory has relieved the patient from the spasms of that muscle, and thereby removed the severe pain from which she was suffering and allowed her to rest at night. Other spasms at the back of the neck are also much relieved, and, if they do not disappear in a little time, can probably be removed by further operation. I defer full report of this case until it is completed.

Queen Anne-street, W.

A CASE OF MALIGNANT REMITTENT FEVER.

BY LOUIS WHEELER, M.B., B.CH.

A PATIENT aged twenty-eight, for ten years resident on the west coast of Africa, with occasional attacks of remittent fever whilst residing there, but exceptionally healthy otherwise, came under my care on the ss. *Niger* on his homeward voyage. He enjoyed capital health along the windward coast up to Sierra Leone, and was perhaps noticeably plethoric for a thin man. At 7.30 A.M. on the morning of May 10th, after having been on shore at Sierra Leone, he had an attack of bilious vomiting, and the thermometer registered 103·8°. An hour later a copious hæmatemesis occurred, which was checked with ice. At 1 P.M. he passed a copious bloody stool. At 4 P.M. his urine became dark claret in colour, with a peculiar musty odour, and very abundant in quantity. His skin was hot and tingling, without perspiration, and his pulse, which through the day had been beating 110 to the minute and very strong, became after the hæmaturia weak, irregular and intermittent. He had twenty grains of antipyrin in the early morning and through the day rice-water, brandy-and-soda and fluid nourishment, amounting in bulk to about four or five quarts, as he appeared to suffer from very distressing thirst. The evening temperature was 104·6°.—May 11th: Continuation of hæmaturia. Temperature 104°; pulse hard and small. Rapid development of jaundice, commencing at 10 A.M. and reaching maximum intensity at 4 P.M. Conjunctivæ almost orange, great thirst and drowsiness. At 5 P.M. a sudden and violent vomiting of bright-yellow bile occurred, which took place again twice within the following two hours, and visibly diminished the existing jaundice. Evening temperature 105°; urine very black and plentiful.—12th: Morning temperature 102·4°; urine clearing; jaundice diminished, but thirst still very intense. Vomiting through the day of material introduced into the stomach. Evening temperature 100·2°; urine dark yellow, and pulse much stronger. Treatment: Stimulants, iron, digitalis, and quinine, of each ten minims for a dose, thrice through the day.—13th: Morning temperature 99°, vomiting ceased, urine dark yellow and diminished in quantity. Great weakness but improved pulse and diminished jaundice. Treatment: Quinine (thirty grains through the day); stimulants, chicken broth, &c.—14th: Convalescent. No fever, urine normal in colour and quantity, and jaundice practically disappeared.

The interesting points of this very unique case of remittent fever were: (1) The very extensive loss of blood from all the excretory channels (stomach, kidneys, and bowel); (2) the virulence and rapid onset of the jaundice, pointing as I imagine to an energetic but obstructed liver; (3) the rapid convalescence and clearing up of the hæmaturia.

ST. MARY'S HOSPITAL.

SPASMODIC WRYNECK, TREATED BY RESECTION OF THE SPINAL ACCESSORY NERVE.

(Under the care of Mr. EDMUND OWEN, M.B., F.R.C.S.)

IN THE LANCET of March 26th, p. 713, attention was drawn in an annotation to the advances recently made in the surgical treatment of spasmodic wryneck, to the variations in the site of the lesion, and to the present obscurity of its pathology, which led of necessity to something like empiricism in the application of curative measures. The difficulty of gaining access to the affected nerves was dwelt upon, and the unsatisfactory results of stretching and of simple section were emphasised. A brief record was then given of some of the happier results that had attended free excision of the affected nerves in the hands of M. Petit, and reference was made to the work of Dr. Keen, Mr. Noble Smith, and Dr. Powers in the same direction. In another column of our present issue a further history is given of two of Mr. Smith's cases which have been previously recorded, and brief notes of two further cases are added. Mr. Pearce Gould also sends an account of a case in which he cut down on the nerve and was stretching it when it ruptured, and a considerable length of the proximal part of the trunk was pulled out. The patient made an excellent recovery. In the correspondence that followed the annotation, Dr. Harkin of Belfast, after condemning operative treatment save as an ultimate resource, recalled some interesting instances related by Dr. Morton Prince of Boston, U.S.A., of cure following the application of a blister to the fourth and fifth dorsal vertebræ. In a *brochure* published in 1891

Digitized by Google

Mr. Noble Smith, after detailing the unsatisfactory results that have followed other methods of treatment, gives a list of the cases in which excision of a portion of the spinal accessory nerve has been practised, the first being on a patient in the Middlesex Hospital, under Mr. Campbell de Morgan, in 1862. The result in the majority of the cases seems to have been very encouraging. In the present case an inch of the spinal accessory nerve was removed from near the anterior border of the sterno-mastoid muscle, and it was noticed that a greatly enlarged lymphatic gland impinged upon the nerve in this position, and might possibly have acted as a causative factor in inducing the spasm. The result as recorded five months afterwards is, though not absolutely satisfactory, decidedly encouraging. Mr. Owen closes his account with a few thoroughly practical hints as to the details of the operation, insisting especially on the necessity for a sufficiently long incision. For the notes of the case we are indebted to Mr. Walter Broadbent.

The patient was a widow of mature age, who was admitted to St. Mary's Hospital on Nov. 21st, 1891, on account of exhausting spasmodic contractions of the left sterno-mastoid muscle, by which the head was jerked down towards the left shoulder, the face being turned to the right side, and the chin thrown violently upwards. She said that about three years ago she first noticed the involuntary jerkings of the head, since which time the spasms have steadily increased, until at last they made her life positively miserable. After hurrying, and whenever, from one cause or another, the circulation was excited, the spasms were at their worst. Of such severity and so frequent occurrence were the attacks that the left side of the head was permanently drawn down towards that shoulder, the deformity causing considerable disfigurement. (A sister of the patient is said to be afflicted in a similar manner.) General and special medical treatment, together with massage and electricity, had been given a skilful and thorough but unsuccessful trial.

On the day after her admission, the patient, having been duly prepared for operation, Mr. Owen made an incision about three inches long, descending from the apex of the left mastoid process, along the anterior border of the sterno-mastoid, Mr. Page and Mr. Silcock assisting at the operation. The external jugular vein having been tied in two places and divided, and the edge of the sterno-mastoid having been raised, the posterior belly of the digastric was exposed, and close beneath it a greatly enlarged and livid lymphatic gland. It was thought that this gland might possibly be the cause of the trouble on account of its pressing upon the nerve; it was, therefore, removed. After a little more dissection the spinal accessory nerve was exposed and about an inch of it removed. The wound was irrigated with a weak mercuric lotion and closed with a continuous silk suture. There was a little delay in the healing; but there was practically no elevation of temperature, and the patient left the hospital in December apparently on the high road to complete recovery.

Result of operation.—The patient presented herself for examination on May 13th, looking considerably younger than before the operation, having lost her distressed aspect, and having put on weight. The exhausting movements of the head left her from the time of the neurectomy, though, to use her own words, "there is still a little something wrong; but it is improving." She holds her head straight, has perfect control over it, and is apparently well-satisfied with her present condition. Her chief trouble is now with the "weakness in the shoulder," which is probably to be explained by the sterno-mastoid and the trapezius having lost most of their supporting influence upon the clavicle and scapula; but even this is getting better.

As regards the operation, Mr. Owen would venture to call attention to the fact that the spinal accessory nerve enters the sterno-mastoid in so deep a situation that the muscle has to be well slackened and turned out before the nerve can be thoroughly exposed. A surgeon, therefore, who tried to reach it through a small incision might not improbably fail altogether to find it. Indeed, in the present instance, a small artery, descending obliquely over the internal jugular vein to enter the muscle, was at first taken for the nerve. But when pinched in the forceps it did not cause contraction of the muscles, as happened later when the nerve itself was so treated; the spinal accessory nerve, moreover, is, as exposed in the operation, a very large and conspicuous trunk. It enters the substance of the muscle at about the level of the angle of the jaw, but above this level it is deeply hidden beneath the muscle. When the muscle is well pulled outwards the nerve is tightly stretched and is thus readily made out.

The points to be borne in mind are that, as the nerve lies deeply beneath the muscle, a free incision must be made to find it; that it is by no means near the anterior border of the muscle; that it runs almost vertically; and that it enters the deep aspect of the muscle at about the level of the angle of the jaw. The incision should be begun at the tip of the mastoid process, and the hinder border of the posterior belly of the digastric and the conspicuous internal jugular vein afford the best landmarks. The operation, though straightforward, is by no means easy; it is far better than that of seeking the nerve as it emerges from the sterno-mastoid.

BRADFORD INFIRMARY, YORKS.

SPASMODIC TORTICOLLIS; EXCISION OF A PIECE OF RIGHT SPINAL ACCESSORY NERVE.

(Under the care of Dr. MAJOR and Mr. J. APPLEYARD.)

THE following case illustrates the successful result of the excision of a piece of the right spinal accessory nerve for spasmodic torticollis of the right side, after failure to obtain much relief from continuous current, cannabis indica, and hypodermic injections of morphia. The symptoms were of seven months' duration and of very gradual onset. In this, as in Mr. Owen's case above recorded, the nerve was not found immediately; the anterior border of the muscle was exposed, but the nerve entered that structure on its posterior aspect, and in both cases its point of entrance was on a level with the angle of the jaw. Six months later, as will be seen by the note appended to the end of the case, the relief on the side operated on was complete, but a similar spasmodic condition had developed on the opposite side. It is still too early to assign its just position to this operation, but the communications published this week form an interesting continuation of the series. It is only when the after histories of the whole have been ascertained that a fair judgment of this method of treatment will be possible. All that can be said at present is that the results are sufficiently encouraging to induce a further trial of the procedure in these very distressing cases.

M. A. B——, married, two children and one miscarriage, became an out-patient of the Bradford Infirmary on Aug. 18th, 1891, under Dr. Major, having been sent by Mr. Herbert Jones of Shipley. She was a strong, healthy woman, never having had rheumatic fever, scarlet fever, specific disease, chorea, or hysteria. She has no knowledge of any shock or injury; but seven months ago she felt a little sensation of tightness in the head, and under slight exciting conditions—as when in the presence of company—a feeble, sudden twist of the head, with chin towards the left shoulder, would come on at rare intervals. This tendency has gradually increased, and markedly so, about one month ago, when she was nursing a serious case and was much deprived of sleep. On her return home the spasms increased in frequency and in intensity, and she came under the care of Mr. Jones, who advised her to become an out-patient under Dr. Major.

State when seen as out-patient.—At night, and when lying down, the spasms are quiescent. On first rising out of bed they develop slightly, and increase in severity as she begins to move about, coming on about every half-hour. In an attack her face turns towards the left shoulder, and severe pain is complained of at the back of the head and neck. The general health is good, menses regular, and the lungs and heart sound. No disease of the spinal column, no albuminuria, and no tender teeth, although there are carious stumps. During the time she was an out-patient, from Aug. 18th to the 31st, the continuous current was applied three times a week, and arseniate of sodium with bromide of sodium administered internally, with little or no benefit.

On Sept. 1st she became an in-patient under Dr. Major, and from Sept. 1st to the 27th cannabis indica in gradually increasing doses was given; yet no improvement.

Sept. 27th to Oct. 19th.—Hypodermic injections of morphia beginning with one-eighth of a grain twice daily, and gradually increasing to half a grain, with some degree of

Digitized by Google

relief. Yet the spasms did recur, and occasionally with severity, as the effects of the morphia passed away. On Oct. 8th it was noticed that pressure on a point two inches below the lobule of the right ear, on the line between the mastoid process and the right sterno-clavicular articulation, would stop the spasm at once, and control it for a time.

Oct. 19th.—Patient discharged, a little relieved, but advised to return and have excision of a portion of the right spinal accessory nerve performed, if the spasm and pain came on again severely.

27th.—The patient returned to-day, and was admitted to the surgical wards under Mr. Appleyard. The spasms and severe pain at the back of the head and neck have recurred, almost as bad as ever, causing her much distress and loss of sleep, so that her health begins to suffer.

30th.—Under chloroform, with the head on its side and face turned to the left, an incision for about three and a half inches was made from the right mastoid process, downwards along the anterior edge of the right sterno-mastoid muscle, the fascial sheath opened, the anterior border of the muscle defined, and the tip of the right forefinger inserted near the mastoid process under the muscle, and gradually but gently worked downwards inside the sheath, each resisting vessel or collection of fibres drawn out with a blunt hook for inspection before division, and ligature when necessary. At last the nerve (spinal accessory), after some delay and difficulty, was felt firmly resisting the progress of the finger, but nearer to the posterior edge of the muscle than was expected, and entering the muscle about the level of the lower border of the angle of the jaw. It was hooked forwards for inspection, found to be a little thicker than a crowquill, and certainly solid and made up of nerve bundles. A piece three-quarters of an inch long was excised; one small artery and one vein were ligatured; there was only slight loss of blood; a rubber drainage-tube was inserted at the lower end of the wound; the edges were brought together by catgut sutures; iodoform and boracic acid were dusted on; a little green protective placed directly over the wound, and sublimate wool with a gauze bandage over the whole.

31st.—Head still takes the position of torticollis (face to left), but there is complete absence of spasm and of pain. Temperature 98·2°.

Nov. 1st.—Dressed; tube shortened; no suppuration. Temperature 98·4°.

2nd.—Primary union of upper two-thirds; drainage-tube removed.

3rd.—Poroplastic collar fitted and applied to the neck.

4th.—No recurrence of spasmodic movements or of pain.

6th.—Wound healed. Temperature natural throughout. No spasms and no pain.

14th.—Discharged completely relieved, having had no recurrence either of pain or of spasm. Face directed straight forwards.

Note.—Mr. H. Jones wrote to-day (April 11th, 1892) saying that he saw the patient ten days ago, and she had had no recurrence of symptoms of any kind.

May 10th.—The patient has returned with the development of a similar condition on the left side of the neck, but the relief on the right side is still perfect and complete.

Medical Societies.

ROYAL MEDICAL & CHIRURGICAL SOCIETY.

Pylorectomy.—Jejunostomy.—Ovarian Pregnancy.—Amputation in Diabetes Mellitus.

THE last ordinary meeting of this Society for the present session was held on June 14th, the President, Sir Andrew Clark, in the chair.

Mr. MAYO ROBSON of Leeds read a paper on two cases of Pylorectomy and one of Jejunostomy. The cases were brought forward—(1) because it was important that all serious and especially new operative procedures should be chronicled for statistical and comparative purposes; (2) because it was not yet clearly established that these operations for cancer could be relied on to produce such an amount of relief as to warrant their continuance. Concerning the operations of gastrostomy for impermeable cancer of the œsophagus, and gastro-enterostomy for pyloric obstruction, there seemed to be sufficient evidence to prove that the relief afforded was amply sufficient to justify their continuance. A sequence of gastro-enterostomy, the regurgitation of the bowel contents into the stomach, was mentioned. The cases detailed were: A case of pylorectomy for pyloric stenosis due to malignant tumour, followed by recovery; there was recurrence of symptoms due to contraction of cicatrix. Gastro enterostomy was performed four months after. Regurgitation of fæcal matter occurred into the stomach without intestinal obstruction; want of assimilation of food and fæcal poisoning resulted. The second case was one of pylorectomy for pyloric stenosis due to malignant tumour. There was apparent loss of power of assimilation, and death occurred from exhaustion on the fifth day. In the third case jejunostomy had been performed for extensive cancer of the stomach, rendering feeding by the month impossible; recovery followed. Alimentation was carried on through the artificial opening for two months. Ultimately death resulted from exhaustion due to the progress of the disease. He advocated the performance of jejunostomy, but only after clear explanation to the friends and the patient that the prolongation of life could only be for a limited time, and that much real comfort from the operation could not otherwise be expected. No single operation for pylorectomy was to be advised; the method of procedure should be varied according to circumstances—e.g., where the disease was very extensive, the tumour being fixed and the glands enlarged, pylorectomy was to be avoided and gastro-enterostomy performed. Where the disease was extensive, but not too far advanced to prevent complete removal, the combined operations of pylorectomy and gastro-enterostomy, as in cases reported by Messrs. Lowson, Greig Smith, Bull, and Jessett, were advocated. Where, however, the disease was in an early stage, simple pylorectomy, with suture of the duodenal and stomach openings, was probably the simplest and safest procedure. In order to shorten and simplify the operation, and to prevent recontraction of the pylorus, a modification was suggested by means of a decalcified bone or gelatine tube shaped like a cotton reel, and in the use of which only two continuous sutures were required. The method was illustrated by diagrams and models. The author believed that this method was applicable to, and had certain advantages in, the performance of gastro-enterostomy, intestinal implantation, lateral intestinal anastomosis, and end-to-end enterectomy.—Mr. JESSETT held that these operations had hitherto met with such success as to warrant their continuance. He said that he had done nine gastro-enterostomies, with five successes. One was done two years ago, a second fifteen months ago, and a third nine months ago; all had gained weight and strength. Two had died: one six months, and one five months after operation. Of the four immediately fatal cases, one died of exhaustion soon after operation, one of septic peritonitis, and another from a leakage. He had only done one case of pylorectomy (last July). She had gained more than two stones in weight since the operation. He had had five cases of jejunostomy, and all recovered. One had lived for nine months after the operation, and another for six. They were all instances of extensive disease of the stomach, not admitting of pylorectomy or of gastro-enterostomy. In suturing he had discarded the use of silk ligature for chromic catgut. The bobbins, which were shown, were much like a tube he had used in conjunction with the bone plates.—Mr. BARKER said that surgeons would feel grateful for this new modification in the operation, which would very materially shorten the procedure in pylorectomy. He held that it was still an open question whether pylorectomy should hold a place in surgical procedures. If the disease were advanced it was undoubtedly unjustifiable; if it were not advanced, the relief gained by gastro-enterostomy was probably as great as that to be obtained by pylorectomy. In a very early case with very slow growth pylorectomy might, perhaps, be admissible, but his impression was that before long it would be entirely abandoned for gastro-enterostomy in cancer cases. He had only done gastro-enterostomy twice successfully, and regurgitation occurred in the first case, the vomit being most offensive. Believing it was due to gravitation, he placed his patient in a semi-recumbent position, and she made a good recovery. He did not think that there could be much danger from stercoraceous poisoning, for the patients were usually much starved

Digitized by Google

before the operation. As to the kind of suture to be employed, he was more than ever inclined to use fine sterilised silk, and he had never seen it give rise to unpleasantness. The essence of the author's process was that it brought the mucous surfaces rapidly together and obtained a quick union of their edges. The bobbin was used only as an aid to the suturing.—Sir ANDREW CLARK said that physicians were apt to think that sufficient care was not taken with the feeding after the operation. He inquired what was the nature of the nutrient enemata that were employed? What were the usual materials used for feeding by mouth? in what quantities and at what times? and did the author observe any difference as to nutritive value between fresh foods and preserved foods?—Mr. ROBSON, in reply, said that the sooner feeding was begun by mouth the better. He gave by mouth meat juice, liquid peptonoids, together with a little condensed peptonised milk. He also used nutrient enemata, containing three ounces of ordinary beef tea, half an ounce of the peptonised milk, and a little brandy. He only used opium if the enemata were not retained. He had sometimes used the freshly expressed juice of meat. The great advantage of the bobbin was that it shortened the method. Pylorectomy could only be adopted in very exceptional cases, where the disease was very early. He agreed that gastro-enterostomy was an operation more frequently to be employed, and the more useful of the two. As to regurgitation: in one case it produced the most intense nausea, and appeared to hasten the lethal result, the breath being horrible in odour. He decidedly preferred silk sutures, regarding them as safer. But when Senn's plates were used the bowel had to be perforated, and then it was a disadvantage to use silk. The bobbin enabled one to draw the sutures in the mucous membrane quite tight. It could be introduced through a smaller opening than that required for Senn's plates, and he had used it in situations where the plates were of no use.

Mr. LAWSON TAIT of Birmingham communicated a paper on the Alleged Occurrence of Ovarian Pregnancy, being an explanation of some cases which had been published as belonging to this variety of ectopic gestation. The author published a scheme of ectopic gestation, in which he placed the so-called "ovarian pregnancy" as a first variety, marking it as "possible, but not yet proved." He designated it, even if proved, as a mere pathological curiosity, devoid of all kinds of clinical interest and importance. Since the publication of this scheme several attempts had been made to prove, in recorded instances and preparations, that a real ovarian pregnancy had occurred, the main feature of such cases being the discovery in the wall of the gestation sac of true ovarian tissue, together with the apparent absence of the ovary otherwise than as constituting the sac on the corresponding side. The author advanced another and more recent explanation of the nature of these cases, and he showed by actual preparation and diagrammatic explanation that the broad ligament in its extension over an ordinary parovarian cyst would extend the Fallopian by traction to an abnormal length of as much as fifteen inches, and the same traction acting circularly from the hilum of the ovary could tease out the ovary into a very extensive thin plate of ovarian tissue. Actual specimens exhibited demonstrated this. The traction of the broad ligament in the development of a broad-ligament pregnancy carried on exactly the same process, and, by pulling out the ovary into a thin layer, rendered the discovery of ovarian elements in the wall of the cyst not only possible but inevitable. It was thus perfectly clear that a broad-ligament pregnancy might be—and the author believes that in all these cases had been—mistaken for an ovarian pregnancy.—Mr. ALBAN DORAN brought down a series of specimens to illustrate the lesions that might simulate ovarian pregnancy. The ovary might get jammed between the uterus and the gestation sac as the tube enlarged, and then it became adherent. Freund of Strasburg had based his opinions as to ovarian pregnancy on two operations done at term; but it was quite impossible then to find out the relation of the parts owing to multiple adhesions. When a cyst formed in the broad ligament the tube became stretched in its long axis instead of its short axis, and the same thing happened in a broad-ligament gestation resulting from rupture of the tube. When a tubal cyst burst in this way between the layers of the broad ligament there followed later either direct incorporation of the ovary with the fœtal cyst wall, or the ovary got jammed very tightly between the uterus and the fœtal sac, and then became stretched out over it. In a tubal abortion the ovum, being partly extruded, lay in the fimbriæ, and so might easily become attached to the ovary, and later the tube might retract and become separated. This of course would closely simulate true ovarian pregnancy.—Mr. ROBSON said he had operated on ten tubal gestations, and out of that number he thought that two might have been ovarian, though neither of them turned out to be so on careful subsequent examination. In one case, that of a lady from whom he had already removed a ruptured tube on the right side, he had to operate again on account of a swelling to the left of the uterus, associated with a history like that of ectopic pregnancy. He found and removed a very large apoplectic ovary, but, on careful examination, no trace of membranes could be found in it. The oviduct was apparently quite healthy, and the fimbriæ were normal.—Mr. TAIT, in reply, asked that an addendum might be added to his paper, as he had found that Drs. Hart and Barbour, in the *Edinburgh Medical Journal* for 1888, had predated him; he read some extracts from their paper. His object was to insist on this curious power of movement of the peritoneum which could tease out the ovary into a thin diaphanous lamina. The investigation of these cases required the most extreme care, and he laid so much stress on the importance of this question because his contention, if correct, supported so strongly the views he had already published.

Mr. W. G SPENCER finally read a paper on Amputation in Diabetes Mellitus. The author brought forward evidence to show that the timely adoption of amputation above the knee or elbow for the removal of severe inflammatory complications would prolong life, and very much reduce the amount of sugar excreted before operation. He urged that failures had resulted from amputating through the foot or leg when the vessels had been already narrowed or thrombosed, and that it was useless to attempt the reduction of the sugar by drugs and diet when a severe inflammatory lesion was present. Cases were quoted to show that healing readily took place in diabetics, especially a malignant case of diabetes mellitus attacked with erysipelas and abscess, and which died in diabetic coma three weeks after healing. He then compared two cases: one of suppuration around the femur above the knee with no bone exposed, treated by palliative measures, ending in diabetic coma; the other of suppuration around the elbow with the lower third of the humerus bare, which recovered good general health after amputation through the arm. Urine before operation 1040, 10 gr. to 1 oz. of sugar; after operation 1023, sugar a constant trace. Drugs and diet influenced neither case, except the latter after healing. Reference was made to other cases by Professor Roser, König, Kraske, and Heidenhain. Professor Küster amputated through the thigh in eleven cases of diabetic gangrene: six recoveries—two primary, four after limited ulceration. Sugar before operation—(1) large, (2) 5 per cent., (3) 2 per cent., (4) 3·6 per cent., with one-third albumen, (5) 1 per cent., (6) a trace. Five fatal: (1) In coma at operation; (2) double amputation at seven days' interval; (3), (4), (5) very albuminous urine. Stumps of fatal cases tending to heal without suppuration. Professor Küster's experience in senile and diabetic gangrene was quoted in support of the high amputation advocated by Mr. Hutchinson. Amputation four times of a toe—once through the foot by a Lisfranc, three times through the foot by a Chopart, six times through the leg. All became again gangrenous, and only recovered after secondary amputation through the thigh, except two legs in which the ulceration and necrosis were limited. Three cases of diabetic gangrene under Professor König and Mr. Langton recovered from amputation through the leg after ulceration and necrosis. Primary union had only been obtained after a high operation. Indications for operating in gangrene were mentioned, and cases illustrating the more favourable character of perforating ulcers, including one under Mr. Thomas Smith.

UNDERGROUND DWELLINGS, ST. PANCRAS.—Active steps are being taken by the St. Pancras Health Committee to prevent the occupation of cellar-dwellings in the parish. Legal notices have been served upon all such owners, requiring them either to comply with the Metropolis Public Health Act of 1891, or not to allow these dwellings to be used for human habitation.

Reviews and Notices of Books.

Surgical Diseases of the Ovaries and Fallopian Tubes, including Tubal Pregnancy. By J. BLAND SUTTON, F.R.C.S. London: Cassell and Company, Limited.

THIS is a book that ought to be studied by all interested in the diseases of women, for it is not only a record of personal experience but credit is given to others for work done in this department of practice. The author, however, has difficulty sometimes in utilising the records of cases of several observers—for instance, in regard to the important subject of extra-uterine or ectopic gestation—owing to the erroneous statements made in order to support preconceived notions of pathology. The book consists of four parts, diseases of the ovaries being treated in the first. As a preliminary investigation the subject of menstruation is discussed, for in ovarian and tubal diseases there is often some interference with the menstrual function. In regard to the question of the alleged exfoliation of the uterine mucous membrane during the period, the author's studies of the endometria obtained from young women dying during menstruation induce him to believe that the loss of tissue described by many writers is the result of post-mortem change. With a view of getting more definite information he relates his systematic observations on Macaque monkeys in which menstruation takes place. He could not find any trace of destructive changes either in the uterus or Fallopian tubes, or even shedding of the epithelium, and his "observations threw no light whatever on the source or cause of the hæmorrhage." The second part, dealing with morbid conditions of the Fallopian tubes, ought to be carefully studied. We share the hope expressed by the author that, as so much attention is now being given to diseases of the uterine appendages, it may be possible to formulate more definitely the symptoms and physical signs of these, so that the treatment followed may be rational and not too heroic, thus avoiding the errors which he admits have been made by several of his friends, as in two cases where pelvic pain existed, inducing "surgeons to remove the ovaries, even in the absence of physical signs." He says: "Such ovaries have been submitted to me for microscopical examination, but I have not succeeded in detecting any evidence of disease in them." The chapter dealing with catarrhal salpingitis in relation to adenoma of the cervix uteri is very instructive. In the third part tubal pregnancy is discussed in an able manner, and the eleven chapters form a valuable contribution to our knowledge of many important points connected with this subject of the causes of which we know little. The concluding part of the work discusses the methods of performing operations for ovarian and tubal diseases and the last chapter is occupied with the consideration of the effects of the removal of the ovaries on the secondary sexual characters of women. The book will help to clear up many difficulties connected with the pathology of the diseases of the ovaries and Fallopian tubes. It contains numerous illustrations, nearly all of which have been produced under the author's personal superintendence.

Diseases of the Nose and its Accessory Cavities. By GRENVILLE MACDONALD, M.D. Lond. Second Edition. Pp. 381. London: Alexander P. Watt. 1892.

THE early appearance of a second edition of this eminently practical manual indicates that the author was meeting a recognised want when a little more than a twelvemonth ago he produced the first edition. The study of rhinology is one which has attracted much attention of late years, and it is distinctly an advantage to have an opportunity of studying the methods of diagnosis and of treatment which are followed by one who has had great facilities of working at this subject, and who is yet sufficiently open-minded to feel that the future will remove "some of the prevalent exaggerations as to the remoter effects of nose disease." Much harm is done to the progress of truly scientific research by running any special subject too closely, until general scepticism results, more particularly when the means of diagnosis are thought to be out of the reach of the general practitioner, and the necessity for treatment therefore seems open to doubt. A careful perusal of this manual indicates that the author is quite aware of these dangers, and that he is writing for the assistance and the guidance of those who desire to follow up the study patiently and hopefully. The book literally bristles with practical hints which can be applied by all who are willing to devote the time to acquire sufficient dexterity with the methods advocated and sufficient knowledge of the sometimes slight deviations from normal conditions which constitute removable causes of discomfort, or even proceed, if unchecked, to more serious conditions.

The first two chapters are devoted to the physiology of nasal respiration and to a description of the methods of examining the nasal passages. The influence of diminished air tension in the nose, where the walls are rigid, in causing hyperæmia and in turn leading to increase in bulk of one or more of the tissues affected, thus laying the foundation for hypertrophy and œdema, forms a section which is full of interest, while it is clearly and convincingly stated. Under the heading of "acute rhinitis" three varieties are described—catarrhal, dry, and croupous. The last, which has only recently attracted attention, is of great interest, as the patch so often resembles the false membrane of diphtheria. The author has, however, seen this condition after the application of the electric cautery and he holds that it is merely the expression of the intensity of the inflammatory action in those peculiarly predisposed. The facts here stated seem to have an important bearing upon the occasional appearance of false membrane in other parts of the respiratory passages.

The varieties of chronic rhinitis are dealt with in considerable detail, the value of cocaine in diagnosis is insisted upon and the amount of benefit that may be anticipated from treatment is also clearly stated. Incidentally the author notes the frequency with which reflex phenomena disappear with the removal of forms of nasal obstruction; his experience certainly does not coincide with that of Dr. Goodhart, as expressed in his Harveian Lectures on Common Neuroses. Dr. MacDonald considers that surgical measures are frequently the only satisfactory methods to adopt in cases of hypertrophy; while Dr. Goodhart, hesitating to use the emphatic "never," substitutes practically the Gilbertian equivalent of "hardly ever." The description of the pathology of the development of osseous cysts is new in the present edition, and forms an interesting section; the author is most probably correct in regarding hypertrophy as the first stage which leads on to the formation of adhesions, resulting in the production of a cavity lined with mucous membrane and continuing its secretion. The dangers of the development of sarcomatous or cancerous tumours after the removal of nasal polypus, as expressed by Mr. Erichsen, do not accord with the author's experience. A great deal of space is necessarily devoted to ozæna, and here, as in so many other parts of the book, the symptomatology receives full consideration. The dependence of the odour upon putrefactive changes and the various explanatory theories and observations are duly noted, though it is held that the important distinction between the secretion found in ozæna and simple pus has been neglected and that putrefactive decomposition of mucus, as well as that of pus, may possibly explain the characteristic odour developed.

Digitized by Google

The views expressed upon nasal asthma have become more precise since the issue of the first edition; originally the probable beneficial results of treatment by operation were spoken of hopefully, but with some degree of uncertainty. Further experience has enabled Dr. MacDonald to collect notes of sundry cases illustrative of the benefits which have followed the removal of various forms of obstruction. Still the view is stated, with due reservation, that in any asthmatic patient, whether the disease is spasmodic or bronchitic, any abnormality of the nose should be rectified.

It is impossible within reasonable limits to give further analysis of this interesting book. The section upon post-nasal growths will well repay perusal, and its value is greatly enhanced by the careful illustrations drawn from life by Mr. Proctor Hutchinson. The engravings in the text are admirable and the chromo-lithograph which forms the frontispiece is well executed and free from the usual exaggerations of colour and form which so frequently perplex instead of giving assistance. No pains seem to have been spared in the preparation of the second edition; many subjects have been treated at greater length, and several new illustrations have been added. Having said so much in praise of the volume, and of the clearness and excellence of the original illustrations, it is in no carping spirit that we note the introduction of some few redundant illustrations of instruments, to which evidently but little importance is attached by the author himself, as they are barely mentioned in the text.

ROYAL SOCIETY CONVERSAZIONE.

THE exhibits at the conversazione of the Royal Society on Wednesday last were as numerous as they were on the occasion in May, although several of the apparatus and experiments then shown were, doubtless on account of their interest, to be witnessed again. Lord Kelvin, who was accompanied by Lady Kelvin, received a goodly number of Fellows, but the greater number of those present were visitors. In the reception-room the attention of the company was at once attracted to the extremely interesting water-colour drawings of Greek temples at Athens as they appeared in 1847, illustrative of current investigations by the exhibitor, Mr. F. C. Penrose, on the orientation of ancient Greek temples. These have been recently examined for the purpose of obtaining astronomically their exact orientation as a means of discovering the dates of their foundation. Probably no better specimens of mammoth remains have ever been found in Britain than those fortunately secured and exhibited by Dr. H. Hicks. The remains were discovered in Endsleigh-street, N.W., in March, 1892, in an excavation for the purpose of deepening the sewer at a depth of twenty-two feet from the present surface of the street. When discovered the epiphyses of the bones of the young mammoth shown were detached, but were found close to the shafts. The tusk, which must have been about 12ft. in length, belonged to an adult and much larger animal. Close by this exhibit was a remarkable specimen of a new Theriodont reptile contributed by Professor H. G. Seeley. The back of the head closely resembles Dicynodon, but in other characters it shows remarkable resemblances to a mammal. The molar teeth resemble those of a dog; the articulation of the ribs is mammalian; the dorsal ribs interlock in a way previously unknown; the scapula is also exceptionally mammalian, showing the origin of its spine. The damage to plants caused by London fogs was admirably illustrated in the water-colour sketches shown by Professor F. W. Oliver. The effects are noted at considerable distances from the metropolis, as at Cooper's Hill and Dorking. The injury is most probably due to the direct action of the sulphurous acid of the fog on the living substance of the foliage and flowers, and in others to the cumulative action of deposits of sulphuric acid. The reason, explained Professor Crookes, that, when once nitrogen is set on fire, the flame does not spread throughout the whole atmosphere and deluge the world in a sea of nitric acid is that the igniting point of nitrogen is higher than the temperature produced by its combustion. Nitrogen, however, as he easily demonstrated by means of a powerful coil, is a combustible gas—that is to say, a mixture of nitrogen and oxygen (air) will, under certain conditions, burn with a flame and produce nitrous and nitric acids. An electric current of sixty-five volts and fifteen ampères, alternating 130 times a second, is passed through the primary of a large induction-coil, when an arching flame, consisting chiefly of burning nitrogen, issues from each of the secondary poles meeting at the centre. The flame is easily blown out, but it can be relighted by a taper. The hot gases rising from the flame have a strong odour of nitrous acid, and when it is produced in a closed globe the interior rapidly fills with dense red fumes. Professor Crookes repeated some of the wondrous experiments with electric currents of high potential and extreme frequency which proved such a striking feature of the May exhibition. Mr. Wimshurst, with a powerful machine, gave illustrations of electrical discharges over certain prepared surfaces, the effects vying in splendour with the previous exhibit. As it was shown, when electrical discharges are passed over imperfectly conducting surfaces of considerable area the flashes display branch-like forms resembling lightning. The colour of the flashes can be varied by suitably selecting the conducting medium. With the highest difference of potential the discharge sparks are of great density, and even attain seven feet in length. Mr. G. J. Romanes exhibited some interesting results of experimental breeding, especially with reference to heredity. He holds briefly that the experiments prove the error of those writers who assume that an act of fertilisation consists in the male and female elements intimately blending together after the manner of a merely mechanical mixture, so that the offspring always presents characters more or less intermediate between those of its parents. In many cases this does happen, but in many other cases the admixture of hereditary elements is by no means intimate—those derived from the father and mother appearing to remain respectively grouped together, with the interesting results shown in the exhibit. A very ingenious instrument for measuring the thermal expansion of minute solid bodies up to high temperatures, and even tracing the volume change of the silicates up to and over the interval of plasticity, formed the subject of Mr. J. Joly's exhibit. We may soon expect to handle in everyday use articles made of that light and beautiful metal, aluminium. Stethoscopes, theodolites, telescopes, microscopes, camera fittings, and mounted lenses were amongst the pretty articles of aluminium exhibited by the Phœnix Engineering Company, to show the applicability of the metal to the construction of scientific instruments. Dr. F. W. Edridge Green showed a capital series of coloured pictures executed by colour-blind persons, the pictures showing the mistakes made by the colour-blind in matching colours, the different degrees of colour-blindness being thus represented. Demonstrations by means of the electric lantern fell to the lot of Mr. Savile Kent, Mr. E. B. Poulton, Professor Norman Lockyer, and Professor C. V. Boys. Professor Lockyer exhibited his remarkably fine series of celestial photographs of recent production, while Professor Boys showed his extraordinary photographs of flying bullets. Finally, the visitors were favoured with a mellow but distinct rendering of the opera "Salammbo," as it was being performed in Paris on Wednesday night. The apparatus was exhibited by the Postmaster-General, and a number of telephones were provided to enable ten persons to listen simultaneously.

INFECTIOUS DISEASES HOSPITAL AT CLIFTON.—This hospital, which has been erected by a joint committee representing the Brighouse and Rastrick Local Boards and the Halifax Rural Sanitary Committee, was formally opened on the 10th inst. It is situated at Thornhills, Clifton. The main buildings are of wood, covered with galvanised metal. There are four wards, each having twelve beds, a convalescent ward, matron's and nurses' apartments, domestic offices, and other necessary conveniences for an infectious hospital.

THE LANCET.

LONDON: SATURDAY, JUNE 18, 1892.

AT the meeting of the Council of the Royal College of Surgeons of England held on Thursday, June 9th, the report of the committee appointed by the Council in April, to consider "whether any, and if so what, further advantages can be extended to the Fellows," was received and adopted. When the committee was appointed we were under the impression that it was open to the committee to consider any subject affecting the interest of the Fellows, whether provided for or not in the Charters and By-laws of the College. It would appear, however, from the addendum to the report, drawn up at the instance of three members of the committee—Mr. MACNAMARA, Mr. WILLETT, and Mr. RIVINGTON—and ordered by the Council to be entered on the minutes, that the deliberations of the committee were, for some reason or other, confined to matters not regulated by the Charters and By-laws. That this fact should be placed on record for future guidance and for the purpose of showing that they were not responsible for the limitation of the inquiry was evidently advocated by the three members of the committee already mentioned and opposed as evidently by others; otherwise there would have been no reason for not inserting the words in their proper place in the text of the report. Why the insertion of the words should have been objected to at all in committee it is very difficult for anyone outside the Council to understand; but as they were it is probable that they were objected to equally at the Council meetings, and that the Council decided by a majority that they should stand and be entered on the minutes. Be this as it may, the deliberations of the committee were confined to three principal points—viz.: (1) meetings of Fellows, (2) common room for Fellows, and (3) admission of Fellows as visitors to meetings of the Council. On the third point the committee were not prepared to make any recommendation. With regard to the second point—viz., common room for Fellows,—the committee found that legally there might be some difficulty in permanently assigning any part of the corporate premises to the exclusive use of any section of the corporation, and were not therefore prepared to recommend the provision of a common room for the exclusive use of the Fellows as suggested to the Council by certain Fellows of the College, but recommended "that the room adjoining the secretary's office now forming a part of the library not used by readers be furnished as a common room for the use of Fellows and Members of the College." With regard to the first point—viz., meetings of Fellows,—the committee recommended "that meetings of Fellows apart from the Members, at which the President or other member of the Council acting for him shall preside, be summoned by the President and Council for consultative purposes at such times and for such objects as may by the Council be thought desirable, either with or without a requisition from the Fellows." In making this recommendation, however, the committee thought it desirable to state that in the event of its adoption by the Council it would not, in their opinion, be reasonable to refuse to summon a similar meeting of Members upon the same conditions. The conclusions of the committee confirm the opinion which we expressed last week, that it is not possible for the Council to grant privileges to one section of the Members of the College—viz., the Fellows—without granting similar privileges to the Members at large. The Association of Fellows requested the Council to grant to the Fellows a common room at the College. A committee of Council takes the opinion of the legal advisers of the Council, and recommends the Council to grant a common room for the use of the Fellows and Members. The Association of Fellows pressed upon the Council of the College the advisability of consulting the Fellows apart from the Members. The committee of Council, acting again, we presume, under legal advice, recommends the Council to adopt this course, but at the same time intimates that if a meeting of the Fellows is summoned by the Council to consider any special topic, the Council could not reasonably refuse to call a similar meeting of Members if the Members wished for it. This result ought materially to strengthen the hands of the Association of Members of the College in their efforts to raise the constitutional position of the Members, and should be an incentive to increased exertion and final success. It also suggests the question, What, after all, have the Fellows gained from the goodwill of the Council and the inquiries of the committee? They have gained one point, and one only, and that is the privilege of being consulted by the Council separately from the Members. This is a privilege of considerable importance, but it is only a privilege to be enjoyed at such times and on such occasions as the Council think desirable, and is revocable at the pleasure of the Council. To be of real value the privilege should be converted into a right by the sanction of a Charter. Moreover, the proceedings of an assembly of Fellows should be regulated according to the rules governing similar assemblies at other institutions. The meetings at the College of Surgeons are distinguished by an utter absence of proper organisation and rules of procedure, and the Council of the College appears to entertain a special predilection for casual assemblies summoned at random and without any special purpose. Such is to be the meeting of Fellows which the Council proposes to hold after the election at the College on July 7th. The Fellows are to be invited to meet the Council, but whether for convivial purposes, for admonition, for instruction, or for any other end, the Council does not specify. This method is peculiar to the Council of the Royal College of Surgeons of England, which will not submit to any kind of restriction on the free exercise of its good pleasure and authority. It certainly wears the aspect, and is open to the interpretation, of elaborate trifling; but probably it is the result of a determination to prevent the Council from advancing in accordance with opinion outside the Council except at a snail's pace. The promoters of the meeting must have had some object in view in summoning it; but why the object should not be stated is beyond the reach of any ordinary intellect outside the Council chamber, and we must wait for the meeting itself before the veil can be withdrawn. It is of little use to waste time in specula-

Digitized by Google

tion upon the subject, and probably the oracle would only return an ambiguous answer if directly interrogated. The practical point is for all Fellows who are interested in the constitutional reform of the College to attend the meeting and to be prepared to move resolutions in favour of those principles which must commend themselves to a large majority of the constituency of the College.

WE are only at the beginning of the system of notification, and there will be much need for patience, in the case both of those who notify and of magistrates who have to act upon the certificates of medical men. A case has just been heard before Mr. CURTIS BENNETT at the West London Police-court which thoughtless people will say illustrates nothing but the differences of doctors, but in which sensible people will see a striking illustration of the difficulties of medical practice. It was the case of the child of a Mrs. WILLIAMS, who keeps a mangle, and the patient was thought by Mr. COONEY, the district medical officer and also medical officer of health, to be suffering from scarlet fever on May 19th. The child was in a room with three women and two other children. Nothing could be more anxious than the right diagnosis and disposal of such a case by a gentleman officially representing the medical interests of the district as Mr. COONEY did. Nothing could be more urgent than the duty of having the child removed from such apartments, in the interest of the public and the remaining children, if the case were really one of scarlet fever. On the other hand, if it were not so, its removal would be an intolerable grief to its mother, who had already lost many children, and a grave risk of infection to the child itself. The mother did not accept Mr. COONEY'S diagnosis, which he followed up by sending the ambulance. The mother meantime sought other opinions, including that of Dr. W. F. CLARKE, as undoubtedly a poor person is entitled to do as much as her richer neighbours. Mrs. WILLIAMS had sent for Mr. JOSEPH HENRY BUTLER before sending for Dr. CLARKE, but he declined to take charge of the case, as Mr. COONEY had seen it. Dr. CLARKE was quite unaware all the time that any other medical man was attending. He could see no symptom of scarlet fever, but observed a little bronchitis with slight fever and enlarged tonsils. Such is the simple case out of which has arisen a remarkable difference of medical opinion, and in which the bench itself has not shown to the best possible advantage. Mr. COONEY and Dr. CLARKE acted independently of each other. They each fortified themselves with other medical opinions, and in the long run no less than nine gentlemen were involved in the diagnosis of this poor little child's case, including such experts as Dr. CAYLEY, Dr. SIDNEY PHILLIPS, Mr. BRUCE, medical superintendent of the Western Fever Hospital, and others. Of the nine, three were in favour of the diagnosis of scarlet fever, including Mr. BRUCE. Five were decidedly against it, including Dr. CAYLEY and Dr. PHILLIPS. Mr. WOODHOUSE was uncertain. He thought the child should be isolated, but did not like definitely to say that it was infectious. Dr. CAYLEY recommended the child for admission to the Middlesex Hospital, showing how absolute was his conviction of the absence of scarlet fever or any other infectious disease. The magistrate, after the order for the child's removal to an infectious hospital had been given, was very angry with Dr. CAYLEY for having recommended this. It is to be regretted that he would not hear Dr. CAYLEY'S explanation, and even declined to accept his statement that when he visited the child he was not aware of the controversy that was raging round its case. Whether Dr. CAYLEY was right or wrong, no one who knows him will for a moment hesitate to accept with implicit confidence his disclaimer of any intention to act disrespectfully to a magistrate placed in the difficult circumstances in which Mr. CURTIS BENNETT was placed here. The case is a very striking illustration of the difficulties of diagnosis. So few details are given that we cannot pretend to form an independent opinion. As to the question of peeling, there is the greatest variety of statement, Dr. CLARKE, perhaps, letting in a little light in a sentence, "There was a small rough patch on the chest, and if that spot was looked at it might have misled anyone."

Mr. CURTIS BENNETT—when finally trying the mother for disobedience to his order for removal—inclined to the opinion of the minority, and, believing that there were some substantial friends behind the poor woman with the mangle, inflicted a penalty of £10, and £2 2s. costs. Notice was, however, given of appeal. Mr. CURTIS BENNETT intimated his intention hereafter of acting on the certificate of the person in attendance. He should be the best judge of the law in this matter; but we venture to suggest that the very use of a magistrate is in cases where there is a conflict of testimony. It is for him to hear and weigh the testimony of both sides and then decide independently. As to the medical lessons of this case, they are on the surface. Where there is the least doubt, even in the case of a pauper, there should be delay and consultation; and if doubt still remains, the patient should have the benefit of the doubt, and not be sent into an infectious hospital. We cannot assign exact blame for so much independent and contrary action in this case; but it is to be regretted that Mr. COONEY and Dr. CLARKE did not, at an early stage, confer together to prevent so remarkable an instance as this case affords of professional difference. We have long foreseen the difficulties of the legislation that exposes the medical facts of homes and invades the liberty of families; but with a little patience and conference with medical brethren these difficulties can generally be overcome. It will be necessary for the law to provide means in doubtful cases of obtaining decisive testimony.

THE advent of Hospital Sunday brings us a publication of deep, not to say romantic, interest entitled "Fifty-two Years' Medical Work in Jerusalem." It reminds us that the parent city of Christianity itself witnessed the first attempt to establish medical missions in the world. This was made in 1824—a year of pestilence, destitution, and misery, such as even Jerusalem in its long and tragic history has rarely experienced. The success of the solitary medical missionary, Dr. DALTON, who then came to its relief, was such that the erection of a hospital for

Digitized by Google

the continuance of his work on a more extended scale approved itself to many in England. So in 1842, after much difficulty, a beginning was made with the present building. Its twelve beds were, four years later, supplemented by another twelve, and the hospital has since then undergone many internal improvements. Situated as it is in the Jewish quarter, within the city walls, in a locality which we would call decidedly insanitary, and surrounded by dirty, ill-drained streets, it required every favourable adjunct possible to minimise these grave disadvantages. The publication above referred to presents us with a series of illustrations from photographs of its outside aspect and its internal economy, and from these a vivid impression can be formed of the conditions under which the medical mission has prosecuted its fifty-two years of work. Representations of the *personnel* of the hospital and of its characteristic patients, male and female, are included in these pictures, and add an intensely human interest to the statistical report. A few facts culled from this will attest the widespread usefulness of the hospital. All sects and classes of the Jewish people, from far and near, many of them slaves to the darkest superstitions, find their way into it—Egypt and Syria, India in the far East and Morocco in the far West, sending their contingents; while immigrants from Russia, Poland, Austria, and Germany are from time to time represented. The Jews from these latter countries have more vigour of character than their eastern and southern co-religionists, and the missionaries find them more bitter opponents of Christianity; but all of the race, without distinction of locality or tradition, leave the hospital with gratitude for the benefits they have received, and favourably impressed with the civilisation to which they owe them. From 1860 to 1891, inclusive, there have been treated in the out-patient rooms 256,937 cases of disease and accident, 19,018 in-patients have been admitted, more than a quarter of a million visits have been paid to sick Jews in their own homes, and 884,132 prescriptions have been dispensed. The care and skill of the medical officers have been equal to the more difficult cases of confinement, wounds, fractures, and lesions or malformations requiring surgical intervention, so that the report can with justice put it on record that "the reputation of the hospital for the successful treatment of such cases is spread far and wide amongst the Jewish race." Our readers must turn to the report itself for the personal history—often romantically interesting—of the poor beneficiaries of the hospital. Its details will also convey some idea of the difficulties, religious and racial, with which the medico-missionary staff has had to struggle. For one remark, however, we must find room: "No forced proselytising is allowed." This is very reassuring and cannot fail to produce for the hospital a sympathy and support which are too often alienated by the paladins of aggressive Christianity. When conversions are made they are all the more sincere and permanent from having been unsolicited—from having been, in fact, brought about by free and unconstrained access to the teaching, by example as well as by precept—enjoyed by the inmates. In these circumstances, is it surprising that the resources of the hospital are annually becoming less equal to the demands made upon them, occasionally "fifteen individuals asking for one bed?" Jews, moreover, are now returning in great numbers to their own land; more than 40,000 are already in and around Jerusalem, the majority of them (according to the report), especially those from Russia and Yemen, being poor, friendless, and sickly. A new building is, therefore, urgently needed, and a site is available on the Society's sanatorium grounds, which, we learn, are very healthily situated, outside the city, in the midst of the new Jewish settlements. The plans, on the pavilion or detached-ward principle, have been designed by an able and accomplished architect, and are adapted to fulfil every sanitary condition required by a clinical institution; £8000 will cover the cost of it, and of that sum rather more than £5000 are already in hand. An appeal from the chief medical officer, following as it does upon such a record of noble work as we have been able to indicate, ought surely to find an effective response, at this season especially, on the recurrence of the new festival added to the Christian year. Civilisation owes incalculable benefits, even on the testimony of agnostics, to the movement that started and radiated from Jerusalem. Is it asking too much for some practical recognition of the fact by opportune support of a charity whose site is Jerusalem itself, and whose objects are the least favoured of the Jewish race?

Annotations.

"Ne quid nimis."

THE JUBILEE OF THE FELLOWSHIP OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

BEFORE the end of the year 1893 the Fellowship of the Royal College of Surgeons of England will have been in existence for fifty years. This circumstance would probably have escaped the attention of the Fellows generally, and it was a happy thought on the part of Mr. Willett, who remembered it, to have proposed at the Council meeting on March 10th last: "That it is desirable to celebrate in some suitable manner the fiftieth anniversary of the institution of the Fellowship of this College (the Charter creating this order being dated Sept. 14th, 1843), and that a committee be appointed to report on the best means of giving effect to this resolution." The proposal was seconded by Mr. Rivington, carried unanimously by the Council, and referred to the Committee on Advantages to Fellows. At the last meeting of the Council a report, dated May 30th, 1892, was received on this subject from the committee and adopted. The suggestions of the committee thus adopted by the Council were: "1. That the jubilee of the Fellowship be celebrated on Thursday, July 6th, 1893, the date of the annual meeting of Fellows for the election of members of the Council. 2. That a conversazione be held at the College on the previous evening, Wednesday, July 5th, 1893. Cards of invitation, admitting ladies, to be sent to the Fellows of the College. Members to be invited on applying for cards of invitation. 3. That an address be given by the President in the theatre of the College, at 1 P.M., on the Thursday before the opening of the ballot for the election of members of the Council. 4. That a Fellows' dinner be held on the Thursday evening at some convenient place." These arrangements must be carefully distinguished from the concessions granted by the Council to the Fellows which we have discussed in a

Digitized by Google

separate article, for they have no necessary connexion with bestowing any permanent privileges, and are merely of the nature of social amenities which might or might not be followed or accompanied by any constitutional *rapprochement* between the Council and the Fellows. It is the more necessary to make this distinction, because, whilst it has been determined by the Council that meetings of Fellows shall be summoned for consultative purposes separately from the Members, and that the Council shall invite the Fellows to meet it on July 7th next at 5 P.M., in the theatre of the College, or, in other words, that the separate meetings of Fellows shall be inaugurated on the day of the ensuing election, no mention whatever is made of any *bonâ fide* meeting of Fellows in July, 1893. On that day the Fellows present at the College at 1 P.M. will be addressed by the President, but apparently they are not expected, or to be permitted, to address the President in reply, or to move any kind of resolution other than, it may be presumed, a vote of thanks for his congratulatory remarks. This appears to us to be a decided omission on the part of the committee, for the most convenient day in the whole year for a meeting of Fellows in the theatre of the College would be the day of the annual election, and it would be a substantial concession to the Fellows if such a meeting were to be held every year, other meetings of Fellows being called by the Council when necessary, or in pursuance of a requisition signed by a sufficient number of Fellows. Of course the Council can at any time between the present date and July, 1893, rectify the omission, and perhaps it was thought desirable to hold the first meeting of Fellows experimentally on July 7th next, and to await the issue of events before finally committing the Council to a course which, to observers outside the Council, seems to be the most convenient and reasonable course that can possibly be adopted. We fancy that some members of the Council are strongly impressed with the idea that among the Fellows as well as the Members there are, politically, two classes, the sheep and the goats—the former timorous, deferential, subservient, and blindly following the official lead; the latter bold, self-contained, independent, and not amenable to disciplinary influence—and that it is absolutely necessary to adopt the most rigid precautions to repress their natural aggressiveness, as it cannot be expected that the goats will ever be converted into sheep. Another leading idea in the same minds seems to be an instinctive horror of the organisation known as the Association of Fellows. Probably the mention of the Association in the Council chamber has the same effect as waving a red flag before a bull; and the idea that the Association may derive some credit or advantage from the adoption of any particular step may be sufficient to induce these members of the Council to support measures which will prove least acceptable and advantageous to this particular organisation. If this is the keynote to any of the least comprehensible decisions of the Council it is to be regretted, for we fancy the Association will be content if the policy which it has been advocating is adopted by the Council, even though the credit for this result should be ascribed to the very members of the Council who have been the most active in opposing the concessions urged by the Association, with perseverance and success, upon the Council of the College.

THE VENICE SANITARY CONFERENCE.

THE renewal of the Venice Conference between representatives of Great Britain, France, and Austria at Paris has resulted in the signature of an amended Convention dealing with vessels arriving at Suez on board which cases of cholera have occurred within the preceding seven days. The new Convention has not yet been published, but it is generally understood that it embodies very considerable modifications of the conclusions arrived at in Venice, these modifications being in the direction of the views which have all along been entertained in this country. The changes are especially favourable to the better class of passenger vessels, which carry a medical man and means of disinfection; indeed, instead of a general disembarkation of passengers which was formerly held to be necessary should a case of cholera occur on board, the persons who are to be regarded as suspect are now limited to the actual attendants on the sick, and even these can remain on board for the limited term of observation unless it is desired that the vessel should proceed through the canal in quarantine as soon as the disinfection is completed. Compulsory landing is now confined to actual cholera patients, and it is explained that any real hindrance to commerce is hardly ever likely to occur under the new regulations; indeed, during the past seven years only two vessels out of many thousands would have been subjected to any of these restrictions on the ground that they were contaminated. In the event of cholera actually appearing at Suez the regulations are more stringent; but this will hardly be objected to, for Suez is an Egyptian port, and the Government of Egypt have the same right as any other Government to protect their ports from any actually prevailing disease that is brought into them. A strong hope is expressed that the European Powers who assented to the Venice Convention will agree to the modifications arrived at in Paris, so that discussions of many years' duration may at last come to a satisfactory termination.

LEPROSY.

IN the *Daily News* of June 13th appeared a communication from the Berlin correspondent of that paper, giving an account of an interview he had recently had with the English Red Cross nurse, Miss Kate Marsden. This lady had not long since returned from Siberia, where she had been engaged in gathering information concerning leprosy in that part of Russia. The Queen and the Princess of Wales had actively interested themselves in the object of Miss Marsden's journey, and had furnished her with letters of introduction to the Czarina. At St. Petersburg the nurse was very well received. The Czarina and Czarewitch between them subscribed a large sum of money to help to meet the cost of the nurse's journey and the Czarewitch "provided her with a letter to the various governors of the provinces through which she must pass, requesting them to grant her all the assistance in their power." Miss Marsden travelled to further Siberia and there, in the district of Yakutsk, began her inquiries and personal examination concerning leprosy. The disease is said to affect in that part of the Russian empire a tract of country which extends to some thousands of *versts*. "No provision whatever is made for the care of the sufferers." Whenever a person is ascertained to be a leper, he is "driven into the forests and never allowed to come again into contact with his fellow creatures." The lepers herd together in huts, "half built, half excavated from the ground." There these poor creatures exist with a few old sheepskins for their only clothing; and for food they have "small quantities of rotten fish, and the bark of trees,"—and that is all! The rotten fish is left near the leper huts by the relatives of these miserable outcasts. From this fact we may perhaps see reason to doubt the accuracy of the statement quoted above to the effect that these Siberian lepers are not allowed to come into contact with the non-leprous population. Miss Marsden is reported by our contemporary to have said that these lepers were "of all ages and in all stages of disease, but in many instances their condition was such that they had lost all semblance of humanity." These leper colonies are subject

Digitized by Google

to no kind of supervision; and their inhabitants live in a condition of indescribable filth and vice. Miss Marsden has succeeded in forming a committee at Yakutsk, consisting of the governor of the district, two priests, and some of the leading inhabitants of the neighbourhood. This committee proposes to take steps to obtain all that is needed to ensure the establishing of a leper colony in the district and to place the lepers there under proper and kind supervision. Miss Marsden proposes to return to Yakutsk, to help in this good work. On her return from Siberia her report created so much interest in Moscow that a "Russian princess, in one of the convents there, with five Russian Red Cross sisters, volunteered for service in the leprosy-stricken district." It may not be out of place to remark that we have our own lepers in India and elsewhere. His Royal Highness the Prince of Wales did excellent service a few years ago in directing public attention to England's responsibilities in this direction. As a consequence of the Prince's action, Commissioners (three of their number were sent from England) have examined and reported upon leprosy and lepers, as the disease and its victims are seen in British India. This report, not quite complete, but very nearly so, was brought to London last January, and, we understand, has itself been reported upon by a select committee appointed for that purpose by the National Leprosy Fund Committee and by the two Royal Colleges of Physicians and Surgeons. We venture to express a hope that this good work, so energetically commenced by the Prince of Wales, will be as vigorously pushed on in the direction of some practical outcome. From America, from many of our own colonies, and from very many other parts of the world, we hear of attention being turned to the subject of leprosy, because, rightly or wrongly, people begin to fear that this dreadful disease is spreading—no doubt slowly—among people who were previously free from leprosy. It is very certain that if the disease is to be stamped out at all, it is now, and not in the uncertain future, that a determined effort in this direction should be promptly made. England has hitherto been often the first among the nations to lead the way in sanitary progress. We think it would be well worthy of her were she to take prompt and decided measures for ensuring the proper and kind treatment and control of the leper populations, which are only too numerous among the many races who are the subjects of the Queen.

LORD WANTAGE'S COMMITTEE.

THE debate on the report of Lord Wantage's Committee took place on the 10th inst., on the return of Mr. Stanhope to parliamentary work. We congratulate the War Minister on his recovery and reappearance in the House. The result of the debate was exactly such as might have been anticipated. The report of the committee, the voluminous evidence on which it was founded, and the conflicting opinions of the various speakers who took part in the debate, all served to indicate that the subject was beset with difficulties; and that if there was any general agreement as to the necessity of something being done, there was practically none as to what should be done. There is complete unanimity as to the excellent quality of the British army in India and abroad. All the contention is about our battalions at home and the quality and sufficiency of the recruits by which our army at home and abroad has to be maintained. Even had there been a strongly expressed general agreement as to the nature of the measures required, the fact of our being upon the eve of a general election would have been a sufficient reason for a War Minister's refusal to do anything at the present time. It must be confessed that Mr. Stanhope had no great difficulty in making out a case for delay and further consideration. He is absolutely sceptical as to the probability of improving the quality of our recruits by an increased pay. We get youths now, and men of over twenty years of age would not be attracted to the army in any large numbers by a small increase of pay to the individual, which would, however, in the aggregate amount to a very large sum. It must be borne in mind, too, that there is no going back. Once any increase of pay has been introduced, whether it succeed or fails of its object, it can never be decreased again. We think, however, that sooner or later it will have to be done as an act of equitable and fair dealing with the soldier; meanwhile, there is one source of unpopularity and irritation which should be removed, and that is the stoppages now imposed upon the soldier. It is contended that instead of men we are getting boy soldiers and maintaining nursery battalions. If so, why do we not go a step further, and imitate the navy in training up boys for subsequent service as soldiers? It has been recommended by the Duke of Cambridge and Lord Roberts is strongly in favour of that measure. There are a number of small reforms which might be effected. We are glad to see that the lot of non-commissioned officers is to be made more attractive—a highly desirable measure. If the nation cannot pay in one way it should in another, and we are of opinion, although many may not agree with us in this, that the day has come for increasing the number of commissions to be given to intelligent and steady men for gallantry and good work as soldiers. There should be a sufficient stimulus in this direction for a young fellow of ambition to feel that all was open and possible to him in a military career. While we consider that there are still many small and irksome regulations and customs in the army, as affecting the rank and file, which might be done away with and the removal of which would tend to lessen the differences between civil and military life without any injury to discipline, no one can shut his eyes to the fact that the soldier's condition has been enormously improved of late years, and it is but justice to Mr. Stanhope to declare that he has been second to none in his efforts in this respect during his turn of duty as War Minister. With regard to Lord Roberts and the Wantage Committee, we think it is to be much regretted that the views expressed by the Commander-in-Chief in India, as set forth in *The Times*, were not embodied with the published evidence in the form of an appendix. The position and rank of Lord Roberts, as well as his experience and reputation, give him every title to be heard; and the evident care and thoughtfulness with which his views have been formulated, required that they should be put on record and thoroughly considered, as they will surely have to be when the subject again comes up for deliberation and debate in a new Parliament.

HORRORS OF THE HIGHWAY.

"THE nineteenth century omelette," says Mr. Frederic Harrison, "entails a terrible smashing of eggs," as the shortened lives of our beasts of burden in great cities too painfully testify. The omnibus traffic, in London especially, is becoming more and more of a harrowing sight, its sacrifice of horseflesh adding another to the many trials which the humanely minded among us have to undergo as we daily thread the streets. The strain imposed on these poor animals is sometimes appalling to witness, and hardly a week passes without numbers of them sinking under their load and dying where they fall. Twice last week, between Sloane-street and Piccadilly, a horse might have been seen to succumb on the incline and after a few convulsive heart-heaves to breathe its last. In each instance it was a case of the *cor ruptum* of Boerhaave, not to be wondered at when the severe and continuous effort that preceded it is considered. The animals are as powerful as can be procured; they come mostly from France, specially imported for their strength and endurance. But the omnibus which

Digitized by Google

they are made to drag in pairs is at least a ton in weight before a single passenger enters it, and when it is full—fourteen outside and twelve inside, often with heavy packages in addition, the driver and conductor bringing the total up to twenty-eight—some notion of the exertion required to pull it at a brisk pace uphill may be imagined. Nor is this all. The incessant stoppages imposed by passengers who get up or down along the route, when half a minute more might bring them to a point where the vehicle pauses by regulation, add enormously to the strain exacted from the long-suffering animals. At the briefest of intervals they have to put on a fresh spurt, often on a slippery wood pavement, simply because some thoughtless "fare"—possibly on his or her way to an anti-vivisection meeting—will not take the trouble to wait till the 'bus "stops by nature." True, the hours during which the horses are made to do this work are few and far between; but that, even with this provision, the work itself is cruelly in excess of their powers is evident from the fact that the strongest of them rarely last more than two years. They are well fed and comfortably stalled; but not even such favourable conditions can prolong their lives to the normal term. The Society for the Prevention of Cruelty to Animals has just held its sixty-eighth meeting, but amid much good work it has effected for our "dumb servants" we miss in its report an adequate appreciation of the sacrifice of horse-life to the omnibus Juggernaut. It might surely spare a little of the time and energy it expends on painless vivisection to intervene in favour of our over-wrought draught cattle, and contribute in some degree to minimise the "horrors of the highway."

THE TREATMENT OF HILL DIARRHŒA.

THE May number of the *Indian Medical Gazette* contains a valuable paper on this subject by Surgeon Lieut.-Colonel A. Crombie, M.D., the surgeon superintendent of the General Hospital, Calcutta. He says that every cold winter he sees a number of patients who give the history of having suffered from hill diarrhœa during the previous summer; but who, in detailing the treatment which they have received, do not mention the remedies which have been found to be very efficacious in his own experience and in that of others. Without going minutely into the causes of hill diarrhœa it may suffice to say that it is a disease liable to occur at hill stations where the elevation is 6000 feet or more above the sea level. One of its peculiarities is that, in recent cases, the diarrhœa is confined to one particular portion of the day, beginning between 3 and 5 o'clock in the morning and lasting until 9 A.M. It is a disease of adults; children under twelve years of age being very rarely affected. Many persons going from the plains of India on reaching an elevation of 6000 feet immediately begin to suffer from symptoms of dyspepsia and flatulent distension of the stomach and intestinal canal. These symptoms may exist with or without diarrhœa. In the former case the motions are very light in colour, like whitewash, liquid, and frothy. On the approach of monsoon influences the hill diarrhœa becomes an epidemic. In July, 1880, at least one-third of the population of Simla suffered from it; and had the epidemic been one of cholera instead, with its attendant mortality, it is questionable whether the survivors would have been sufficiently numerous to have buried the dead. Dr. Cromble considers that it is not a true diarrhœa, but an indigestion due to an imperfect secretion of the digestive ferments generally, including those of the bowel. The treatment consequently consists in supplying the deficiency in the secretion of these ferments and in the administration of intestinal antiseptics to check the abnormal fermentation set up by the absence of bile and other secretions in the small intestine. The line of treatment indicated is threefold. Living at high altitudes being the principal cause of the disease, all that is necessary for its cure is a return to a lower level. In early cases this alone is sufficient to put a stop to the symptoms in twenty-four hours. In the second place, the epidemic being closely related to the monsoon influences, those liable to hill diarrhœa should leave the hills at the beginning of the rains, as is now done at Darjeeling every year. The third measure consists in the administration of pepsine, the extreme usefulness of which was accidentally discovered by Dr. John Anderson and Dr. Crombie in 1881, and in the use of perchloride of mercury, the value of which in tropical diarrhœa was recognised and pointed out by Surgeons Macpherson and Barry. Peptonised milk, or ten or twelve grains of pepsine or ingluvin two hours after food, is generally sufficient to relieve the symptoms. The solution of the perchloride of mercury is best administered ten or fifteen minutes before each meal. Dr. Crombie appends the notes of various cases in illustration of the foregoing statements.

SCARLET FEVER AT WATFORD AND BUSHEY.

A CONSIDERABLE prevalence of scarlet fever is in progress in and about Watford, and the isolation hospitals being full, the rural sanitary authority have taken some cottages at Bushey to serve as a hospital. This action has evoked strong condemnation on the part of some residents in Bushey, and this the more because the cottages are alleged to be without any open space in which patients can take exercise, and because they are in consequence without any needed space between the infected buildings and neighbouring property and roads. The truth is that the time has passed for suddenly improvised hospitals, and it is to be hoped that the Watford urban and rural authorities will seek a proper site and erect on it a proper hospital, which shall serve ordinary purposes and admit of temporary extension in case of sudden emergencies.

COPPERED GREEN PEAS.

ANOTHER attempt to prosecute a vendor for having sold preserved peas to which copper sulphate had been added has failed. The peas were certified by the analyst of Liverpool city to contain copper equivalent to one grain of copper sulphate per pound. The stipendiary magistrate decided that the Act of Parliament did not prohibit anyone from using a substance of this kind to preserve the natural colours of a product if it could be done harmlessly. He did not think it was a case of fraud; and though copper had evidently been used, it was in such a form as not to be injurious. He therefore dismissed the case; but he wished not to be considered to be laying down any general maxim on the question at large. As happened in the recent Glasgow case, the opinions of professional experts as to the innocuousness of copper compounds in the form and quantity present in peas so preserved differed widely. Some held that the copper salt being converted into an albuminate was non-injurious, because insoluble. The research of Drs. Charteris and Snodgrass[1] would indicate, however, the contrary to be the case, for in their experiments they showed that albuminate of copper was rendered distinctly soluble by the digestive process. It is quite evident that until it has been decided that copper salts used in this manner are really injurious to health, no case under the present wording of the act can be established. The greening of peas by this means is of course an unnatural process, and copper is not a normal ingredient of vegetables. Copper compounds are unquestionably irritant poisons, and it is a significant fact, as we have pointed out before, that though the sulphate is used merely to impart a fresh appearance

[1] THE LANCET, Jan. 23rd, 1892, p. 190.

Digitized by Google

to the peas, the French Government have prohibited its use in this way so far as home trade is concerned, although they permit the adoption of the *reverdissage* process where the peas are intended for export purposes only. Surely it is high time that the question as to whether copper in peas is injurious or not should be once for all decided. Then taking proceedings will not be a farce, and much of the valuable time and labour which are at present lost by the magistrate, the analyst, and others engaged in such cases will be saved.

EFFECTS OF AN OVERDOSE OF CODEINE.

AN overdose of codeine is not a common occurrence, and therefore Dr. Mettenheimer, who has met with such a case, has reported it. An elderly lady consulted him for a slight catarrhal, non-febrile affection which, however, gave rise to a troublesome, spasmodic form of cough. For this he prescribed 0·03 gramme (about half a grain) of phosphate of codeine, in the form of a pill, to be taken every three hours. The patient, however, swallowed four of these pills, or about a grain and a half of the codeine salt, at once. Shortly afterwards she vomited twice and suffered from abdominal pain. There was, too, suppression of urine and she felt very ill, being sleepy but unable to go to sleep. The next day she was still drowsy and had no appetite but there was no return of the sickness. She was then seen by Dr. Mettenheimer, who found the pupils contracted, the pulse hard and quick, and the respiration accelerated. The cough had entirely disappeared. The contracted state of the pupils, the loss of appetite, and the abdominal pain persisted for several days. No urine was passed until thirty-six hours after the pills were taken. On the third day the drowsiness had passed away. The cough did not return for a week and when it did it was comparatively slight. This case seems to show that codeine in large doses has a very similar effect to opium and that it may prove a most efficient remedy for some kinds of cough. As the tongue remained clean it would appear that the vomiting was due to cerebral, rather than to gastric, irritation.

CONGENITAL DILATATION OF THE COLON.

A REMARKABLE case of defective formation of the colon, leading to habitual constipation and an enormous accumulation of the contents of the bowel, is described by Dr. Formad in the June issue of the *University Medical Magazine* (Philadelphia). The condition is one of great rarity, and is the converse of that described in these columns last week by Mr. Dodd (p. 1299). The subject of this malformation was a male twenty-nine years of age, who died suddenly when at stool. From his infancy his abdomen had been of large size, and he was subject to attacks of constipation often lasting for some days. Although from the age of sixteen he was engaged in work (first at a foundry and then as a labourer at an oil refinery), he continued to be subject to constipation, sometimes lasting for a month at a time, and his abdomen increased in size, so that at twenty years of age he was exhibited in a "museum" as a "freak," and was known as the "Wind-bag" or "Balloon-man." "It is said," writes Dr. Formad, "that the circumference of his body at this time was equal to his height, and that he was able to diminish or increase the circumference of his abdomen and chest at will to the extent of fourteen inches." He was a great eater and occasionally intemperate. For a short time he became an inmate of a hospital, where, after an examination under ether, it was concluded that the case was one of simple enlargement of the colon. Shortly after leaving the hospital he died suddenly as stated. After death the circumference of the abdomen measured 7 ft. 2½ in., and that of the chest below the nipple 5 ft. from the eversion and straightening of the ribs; whilst the height of the body was 5 ft. 7½ in. There was general emaciation. The diaphragm was pushed up by the distended abdominal viscera to the level of the third intercostal space anteriorly and the fifth dorsal vertebra posteriorly. The heart occupied a horizontal position to the axis of the body, its apex being about the second left interspace. The colon was of enormous dimensions, appearing to be about ten times wider than normal. Its total length was about 8 ft. 4 in., and the circumference of its several portions was as follows: Cæcum, 10 in.; ascending colon, 15 in.; transverse, 15 in. to 30 in.; descending, 24 in. to 25 in.; sigmoid, 25 in. to 27 in.; thus gradually increasing in width from the cæcum onwards, its widest part being in the transverse colon. There was no kinking or mechanical obstruction of any sort. The contents of this enormously overgrown gut consisted of semi-fluid fæcal matter of dark brown tint, weighing 40 lb. and presenting no abnormality either on microscopical or chemical examination. The rectum as well as the whole of the small intestines were perfectly normal in size. The coats of the colon were not unduly thick, but there was a marked absence of sacculation and of epiploic appendages. There was some thickening of the coats of the stomach, but no notable changes in the other viscera. Dr. Formad enters into the literature of the subject and concludes that in such cases there is primarily a congenital defect in the formation of the muscular coat of the bowel which favours fæcal accumulation; and he thinks it very probable that the innervation of the colon is also at fault. One remarkable feature about the case is the tolerance established by the long-lasting constipation. The man does not appear to have suffered from symptoms attributable to fæcal absorption, nor was there any of that ulceration of the mucous membrane so common in cases of accumulation from chronic obstructive disease.

THE WATER-SUPPLY OF BUDA-PESTH.

A FEW days ago his Majesty the Emperor Francis Joseph proclaimed the town of Buda-Pesth the second capital of the Austro-Hungarian empire. Henceforth Buda-Pesth will rank side by side with Vienna. This completes the full recognition of the autonomy of the Hungarian kingdom within the Austrian empire. To the sanitary reformer the town of Buda-Pesth is of especial interest, because it is in the capital of Hungary where the next International Congress of Hygiene will meet. It is to be hoped, however, that between this and then a proper water-supply will have been obtained. The insufficient quantity of pure water at the disposal of the inhabitants of Buda-Pesth is an old and yet urgent grievance. The difficulty would probably have been already overcome but for the divided opinion of the local authorities. Temporary waterworks were constructed on the borders of the Danube in 1867 and have since been enlarged; but they do not suffice, and in many parts of the town the unfiltered water of the Danube is consumed. This water receives not only the contents of the sewers of the town but also the drainage of several hospitals. A project was started for obtaining water from the subterranean water shed of the Kaposztasmegyer district which is only about seven or eight miles distant from the capital. The soil there is composed of gravel, some thirty feet deep, resting between two layers of clay. This constitutes a natural filtering bed. The engineer of the town, however, doubts whether the supply from this source will always be sufficiently abundant. Herr Salback, engineer, from Dresden, was called upon to arbitrate in the dispute, and gave a verdict in favour of the project. The water from this source is described as varying in temperature from 10° to 17° C., and as containing from 232 to 304 inoffensive bacteria per cubic

Digitized by Google

centimetre. It was proposed to dig some thirty wells at about 200 yards from each other, and a yield of 235,000 cubic metres of water per day, it is thought, could be obtained. For Pesth half this amount would suffice, while Buda, the other half of the town, being on the other side of the Danube, has a separate supply. The intake seems somewhat nearer to Pesth, which is the more modern part of these joint towns, and it is here that an extraordinary increase of population is taking place. Strict precautions will be necessary to protect these wells.

THE SPREAD OF CHOLERA TOWARDS EUROPE.

THERE can be but little doubt that cholera is spreading in Persia in a direction and on a scale that is likely to constitute a grave danger to Europe. In the district of Meshed the deaths are estimated at from 150 to several hundreds a day, and the approach of the disease to the Russian frontier is looked upon with serious apprehension. The Russian Government have appointed a Commission, and places of observation have now been established at Baku and Astara for the Black Sea and Caspian Sea, besides a number of stations along the frontier; and by these routes alone will passengers and goods be allowed to enter Russia. This is the old route by which cholera has travelled from east to west in former years, and there is no reason to doubt that the sanitary state of many places in Southern Russia is but little different from that which prevailed in former years when cholera and the so-called Astrakan plague were so rife amongst the inhabitants. The trade routes from Persia into Europe in the neighbourhood of the Caspian and the Black Seas are especially dangerous in the case of a disease which is now shown on incontestable evidence to spread, in Europe at least, along the lines of human traffic and intercommunication. Hence other countries in Europe besides Russia should be prepared for any emergency that may arise, and our own sanitary authorities will not fail for work if they seek to remove in advance all conditions in their districts which are favourable to the diffusion of imported cholera.

THE COUNCIL OF THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY AND THE ASSOCIATION OF FELLOWS.

OUR attention has been called by the honorary secretary of the Association of Fellows, Mr. H. Percy Dunn, to a decision of the Council of the Royal Medical and Chirurgical Society. The Association of Fellows of the College of Surgeons of England, which was formed to advance the social, professional, academical, and constitutional interests of the Fellows of the College, which numbers in its ranks about one-fourth of the constituency of the Fellows of the College, and comprises several present and past members of the Council of the Royal College of Surgeons of England, has been in the habit of holding its general meetings sometimes at the rooms of the Royal Medical and Chirurgical Society, 20, Hanover-square, sometimes at those of the Medical Society in Chandos-street, and sometimes elsewhere. As several members of the committee belong to the Royal Medical and Chirurgical Society, and have held high positions in that Society, the committee has given a preference to the rooms of the Society, deeming that it would be an advantage to the Society in its new quarters to pay for the hire of one of its rooms. In the ordinary course, the committee instructed the honorary secretary this year to apply to the Council for a room in which to hold its annual meeting on June 23rd. To the surprise of the committee the Council has sent a letter to the honorary secretary of the Association informing him that the use of the room cannot be afforded to the Association on the ground that the Association is a political organisation, as if the combination of Fellows of the College for the purpose of securing due professional consideration for the order of Fellows, the most cultivated section of the College constituency, were a high crime and misdemeanour, and not in every way a constitutional and proper organisation. If it be alleged that the Society's premises should only be used by associations whose primary object is the advancement of science, it may be answered that to draw closely the bonds of professional union between the Fellows of the College and its Council—the fundamental object of the Association of Fellows—must be conducive in every way to the prosperity of the College of Surgeons, not merely as a so-called political but as a scientific body; and all influences which tend to dissociate the Council from the Fellows of the College must also tend to bring down the College from its high position as a scientific institution.

A FATAL FLY STING.

THE sad accident which has deprived Mr. Balfour of his secretary, Mr. Frank J. Woods, is happily one of rare occurrence, although the conditions for it are only too prevalent. Mr. Woods died, after about ten days' illness, from erysipelas and septicæmia supervening on a sting on the lip inflicted by a gadfly. It was conjectured, and doubtless with truth, that the insect must have been in contact with a diseased animal; but the transference of putrescent material from any source may have been made by the gadfly to the wound it inflicted on a highly vascular part. The only thing to be done under such circumstances is to subject the wounded part to powerful suction; and in the case of a bite on the lip this may be done fairly effectively by the individual himself, for only in this way is it at all possible to extract the poisonous material. Yet this measure may fail to effect its object, since the facilities for rapid absorption are so great and the point of entrance of the poison so minute.

"CURES" FOR INEBRIETY.

THE gold treatment for alcoholism and the morphine habit, which has been so largely advertised in America, is now about to be introduced into this country. To-day (Friday) a meeting is to be held at the Westminster Town Hall, under the auspices of the Church of England Temperance Society and the chairmanship of the Right Rev. Bishop Barry, at which information will be given respecting this treatment and its results in 60,000 cases. We hope that this information will go further than a mere reference to so many alleged cures. The drug used by Dr. Keeley is stated to be a double chloride of gold, but beyond this nothing is known. The formula, method of use, and dosage are kept quite secret. For twelve years Dr. Keeley is reported as having pursued this treatment at Dwight, Illinois, U.S.A., and in that time 60,000 persons are said to have been treated at the parent home and at the branches established in various American States, with only 5 per cent. of relapses. In one month more than 1000 persons were treated at Dwight alone. We are informed that "the treatment is tonic and healthy tissue making, and no individual has ever received injury from its use. It does not supplant moral influences, but uses them to develop, educate, and strengthen the moral sense when the physical causes of disease have been removed." These are "good worts," and we expect to see them soon in a prospectus issued by some company-promoting syndicate. Truly the methods adopted by some American physicians astound us. The running of a secret cure for one's personal profit would in this country ensure the erasure

Digitized by Google

of the inventor's name from the roll of any college of physicians or surgeons, university or medical society with which he might be connected. Professional usage and etiquette demand that any method of treatment deemed useful in any class of diseases should be made the common property of the profession, should be as available for the welfare of the poor as of the rich, and should be openly and without reserve tested and proved at some of our numerous public institutions. This modern American plan, which must give so great offence to the vast majority of medical men in the United States, whom we know to be as scrupulously tenacious of the laws of professional etiquette as our own physicians and surgeons, puts a method of treatment—good, bad, or indifferent, we know not, for we have nothing to do with secret remedies and cures—on the same line with the latest patent pill. Professional decency, honour, and etiquette are alike passed by as unimportant. We need say no more, except to warn physicians and patients against making use of a treatment of the detail of which nothing is known and which apparently there is no intention of submitting to the critical and open judgment of the profession. We hope that a society like the Church of England Temperance Society will not lend the weight of its influence to such unprofessional methods. Its zeal for temperance should not overrun discretion, and tempt it into a false position in regard to the right and proper methods of professional procedure. There are other American physicians who claim results equal to Dr. Keeley's (whether rightly or wrongly we know not), and we have seen a letter from one who offers to come to England and "operate" side by side with Dr. Keeley; so that we may soon expect to have other aspirants to the fame and fortune which are sure to attend, for a slight period at least, the introduction of the latest American medical "boom."

THE HOSPITAL SUNDAY COLLECTION.

THE collection which is to be made to-morrow in the various places of worship throughout the metropolis will, without a doubt, result in a munificent tribute, to be dedicated to the service of the sick poor; but although we entertain no anxiety upon that point, we do strongly feel the necessity for a great effort on the part of all who are interested in this good work, if the present year is not to suffer by comparison with some that are past. Last year the collection reached an aggregate considerably in excess of any that had been realised before that date, but this eminently satisfactory result was attained by the aid of some very large gifts, such as cannot be counted upon for renewal on the present occasion. Under this point of view, therefore, the success of 1891 argues rather that it will be difficult than that it will be easy in the present year to secure a collection with which the contributors and the Council of the Fund may be content. Indeed, were it not for the continual growth of the metropolis—a subject which we have sufficiently illustrated in our Special Supplement published last week—it would be unreasonable to expect that the collection should continue from year to year to increase. Still, while London continues to expand and thicken on the ground at the rate of growth which at present obtains within the metropolitan area, it would be supine, indeed, on the part of those who are charged with the conduct of this undertaking if they were content to allow any year to mark a culminating point in the history of the collection. Year by year the wealth and magnitude of our vast city are augmented in a measure which the imagination fails to apprehend, and if the charity of the metropolis does not expand in a commensurate proportion some one must be seriously to blame. The meeting which assembles at the Mansion House to-day (Friday), and which will be reported in our second edition, will, we hope, have the effect of quickening the widespread interest which already exists among a large number of supporters of the Fund beyond those who will actually assemble to listen to the address of Mr. Egmont Hake and the appeals of other well-known speakers. Important as are such methods of evoking enthusiasm, the main reliance of the hospitals and dispensaries must be placed upon the spontaneous efforts of those ministers of religion and others whose advocacy of their cause in public and in private has effected so large a result in the past. Among these advocates of the charity we are glad to know that we may reckon the great body of our professional brethren in London and its neighbourhood. Their influence has always been cast in this scale, and it will not now be withheld. We trust they will on this occasion be not less successful than in the past.

POISONING BY STRYCHNINE.

WITHIN the last few years strychnine has been used somewhat frequently for the purposes both of suicide and of homicide; while within the last few weeks what would appear to be a series of cases of poisoning by this alkaloid has occurred. As this matter is still *sub judice*, we withhold further comment, and pass on to the general consideration of the subject, which deserves the very gravest consideration of the Legislature, the medical profession, vendors of poison, and the general public. In the first place, strychnine is much too easily procurable in the shape of vermin killer powders. These have been distinguished by different names, but all are equally dangerous, a threepenny packet containing more than a grain of this deadly alkaloid. It is true that these powders are sold according to the regulations of the Act of Parliament, names and addresses being required, as well as entry and signing in the book kept for that purpose. It is equally true that all these may be false. Again, while it is required that the poison must be mixed with some colouring matter, this latter has in the case of some powders been found to have the dangerous faculty of being destroyed by the gastric juice. The sale of strychnine or any of its compounds under these circumstances ought to be absolutely forbidden. Rats and mice, cockroaches, and beetles can be caught in traps and destroyed without danger to anyone. Whether the sale of these powders be profitable or not we do not know; but until some additional restriction has been placed upon their sale, we would urge upon all respectable chemists and druggists the great desirability of not selling these powders except to customers whom they know well, and who are not likely to make an improper use of them. Passing on to members of the medical profession, we would remark that while the symptoms of strychnine poisoning are well known, they vary very much according to the surrounding circumstances. When the dose has been large the tetanic spasms will be well marked, but when a minimum fatal dose has been given these will be modified into a species of convulsions which may be regarded as unconnected with poison. Hence the importance of not only observing the symptoms of any sudden attack of convulsions very carefully, but also of duly weighing all the surrounding circumstances, the previous taking of food or medicine, the absence of any former similar attack, and the appearance and manner of those around. Some years ago a man who went in the morning to his work in his usual health, who had never had a day's illness, came home to his dinner and died suddenly in convulsions. A surgeon called in did not see him until after his death, and gave a certificate of death from sunstroke. It was the third death in the same family within a very short period under very similar circumstances, and all three, father and two children, had been secretly insured. There can be no doubt that strychnine had been given and had

Digitized by Google

caused death, but it could not be detected in the exhumed bodies. Moreover, the post mortem appearances will vary much according to the dose given. When this is large and the body is seen soon after death, the opisthotonus, the rapid access of what resembles rigor mortis, but which is really the action of the poison, will be evident to the eye. But when the dose has been small and decomposition has commenced, the same appearances, though not absent, will be very much modified. Again, in a more recent case, the "mouse powder" used by the poisoner contained both arsenic and strychnine, which circumstance tended to mask both the symptoms and the post-mortem appearances. These points are all well worthy of consideration. In the perusal of former cases of poisoning nothing can be more unfortunate than the frequency with which circumstances, obviously suspicious when viewed in the light thrown upon them by subsequent events, have been passed over by the medical attendant, who has been too apt to ignore the possibility of criminal poisoning. Nothing is more calculated to excite public distrust than the burial of bodies with certificates of deaths from natural causes, to be followed by their exhumation shortly afterwards, and the discovery of poison in the viscera. Medical jurisprudence and toxicology are not branches of the profession to be studied at the medical school when a student, and to be dropped after the examinations have been passed. They should be studied carefully all through a medical practitioner's life whenever and wherever opportunity affords, and should be regarded as an important item of medical practice, which may be encountered at any time and under any circumstances.

THE PROGRESS OF SMALL-POX.

SMALL-POX is still an element of considerable danger to the public health of England. During the four weeks ending June 4th last there were 125 attacks in the metropolis, 11 in Liverpool, between 20 and 30 in Dewsbury, 12 in Wakefield, 5 in Sheffield, 8 in Halifax, and 15 in the neighbourhood of Dartford, which is not far from the small-pox establishment of the Metropolitan Asylums Board, besides a number of other more isolated groups of attacks. Never before, in the sanitary history of this country, have early isolation, vaccination, and disinfection been so practicable as they have become since the passing of the Act for the compulsory notification of infectious diseases; otherwise we should look with much concern to a recrudescence during the ensuing winter of an infection which has established itself in so many centres of population.

HOURS OF RAILWAY SERVANTS.

THE report of the Select Committee of the House of Commons appointed to inquire into the hours of labour worked by railway servants deals in a manner which will, we hope, secure general approval with the very difficult questions brought under discussion. The reality of the grievance from which some classes of railway servants suffer in this respect has long been quite beyond dispute; and it is, moreover, one from which the public suffer hardly less than the immediately aggrieved parties. The frightful risk which the travelling public incur through the entrusting of the safety of trains to the hands of engine-drivers and signalmen exhausted by overwork needs no demonstration. And on this ground alone it may well be legitimate enough that the Legislature should intervene and put a restriction upon the conditions of railway labour even when such restrictions may not be demanded or even desired by either the masters or the men. But legislation of this kind is not to be desired upon its own account, and recourse to it should only be had for the purpose of attaining very definite and very sufficient objects. The object, and the only proper object in this case, is the public security, liable to be seriously imperilled by the employment of inefficient workmen in the working of the railways. The committee have very properly, as we think, refused to consider collateral objects, and directed their endeavours to the securing of this one alone. It was natural that some witnesses should make the occasion one for advocating a legally restricted day with the ulterior purpose of securing legally defined overtime and overtime pay. But their views did not impress the committee, and the only legislation which is recommended by the report is such as would leave both parties free to make any terms as to wages upon which they could agree. It is furthermore satisfactory to find that the committee have arrived at a conclusion that very little in the way of legislation is necessary to secure the object which they have had in view. They point out that great improvements have already been effected under the pressure of public opinion merely, and infer that much more, and probably all that can be desired, might be effected if full publicity were secured by means of returns, and, in case of accident, by formal inquiries. In this way they think that the companies might be coerced effectively, but at the same time in such a way as would leave their responsibility for the due administration of their business wholly unimpaired. Should the event falsify their expectations, they would be prepared to give to the Board of Trade or the Railway Commissioners power to call upon any company shown to be in default to formulate and enforce a time-table which should be approved as satisfactory by the public authority exercising the proposed jurisdiction, observance of the regulations being enforced by suitable penalties. The report appears to us to be eminently judicious and impartial, and one which, in much of the legislation respecting industrial pursuits which it is only reasonable to expect in the near future, may safely and usefully be accepted as a model and a repertory of sound sense.

THE PANCREAS AND DIABETES.

PROFESSOR SEEGEN, one of the chief authorities upon diabetes in its physiological as well as its clinical aspects, recently read a paper before the Medical Society of Vienna, in reference more particularly to the recent researches upon extirpation of the pancreas and diabetes, and having regard to Lépine's explanation that the pancreas produces a glycolytic ferment, the lack of which causes an accumulation of sugar in the blood. Professor Seegen says that, granting that the blood of a diabetic patient has less glycolytic action than that of a healthy subject, it is assuming a great deal to hold that this proves the presence in health of a special glycolytic ferment manufactured by the pancreas. By careful experiments he finds that the normal sugar disappears most rapidly from freshly drawn blood when the latter is maintained at a high temperature (39° C.), whilst a current of air is being passed through it. That this is not due to the action of living protoplasm he shows by the addition of chloroform (to kill the protoplasm), which makes hardly any difference in the glycolytic action. Moreover, since the glycolysis goes on more actively after blood has been drawn for some time than at first, Professor Seegen infers that the ferment is produced by some change in the blood outside the body rather than by the pancreas. He does not discuss the question of the diminution of this ferment in the blood of diabetics (men or animals), but refers to Minkowski, who found the sugar rapidly diminish in blood from a diabetic dog. Professor Seegen suggests that diabetic blood may contain something antagonistic to glycolysis, so that even if

Digitized by Google

Lépine's experiments are correct, they do not necessarily point to a diminution of the ferment in that disease. He holds, therefore, that the explanation of "pancreatic diabetes" has still to be found. Minkowski showed that if a portion of the pancreas (in animals from which it had been extirpated) were transplanted beneath the peritoneum, the diabetic condition is averted, only to appear when the transplanted organ is removed by a further operation. This, as Professor Seegen points out, is comparable with the effect of experiments in thyroid grafting by Eiselsberg, who found that tetany did not occur until the transplanted organ had been excised by a second operation. Morbid anatomy has, however, abundantly shown that in cases of diabetes the pancreas may be quite normal, so that, in fine, upon this question Professor Seegen agrees—and, indeed, has always maintained—that in cases of diabetes there is diminished glycolytic action in the body; but he denies that Lépine has proved this to be due to disease of the pancreas causing a diminished production of a hypothetical ferment.

TUBERCULOUS CATTLE IN LONDON.

THERE is some satisfaction in learning from the daily papers that the prevalence of tuberculosis among cattle in and around London is causing serious anxiety to the Government authorities, and that special inquiry is being made as to the abnormally large number of cases reported during the past few weeks. For more than half a century the disease has been causing great havoc not only in and around London, but throughout the United Kingdom, and the loss it has occasioned is incalculable; but we are not aware that it is much more prevalent now than at any time during the last twenty years. It is certainly attracting more attention, however, thanks to the persistent efforts of sanitarians and others, who understand what it is and the dangers that attend it, to awaken the authorities to their duty. Agricultural interests, no less than the public health, demand that the malady be dealt with energetically, and that special measures be devised to limit its extension and safeguard consumers of the flesh and milk of cattle from any dangers that may be incurred through subsisting on such aliment. Now that the officials who are responsible for the suppression of contagious diseases among animals are at length beginning to feel anxious there is some hope that something may be attempted towards getting rid of a scourge which is more serious than any other affecting bovine animals.

THE FUNGUS OF CHALAZION.

DR. M. F. WEYMAN, in the *Journal of the American Medical Association* of April 9th, 1892, publishes a paper read before one of the medical societies on researches made by him on the nature of the tumour which occasionally develops in the Meibomian glands of the eyelids, and is known by the name of "chalazion" Although Professor Virchow showed many years ago that it is a cystoplastoma, it still figures in many of our modern text-books as an ordinary cyst. Professor Virchow's nomenclature with reference to this little neoplasm is undoubtedly well chosen, but the term "granuloma," at first proposed by Dr. Thomas of Tours, seems preferable. Dr. Weyman attempted to ascertain the etiology of these growths, and has discovered a fungus which he considers explains the whole subject. The first thing he noticed were numerous spores which appeared in his sections. They were situated in the capsule and the tissue adjoining it. Towards the centre they became fewer in number. Many were seen floating free in the field; also mycelial branches seemed to penetrate through the capsule. Dr. Weyman at first thought that the spores might have developed in the staining fluids, or that thin fibrous tissue might simulate the appearance of hyphæ; but, after several trials, he succeeded in demonstrating small fragments of the fungus. They looked like very long and thick bacilli, and required strong illumination before they could be seen. Careful focussing showed that these little rods were not only on the surface of the section, but they could be traced successively through its whole thickness. Dr. Weyman employed the following method in his researches: The sections were immersed in a solution of caustic potash (one part of the hydrate to two of water). They were then placed under the microscope after gently warming the reagent. The sections readily dissolved and disappeared, leaving the fungus behind. Gentle washing removed the detritus, while a slightly acidulated current cleansed away the last tissue fragments, and also the potash. The fungus stained readily with magenta. The sporangia were represented by irregular terminal masses on the filaments, showing numerous spores embedded in its substance. The filaments were of two kinds, the thin and the thick, the latter greatly predominating. Of some fifty sections taken from different tumours, every one showed the parasite without fail. The conclusions at which Dr. Weyman arrived were:—1. Chalazia are not retention cysts, but true granulomata. 2. Their appearance in large numbers in successive periods suggests a parasitic etiology. 3. Their ready reproduction after removal also points in that direction. 4. The growth of granulation tissue presupposes a long continued irritation of a low grade. 5. A fungus can be demonstrated. 6. The "fungus chalazicus" fully explains the etiology of the neoplasm.

THE VALUE OF CRICKET, EDUCATIONAL AND HYGIENIC.

IN the *Educational Review* the national game finds an ardent vindicator in the headmaster of Haileybury, the Hon. and Rev. E. Lyttleton. For him it has a distinct, not to say unique, "educational value." It teaches the young player bodily pluck, sufficient at least to inure him to stand up to fast bowling on a good wicket. Diffidence among boys of the present day is a very common source of weakness; but no one who has learnt to face a swift ball in presence of hundreds or even thousands of critics need be long despondent. The controlling of temper is another virtue acquired in the cricket-field. "The man," says Mr. Lyttleton, "who can walk away from the wicket, having been badly run out by his partner after getting twenty runs without a mistake"—to cite one vexation out of many—"has learnt an amount of self-discipline which no other frequent experience during his youth can possibly give him." The charge of an eleven, even of a school eleven, is also an admirable training in the management of men; and here Mr. Lyttleton becomes quite eloquent on the merits of the boy captain who has his team well in hand, whether for defence or attack, and has learnt to keep his head alike in unlooked-for success and in undeserved failure. All this, and a great deal more, he pronounces, and justly, "education"—education which has its proper place alongside, not in substitution, of the work for which schools are organised and maintained. The moral, if not the intellectual, powers receive in the cricket-field a development and a bracing which to the majority of youths could be imparted in no other way. Head-masters—the late Mr. Freeman notwithstanding—are quite justified, therefore, in choosing for some, not all, of their assistants men who can direct the operations of the cricket-field, so as to retain and enhance its undoubted "educational value." Mr. Lyttleton might have extended his approval to other pastimes besides cricket for their educational advan-

Digitized by Google

tages, and in so doing he might have admitted, if not pointed out, certain drawbacks which make "the national game" a doubtful, in some cases a dangerous, indulgence for growing youth. Cricket exacts, not only a violent, but what is worse, an irregular expenditure of effort, thereby incurring the just censure of those who find muscular exertion salutary and profitable in proportion to its being graduated and equable. A boy will stand at the wicket for several overs and have hardly any call made upon his strength or his running powers, or he may be playing a brisk game and putting on runs at the top of his speed for an hour or more. He may lose a partner who has aided him in this violent exercise, and, bathed in perspiration, he may have to stand quiescent in rain or in cutting wind while his next partner does nothing but block balls. The same irregularity of exercise, the same sudden alternation of high-pressure exertion with nearly absolute inactivity, characterises the fielding, to the manifest overstrain of heart and lungs, particularly of the former. Football is open to much the same kind of objection, and competitive rowing has its drawbacks. In the case of adults, and especially of those who are somewhat past their prime, not one of these pastimes can cope with golf as a means of gently, systematically, and effectively evoking muscular energy and maintaining the whole body, for a stated time, in equable exercise. Here there is no alternation of fierce exertion and semi-dormant quiescence; no sudden "spurts" or violent efforts of energy; no heats succeeded by chills; no "sharp curves" in muscular action when the limbs, stiffened by hours of disuse, are called upon for prompt and intense practice. Golf, moreover, requires in the good player quite as much exercise of judgment, of self-control, of pluck, of steadiness, and patience under adverse circumstances as any game followed out in the open. The fact, too, that old men and young can join in a match, with manifold advantage to both, is a further point in its favour not scored by cricket, or rowing, or football. The wider area over which it is played, involving more continuous and extended movement, explains the popularity it enjoys with robust youth and valetudinarian middle age alike. Mr. Lyttleton might add to his vindication of school sports an "Apologia" for golf, which could not fail to react for good, educationally and hygienically, on the rising generation. Certainly in grace, not to say dignity, and in the postures and sway of person it calls forth, it is more in harmony with the classical palestra than either of its more violent congeners—cricket or football.

MALIGNANT SMALL-POX AT NEWCASTLE: A DANGEROUS "CASUAL."

OUR Northern Counties correspondent, in his letter this week, notes that a case of malignant small-pox occurred at Newcastle last week. The circumstances of the case are somewhat unusual. A sailor came from North Shields from the Sailors' Home, where he had been staying, and presented himself for treatment amongst the casual patients waiting at the Royal Infirmary. As the case on being seen did not appear very clear, he was taken in and placed in a ward. Examination showed that the man was suffering from hæmorrhagic small-pox, and he was at once removed to the proper hospital, where he died the next day. It appears that the unfortunate sailor had come home from a foreign port and had stayed a few days at the North Shields Sailors' Home, where probably he passed through the stage of incubation. We know that the malignant or hæmorrhagic form of small-pox is by no means easy to diagnose at first, as often there are no characteristic eruptions; still the whole system is as it were saturated with the variolous poison, and death follows in from three to five days. We are glad to know that so far there has been no dissemination of the disease in Newcastle, and that every care has been taken to prevent its spread. Revaccination has been resorted to very freely by all students and nurses and others of the staff who may have been exposed to risk. The case, moreover, points to the necessity for increased vigilance and for efficient vaccination and revaccination. Sea-ports like Newcastle must of necessity be open to risks of this nature from time to time.

INCREASED DRUNKENNESS IN WOMEN.

IT is a matter of common belief that drunkenness in women is increasing very much. This view received confirmation at an inquest a few days ago touching the death of Mary Zeig, aged sixty-seven, an habitual drunkard. Dr. Norman Kerr testified that death was due to apoplexy consequent on habits of intemperance. She had been drinking three weeks continuously, and on the Friday had gone to a public-house and taken a quantity of rum. Dr. Kerr said he had never seen such a number of drunken women as in the Whitsuntide holidays. He had frequently seen groups of four or five—some quite young—in a state more or less intoxicated. He could only attribute it to the hot weather. We are afraid the cause lies deeper than in the weather. Dr. Danford Thomas stated that he had held lately an increased number of inquests upon women, many comparatively young, whose death was clearly due to alcoholic excess. This kind of evidence is very serious, and emphasises an evil which is about to be inquired into by a Departmental Committee. The jury were affected by the representations of the coroner and Dr. Kerr, and urged on the Committee the urgent necessity of compulsion in the treatment of chronic inebriates. The existing law is entirely inadequate. It is of use only to the wealthy, who can afford to go to retreats, and to those who have self-respect enough left to go voluntarily. Dr. Kerr suggested the creation of a special prison for the compulsory treatment of such cases. It might be called by some other name. But the suggestion is in the right direction and should be seriously considered by the committee. The condition of our chronic inebriates, and of the laws relating to them, are disgraceful to us, and deserve the anxious attention of statesmen of all parties.

THE ORGANISATION OF SCIENCE.

SPECIALISM with centralisation forms the sum and substance of a short paper bearing the above title, and issued with the object of introducing a new method into scientific publication. A society of investigation, says the author, should concern itself with some one particular field of research. Such institutions as the Royal Society, with its many and varied interests, are overgrown monstrosities. Their function, if they are allowed to exist at all in their present form, should be that of arranging for presentation to the general scientific intellect, the discoveries of smaller but more active pioneer societies. The formation of a scientific literature we are told is the chief purpose of a society. Lectures and discussions are little accounted of. There is truth in this, no doubt, but it is not the whole truth, and the author adds rather inconsistently a word in warm approval of what he calls informal personal discussions. He has a firm belief in London as the only possible headquarters of any society, though he also advocates the formation of local sections for country members. All independent—i.e., non-metropolitan—associations are expected to obliterate their separate identity and become branches of a central organisation. Any preference for an individual existence is mere *esprit de ville* and antagonistic to the principles of scientific order. The author's pet society is evidently the Linnean. He resents

Digitized by Google

anything that looks like poaching upon its preserves. Singularly enough, he recognises no breach of the law of specialism in the fact that this body cultivates the study of zoology as well as that of botany. Even the Zoological Society, he considers, has no right to the fauna, which he claims for the Linnean. This illogical attitude in a rigid specialist is hardly calculated to support his primary argument, which fails to convince us either that a science can be divested of its general relations, or that intellectual enterprise can be limited by the rules of a central bureau.

THE INSPECTION OF SEAMEN'S FOOD.

THE discussion of this subject still continues, and it is well that it should continue. It is clearly right that the food of seamen should be good, and that every effort to improve their hygienic condition should be made. This is not to be done by inspecting it perfunctorily on the day of sailing or after it is partly packed away. Rather is it to be done by fixing responsibility on someone for any defect in its nature or in its cooking. This is a responsibility that good shipowners should not hesitate to undertake even if it involves trouble and some slight diminution of dividend. A writer in *The Times*, Mr. George Herbert Little, says it should be made illegal for the shipowner to contract with the master for feeding the crew. We are inclined to agree with this. The captain is apt to try to make profit out of such an arrangement. The owner wants to make not profit but credit out of the food arrangements of his crew. Nothing would more conciliate and benefit the seamen, and there is everything in their peculiar life and their uninfluential position to make it the duty of the State to see that their wants are met, and that elements of fresh and succulent food are introduced as far as possible.

THE CONGRESS OF HYGIENE AND DEMOGRAPHY.

A WORK of art, which will vividly recall the interesting events of the Congress of Hygiene to the minds of those whose privilege it was to take part in its proceedings, has been published with no little pains and with remarkable skill and success by Barrauds, Limited, 263, Oxford-street, W. This memento of such an important meeting is presented to us in the form of a permanent photograph, containing the well-delineated faces of over a thousand of the members who took part in the various sections of the Congress. Each of the photographs has been taken separately, and the grouping subsequently arranged. Notwithstanding the vast sea of countenances, the eye is readily arrested by the forms and faces with which it is familiar. It were an invidious task even to name a few of the many illustrious men present at the Congress. The photograph will be treasured as a work of art, and as a means of revivifying the memories of acquaintances struck on that memorable occasion.

ALBUMINURIA AND OPIUM.

IT is difficult to feel any satisfaction with the verdict which was lately returned at a coroner's inquest in Carmarthen, or to endorse the remarks made by the coroner in the course of his summing up. From the evidence it appeared that the deceased, a man aged thirty, after exposure late one night complained of shortness of breath. His mother, two days later, went to a local druggist, told him how her son was suffering, and, after careful inquiry into the symptoms, a bottle of mixture and a box of pills were given to her with directions. The following day the man was so much worse that a medical man was called in, when he found the patient in a hopeless condition, with swollen limbs and albuminuria. In addition there were marked indications that opium had been administered, and it was admitted that both the pills and the mixture contained opium. The practitioner stated in evidence that he attributed death primarily to the condition of the kidneys and heart, accelerated by the action of opium. The coroner, while telling the jury that opium was the very worst remedy for the disease described, thought there was an error of judgment on the part of the druggist, who could not be blamed at all, since what he had done had been with the best intention, as his desire was to relieve the deceased, and, under direction, a verdict of "Death from misadventure" was returned. The druggist stated that he had been informed that the deceased, who was an educated man, had been doctoring himself with "castor oil and other things." The whole trouble seems to have arisen from the meddlesome desire to prescribe, and in this case the position is not improved by the fact that all details of the illness were given in the absence of the patient. Doubtless the druggist merely did what he was asked to do with the best intentions; but this case ought to serve as a most serious warning against counter-prescribing, as well as against the administration of opium in cases of albuminuria. The patient's own treatment of himself with castor oil would, as the sequel shows, have been attended by less danger.

THE LONDON AND COUNTIES MEDICAL PROTECTION SOCIETY.

A MOVEMENT is on foot for the extension of the above Society to East Anglia, and the counties of Hertford, Huntingdon, Lincoln, Yorkshire, and Cambridge. The central Society has its headquarters at 13, Royal-avenue, Sloane-square. The President is Mr. Hutchinson. The Vice Presidents include Dr. Broadbent, Dr. F. H. Alderson, Mr. Balding, F.R.C.S., J.P., Royston, Herts, and many well-known London and provincial names. The treasurer is Dr. George Heron, M.D., F.R.C.P., and the secretaries are Dr. George B. Mead of Newmarket and Dr. Hugh Woods of Highgate. There can be no doubt about the need for such a society. The only question is whether there is room for two. We have one already in very active and efficient working order with a large membership. The creation of another may give one of two bad impressions to the public—either that we need very much protection, or that we are a very disunited body. We commend this view to the best consideration of the promoters, with whose main object we, of course, sympathise.

CRUELTY AND VIVISECTION.

THE sixty-eighth annual meeting of the Royal Society for the Prevention of Cruelty to Animals held last week. From the report of the committee on that occasion we learn that the past year was one of greater vigilance, effort, and accomplishment than that which preceded it—6404 persons having been convicted in the former, 5890 in the latter. Among other matters discussed at the meeting was that of vivisection. It was indeed hardly to be expected that no speaker of those present should touch upon this topic, notwithstanding that, as the president, Lord Aberdare, observed, it hardly comes within the ordinary scope of the Society's work. His lordship, in replying to some remarks on this subject, reminded his hearers that by assuming the functions of anti-vivisection agitators they would seriously compromise the harmony of their own association and the success of its endeavours. The proper work of the Society was the repression of cruelty—that is, of the needless infliction of pain. Beyond the performance of this duty it had no power. He believed that the great majority of experiments upon living animals were painless. With any distinct case of cruelty thus

Digitized by Google

caused, however, he would be ready to deal. It is worth noting that the Society's agents have not thus far been required to act in such a case, nor, we may add, is there any reason to anticipate their interference. The question at issue, it should be remembered, does not concern the suffering animal only. It affects also the vital interests of man, and we are confident that a means of research which alone brings us to approximate certainty in the treatment of disease, even though it employ the pain of the lower to relieve that of the higher creature, will command the support of public opinion.

ALLEGED CHOLERA IN PARIS.

CASES of cholera are alleged to have occurred in and about Paris for several weeks past, and some of them have proved fatal. They have occurred during exceptionally hot weather, and at a time when water from the Seine has been distributed to the population. The use of this water is always found to be associated with risk, especially during summer weather, when, owing to drought, it is most resorted to. The alleged cases now occurring in Paris are regarded as sporadic only.

EXTIRPATION OF THE LARYNX.

THE number of cases in which the operation of removal of the entire larynx has been successfully performed is gradually increasing. The latest of these was recorded by Professor Wolff at the recent session of the Surgical Congress at Berlin, where the patient was exhibited eight months after the operation. The interest of the case is enhanced by the fact that by means of an artificial larynx, invented by Professor Bruns, the patient is able to speak and sing, as illustrated before the Congress by his recitation of a monologue from Schiller's "William Tell" and his singing of "Gaudeamus igitur."

MEDICAL HEROISM.

ALTHOUGH daily there are members of our profession who perform deeds well entitled to the epithet "heroic," it is only now and then that some action more striking in the circumstances that surround it gains for it public notice. Such an act was performed a few days since at Sunderland, where three men were rendered insensible by carbonic fumes whilst cleaning out a stove connected with a blast furnace. Dr. Glen, who was sent for, at once ascended to the top of the stove, a height of 60 ft., and, lashing himself with a rope to prevent his falling, he successfully applied artificial respiration to each of the three victims, the time taken in this perilous task being fully an hour.

KILLED BY AN EMETIC?

A CASE of toxicological interest recently occurred at Macclesfield. J. B——, aged sixty-six years, went into a publichouse, and, after having some rum, told the landlord he had taken a pennyworth of sulphate of zinc. He does not seem to have vomited, but next morning he was found dead. It does not appear that a post-mortem examination was made, but a medical witness deposed that inasmuch as some common salt was administered to deceased to provoke emesis, the result would be that chloride of zinc would be formed, which would act as an irritant and cause perforation of the stomach. It is not safe to argue, from our knowledge of chemical decompositions out of the body, that exactly the same results would happen in the stomach. The fluids of the body contain chlorides in solution. Moreover, there is free hydrochloric acid in the gastric solution, and yet sulphate of zinc is considered a safe and proper emetic. We imagine that the death was due to the absorption of alcohol and zinc rather than to the irritation of the stomach, which, to say the least, was not sufficient in this case to provoke vomiting.

THE WORKING CLASSES AND HOSPITAL SUNDAY.

WE are glad to see hospitals (e.g., St. Mary's in *The Times*) disclaiming responsibility for encouraging street collections for hospitals. In one of these a poor child with spinal complaint has been carried round for mere sensational effect, regardless of *his* sensations. We feel convinced that noisy street demonstrations, especially on Sundays, are a mistake, and bring the cause into disfavour rather than otherwise. We have one good suggestion to make most respectfully to the working classes, and that is that they and their families should go, with all the money they can spare, to the various churches of London on Sunday, and so swell the hospital collection by £10,000. This will not diminish their own special collection. Apart from all dogmatic theology, the working-men of England are good Christians, and they cannot better show it than by joining the rest of the community in one of the highest Christian acts which blends all creeds and should blend all classes.

THE SUSPENSION OF A DISTRICT MEDICAL OFFICER.

WE await with much interest the reply of the Local Government Board to the letter of the solicitors of Mr. Walters. Since our last comments upon this case, Mr. Walters' suspension has been again considered by the guardians of the poor of his district, several of whom considered he had been too hardly and illegally dealt with; but on a vote being taken for the adoption of the report (recommending his suspension), it was carried by seventeen to six. We trust, therefore, that this division in the opinions of the guardians will not be lost sight of by the central authority, and that a Poor-law medical officer of thirty-eight years' standing will be honourably acquitted of having acted contrary to the law as laid down in the Consolidated Orders.

THE EXPOSURE OF INFECTION.

IT is not often that successful proceedings are taken for the exposure of infected persons or things, it being necessary to successful action to prove that the exposure was wilful. But a few days ago Dr. F. J. Allan, medical officer of health for Shoreditch, secured the conviction of a woman who, whilst her children were kept away from school in consequence of their suffering from scarlet fever, sent them about to do her shopping. The magistrate rightly stated that the practice was a most mischievous one, and he fined the woman ten shillings, with costs. It is to be hoped that, notwithstanding the comparative leniency of the fine, the lesson will be taken to heart by parents and others who often commit a like offence against the public health.

FOREIGN UNIVERSITY INTELLIGENCE.

Basle.—A chair of Hygiene is to be established.

Berlin.—The chair of Chemistry vacant by the death of Professor Hoffmann, has been offered to Professor Emil Fischer of Wurzburg, where he was appointed to succeed Wislicenus, on the latter's migration to Leipsic.

Buda-Pesth.—Drs. Haberern, Dirner, Bársony, and Roth mann have been recognised as *privat-docenten* of Surgery, Gynæcology, Midwifery, and Odontology respectively.

Erlangen.—Dr. Emil Graser has been appointed Extraordinary Professor of Surgery. He was for many years first assistant to Professor Heinecke.

Freiburg (Baden).—Dr. Rose has been appointed to the charge of the new dental out-patient department.

Gratz.—Dr. Borysiekiewicz has been appointed to the chair of Ophthalmology, and Dr. Jarisch of Innsbruck to that of Dermatology.

Digitized by Google

Rostock.—A new Eye Clinic, which is perhaps the best in Germany, has just been erected. It is fitted with electric light and electric bells, and the operation room is furnished exclusively with stone, metal, and glass materials.

St. Petersburg (*Medical Academy*)—Dr. Ballin of Kharkoff has been appointed to the chair of Medical Jurisprudence and Toxicology in succession to Dr. Sczukin.

Valladolid.—Señor Don Dr. Mariano Sancho Martin of Valencia has been appointed to the chair of Clinical Midwifery.

Vienna—Dr. Otto Zuckerkandl has been appointed *docent* in Surgery. Dr. Bernheimer has been recognised as *privat docent* in Ophthalmology.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Dr. Jacob Fischl, Professor of Mental Diseases and Physician in charge of the Lunatic Asylum in Prague.—Dr. Freudentheil, Sanitary Councillor of Wiesbaden.—Dr. Bernardo Figueroa, Vice-President of the Society of Clinical Studies, Havana.

THOSE of our readers whose autumnal holiday will find them in Italy in October next are reminded that the Fifth Italian Congress of Internal Medicine will meet in Rome on the 25th, 26th, 27th, and 28th of that month, when papers will be read on several subjects of present interest—pathological and therapeutic. All who wish to take part in the discussions must announce their intention of so doing to the secretary on or before Sept. 15th. The Italian railways allow a liberal reduction of fares to those of the profession who are inscribed as participants in the Congress.

A MEMORIAL TABLET has just been unveiled in his native Vasto, on the Adriatic, to the great Abruzzese anatomist, Giuseppe Pietrocola, for many years one of the chief lights of the Neapolitan school, where, in addition to professorships in anatomy and clinical surgery, he held for some time the post of Rector in the University. As a man of science and teacher he was in advance of his time, while it may interest English readers to know that he was a near relation of our illustrious painter and poet Dante Gabriel Rossetti.

WE understand that Dr. Edward Liveing (registrar of the Royal College of Physicians), Dr. Norman Moore, and Dr. Allchin will give evidence on behalf of the Royal College of Physicians before the Gresham University Commission.

AT the meeting of the Council of the Pharmaceutical Society of Great Britain on the 8th inst., Mr. Michael Carteighe was again elected President, an office held by him for the previous ten years.

THE vacancy in the surgical staff at St. Bartholomew's Hospital created by the resignation of Mr. Morrant Baker, F.R.C.S., has been filled by the election of Mr. Henry Trentham Butlin, F.R.C.S.

DR. B. W. RICHARDSON, F.R.S., will be a candidate for the Parliamentary representation of the Walton division of Liverpool at the coming general election.

OPEN SPACES.—A Local Government inquiry was held last week at Accrington upon an application by the town council to borrow £12,048 for the construction of a new park at Oakhill. There was no opposition. The ground is well situated and comprises thirteen acres.

THE ANNUAL DINNER OF THE ARMY MEDICAL STAFF.

THE annual dinner of the Army Medical Staff was held at the Hôtel Métropole on Monday last. Sir Wm. Mackinnon, K.C.B., Director-General, was in the chair. Brevity in the speeches was the order of the day; but Sir Joseph Fayrer, in proposing the toast of the evening, dwelt at some length upon the great improvement that had taken place in the position of the army medical officer. The company numbered about 150.

The officers of the Army Medical Staff present at the dinner were:—

Director Generals (Surgeon-Major-Generals): Sir T. Crawford, K.C.B., and Sir W. A. Mackinnon, K.C.B. (in the chair). Surgeon-Major-Generals: J. G. Faught, D. A. C. Fraser, J. Irvine, S. A. Lithgow, C.B., D.S.O., W. H. Muschamp, and J. B. C. Reade, C.B. Surgeon-Colonels: O. Codrington, Professor H. Cayley, W. G. Don, A. G. Elkington, A. A. Gore, Professor C. H. Y. Godwin, J. B. Hamilton, H. C. Herbert, J. H. Jeffcoat, C. M. Jessop, E. McGrath, T. Maunsell, A. F. Preston, E. H. Roberts, P. B. Smith, W. Sly, F. E. Scanlan, and H. R. L. Veale. Brigade-Surgeon-Lieutenant-Colonels: J. Adcock, J. F. Beattie, C. Cuffe, C.B., G. A. Gribbon, J. Hector, J. G. Leask, C. Mackinnon, W. T. Martin, W. Nash, T. Mould, Professor J. L. Notter, W. F. Rutledge, W. B. Ramsbotham, D. Renton, F. B. Scott, C.M.G., E. D. Tomlinson, W. W. Tomlinson, T. Wright, and T. W. Wright. Surgeon-Lieutenant-Colonels: D. B. Brown, W. P. Bridges, J. Coates, M. M. Galliwey, F. Johnson, J. McNamara, and W. F. Stevenson. Surgeon-Majors: J. R. A. Clark, E. A. Croly, S. H. Carter, J. J. Crean, W. A. Carte, P. J. Dempsey, W. E. Gubbins, H. Grier, T. Ligertwood, W. H. Macnamara, N. McCreery, T. Murtagh, E. North, E. R. Power, E. A. H. Roe, and R. Smith. Surgeon Captains: E. A. Burnside, W. Babtie, W. H. Bean, W. G. Bedford, T. H. F. Clarkson, A. M. Davies, R. H. Firth, R. S. F. Henderson, J. W. Jerome, A. G. Kay, J. D. Moir, W. W. Pope, J. M. Reid, S. O. Stuart, T. B. A. Tuckey, C. R. Tywell, and T. P. Woodhouse. Guests present: The President of the Royal College of Surgeons (T. Bryant, Esq., F.R.C.S.), Sir Joseph Fayrer, K.C.S.I., Sir W. MacCormac, C. N. Macnamara, Esq., F.R.C.S., Vesey Holt, Esq., E. Hart, Esq., and H. Power, Esq.

INTERCOLONIAL MEDICAL CONGRESS OF AUSTRALASIA.

THIRD SESSION, SYDNEY, NEW SOUTH WALES, 1892.

THE first session was in Adelaide, the second in Melbourne, and, following the line of the colonial capitals eastwards, the third session will commence in Sydney on Sept. 29th of this year. The chairman is Dr. P. Sydney Jones, the treasurer Dr. Thomas Chambers, and the joint general secretaries Professor Anderson Stuart and Dr. S. T. Knaggs. Influential general and executive committees have been formed and a guarantee fund of over £800 established. Special low rates are usually levied by the different intercolonial steamship companies and by the railways upon such occasions, for many members have to travel a whole week in order to be present at the meetings, so great are the distances. The P. and O. and Orient Companies have granted special concessions to visitors from Europe should any member of the profession in Europe think of combining a little work with the *grand tour*; they would see Australasia under the most favourable conditions, and would meet their medical brethren from all parts of the colonies. The meetings will be held within the palatial buildings now completed for the medical school of the University of Sydney, so that all the sections may meet under one roof—a very great convenience, especially in an almost semi-tropical place like Sydney, although the month of September has been chosen as most likely to have good weather. The posts of honour have been conferred only upon members residing in other colonies than New South Wales, the colony in which the meeting is held this time, and in this way the earnest and useful work done by the past presidents and local secretaries has been recognised. The arrangements which have just been briefly noticed were made by a provisional executive committee, but were ratified at a meeting and adjourned meetings of the profession and of the New South Wales section of the Congress, held in Sydney on March 25th and April 7th and 22nd, after a thorough and at times warm discussion. The apparent ground of difference was the manner in which the Provisional Executive Committee, the treasurer, and

Digitized by Google

the joint general secretaries had been appointed in Melbourne. In the end, however, though not without a protest from the minority, the work done was ratified by the majority, and, with a few trivial changes, the report of the provisional executive committee was adopted. From the marked interest now being taken in the work of the Congress in all the colonies, it is anticipated that the session will be a great success. To such a result the fact that the session will be in Sydney will largely contribute, for the picturesque surroundings of the city and the hospitality of the people are proverbial, while the splendid accommodation for the meetings of the Congress and its sections provided by the medical school and other University buildings is unequalled in the colonies, and perhaps not excelled in any part of the world.

THE RAILWAY COLLISION AT BISHOPSGATE.

WE are indebted to Mr. Charles Rolfe, house surgeon to the London Hospital, for an account of the nature of the injuries inflicted in the railway collision which occurred at Bishopsgate Station on Tuesday morning, the 14th inst. It appears that fourteen cases of injury were received into the wards of the London Hospital, and were placed under the care of Mr. Treves. Of those patients two died immediately after admission to the wards from the severity of their injuries, making in all six deaths from the accident. The other patients are doing well, and the injuries may be briefly described as follows:—

1. Fracture of femur, tibia, and fibula simple on same limb; fracture of radius, with dislocation of wrist outwards; fracture of several ribs and contusions. 2. Compound fracture of tibia and fibula, with severe scalp wounds and concussion. 3. Fracture of femur on left side; fracture of clavicle on right side, contusion, &c. 4. Fracture of several ribs, injury to chest, and severe shock. 5. Fracture of pelvis and sternum and contusions. 6. Fracture of pelvis and shock. 7. Fracture of tibia and fibula, dislocation of shoulder, and contusions. 8. Contused legs and severe scalp wound. 9. Shock and contusion. 10. Severe sprain of knee and ankle, with contused chest and shock. 11. Sprained ankle and shock.

Besides the cases admitted to the hospital as in-patients, about thirty other cases were treated at the hospital and sent away. We have not been favoured with any reply to our inquiries regarding the cases which were treated in St. Bartholomew's Hospital. But most of those admitted were suffering from injuries of a severe character. In all, besides those who lost their lives, some fifty persons were more or less severely injured in the collision.

HOSPITAL SUNDAY SERMONS.

John-street Chapel, Theobald's-road, W.C., Rev. J. Shephard, F.G.S.—Morning, "But he was a leper"; Evening, "How far is faith healing consistent with the Scriptures?"

Parish Church, Lewisham, S.E., Rev. Samuel Bickersteth, M.A.—Morning, "As poor, yet making many rich"; Evening, Rev. T. B. Charlesworth, M.A., "Partakes of the sufferings."

St. John, Horsleydown, Rev. W. J. Batchelor.—"The Rewards of Kindness" (St. Mark ix., 41).

Swiss Church, Rev. Alb. H. Roerich.

Lewisham-road Chapel, Rev. A. C. Gray.—Morning, "The Healing Power of Christianity" (Matt. x., 1 and 8); Evening, "The Balm of Gilead" (Jeremiah viii., 22)

Corpus Christi College Mission, 32, New Cross-road, Rev. W. W. Hough.—Morning, "The Work of the London Hospital"; Evening, "Bearing one another's Burdens."

St. Joseph's Church, Roehampton, S.W., Rev. M. King, S.J.—"Christ's Legacy to the Suffering Poor."

St. Luke's, West Holloway, Rev. R. Glover, M.A.—"A Divine Prescription for Bodily Health" (Prov. iii., 7 and 8).

St. Augustine, Kilburn, Rev. G. Greenwood, Chaplain to the Medical Guild of St. Luke.—"The danger of our losing sight, in contending for the faith &c., and of the great duty of Christian benevolence &c." (Ep. to St. Titus, iii., 8); Evening, Rev. R. C. Kirkpatrick, "The dignity and destiny of the human body, and the Church's duty of ministering to its sufferings from our Lord's example" (St. Mark vi., 56).

All Saints', Hatcham Park, S.E.—Morning, Rev. J. Seaver, M.A., vicar of St. Mary's, Peckham; Evening, Rev. Evelyn J. Hone, M.A., vicar of St. John's, Deptford, and rural dean of Greenwich.

Waldegrave-road New Church, Anerley, Rev. William Heald.—Morning, "Healer of Diseases" (Psalm ciii., 3); Evening, "Healing by Touch" (St. Mark i., 41, 42)

St. Marylebone Parish Church (the Old Parish Church), Rev. E. Thomas, M.A., B.C.L. Oxon., Incumbent.—"The Mystery of Pain" (Romans viii., 22).

Forest-hill Congregational Church, Rev. R. Alex. Johnson, B.A.—Morning, "The Infallible Lawgiver and Teacher"; Evening, "Life and Immortality" (Job ii, 4).

St. Phillip's, Queen's-road, Battersea, S.W.—Morning, Rev. E. H. Jones, Vicar; Evening, Rev. C. P. Greene, Rector of Clapham.

St. Luke's, Uxbridge-road, Rev. W. St. Hill Bowme, Vicar.—Morning, "Hôtels-Dieu"; Evening, Rev. C. M. Mivre, Vicar of St. Peter's, Bayswater.

Christ Church, Harrow-road, W. (late Lock Chapel), Rev. H. C. Thwaites, Incumbent.—"Jesus as Physician and Friend."

Federation of Synagogues, 66, Mansell-street, Rev. Henry Harris.—"That ye may see and remember all the Commandments of the Eternal and do them" (Num. xv., 39).

The Old Grand Chapel, Hackney, Rev. J. De Kewer Williams.—"A rare Case of Fever" (Matt. viii., 14, 15); Evening, "A Common Disease of the Ear."

St. Anne's, Soho.—Morning, Rev. J. H. Cardwell, "Lazarus in London"; Evening, Rev. H. B. Freeman, "The Conquest of Pain."

St. John the Evangelist, Brownswood Park, Finsbury Park, N., Rev. G. Birkett Latreille.—"Practical Benevolence."

Baptist Church, Ilford, E., Rev. J. Parker, M.A.—Morning, "Suffering London" (Luke xix., 41); Evening, "The Divine Healer" (John v., 5, 6).

St. Bartholomew Parish Church, Gray's-inn-road, Rev. R. J. Golding-Bird.—Morning, "The Eleventh Commandment"; Evening, "The True Neighbour."

St. Botolph, Bishopsgate.—Morning, Rev. Walter Crick, M.A., "The Martyrdom of Man"; Evening, Rev. G. O'Donoghue, "The Work of the London Hospitals."

St. Barnabas, Addison-road, Rev. G. R. Thomson.—"A Fresh Incentive to Work and Sympathy" (St. John x., 3, 4).

Hillingdon Church, Uxbridge, Rev. H. F. de Convey-Benwell.—"Christ Present in Suffering Humanity."

All Saints', Wandsworth, Rev. J. W. James.—"The Saviour's Sympathetic Sorrow."

Dartford Parish Church.—Morning, Rev. Allan H. Watts, "Light on a Dark Cloud"; Evening, Rev. A. T. Polhill-Turner, "The Great Physician."

THE DEATH OF CAPTAIN STAIRS.

CAPTAIN WILLIAM GRANT STAIRS, whose death has been reported, had just completed his thirtieth year. He was one of six children. His father, the late Mr. John Stairs, was an influential member of one of the oldest and most respected families in Halifax, Nova Scotia. His mother still survives, and one of his sisters married Surgeon-Major Burke, A.M.S., now serving in India. Captain Stairs was educated at Merchiston Castle School, Edinburgh, and entered Kingston Military College, Ontario, where he qualified for admission to the Royal Engineers, but was not selected owing to the limited number of vacancies. He then spent some time surveying in New Zealand and returned to Halifax, where he was offered and accepted a commission in the Royal Engineers corps. Previously to his joining the Emin Pasha Relief Expedition he had not seen any foreign or active service. For three years—1887, 1888, and 1889—he served under Mr. Stanley while crossing Africa from west to east, and was present during the principal events which resulted in the rescue of Emin Pasha and his followers. During this period of difficulty and danger he gained the admiration and love of his chief, his comrades, and his men. At the commencement of the expedition he suffered from an attack of typho-malarial fever, but was able to leave the base at Yambuya and accompany Mr. Stanley in search of Emin. At the action of Avisiba he received a wound from a poisoned arrow one inch below the heart, and for fifteen months he carried over an inch of arrow-point in his breast, performing heavy duties all the time. The wound was immediately sucked by Surgeon Parke, and no ill effects supervened. All the remaining men who were wounded by poisoned arrows at this fight died of tetanus.

On returning from the Albert Nyanza, Stairs was selected to march from Fort Bodo to the Ipoto, a distance of eighty miles, to rescue Surgeon-Captain Parke and Captain Nelson from the savage Manquema, which task he performed skilfully. He was then sent to escort couriers with letters to Major Bartellot, and bring back convalescents from Ugarrowwa's to Fort Bodo, covering 368 miles through dense forest, and returning in sixty-nine days with fourteen out of the total fifty-six invalids who had been left to recruit at that place.

During Mr. Stanley's absence in search of the rear column Captain Stairs was left at Fort Bodo with Parke and Nelson for 188 days, and performed his duty with "courage, care, watchfulness, diligence, and fidelity."

Digitized by Google

While he was commandant at Kandékore Camp everything was in perfect order; and the gallantry he displayed when he assaulted and rushed a cane-brake of Mazamboni's indirectly led to subsequent peace and friendship with this powerful and important chief. On June 6th Stairs was the only one "fit" to ascend "Ruwenzori," or the Mountains of the Moon. After two days he reached a height of over 10,000 feet, and discovered several interesting plants. A few days later he explored the south end of the Semliki Valley, and made his report. These are a few of the valuable and difficult duties he performed between June, 1887, and December, 1889. When Stairs returned to this country both his chief and his comrades acknowledged his superior intelligence, zeal, and good fellowship. The military authorities, as a reward for his good work, offered him either a troop in a cavalry regiment or a company in infantry; he accepted the latter, and thus became a captain, as he had been a lieutenant in the Royal Engineers when he started.

After a short stay in England he undertook the command of a Belgian expedition to Katanga, on the west of the Tanganyka lake. He was returning with his expedition down the Zambesi river after having successfully accomplished his mission in the interior of Africa, and just as he reached the sea on his way home he died. One of his first acts on returning from Africa in 1890 was to write a letter to the Director-General of the Army Medical Service, asking that it might be placed on record that his life had been saved by Surgeon Parke having sucked his poisoned wound. His letter to THE LANCET of May 23rd, 1891, also gives an index to his generous and grateful character.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN thirty-three of the largest English towns 5710 births and 3490 deaths were registered during the week ending June 11th. The annual rate of mortality in these towns, which had been 19·4 and 17·9 per 1000 in the preceding two weeks, was last week again 17·9. In London the rate was 17·5 per 1000, while it averaged 18·1 in the thirty-two provincial towns. The lowest rates in these towns were 11·8 in Croydon, 11·9 in Cardiff, 12·5 in Derby, and 12·8 in Nottingham; the highest rates were 23·7 in Manchester, 24·1 in Oldham, 25·8 in Preston, and 26·5 in Swansea. The 3490 deaths included 466 which were referred to the principal zymotic diseases, against 478 and 455 in the preceding two weeks; of these, 205 resulted from measles, 85 from whooping-cough, 63 from diarrhœa, 51 from diphtheria, 42 from scarlet fever, 19 from "fever" (principally enteric), and 1 from small-pox. No fatal case of any of these diseases occurred last week in Norwich or in Hull; in the other towns they caused the lowest death-rates in Bradford, Huddersfield, and Brighton, and the highest rates in London, Oldham, West Ham, and Swansea. The greatest mortality from measles occurred in Birmingham, Manchester, London, Oldham, Birkenhead, West Ham, and Halifax; from scarlet fever in Preston and Oldham; from whooping-cough in Preston, Swansea, and Sunderland; from "fever" in Swansea; and from diarrhœa in Derby and Burnley. The 51 deaths from diphtheria included 37 in London, 3 in Salford, 2 in West Ham, 2 in Birmingham, and 2 in Nottingham. A fatal case of small-pox was registered in Newcastle-upon-Tyne, but not one in London or in any other of the thirty-three large towns; 73 cases of this disease were under treatment in the Metropolitan Asylum Hospitals, and 12 in the Highgate Small-pox Hospital, on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 1878, against numbers increasing from 1226 to 1820 in the preceding eleven Saturdays; 207 cases were admitted during the week, against 202 and 215 in the previous two weeks. The deaths referred to diseases of the respiratory organs in London, which had declined from 304 to 240 in the preceding four weeks, further fell to 208 last week, and were 53 below the corrected average. The causes of 85, or 2·5 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Croydon, Norwich, Bolton, Blackburn, and in five other smaller towns; the largest proportions of uncertified deaths were registered in Leicester, Liverpool, Preston, and Sheffield.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 22·1 and 20·2 per 1000 in the preceding two weeks, rose again to 20·8 during the week ending June 11th, and exceeded by 2·9 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 11·9 in Leith and 15·8 in Dundee to 26·4 in Greenock and 26·8 in Paisley. The 578 deaths in these towns included 30 which were referred to whooping-cough, 27 to measles, 13 to diarrhœa, 6 to scarlet fever, 4 to "fever," 2 to diphtheria, and not one to small-pox. In all, 82 deaths resulted from these principal zymotic diseases, against 80 and 70 in the preceding two weeks. These 82 deaths were equal to an annual rate of 2·9 per 1000, which exceeded by 0·5 the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of whooping-cough, which had declined from 26 to 20 in the preceding three weeks, rose again to 30 last week, of which 20 occurred in Glasgow, 4 in Aberdeen, and 3 in Edinburgh. The deaths referred to measles, which had been 32 and 34 in the previous two weeks, declined to 27 last week, all of which were recorded in Glasgow. The 13 fatal cases of diarrhœa showed a further increase upon recent weekly numbers. The 6 deaths from scarlet fever were within one of the number in the preceding week, and included 2 in Glasgow and 2 in Edinburgh. Of the 4 fatal cases of "fever," 2 were recorded in Dundee. The deaths referred to diseases of the respiratory organs in these towns, which had been 120 and 123 in the preceding two weeks, were 124 last week, and were 15 below the number in the corresponding week of last year. The causes of 48, or more than 8 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had declined in the preceding three weeks from 34·6 to 28·6 per 1000, further fell to 24·0 during the week ending June 11th. During the first ten weeks of the current quarter the death-rate in the city averaged 32·4 per 1000, against 19·4 in London and 18·7 in Edinburgh. The 161 deaths in Dublin during the week under notice showed a decline of 31 from the number in the preceding week, and included 25 which were referred to measles, 1 to whooping-cough, 1 to diarrhœa, and not one either to small-pox, scarlet fever, diphtheria, or "fever." In all, 27 deaths resulted from these principal zymotic diseases, equal to an annual rate of 4·8 per 1000, the zymotic death-rate during the same period being 3·1 in London and 2·0 in Edinburgh. The fatal cases of measles, which had declined from 28 to 21 in the preceding three weeks, rose again to 25 last week. The deaths referred to "fever," which had been 6 and 3 in the preceding two weeks, declined to 1 last week. The 161 deaths registered in Dublin last week included 38 of infants under one year of age, and 23 of persons aged upwards of sixty years; the deaths of infants showed a slight further increase upon recent weekly numbers, while those of elderly persons showed a marked decline. Five inquest cases and 5 deaths from violence were registered; and 34, or more than 20 per cent., of the deaths occurred in public institutions. The causes of 22, or nearly 14 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

Brigade-Surgeon W. Dymock, Retired List, Indian Medical Service, died at his residence, Malabar Hill, Bombay, on April 29th, aged fifty-nine. He was eldest son of the Rev. T. F. Dymock, rector of Hatch Beauchamp, Somerset.

Colonel H. A. Bushman, C.B., half-pay, late 9th Lancers, has been selected to succeed Colonel W. H. Lee as Assistant Adjutant-General at Netley on the 25th proximo.

The Government of India has decided that, as Officers of

Digitized by Google

the Indian Medical Service of less than three years' full-pay service have now the rank of subaltern only, they are entitled under the provisions of paragraph 282, Army Regulations, vol. x, part 1, to a free passage by sea when proceeding to England on leave on medical certificate.

Surgeon-Colonel J. B. Hamilton, Principal Medical Officer of the Western District, has been appointed to a similar post on the staff of Major General Lord Methuen, commanding the Home District.

Surgeon-Colonel R. Lewer proceeds to Gibraltar, as Principal Medical Officer in succession to Surgeon-Major-General R. W. Meadows.

A NEW ARMY REGULATION.

A new Queen's regulation for the Army has been promulgated from the War Office by the Commander-in-Chief as to reports which general officers commanding at home and abroad are to send in as to the state of their commands as soon as possible after Jan. 1st in each year. The reports are to *deal with the health of the troops* generally, showing whether there has been any unusual increase or decrease of sickness, with the explanation thereof, if possible; the general condition of defences, barracks, &c., and the progress of military works; the general condition of mobilisation equipment, stores, storehouses, &c.; the working of any new regulation or system, or the utility of any new arm or equipment, and any other matter which may be of importance and interest.

SURGEON-CAPTAIN H. C. GORDON.

By the arrival of the steamer *Oil Rivers* in the Mersey on Saturday last news was received of the death of Surgeon-Captain H. C. Gordon, M.D., who recently took part in the operations against Tambi, near Sierra Leone. Surgeon-Captain Gordon was stationed at Sierra Leone when the news was received of the British defeat at Tambi, and the killing of Captain Robinson. He went up the river with the avenging party of West Indian troops, who captured the place and killed numbers of the enemy. He suffered from heart disease, and was on that account coming home in the steamer *Oil Rivers*, on which he embarked at Sierra Leone on the 27th ult., but died three days later, and was buried at sea. He was about thirty-five years of age, and belonged to Aberdeen.

DEPUTY-INSPECTOR-GENERAL R. TEMPLETON.

The announcement of the death of Deputy-Inspector-General R. Templeton, M.D., will be a subject of regret to the few contemporary medical officers that survive him, as well as to the larger number of those who knew him. Dr. Templeton was a member of the Ordnance Medical Department, and it is of interest to recall the fact that the organisation of the present Army Medical Staff is on very similar lines to those that existed in the old Ordnance Medical Department. Dr. Templeton after serving at home went to Ceylon, and was for a long time Surgeon of the Royal Artillery at Malta, and later on went to the Crimea. On his retirement he was appointed medical officer in charge of the Royal Hibernian School, Dublin. As a medical officer he was highly respected in his time, and was one of the first to apply operative treatment in cases of real and supposed abscess of the liver, of which his service in Ceylon gave him much experience. He had the reputation of being an excellent mathematician. Deputy-Inspector-General of Hospitals R. Templeton, M.D., Surgeon-Major Retired List, died at 42, Bayscombe-road, Shepherd's-bush, W., on the 2nd inst. He joined the Army, May 6th, 1833; became surgeon, April 5th, 1847; surgeon-major, Dec. 7th, 1855; and retired Jan. 31st, 1860, with the honorary rank of deputy-inspector-general.

AMBULANCE WORK AND MATERIAL IN PEACE AND WAR

Mr. John Furley, J.P., read an interesting paper on the above subject at the Royal United Service Institution on the 10th inst., Sir Thomas Crawford, M.D., K.C.B., in the chair. The object of the lecture was to show that the Army Medical Service could be supplemented in time of war, and that much could be gained by coöperation between military and civil organisations, together with the methods by which this might be accomplished. Probably no one possesses a larger amount of experience in connexion with this subject than Mr. John Furley, and, as might have been anticipated, he had much to say that was both practical and useful, especially in connexion with ambulance transport and material, and the utilisation of corps of civilians trained by the St. John Ambulance Association. Among other points he ventured an opinion that the British Army possessed the best and strongest built waggons but about the worst ambulance carriages for the conveyance of sick and wounded. After having discussed the subject of his lecture in detail he summed up the conclusions to be deduced from it. Sir Vincent Kennett Barrington, Inspector-General Lawson, Surgeon-Major Pratt, and Mr. Archibald Forbes took part in the subsequent debate on the paper.

ARMY MEDICAL STAFF.

Surgeon-Major-General J. B. C. Reade, C.B., who attains the limit of age on the 7th proximo, is to be retained until March 31st, 1893, to permit of his putting in the period of five years as professional assistant to the Director-General. It is presumed that this officer will be Supernumerary of his rank in order that his retention may not interfere with promotion.

INDIAN MEDICAL SERVICE.

Bombay.—Surgeon-Captain M. A. T. Collie, M.B., C.M., acting Resident Surgeon, European General Hospital, Bombay, is allowed furlough on medical certificate for one year.—H.E. the Governor in Council is pleased to make the following appointment: Surgeon-Major D. C. Davidson to relieve Surgeon-Captain H. W. Stevenson of his duties as Superintendent, Mahableshwar.—H.E. the Governor in Council is pleased to appoint Surgeon-Captain T. E. Dyson, M.B., C.M., to be Deputy Sanitary Commissioner, Gujarat Registration District, vice Dr. M. B. Kola, M.D., retiring.—H.E. the Governor in Council is pleased to appoint Surgeon-Captain T. D. C. Barry to be Chemical Analyser to the Government, vice Brigade-Surgeon-Lieutenant-Colonel I. B. Lyon, C.I.E., retired.—Surgeon-Captain J. Crimmin, V.C., and Surgeon-Major F. F. MacCartie, M.B., respectively delivered over and received charge of the office of the Health Officer of the Port of Bombay on May 17th, 1892.

Bengal.—The services of the undermentioned Officers of the Bengal Establishment are placed temporarily at the disposal of the Government of Bengal: Surgeon-Captains T. Grainger, M.D., and J. G. Jordan, M.B., C.M.—Surgeon-Captain H. E. Banatvala, Bengal Establishment, whose services have been placed temporarily at the disposal of the Chief Commissioner, Central Provinces, is posted to the Bilaspur District as Civil Surgeon and Superintendent of the Gaol.

Hyderabad.—On the application of the Nizam's Government the Government of India have sanctioned a five years' extension of the service of Surgeon-Captain Hehir, who is the head medical officer of the regular troops and health officer to the Chadarghat Municipality.

Madras.—Surgeon-Captain J. A. Burton, Madras Establishment, is appointed to officiate as Civil Surgeon of Amraoti during the absence on furlough of Surgeon Captain R. B. Roe.—Surgeon-Major H. Allison, M.D., Fort Surgeon, Madras, is appointed to act as Chemical Examiner, Madras, without prejudice to his own duties, during the absence of Surgeon-Captain J. L. Van Geyzel, M.D., on furlough.—Surgeon-Major G. L. Walker, M.D., is appointed to act as District Surgeon, Malabar, and Superintendent of Gaol, Calicut, during the employment of Surgeon-Major A. H. Leapingwell on other duty.—Surgeon-Major S. C. Sarkies is appointed to act as District Surgeon and Superintendent of Gaol, Nellore, during the employment of Surgeon-Major G. L. Walker on other duty.—Surgeon-Major W. F. Thomas is appointed to act as District Surgeon, Chingleput, during the employment of Surgeon-Major H. A. F. Nailer on other duty.—Surgeon-Major W. F. Thomas is appointed to act as Superintendent, Reformatory School, Chingleput, during the employment of Surgeon-Major H. A. F. Nailer on other duty.—Surgeon-Lieutenant R. K. Mitter, Indian Medical Service, doing duty in the Madras District, to do duty in the Secunderabad District.

Oudh.—Surgeon-Captain G. H. Fink, Civil Surgeon, Bijnor, is granted privilege leave for forty-two days, from May 15th, 1892.

Surgeon-Major P. J. Freyer, Civil Surgeon, Moradabad, is appointed to hold visiting medical charge of the Bijnor District, in addition to his other duties, during the absence on privilege leave of Surgeon-Captain G. H. Fink.

Surgeon-Captain G. C. Hall, Indian Medical Department, is granted leave to proceed out of India on medical certificate for six months' Pension service, sixth year, commenced Nov. 11th, 1891.

Brigade-Surgeon-Lieutenant-Colonel J. Smith, Medical Officer, 25th Regiment Madras Infantry, for six months, from April 17th, 1892, on medical certificate.

The undermentioned officer is granted furlough out of India:—Surgeon-Lieutenant-Colonel H. Johnstone, M.D., Civil Surgeon, Rangoon, medical certificate for one year.

Brigade-Surgeon-Lieutenant-Colonel P. Cullen, M.D. Civil Surgeon Nursingpore, Central Provinces, is permitted to retire from the Service, from June 1st, 1892, subject to Her Majesty's approval.

MILITIA MEDICAL STAFF.—Surgeon-Lieutenant-Colonel W. Malcomson, 4th Battalion, Princess Victoria's (Royal Irish Fusiliers), resigns his commission; also is permitted to retain his rank and to wear the prescribed uniform on his retirement.

NAVAL MEDICAL SERVICE.—In accordance with the provisions of Her Majesty's Order in Council of April 1st, 1881, Fleet Surgeon Henry Nanton Murray Sedgwick has been placed on the Retired List at his own request, with permission to assume the rank of Deputy-Inspector-General of Hospitals and Fleets; Fleet Surgeon Ralph Westropp Brereton has been placed on the Retired List at his own request.—The following appointments have been made at the Admiralty:—Fleet Surgeons Isaac H. Anderson to

DISPUTED CASE OF SCARLET FEVER.

To the Editors of THE LANCET.

SIRS,—As the magistrate criticised severely my conduct in this case, I shall be glad if you will allow me space to explain how it was I acted as I did.

On May 19th I was called to see Emily Williams by the mother, and I was informed by no one that there was anything peculiar about the case. I continued to attend her almost daily through a mild but well-marked attack of right-sided pleurisy, with pain, rapid breathing, and well-marked pleuritic rub. The child was never seriously ill, and was convalescent on the 28th, when my visits ceased. About the 25th a member of the Fulham Vestry called upon me and told me I was attending a case of scarlet fever. This I denied. He mentioned the number of the house at which I was attending, but still I told him he was mistaken; there must be two children ill in the house. However, he made it clear to me that my case was the one the medical officer of health had certified as scarlet fever. When I discovered this, knowing that this member of the vestry would soon be seeing the medical officer of health, I asked him if he would kindly make it clear to him that I attended the case in ignorance, and gave my diagnosis before I knew he had ever seen it, as I had no wish to quarrel with the medical officer of health. The case then came before the guardians, and my diagnosis was made public. As I have always worked amicably with the medical officer of health in his official capacity, and as I received no communication from him, I concluded he had decided to let the case drop. On Saturday, June 4th, I was told in the street that the medical officer of health had gone to the court for an order to arrest my patient. I arrived at the court too late to give evidence. In the evening Mr. Butler called upon me. I had never spoken to or had any communication with him on this or any other matter before.

I should like to take this opportunity for apologising to Dr. Cayley for all the worry the case has been to him. It was too late on Saturday to write, so I simply wired to him asking him to see a case with me; but before the case was brought in to him, Mr. Butler and I explained to him that the magistrate had issued an order for the arrest of the child, on the evidence of medical men who had seen the child on two or three occasions only.

I am, Sirs, your obedient servant,
W. F. CLARKE, M.D., B.S. Lond.

P.S.—A bill has been circulated in the district, on which my name appears. I had no knowledge of or share in the publication of the document before copies were delivered at my door, and I have taken steps to stop its circulation.

Fulham, June 14th, 1892.

THE HOLY PLACES OF ARABIA.

To the Editors of THE LANCET.

SIRS,—The paper on the above subject, in your issue of the 14th ult., by my friend, Dr. John Wortabet of Beyrout, contains much information, both curious and uncommon. By a printer's error the town of Jidda (Jedda) appears as Tidda throughout the article. Several travellers besides those mentioned by Dr. Wortabet have visited and described the Arabian coastlands—e.g., Irwin, Niebuhr, Seetzen, and Wellsted; and Didier in 1856 reported a journey inland to Taïf; but Mecca and Medina remain to be among the least known of the world's cities. Dr. Wortabet quotes Burckhardt's narrative. This intrepid man suffered severely at Mecca from dysentery, and at Medina from fever, which nearly proved fatal, and his death from the former disease in 1817, two years after his return to Egypt, must probably be ascribed to the Arabian visit. A member of our own profession, Robert Richardson, M.D., L.R.C.P. Lond., himself a traveller of no mean rank, happened to be at Cairo, and attended poor Burckhardt in his last illness.[1] When lately in Egypt I sought out Burckhardt's tomb. "The Turks will take my body, I know it," he had said when dying, for as a Mussulman he had lived, and he lies in a Moslem grave. Above is sculptured the full white turban, and below, in Arabic, are the words: "Sheikh Ibrahim, the Moslem, the English Traveller." Dying at thirty-three years of age, when on the eve of entering on his intended life work in Central Africa, Burckhardt left so rich a store of records from the mere preparatory journeys he had taken as to place him in the very first rank of Eastern explorers. As regards the number of pilgrims who visit Mecca, Mr. Wilfrid Blunt computed the "Haj" of 1880 at 93,000. Mr. John Ray, in 1693, quotes an author who speaks of 200,000. The Christian pilgrimage to Jerusalem towards Easter-time is not wholly unlike the Mohammedan in its sanitary aspects, as I can testify; but the numbers are much smaller, and the mortality is far less.

I am, Sirs, yours faithfully,
Finsbury-square, June 2nd, 1892. R. HINGSTON FOX.

THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

To the Editors of THE LANCET.

SIRS,—I note in your columns of to day's issue, at p. 1330, that a report was approved and adopted by the Council containing a clause to the effect that it is impossible to grant even the mildest of the requests of the Association of Fellows—that for a common room—because the Council regard the Fellows as only a section of the Corporation. Surely this is an admission of what I have always contended, that the Membership gives the corporate existence, whilst the Fellowship is a mere academic distinction. Now comes the question: How is it that seats on the Council are confined "to the exclusive use of any section of the Corporation"? Permit me, in conclusion, to say that the action of the Committee of the Members' Association which I deprecate has nothing to do with the question of appeal. The abandonment of that policy was my own action, based on an opinion which I obtained, and which the Committee generously left me to pay for. My refusal to have anything more to do with them was partly explained by Mr. Ashton Ellis's reply, and is due partly to other matters which are slightly indicated by the nonsense written by Mr. W. G. Dickinson. I am, Sirs, yours faithfully,
Birmingham, June 11th, 1892. LAWSON TAIT.

ANÆSTHETICS.

To the Editors of THE LANCET.

SIRS,—After the discussions at the Gynæcological Society last week on anæsthetics, perhaps an account of the after-effects of nitrous oxide and ether on the patients operated on at the Chelsea Hospital for Women during this year may not be uninteresting. The results in 89 cases show no

[1] Richardson's Travels, vol. i., p. 161.

Digitized by Google

deaths attributable to anæsthetics. Apart from abdominal sections there have been 68 operations, averaging twenty-three minutes each, on patients averaging thirty-five years, gas and ether or ether alone being the anæsthetic used; 21 had no retching or vomiting, and the remaining 47 had each on an average not more than 3 attacks of vomiting, with a little retching. There have been 21 abdominal sections, averaging forty-five minutes each, patients' ages thirty-one years; of these, 18 have the exact number of times they vomited noted, being 4¼ or 2½ times for each patient; the remaining 3 were described as "a little," "very slight," and "not violent at intervals for three hours"; 11 had no retching; and, dividing the remainder into slight and severe, only 2 were noted as having severe retching. About 20 had ether alone, all becoming insensible without coughing, struggling, feeling suffocated, or showing distressing symptoms, the majority being unconscious in three or four minutes. Clover's inhaler, with Hooper's anæsthetic ether, is used, and as little gas and ether given as possible, the relaxation being satisfactory, and the operation can be commenced in two minutes; but I find it better to let them get more slowly under, and take five minutes for abdominal sections. Bronchitis was not set up by ether *de novo*, and a few patients who had coughs before operation were not much worse afterwards. All complained much for twelve to twenty-four hours of the smell and taste of ether, but not often of headache.

I am, Sirs, your obedient servant,

Belgrave-rd., S.W., June 13th, 1892. ANDREW FAUSSET.

RECTAL INJECTIONS OF SALT SOLUTION FOR HÆMORRHAGES.

To the Editors of THE LANCET.

SIRS,—Dr. Spencer's account in your last week's issue of cases treated by intravenous injections of salt solution in cases of grave hæmorrhage has induced me to again bring before the profession what I believe to be a very good substitute for it in an emergency—viz., simple injection per rectum. I published in THE LANCET of 1888 an account of a patient who was apparently dying from post-partum hæmorrhage, but whom I firmly believed owed her life to the rectal injections, the immediate effects of which were striking. Since the publication of that letter I have heard of a number of cases treated similarly. One of the obstetric assistants at University College Hospital told me he had saved two patients, and was much struck with its efficiency. In another case of excision of the jaw, where the patient was in a state of collapse, the treatment was very effectual, as also in a case of collapse from hæmatemesis. Personally, I have seen it repeatedly used in cases of large losses of blood at University College Hospital, where, instead of injecting only from four to six ounces of saline solution, from twelve to fourteen ounces of warm water were thrown into the rectum. Its value in such operations as amputation at the hip or excision of the upper jaw is unquestionable, but I have never seen any reference made to it either in the text-books or periodicals. Its value, however, is more particularly to the medical man attending midwifery cases, as how few practitioners carry the necessary apparatus for venous transfusion, and how difficult it is when the patient is throwing herself about (and perhaps losing blood all the time), and one is single-handed, to perform what is really a delicate operation, whereas by carrying the "salt" made up in powders ready for dissolving one can control the uterus while the nurse prepares the solution, and inject it without relaxing our attention to the *fons et origo* of the mischief. Whether simple water is as readily taken up by the emptied vessels of the rectum as saline solution I have no means of determining, but at all events the stimulating effects of the salts on the heart are by no means to be neglected. The smaller injections seem to me to be preferable, inasmuch as no risk is run of exciting the bowel to expel its contents, and the injection can be repeated every fifteen minutes until such time as the patient can retain liquids given by the mouth, when both means can be continued as long as necessary. Every practitioner and nurse being provided with a syringe, this plan has at least one good point—it can do no harm, and I am firmly convinced that in the majority of cases it will be markedly beneficial.

I am, Sirs, yours faithfully,

RAINSFORD F. GILL, M D. Lond.

Adelaide-road, S. Hampstead, June 14th, 1892.

"STEELE *v.* SAVORY" FUND.

To the Editors of THE LANCET.

SIRS,—We beg to forward herewith a second list of subscriptions to the "Steele *v.* Savory" Fund, which includes several amounts previously omitted.

We desire to explain in answer to inquiries that the subscriptions now being acknowledged are those only which have been sent to the Treasurer of the Special Committee appointed in February last after the termination of the action. A "Guarantee Fund" was established on the commencement of the proceedings three years ago, towards which about £250 was received (some further contributions to this fund promised, but not then paid, have since been sent to the Special Committee and included in their first list). This amount was all expended during the progress of the action, but is allowed for in the bill of costs now delivered, from which it will be deducted. It will be seen that there is still a balance of about £1000 required, which would be easily obtained if every member who has hitherto taken an interest in College reform were to send a few shillings. We should like to take this opportunity of reminding our numerous local secretaries of the letter which we recently sent them, and we trust that they are acting upon it. We shall also be glad if those members of our association who have not yet paid their arrears of subscriptions will do so forthwith. We hope that these gentlemen will not put us to unnecessary trouble by delaying their remittances.

We remain, Sirs, faithfully yours,

JABEZ HOGG, } Joint
W. G. DICKINSON, } Hon. Secs.

June 14th, 1892.

BRITISH MEDICAL TEMPERANCE ASSOCIATION.

To the Editors of THE LANCET.

SIRS,—The twenty-sixth consecutive comparison between the Temperance and General sections of the United King-

Digitized by Google

dom Provident Institution has just been published, and many of your readers will desire to know whether it tallies with the rest. There is even a greater difference than in any previous year:—

	Expected.	Actual.	
Temperance	321	240	= 70·7%
General	386	425	= 110·1%

The totals of the twenty-six years are:—

	Expected.	Annual.	
Temperance	5177	3663	= 70·7%
General	7663	7459	= 97·5%

This result is consoling to abstainers, and gathers force with each successive year.—I am, Sirs, yours faithfully,

J. J. RIDGE,
Enfield. Hon. Sec., Brit. Med. Temperance Assoc.

LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

Death under Chloroform.

AN inquest was held last week by the city coroner upon the body of a man who died at the Royal Infirmary during the administration of chloroform. The operation which it was intended to perform, though painful, was a comparatively minor one. Three of the house surgeons were present, one of whom was the administrator. Every precaution appears to have been taken, and every effort made to avert the fatal result; but without effect. The jury returned a verdict freeing all concerned from any blame. Deaths from chloroform in this city have been of late as rare as they were unfortunately frequent during 1891 and 1890. So far as can be ascertained, there have been no deaths this year or during the last two months of 1891, the last death having occurred on Oct. 15th, 1891.

Grant of Land for a Crematorium.

The Burial Board for the parish of Liverpool passed a resolution in favour of permitting the crematorium, which the new Cremation Society of Liverpool purpose erecting, to be placed upon a portion of the cemetery space at Anfield, which has not yet been used for burials. The parish of Liverpool, as represented by the rector, churchwardens, and members of the select vestry, have confirmed this resolution by a substantial majority. Thus, as suggested in THE LANCET some months ago, the two systems of disposal of the dead will be tried side by side, and opportunities will be afforded of comparing the two, each with the other. Without expressing any preference for either, the example thus set is worthy of being followed by other Burial Boards. Cemeteries exist for the disposal of the dead, primarily it is true by burial; but now that so many influential persons have shown themselves in favour of the disposal of their bodies by burning, it is only right that the opportunity for this should be afforded, subject to every needful safeguard. The recent cases of poisoning and the discovery by Dr. Stevenson of strychnine after burial and exhumation show how very necessary it is that some change should be made in our present system of death certification and registration. Before any body is destroyed by fire such inquiry should be made as would deter any from attempting to conceal foul play by this means.

Anonymous Correspondents and Coroners.

A Liverpool provision merchant, highly respected, died at his residence in Birkenhead rather suddenly on the morning of the 9th inst. The cause of death was apoplexy. This was certified to by the medical attendant who saw the deceased shortly after the attack and remained with him until his death. Mr. Henry Churton, the coroner, received a postcard from someone who preferred to be anonymous, informing him of the death, hinting that it was not a natural one, and that steps were being taken to hush it up. Mr. Churton caused full inquiries to be made by his officer and the local police, and, satisfied by them that the death was as it had been certified, declined to hold an inquest. It is to be hoped that the perpetrator of so cowardly an attempt to wound the feelings of surviving relatives and to bring discredit upon inquests by an attempt to hoax a coroner may be brought to justice.

St. James's Cemetery.

Dr. Hoffman, of the Burial Acts Department of the Home Office, attended at St. James's Cemetery on the 11th inst. and held an inquiry in the chapel, hearing various speakers in favour of closing the cemetery partially or completely. There were present Dr. Stopford Taylor (medical officer of health), Dr. Davidson, Dr. Bradshaw, Mr. Bickerton, and Mr. Lowndes. Mr. R. D. Holt, Mr. F. Smith, and Mr. Williamson (three members of the Corporation) were present, as well as the newly appointed chaplain, the Rev. R. F. Winter, and Mr. Charles Bird, the clerk to the cemetery, who has resided there for fifty years. Dr. Hoffman at the commencement of the proceedings explained that the inquiry, so far as he was concerned, was on sanitary grounds, and on sanitary grounds only. He had visited the cemetery that morning and had seen some open graves (which were being prepared for expected interments that or the next day) which he observed were very dry, though it had been raining that morning and more or less all the previous night. The clerk stated that the regulations and rules made with reference to burials in this cemetery were strictly enforced. The ground was dry, and water would not stay, though the cemetery was not drained. The graves were all either private or leased; the lowest price for any single grave was £5, including the first interment. The leased graves were sold for seven years, but no one was allowed to be buried in them, except the relatives of the person during that period. They were not leased again until fourteen years had expired. The depth was twelve feet, and coffins placed in vaults were always hermetically sealed either in lead or with stone slabs cemented together. The interments in 1891 numbered 451; 19 in vaults, 44 in new graves, and 318 in existing graves. The total number of interments in the cemetery since its opening in 1829 is 47,091. These are comprised in a space of 44,000 square yards of land, the greater portion of which is many feet below the level of the adjacent streets. The cemetery, in fact, though intramural, is, so to speak, sub-mural, being at the same time perfectly open. There is a very strong feeling among members of the profession, and some of the general public, against the breaking of any virgin soil in this cemetery (of which there remains a sufficiency to make many new graves), though it is generally admitted that to close the cemetery absolutely would be unreasonable and unjustifiable. Dr. Hoffman will, as usual, make his report later on.

Honours to Local Professors.

Professors Herdman and Gotch, having been elected Fellows of the Royal Society, were entertained at dinner at the Art Club on the 11th inst. by the Senate and members of the Liverpool University College.

June 14th.

NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

The Weather and Health in the North.

WHIT-WEEK has been remarkable this year for its sudden change of temperature. Much as we are used to climatic variations, we rarely have such a record as we experienced this week. Up to Thursday we had a steady rise of temperature with bright sunshine. The heat was so great as to cause lassitude and depression, and, indeed, sunstroke, two fatal cases being recorded—one at Barnard Castle and the other at Penrith. But between Thursday night and Friday morning all was changed by a thunderstorm, north-east wind and rain, with a fall of temperature of about twenty degrees. This rapid change has given rise to much illness; susceptible people have been caught, and now there is a pretty general epidemic of tonsillitis astir in Newcastle and district. I have, however, a much graver matter to note—namely, a fatal case of small-pox in Newcastle, the particulars of which are as follows:—A sailor from North Shields presented himself amongst the casuals one day last week at the Royal Infirmary. As there appeared some doubt about the nature of his affection, he was taken into the house, and ultimately the case was diagnosed as hæmorrhagic small-pox, upon which he was removed to the special hospital set apart for such cases, where he died the next day. I believe that the sailor had come from some foreign port, but that

Digitized by Google

he had been for a short time a resident at the Sailors' Home at North Shields; but of course this will be investigated in due time, and no doubt every means will be taken to prevent the spread of the disease.

The Proposed New Infirmary for Newcastle.

A requisition has been presented to the Mayor of Newcastle asking him to call a public meeting of the inhabitants to consider the question of building a new infirmary to perpetuate the memory of the late Dr. Bruce, and his worship has consented to hold a meeting in the Guildhall on the 29th inst.

Carlisle: a New Sanitary Association.

An Association, called the North-Western Sanitary Association, has been formed in Cumberland to ensure the proper sanitary condition of dwellings, and to give the best practical advice as to the best means of remedying defects in the houses of the poorer classes. The Association is not formed for the purpose of profit, and any surplus after the payment of the officers will be set apart for the advancement of sanitary science, as may be decided at a general meeting of the subscribers.

Opening of the Bowes Museum and Park at Barnard Castle.

On Friday last the Bowes Museum and Park were formally opened and handed over to the public. The museum and park were founded by the Countess of Montalbo, a French lady, and wife of the late Mr. John Bowes, of Streatham Castle, whose family have been connected with the district for centuries, and whose present representative (the Earl of Strathmore) presided at the inaugural banquet. The Countess and her husband, who mostly resided in France, were enthusiastic art patrons and collectors, and about twenty-two years ago they decided to remove their collection to England, and fixed upon Barnard Castle for that purpose. She first purchased the land at a cost of about £100,000, and she lived to lay the foundation stone, but the building was carried on by Mr. Bowes, and endowed by him to the extent of £135,000. Certain legal obstacles prevented this bequest being fully carried into effect; but his estate being administered in Chancery, and a scheme being assented to by the Charity Commissioners, the intentions of the founders will be, it is expected, fully carried out in time. The building has cost about £200,000, is very handsome in itself, commanding fine views of the Yorkshire moors. The value of the contents of the museum is not known, but they have been insured against fire for £54,000. It was the foundation of the Bowes Museum which led to the alteration of the law of mortmain in 1871, which enabled any person to bequeath by will for public parks, schools, and museums (subject to restrictions) land not exceeding twenty acres to any one park, two acres for any public museum, and one acre for any one schoolhouse.

Sunderland.

At a meeting held at the Sunderland Infirmary last Friday to make arrangements for the forthcoming Hospital Saturday collection, the secretary stated that, during the twelve weeks that the miners' strike had lasted, the infirmary had lost £420 in working men's subscriptions alone, and the losses from other sources owing to the strike (added to the above) amounted to about £700. The foundation stone of the new Eye Infirmary at Sunderland is to be laid on July 2nd by Mrs. Backhouse.

Berwick: the late Dr. Maclagan.

A movement is on foot at Berwick to establish some memorial of the late Dr. P. W. Maclagan in recognition of the prominent position he so long occupied in the border town as a physician, philanthropist, and as a man of science. Meantime, a ward in the Berwick Infirmary has been called the "Maclagan Ward," in recognition of his long and faithful services to the institution.

Darlington.

At a late meeting of the Darlington sanitary authority it was decided that the Infectious Diseases (Notification) Act, 1889, should be put into force, and that it was to apply permanently to measles.

Lord Barnard has sent a gift of £100 to the Mayor of Darlington towards the relief of the distress in the town. Lady Grisell Baillie bequeathed £3000 to the Baillie Memorial Institute at St. Boswell's.

Newcastle-on-Tyne, June 15th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENT.)

The Extension of Aberdeen University Buildings: Rearrangement of the Classes.

A MEETING of the Senatus of the Aberdeen University was held on June 11th, when the question of the rearrangement of the classes, rendered necessary by the University extension, was under consideration. Notices of motion had been given by Professor Stephenson, Principal Sir William Geddes, Professors Minto, Nicholson, Fyfe, and Milligan, anent the rearrangement. After discussion, the motion of Professor Minto, in an amended form, was carried by nine votes to six. The adopted motion runs:—"That since it is desirable, in order to provide proper facilities for study, that the classes included in the medical curriculum should be located together, and since it is desirable, for similar reasons, that all the classes included in the scheme of options for an arts curriculum should be located together, and since the science classes which are common to both cannot be divided between King's College and Marischal College without serious disadvantage, and ought to be all close to the other classes of any curriculum of which they form a part, it is, in the opinion of the Senatus, desirable for the full efficiency of the University, under the new ordinances, that authority should be obtained for having all the classes of arts, science, and medicine on the same site." The following motion also became the finding of the meeting:—By Professor Hay: "That the Senatus now resolve to recommend to the University Court that the proposed extension at Marischal College should be carried out on such lines as to permit of the object of the motion now carried being ultimately attained."

The Health of Aberdeen.

The death-rate for May was 17·87, as against 19·43 in May and 19·47 in June, 1891. The rate for May is, in fact, the lowest recorded for the last ten years at least. There were thirty-eight cases of scarlet fever, a decrease of eleven since April; and six cases of measles with one death, as against one case last month. Thirteen cases of measles from an adjoining parish were removed to the city hospital. Diphtheria shows a diminished record—seven cases with two deaths, as against ten cases with three deaths. Whooping-cough is also on the wane, 100 cases, as compared with 191 cases in April, being recorded.

Professor Struthers on the New Medical Education.

Dr. Struthers has written two very interesting articles on the new medical education, which are published in the *Aberdeen Daily Free Press*. He advocates less lecturing; especially he denounces the system of taking out a course more than once. He strongly recommends the further use of laboratories, and he deprecates the introduction of anatomy, except in its very elementary forms, before the first professional examination is passed.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

Royal College of Surgeons.

A MEETING of Fellows will be held on Monday next, the 20th inst., to witness the election of examiners for the ensuing year. The rule that no candidate should be eligible for an examinership after a three years' tenure of office without a twelvemonth's interval has been repealed by the Council, who will elect examiners irrespectively of the time they may have served.

Mercer's Hospital, Dublin.

The expenditure last year exceeded the income of the same period by £791 9*s.* 3*d.*, the amount obtained by legacies coming to the paltry total of £33 12*s.* 11*d.* The institution is situated in one of the poorest parts of the city, and receives yearly a very considerable number of accidents of a serious nature.

Royal Medical Benevolent Fund Society of Ireland.

The annual meeting was held last week at the Royal College of Physicians. The committee in their report refer to the scanty support given by their professional brethren in the country, and point out that last year no less than five important counties did not contribute a single shilling to the fund. Thirteen *ad interim* applications for relief were considered since the last annual meeting, two of which were from medical men and eleven from the widows of medical men. This year grants to the amount of £995 have been distributed. The expenses of management amounted to £125, or about 9·8 per cent. of the income, which appears somewhat higher than it might be considering the number of honorary officers.

Royal Hospital for Incurables.

At a meeting of the board of governors held last Saturday J. J. Cranny, M.D Dub., was elected honorary consulting physician, and John V. Lentaigne, F.R.C S I, honorary consulting surgeon, to the hospital.

Children's Hospital, Temple street.

The committee intend to hold the annual garden fête and fancy fair on the 23rd inst. and following day.

The proposed Consumption Hospital at Ballynafeigh.

At the last meeting of the Belfast City Council, held on June 1st, the report of the public health committee was brought forward, with an appendix submitted by the medical superintendent officer of health and the executive sanitary officer, who had been instructed to report on the plans of the new consumption hospital. In this document these gentlemen say they have inspected the plans and the suggested site, and, while there is no objection to the former, they do not think it is advisable to build any hospital for the treatment of disease in a populous locality. They say the infectious nature of tubercle is now generally admitted, and, though in other large cities hospitals for the treatment of that disease exist in populous districts, they do not think it would be wise or expedient to follow this example. They point out that, while the death-rate in Belfast during the past year amounted to 2·6 per 1000 from all zymotic disease, that from phthisis amounted to 4 per 1000. They recommend that a site should be chosen outside the city boundary, in a locality not likely to be largely built upon for some time to come. This report was adopted by the public health committee. On the same day an extremely influential deputation of the citizens of Belfast waited on the Council, urging them to allow the building of the new hospital to be proceeded with at once. One of the deputation, a well-known clergyman in Belfast, stated that before they acquired the site they carefully informed themselves as to whether any danger was likely to accrue to the inhabitants of the neighbourhood from the erection and maintenance there of such a hospital. They had visited the Brompton Hospital, London, the largest institution of the kind in the world, containing beds for 420 patients, and the authorities there simply laughed at the views expressed by the Belfast Health Committee as to the danger of the hospital to the surrounding population. When the matter was considered by the Council, on the motion of Mr. Stewart, the report of the public health committee was passed, with the excision of a paragraph and the whole of the appendix referring to the Consumption Hospital. This was thought to mean that the plans had passed; but I understand the subject was again before the public health committee, and is not yet finally settled. On June 13th a public meeting of the inhabitants of Ballynafeigh was held to protest against the proposed site as unsuitable, and the following, amongst other resolutions, was passed:—"That many of the most eminent medical men confidently assert that consumption is infectious, and although some still hold a different view, it is the decided opinion of this meeting that all risk of infection should be avoided." A deputation from the meeting was to appear on Wednesday, June 15th, before the City Council Improvement Committee. The question of the location of the new consumption hospital is exciting considerable discussion in Belfast, and the local papers are full of letters on the subject, especially on the point, "Is consumption infectious or not?"

The statue of Lord Ardilaun in St Stephen's-green Park, Dublin, will be unveiled next Saturday by the Lord Mayor.

June 15th.

(FROM OUR OWN CORRESPONDENT.)

The Prophylaxis of Tuberculosis.

I HAVE on more than one occasion communicated the results of the experiments conducted by MM. Hédicourt and Richet on the protective properties of cultures of avian tuberculosis on dogs. On Dec. 5th, 1891, four dogs were inoculated with human tuberculous matter, two of these animals having previously been inoculated with avian tubercle. The first group of dogs died on Dec. 27th, each having survived exactly twenty-two days. Of the second group, one was destroyed on April 19th, 1892. This dog, which, despite an appearance of good health, had developed fungous periarthritis of both wrists, and arthritis of the hip-joint, was found post mortem to be affected with pulmonary tuberculosis lesions in which a sclerogenic process had made considerable progress. The other "vaccinated" dog is to-day alive and well, having in the six months since its inoculation gained flesh to the extent of three kilogrammes. This fairly conclusive experiment has since been repeated on a larger scale. On April 14th, 1892, four "unvaccinated" and four "vaccinated" (with avian tubercle) dogs were subjected to inoculations with equal quantities of human tubercle. The culture, forty-five days old, was injected into the saphenous vein, one cubic centimetre being the dose employed. The inoculation was repeated on two subsequent occasions. On the same day three other dogs, already "vaccinated," received a single dose of human tubercle, either in the peritoneal cavity or in the saphenous vein. The results are most striking, for the four "unvaccinated" animals succumbed on the eighteenth, twenty-first, thirtieth, and forty-fifth days respectively, whilst all their "vaccinated" comrades are still living, and apparently enjoying perfect health. May not these laboratory experiments be extended to the wards, and to our homes, and is it too bold a flight of imagination to picture children receiving at the hands of the family medical man one or more injections of avian tubercle as a prophylactic against that fell malady, tuberculosis, just as the onslaughts of variola are guarded against by the routine practice of "vaccination"? Time alone can teach us the value of such protective methods.

Election at the Académie des Sciences.

The vacancy in the ranks of the foreign associates of this body, caused by the death of Dom Pedro, ex-Emperor of Brazil, was at the last meeting, at which Carl Vogt, the eminent naturalist of Geneva, was present, filled up by the election of von Helmholtz of Berlin, the great physicist being awarded twenty-eight votes, as against nineteen recorded for M. van Beneden of Louvain. The other names submitted for selection were those of Newcomb of Washington, Nordenskjold of Stockholm, Weierstrass of Berlin, and last, but not least, our own Lister.

A Small-pox Epidemic at Nîmes.

It is reported that small-pox has been rife at this town since July, 1891, and that no less than 150 persons have succumbed to the disease, 130 of these fatal cases having occurred during the five first months of this present year. It is pointed out that the town, which boasts a population of 70,000, possesses nothing in the shape of a system of disinfection, and that the sanitary board and their single inspector are not endowed with sufficient powers. Vaccination is so neglected that it is only owing to strong representations made by a local journal that the opening of a vaccination bureau thrice weekly was procured. It appears that a large proportion of the population is unvaccinated. The efficacy of revaccination is once more proved by the absolute immunity enjoyed by soldiers, the *employés* of the Paris-Lyon-Méditerranée Railway Company, and of such private firms who exact the observance of this precautionary measure by their workmen.

Paris, June 15th.

BERLIN.

(FROM OUR OWN CORRESPONDENT.)

The Inauguration of the Langenbeck House.

THE Langenbeck House was formally inaugurated on the 8th inst. The Emperor, who was at Kiel, was represented by his cousin, Prince Frederick Leopold. The large hall

Digitized by Google

was filled to the roof with the invited guests and the members of the German Surgical Society. The Empress was represented by a chamberlain. The Commandant of Berlin and other officers of rank, ex-Minister Delbrück, the officials of the Berlin Medical Society, the members of the Imperial Office of Health, and many eminent men of science, including Esmarch, Thiersch, König, Schönbarn, Bardenheuer, Mikulicz, Braun, Helferich, Küster, Lauenstein, Schade, Wagner, Bruns, Wölfler, Bramann, and Trendelenburg, were present. Langenbeck's family was represented by his son, Major-General von Langenbeck, his son-in-law, Major-General von Plessen, and his grandson, Lieutenant von Roon. After Prince Frederick Leopold had taken the seat of honour in front of the platform, Professor Bardeleben, as president of this year's Surgical Congress, addressed the assembly. He gave a history of the Langenbeck House, drawing special attention to the powerful aid of the late Empress Augusta. Prof. von Bergmann then spoke in terms of high praise of the building. He referred to the valuable gifts that had been bestowed on the house, especially the splendid Black Forest clock presented by the Empress Augusta's daughter, the Grand Duchess of Baden, and a portrait of Langenbeck presented by his daughter, the Countess Hardenberg. The band then played Beethoven's "The heavens are telling the glory of God," and the members of the Surgical Society and their guests inspected the house in all its parts.

The Twenty-first German Surgical Congress.

The twenty-first German Surgical Congress was opened at 1 P.M. on the 8th instant in the large hall of the Langenbeck House by the president, Professor Bardeleben. After some official preliminaries, Bruns of Tübingen spoke on the surgical importance of the new firearms. Especially at shorter distances an explosive effect takes place, not so bad, indeed, as that produced by the old rifles, when soft lead bullets were used, but still bad enough. Close shots produce extensive lacerations of the soft parts, and seriously splinter the bones. Often, however, this destruction is not externally visible—at least where the bullet has entered. The bullet never remained in the body at distances of less than 1200 metres, but fragments of the clothing were sometimes carried into the wound, and then, if bones were injured, generally remained at the place where the shot entered a bone. An important difference between the old lead bullet and the new steel-mantled projectile is that the latter does not at once change its form on entering the body. Such changes take place only when it has first passed through walls or rebounded from hard objects, and then the wounds are much more dangerous. Bruns showed pieces of wood penetrated by old and new projectiles. The channels produced by the old ones are short, and widen out conically immediately after the entry of the projectile, whereas those made by the new ones are longer, and uniform from beginning to end. Owing to the great penetrative power of the new projectiles, the death zone coincides with the range of the rifle. It is doubtful, however, whether the number of fatal wounds in war will be greater than hitherto. The fighting will be done at much greater distances, except where troops can avail themselves of very safe cover. Things which used to afford such cover no longer do so. At a hundred metres the projectile goes through four or five ranks of soldiers in close order, at 400 three or four, at 800 two or three. The psychical effect on the men will be different too. The experience that all the improvements of weapons have failed to increase the losses in war justifies the hope that this will continue to be the case. The surgeon's task will be in some respects lighter than before. The use of the probe and the extraction of bullets will be far rarer, and asepsis will be much more frequently attainable than it used to be. Even when the long bones are splintered, the slighter injury caused to the skin and the soft parts will render aseptic treatment easier. The experience of Russian and American surgeons in the recent Chilian war confirms this, and shows that the small bore rifle is a gain to humanity. The danger of fatal hæmorrhage is diminished, and the fact that the bullet's path through the body is in a perfectly straight line enables the surgeon to determine with certainty what parts are injured. On the other hand, it cannot be denied that the long range of the new rifle makes the removal of the wounded very difficult. The best immediate application is an absorbent aseptic bandage. The next speaker, Reger of Hanover, spoke of the effect of hydraulic pressure on the injured organs. The splintering of the long bones, he said, is due to the medullary substance being compressed by the impact of the projectile on the bone. He thought Bruns' description of the terrible effect of near shots exaggerated. Bruns' experiments proved nothing, for they were made on dead animals—i.e., on lax muscles and bones without fluid marrow. Reger believes that the percentage of fatal wounds must diminish with the calibre of the rifle. Messner dealt with the question whether the heat of the projectile suffices to kill all the germs attaching to it or caught up by it on its course, and answered it in the negative. Lauenstein of Hamburg recommended cleanliness on the part of the soldiers as the most important condition of asepsis, but many of his hearers were of opinion that in the filthy work of war cleanliness is impossible. Haase of Berlin combated the opinion that, as the range of the new rifle is four kilometres, the bandaging places must be four kilometres distant from the line of fire. The range of the chassepôt was three kilometres, but the bandaging places in the French war were only 1700 to 1800 metres from the line of fire. The distance will now have to be from 2250 to 2400 metres, or at most 2500. At 1000 metres soldiers fire only at bodies of troops; at 2000 not at all. The carriages to which the wounded are borne must stand from 700 to 1100 metres from the line of fire of one's own troops, 1500 to 1600 from that of the enemy. This is the point at which the zone of less danger begins. The bearers, of course, work in the zone of greater danger, but they did so in 1870 too—indeed, their work was specially dangerous in that campaign, because the range of the needle-gun was much shorter than that of the chassepôt. Their loss was 6·6 per 1000. But, even supposing that the losses in the next war exceed those of the bloodiest battle in 1870 by 50 per cent., only 1158 bearers per army corps would be needed, for there were 772 then. In reality each corps now has 1168, including 200 musicians trained as bearers. The introduction of portable electric search-lights for use in the night is desirable. Bloodhounds might also be of use both at night and on covered ground by day. The total number of the lower ambulance officials in the German army is 45,000. Towards the close of the discussion a question arose as to the advisability of the preliminary closing of shot wounds by the bearers by suture or plaster. Langenbuch advocated this on the ground that most of the wounds will be aseptic, and that therefore primary healing will be attainable in most cases, while, in the contrary case, it will be easy to reopen them. König, Esmarch, Trendelenburg, and Thiersch opposed this view, maintaining that, owing to the entry of particles of clothing with the bullet, and to the uncleanliness of the sewing material and of the sewer's hands, the wounds will very often be by no means aseptic. Thiersch put an end to this debate by the dry remark, "We will keep the wounds open and close the discussion." The chairman took the hint and closed the meeting.

Berlin, June 13th.

Obituary.

THOMAS DAVIES-COLLEY, M.D., J.P.

WE regret to have to announce the death of Dr. Davies-Colley of Chester. So long ago as 1834 he took the M.R.C.S. Eng., and in 1835 the L.S.A., and then began practice in Foregate-street, Chester, in which city his father had been for some time a general practitioner. In a short time, however, he went to study in Edinburgh, where, in 1839, he obtained the M.D. degree. He was elected in 1854 honorary physician to the Chester General Infirmary, which position he held until the beginning of 1890, when he resigned and was appointed consulting physician. During the whole of this time he was most constant in his attendance at the hospital. Everything gave way to what he considered his first duty, attention to the patients under his care at the infirmary. Everything connected with the interests of the institution claimed his warm sympathy and intelligent support. In addition to his professional work he took an active part in the various philanthropic movements of his native city. He took much interest in the management of the Blue Coat Hospital, and was one of the trustees of the Blue Girls' School. He always manifested

Digitized by Google

much interest in archæological matters, and was part and parcel of the local Historical and Archæological Society, and was intimately connected with other scientific societies. Dr. Davies-Colley was one of the most modest and unassuming of men: he went quietly on his way, doing his duty consistently and doing good by stealth. He was on the Commission of the Peace for the city of Chester for more than twenty years. His wife's death preceded his own by only a few months. He, full of years, and having finished his work, passed quietly away on the 3rd inst., at his residence, Newton Cottage, near Chester, in his eighty-first year. He leaves behind him one daughter and four sons, one of whom is one of the surgeons at Guy's Hospital.

MEDICAL TRIAL.

A DISPUTED CASE OF SCARLET FEVER.

MEDICAL MEN AND THE NEW PUBLIC HEALTH ACT.

ON Saturday, the 4th inst., Mr. Cooney, the medical officer of health for the district of Fulham, applied to Mr. Curtis Bennett, sitting at the West London Police-court, for an order for the removal of a child, aged five years, named Emily Williams, from her parents' abode at 19, Protheroe-road, Fulham. He certified that the child was suffering from scarlet fever, and produced a certificate from Mr. Robert Bruce, the Medical Superintendent of the Western Fever Hospital, who had seen the child that day, and who certified that it was suffering from scarlet fever, in addition to stating that there was room for it in the Fever Hospital. Mr. Haynes, solicitor, said he was instructed to oppose the granting of the application. After some hesitation the magistrate decided to hear evidence for and against the application; but when the case came again before him on the following Wednesday, he remarked that after a careful study of the Act he had come to the conclusion that he should not have allowed evidence to be given, but ought to have made an order for the removal of the patient on the certificate of the medical officer of health for the district, supported by the certificate of the Superintendent of the Fever Hospital to the effect that there was room for its reception. However, on Saturday evidence was given.

Mr. Cooney said that he was called to attend the child in his capacity as district medical officer to the Fulham Board of Guardians on the order of a relieving officer on May 19th. He then declared that it was suffering from scarlet fever, and sent for the ambulance from the Fever Hospital in order that it might be removed. When the ambulance came the mother of the child refused to allow it to be taken away, giving as the reason that another doctor had seen it and had said that it was not suffering from scarlet fever. When he saw the child it was in bed in a room where there was a mangle, the mother occupying two rooms only, and taking in laundry work, which was left for the purpose of being mangled. There were three women and two other children in the same room, and the upper part of the house was occupied by another family. He had seen the child again that day (June 4th) and the skin was peeling. Replying to Mr. Haynes, Mr. Cooney said that he did not make the application for an order for the removal of the child before, because he had been informed that two other medical men had seen the child and said it was not suffering from scarlet fever. He had waited for the first day when desquamation had set in before applying for the order. Dr. Clarke and Mr. Butler were the two medical men he had referred to as having seen the child. He was, however, convinced on May 19th that it was a case of scarlet fever.

Mr. Alfred George Wells was next called, and said that he went to see the child at Mr. Cooney's request on May 20th, and it was then suffering from bronchitis in addition to a doubtful case of scarlet fever. He had seen the child again on June 3rd, and it then showed unmistakable signs of scarlet fever.

Mr. Henry Joseph Butler was called by Mr. Haynes in opposition to the granting of the application. He said that he had seen the child, and in his opinion it was suffering from bronchitis, pleurisy, and a slight enlargement of the tonsils. He had seen the child on May 19th, on several occasions since, and finally on June 3rd (the day previously). He had not seen any symptoms of scarlet fever. There was no peeling and no dropsy. In reply to the magistrate, he said that one reason for saying that the case was not one of scarlet fever was that there was no rash. It was, however, possible to be scarlet fever without rash.

Mr. Curtis Bennett said he should make the order for the removal of the child, and in answer to Mr. Haynes's request, that he would grant an adjournment in order that other medical evidence might be called, he said that it would not be right to allow an adjournment for forty-eight hours, and thus give an opportunity for the child to infect the neighbourhood. The sanitary inspector, who went with a police officer to carry out the order the same afternoon, was informed when he reached the house that the child was not there, and the mother declared that she would rather "lose the last drop of blood" in her body than give up the child. Accordingly an application was made on Tuesday for a summons against the mother for penalties for disobedience of the order, and this was made returnable on the following day. When the case came before the Court on Wednesday, evidence was given to the effect that the mother at first told the officers that the child was out for a walk, that she then went with one of them to the house of Dr. Clarke, promising that if he said it was a case of scarlet fever she would give up the child; finding he was out she absolutely refused to give up the child, and finally declared that she did not know where the child was. Mr. Curtis Bennett at this stage expressed regret that he had allowed a discussion of the case when the application for an order was made on Saturday. No further evidence was at that stage called in support of the statement that the child was suffering from scarlet fever, but Mr. Haynes said that Dr. Cayley had been called in to see the child on Sunday morning, and had given an order for its removal to the Middlesex Hospital, of which he was physician, and to which no infectious cases were admitted. He also said that Mr. Butler and Dr. Clarke had seen the child constantly during the period elapsing from May 19th to June 3rd, but had never spoken to each other until five o'clock on Saturday, June 4th, after the magistrate had made the order for the removal of the child. He called

Dr. Berkeley, the house physician at the Middlesex Hospital, who said that the child Emily Williams was admitted by direction of Dr. William Cayley, the physician to the hospital, at two o'clock on Sunday afternoon, June 5th. The hospital was one for non-contagious cases only. He had examined the child, and found that it appeared to be in very good health. There were no signs or symptoms that it was suffering from scarlet fever, and there was nothing infectious about it. Replying to the magistrate, this witness said that he had been three months house physician at the Middlesex Hospital, and previously had been for six months house physician at the Brompton Hospital for Consumption. He had had no experience in attending scarlet fever cases. The child was in the general female ward, with fourteen other patients.

Dr. William Frederick Clarke said he first saw Emily Williams on May 19th. At that time he did not know that any other medical man was attending the child, and he had no knowledge that the medical officer of health for the district had seen the case. He did not find that out until he was stopped in the street and told that he was attending a case of scarlet fever that the medical officer had seen. He then denied that he was attending any case of scarlet fever. He attended the case up to May 28th. When he saw the child on May 19th it was suffering from a little bronchitis, enlarged tonsils, and a slight fever; beyond that there was nothing at all wrong with the child. He was not aware that it had at any time suffered from scarlet fever. It had not a single sign of scarlet fever except the fever common to all diseases of children. He had seen the child on June 4th, again on the 5th, and on the 7th. On the 4th the skin was perfectly normal; there was no sign whatever of peeling. There was a small rough patch on the chest, and if that spot was looked at it might have misled anyone. Asked as to the child's temperature, he said he had made no notes of the case, because he did not know it was important until it was brought into Court on Saturday, the 4th inst. He had had considerable experience in scarlet fever cases.

Mr. Butler was called again into the witness-box, and said he examined the child on Sunday with Dr. Cayley and Dr. Clarke. He did not find any trace of scarlet fever.

The case was then again adjourned until Friday. On this occasion Mr. Blanco White, the solicitor to the Fulham Vestry, appeared to support the summons, and Mr. A. J. David watched the case, as on Wednesday, for Mr. Butler and Dr. Clarke. Mr. Haynes defended Mrs. Williams.

Dr. William Cayley was the first witness called. He said he was consulting physician to the London Fever Hospital, of which he was until recently physician. At present he held the appointment of physician to the Middlesex Hospital, was lecturer there, and held other appointments, besides having qualifications. He first saw the child on Sunday at Dr. Clarke's house. He had been telegraphed to by Dr. Clarke, who asked him to meet him in consultation. He made a careful examination of the child, and was informed that it was a doubtful case of scarlet fever, but he did not discover any signs of the after-effects of scarlet fever at that time. There was no trace of peeling. Beyond enlargement of the tonsils he found nothing wrong with the child. It was a rickety child. He had the urine examined, and it was tested in his presence a few hours later. It was perfectly normal. He did not test the child's temperature at the time, but it was subsequently tested. He could not discover any trace of infectious disease. He recommended the admission of the child to the Middlesex Hospital. He had had considerable experience in fever cases, having been for twenty years physician to the Fever Hospital, but he could not trace anything in the child that would lead anyone to suppose that it had had scarlet fever. Asked as to the present condition of the child, he said that, beyond chronic enlargement of the tonsils and a little cough, there was nothing the matter with the child. He thought there was no necessity for the child to be sent to a fever hospital. Mr. Butler and Dr. Clarke were present when he examined the child on Sunday, and he was informed that an order had been made by the Court for its removal to the Fever Hospital, but he did not mention that in the letter he wrote to the medical officer of the Middlesex Hospital concerning the child's admission. He did not receive any fee for consultation. It would be contrary to the etiquette of the profession.

Dr. Sidney Phillips said he had been in the habit of seeing scarlet fever cases for twenty years, and at times as visiting physician to the London Fever Hospital as many as a hundred cases a day. He first saw this child on June 9th, and then found that it had rickets of some standing, chronic enlargements of the tonsils, one or two glands slightly enlarged, but it was in perfect health. He endeavoured in every way to find a trace of anything to denote that the child had had scarlet fever, but could not find anything. There was no peeling, but in cases where there was scarlet fever without rash there would be little or no peeling. In that particular case there was said to have been rash.

Mrs. Williams, the defendant, was then called to give evidence. She said that after Mr. Cooney had told her the child was suffering from scarlet fever she went to Mr. Butler, who saw the child within half an hour. He examined the child and said it was not a case of scarlet fever, but he declined to take it up as Mr. Cooney had seen the case. He told her, however, that she could call in any other medical gentleman if she liked. She went for Dr. Clarke, who saw the child the same day and continued to attend almost daily until May 28th, when he gave the child up as being well. It was because of what Dr. Clarke told her that she refused to obey the magistrate's order. It was true that she had a mangle in the same room that the child was. On the day after that on which Mr. Cooney first saw the child Mr. Wells called and saw the child. As he was going out he said that it was suffering from bronchitis and a feverish cold. She did not inform Dr. Clarke that Mr. Butler had seen the case; indeed she did not inform him of anything. Mr. Butler called several times afterwards to see how the child was getting on, but he had nothing to do with curing it. She told him that Dr. Clarke was attending the child.

Some friends and neighbours of the defendant were called to testify that they had seen the child and had not discovered any signs of scarlet fever. This concluded the case for the defence

Digitized by Google

Mr. Robert Marston Bruce, the Medical Superintendent of the Western Fever Hospital, was then called by Mr. Blanco White. He said he saw the child on the 4th of June, and found that it had some infection of the throat, enlarged tonsils, papillated tongue, slightly enlarged gland of the neck, some punctation on the leg, and indifferent branny peeling on the legs. He formed the conclusion that the child had recently had scarlet fever from these signs, and from the history of the case which he obtained from the medical officer of health. He had no doubt about the case, and considered it a proper case for isolation. There was at the hospital a child named Reuben Merrett, which when sent in was said to be suffering from diphtheria. On examination he found no positive evidence of diphtheria. It had sore-throat and enlarged tonsils. The certificate on which it was admitted was signed by Dr. Clarke. In cross-examination he said he did not remember a child being admitted to the hospital from Harwood-road on the certificate of Mr. Cooney. It was not any of the signs taken individually, but taking them collectively, that led him to certify that the child was suffering from scarlet fever.

Mr. Francis Woodhouse, the assistant medical officer at the Western Fever Hospital, said he visited the child at the Middlesex Hospital on June 9th and examined it. He also tested the urine, and it showed evidence of albumen. He could not come to any definite conclusion as to the case without knowing its previous history, but he should say that the child had had scarlet fever. He should not like to say that the child was definitely infectious, but he thought she ought to be isolated. Cross-examined, he said he would not swear that the child had had scarlet fever. He admitted the case of Merrett, to which reference had been made, and which was certified to be one of diphtheria. He found on examination that it was not suffering from diphtheria, but from tonsillitis; that would not, he thought, justify its admission to the hospital.

At the conclusion of the case Mr. Curtis Bennett delivered a long summing up from the bench. He said: "This is one of the early cases under the new Act of Parliament, which was passed by the Legislature after very great consideration, for which there was, I may say, a great amount of absolute necessity, in order to check if possible what has been rife—the spread and contagion of infectious diseases amongst the community, especially of large cities such as London. That Act was passed to give the medical officer of health, who finds a case in his district which, in his opinion, is of an infectious character, power to give a certificate to that effect. That certificate is to be backed up by a certificate showing his preparedness to receive the patient from the officer of one of the hospitals provided at the public expense for the reception of patients suffering from infectious diseases, such patients as this little child, where, as is admitted in this case by the solicitor for the defence, it is impossible to provide isolation. Now we come to a most extraordinary statement of facts, quite apart from the case itself. On Sunday last Dr. Cayley, without any knowledge of the previous history of this case, comes down from Wimpole-street to Fulham, and although he knows that an order for the removal of the child to a fever hospital has been made by this court and by myself, sitting here as one of the magistrates of the metropolitan districts, not only upon the certificate of Dr. Cooney, not only upon the certificate of Dr. Bruce, which went further than was necessary, because, in addition to stating that he had room for the reception of the patient, he certified that she was suffering from scarlet fever; but after a public inquiry held in this court, in the course of which Dr. Cooney, who was supported in his evidence by Dr. Wells, had been examined and cross-examined, yet notwithstanding all this that doctor sets the Act of Parliament at defiance, because he, forsooth, in his own individuality and in his own infallibility, chooses to say that this child is not suffering from an infectious complaint. What did he do? It was he who gave the order for the admission of the child—we have it in his own words—to the Middlesex Hospital. What examination had he made? He had not even taken the ordinary course of examining the urine at the time that the admission was given. You have that child sent to one of the institutions maintained by the subscriptions of the charitable public—an institution not set apart for infectious cases, but set apart by the public purse for the treatment of ordinary cases of illness amongst mankind. It had been, as he knew, certified by the medical officer of health for the district, by the doctor of the fever hospital of the district, sworn to in evidence by another medical man that this child was suffering from scarlet fever. He knew, too, that an order had been made for the removal of the child to the only place it could properly be removed to. Yet you have that man giving an order for the admission of that child into the Middlesex Hospital. I do not know what the authorities of the Middlesex Hospital will consider to be the proper course in regard to that. I do not know what the public who subscribe to maintain that institution will say with regard to it. Well, now, let us come to the facts in this case. This case Dr. Cooney saw for the first time on May 19th, and blame was attached to Dr. Cooney by the solicitor who appears for the woman who is the defendant in this case for not having taken steps after that examination earlier than June 4th. I agree with the observations that were made that Dr. Cooney ought to have gone on at once to have had that child removed to a proper place, if there was not a proper place at home. But that child was seen also on May 20th by Dr. Wells, who said he found it suffering from bronchitis and feverishness which he believed to be scarlet fever, but at that time it was not clear. I think, upon that, Dr. Cooney would have been justified in taking—and I think he ought to have taken—further action, and an order for that child to be removed should have been applied for. The mother sends for a doctor named Butler. He attends, but when he finds that the child has been certified by Dr. Cooney he says he will not attend at all. He was the only witness called here on Saturday to say that the child had not got scarlet fever. Dr. Clarke was called in, and he says: 'I did not know the child was being attended by Dr. Butler. I attended it *de die in diem*, and I had no notion it was being attended by any other doctor. I say, after having had it under my care, that I do not think it was suffering from scarlet fever.' Well, I do not know; one has heard something about medical etiquette; I was told that this was an honourable profession, and that these were men of honour. One has heard something about medical etiquette, that when one medical man attends a patient, no other medical man attends except in consultation. Let us take the evidence. Dr. Cooney says: 'I say distinctly on May 19th it is scarlet fever; I have no hesitation in saying it is scarlet fever.' Dr. Wells says: 'I examined it on May 20th, and there were many symptoms pointing to scarlet fever; on June 3rd it certainly had symptoms.' Dr. Butler swears that the child is not suffering from scarlet fever because it had not a rash. He shakes his head, but that is his evidence. When I put it to him in cross-examination, 'Can't you have scarlet fever without a rash?' he was bound to admit that it could be so. Dr. Phillips is called to-day. He gives evidence very fairly. He says: 'I was told that the child had had a rash.' I put it to him, 'Supposing there was a small rash, would not the peeling be almost imperceptible?' He says, 'Yes; but in this case I was told that the child had had a rash.' Dr. Clarke says: 'No rash, no scarlet fever.' Dr. Clarke says: 'The symptoms which I found were these: I found a patch, and that patch might indicate scarlet fever, but I do not *think* the child suffered from scarlet fever.' Dr. Clarke may shake his head, but that is the evidence. I will have it read if necessary. And no further would he go. There was no fear, no hesitation about Dr. Cooney. There is no doubt about Dr. Cooney. He is straightforward and honest. 'If I am wrong I am wrong, but there is my opinion: the child is suffering from scarlet fever.' That is straightforward, English, and honest; no backstair business, running in and out and hiding things from one another. Now, take Dr. Clarke. The furthest Mr. Haynes could get him to go, with all the coaching and all the persuasion, was, 'I do not think the child had scarlet fever.' Well, now, Dr. Clarke and Dr. Butler, until this case was in this Court, never took the slightest trouble about the case to examine whether it was scarlet fever or not. They never once, till after the case had been in Court two days, took a test of the urine. That is admitted by their evidence, from which they cannot get away. That is the state of facts about this case up till last Friday. Now, was this child suffering from scarlet fever? Mr. Bruce was not called to give evidence at this Court till to-day. I had his certificate, and although it was not necessary for him to go so far, and it was not evidence, I could not help seeing what he gave as the reason why this child should be admitted to the fever hospital. I said I would have here Mr. Bruce, the head of the fever hospital for the district couprising this large portion of West London. Mr. Bruce comes and says: 'I believe, I say, to the best of my opinion, notwithstanding all that I have heard from other people, that the child is suffering from scarlet fever, and I am of opinion that it is a fit case to be received into the institution for those cases.' Then we have another gentleman, introduced upon the scene with great pomp, and he was assistant to Dr. Cayley at the hospital. He gave his opinion that this was not a case of scarlet fever. What was it worth? Nothing! He said in cross-examination. 'I am a doctor at the Middlesex Hospital, where I have been three months.' I asked him. 'Have you had scarlet fever cases there?' His answer was 'No.' 'Have you ever attended a case of scarlet fever since you have been there?' 'No' 'Have you ever seen a case of scarlet fever there?' 'Well, I may have seen one when a man came who thought he had got it and who went somewhere else." (Laughter.) 'Where were you before that?' 'I was six months'—'At a fever hospital?'—'No, at the Hospital for Consumption.' I asked him, this gentleman who was called as an expert, 'Have you ever attended a case of scarlet fever in your life?' 'No,' he answered. That is that man's evidence. I am of opinion, and it is perfectly clear, that it is not this poor woman who is fighting this case. If it were, far be it from me to add other troubles by inflicting a fine. (Applause, promptly suppressed.) But there are those behind this case who are doing this, but who have not the honesty to come forward and have not the honourableness to let their names transpire; but they do it in the dark, and upon these people must the pecuniary penalty fall. I have no doubt whatever that the order I made on Saturday was the only possible order which could be made by anybody occupying the position I hold, and which I have had the honour of holding for a number of years. This child was in a house where laundry work is taken in, where laundry work is brought to be mangled and is left there. That child is suffering from scarlet fever, and even if I should be wrong upon that, will any man dare to say that upon the evidence given in this court there is not reasonable ground for the belief that the child had scarlet fever? Then if there is that reasonable belief, where should the child be? As the assistant doctor says, isolation is the proper thing. Of course it is! And this Act of Parliament was passed to meet cases which are doubtful as well as those which are absolutely defined. One is surprised to find that a doctor of the age and experience of Dr. Cayley should, of his own motion, and when he knows that his brethren differ from him, have the child removed and sent away to a hospital where it is taken on a note of admission from Dr Cayley, where it is not isolated, but is placed in a public ward with women and people who are suffering from common complaints. If Dr. Cayley was so satisfied, and his sympathies went out, as with honesty and honour they might, to the poor, why did he not take the child to his own house? Or why, if he wished to show philanthropy, did he not, out of his own purse, provide a place where the child might have been isolated for a time, and not send it to a hospital at the expense of the public? No doctor has ever been guilty of more monstrous conduct. I impose a fine of £10, with two guineas costs."

Dr. Cayley: As you have censured me so severely I wish to say I did not ——

Mr. Curtis Bennett: I have your evidence you did. I cannot listen to you now.

Mr. Haynes gave notice of appeal against both the order and the conviction.

ROYAL MEDICAL BENEVOLENT FUND SOCIETY OF IRELAND.—The following office-bearers have been elected for the ensuing year:—Presidents of the Royal Colleges of Physicians and Surgeons (*ex officio*), Central Committee: L. Atthill, Sir J. T. Banks, J. K. Barton, E. H. Bennett, A. H. Benson, J. H. Benson, Sir Charles Cameron, H. Gray Croly, F. Cruise, J. F. Duncan, T. Fitzpatrick, S. Gordon, T. Grimshaw, W. J. Hepburn, C. Joynt, G. Kidd, Henry King, J. Little, A. H. Marks, W. J. Martin, J. Moore, William Moore, G. Morrogh, J. Pollock, Sir George Porter, Bart., P. C. Smyly, Sir W. Stokes, and H. P. Truell. Hon. Secretaries: J. Moore, J. Finny. Hon. Treasurer Henry King. Acting Secretary: A. H. Benson.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen, having passed the necessary examinations, and having conformed to the by-laws and regulations, were at the ordinary meeting of the Council on Thursday, the 9th inst., admitted Fellows of the College:—

Hartley, John, L.R.C.P. Lond., Dunmow, Essex. Diploma of Member dated Jan. 22nd, 1879.
Anderson, G. R., L.R.C.P.Lond., Lambeth Palace-rd., Nov. 10th, 1887.
Pringle, James Hogarth, M.B. Edin., Glasgow, Aug. 2nd, 1888.
White, Edgar Ramsay, L.R.C.P. Lond., St. Albans, Aug. 2nd, 1888.
Cheatle, A. H., L.R.C.P. Lond., Carlisle Mansions, W., Nov. 8th, 1888.
Roberts, Charles Hubert, L.R.C.P. Lond., The College, St. Bartholomew's Hospital, Feb. 12th, 1889.
Stephens, Daniel Robert Porritt, M.B. Cantab., The College, St. Bartholomew's Hospital, July 11th, 1889.
Jordan, Henry M., L.R.C.P. Lond., Newport, Mon., Aug. 1st, 1889.
Elliott, Robert Henry, M.B. Lond., Girdlers-road, W., Nov. 14th, 1889.
Stevens, Cecil Robert, M.B. Lond., Honiton, Feb. 13th, 1890.
Cargill, Lionel Vernon, L.R.C.P. Lond., Savile-row, W., May 8th, 1890.
Fawcett, J., M.D. Lond., London Fever Hosp., Islington, May 8th, 1890.
Sandifer, Henry Stephen, L.R.C.P. Lond., Canonbury, May 8th, 1890.
Griffiths, Joseph, M.B. Edin., Cambridge, July 30th, 1891.
Rawlinson, Frederick Juland, L.R.C.P. Lond., Barnes, Nov. 12th, 1891.
Shearer, Donald F., M.B. Oxon., Lambeth Palace-rd., May 12th, 1892.
Ash, E. O., M.D. Lond., Donington-on-Bain, Lincoln. (Not a Member.)
Laws, William George, M.B. Edin., Newcastle. (Not a Member.)
Welsford, A. G., M.B. Cantab., Hampstead Heath. (Not a Member.)

Seven other gentlemen passed, but, not having attained the legal age of twenty-five years, will receive their diplomas at future meetings of the Council. Ten gentlemen were referred.

The following gentlemen, having previously passed the necessary examinations, and having now attained the legal age, were also admitted Fellows of the College:—

Abbott, Francis Charles, M.B. Lond., St. Thomas's Hospital. Diploma of Member dated Aug. 2nd, 1888.
Pickard, Ransom, M.B. Lond., Bishop's-road, N.E., Feb. 12th, 1889.

The following gentlemen, having passed the necessary examinations, were at the same meeting admitted Licentiates in Dental Surgery:—

Barnes, Arthur, Charing-cross and Dental Hospitals, Chester.
Barrett, Fredk. Walter, London and Dental Hospitals, Finsbury-sq.
Bascombe, R. E., Middlesex and National Dental Hospitals, Ealing.
Canton, H., M.R.C.S.E., Middlesex and Dental Hosps., Portland-ter.
Castellote, B. Alfred, Middlesex and Dental Hospitals, Clapham.
Clarence, Thomas Herbert, Charing-cross and Dental Hospitals, Southampton-row, W.C.
Curtis, E. A., Middlesex and Dental Hospitals, Blandford, Dorset.
Dodd, Fredk. L., Middlesex and Dental Hospitals, Tunbridge Wells.
Gilmour, William Henry, Liverpool and Dental Hospitals, Liverpool.
Goodridge, Alan, Charing-cross and Dental Hospitals, Dartmouth.
Harwood, E. W., Charing-cross and Dental Hospitals, Mortimer-st.
Hayward, Savill Henry, Charing-cross and Dental Hospitals, St. Ann's-terrace, N.W.
Herschell, Ridley, Middlesex and Dental Hospitals, St. Charles-sq.
Hughes, Geoffrey, Middlesex and Dental Hospitals, Worthing.
Lingford, John Charles, Manchester, Brunswick-terrace, Leeds.
Miller, Ernest Arthur, Middlesex and Dental Hospitals, Westminster.
Owen, William Gladstone, Birmingham, Edgbaston.
Pearse, A. S., Charing-cross and Dental Hospitals, Tunbridge Wells.
Phillips, Howard, Charing-cross and Dental Hospitals, Worcester-park, Surrey.
Sewill, J. S., M.R.C.S.E., Liverpool and Guy's Hospitals, Wimpole-st.
Smith, Edward F., Charing-cross and Dental Hospitals, Brixton-road.
Spokes, Peter Sidney, M.R.C.S.E., University College and National Dental Hospitals, Queen Anne-street.
Stoner, Harold B., Guy's Hospital, The College, Guy's Hospital.
Sykes, James Hall, Manchester, Dardsley, Lancs.
Tanner, Frank Leopold, Manchester, Oxford-road, Manchester.
Trott, Frederick Thos., Charing-cross and Dental Hospitals, Exeter.

Sixteen candidates were referred.

At an ordinary meeting of the Council of the College on June 9th, the following gentlemen were elected Examiners:

First Examination.

Elementary Anatomy.—J. Stanley Boyd, M.B. Lond., F.R.C.S. Eng., Charing-cross Hospital; William Frederick Hasham, F.R.C.S. Eng., Queen's College, Birmingham; Bilton Pollard, M.D. Lond., F.R.C.S. Eng., University College Hospital; James Ernest Lane, F.R.C.S. Eng., St. Mary's Hospital; Louis Albert Dunn, M.B. Lond., F.R.C.S. Eng., Guy's Hospital.

Elementary Physiology.—W. G. Spencer, M.B. Lond., F.R.C.S. Eng., Westminster Hospital; John Rose Bradford, M.D. Lond., M.R.C.S., University College Hospital.

Elementary Biology.—Frank E. Beddard, M.A. Oxon., Guy's Hospital; T. W. Shore, M.D. Lond., M.R.C.S., St. Bartholomew's Hospital.

Second Examination.

Anatomy.—J. N. C. Davies-Colley, M.B. Cantab., F.R.C.S. Eng., Guy's Hospital; William Anderson, F.R.C.S. Eng., St. Thomas's Hospital; George Danser Thane, M.R.C.S., University College Hospital; Alfred Henry Young, F.R.C.S. Eng., Owens College.

Physiology.—Vincent Dormer Harris, M.D. Lond., F.R.C.P. Lond., M.R.C.S., St. Bartholomew's Hospital; William D. Halliburton, M.D. Lond., M.R.C.P. Lond., M.R.C.S., King's College Hospital; D'Arcy Power, M.B. Oxon., F.R.C.S. Eng., St. Bartholomew's Hospital.

Third Examination.

Midwifery.—Walter S. Griffith, M.D. Cantab., F.R.C.S. Eng., M.R.C.P. Lond., St. Bartholomew's Hospital; Peter Horrocks, M.D. Lond., F.R.C.P. Lond., M.R.C.S., Guy's Hospital; George Ernest Herman, M.B. Lond., F.R.C.P. Lond., F.R.C.S. Eng., London Hospital; William Duncan, M.D. Brux., F.R.C.S. Eng., M.R.C.P. Lond., Middlesex Hospital.

First Professional Examination for the Fellowship.

Anatomy.—William Henry Bennett, F.R.C.S. Eng., St. George's Hospital; Frederick Treves, F.R.C.S. Eng., London Hospital; A. Pearce Gould, M.B. Lond., F.R.C.S. Eng., Middlesex Hospital; George Henry Makins, F.R.C.S. Eng., St. Thomas's Hospital; W. Bruce Clarke, M.B. Oxon., F.R.C.S. Eng., St. Bartholomew's Hospital.

Physiology.—John Barlow, M.D. Ed., F.R.C.S. Eng., St. Mungo's College, Glasgow; Benjamin Thompson Lowne, F.R.C.S. Eng., Middlesex Hospital; Cuthbert H. Golding-Bird, M.D. Lond., F.R.C.S. Eng., Guy's Hospital; William Stirling, M.D. Edin., Owens College.

Public Health.—Sir George Buchanan, M.D. Lond., F.R.C.P. Lond., University College Hospital; George Turner, M.B. Cantab., L.R.C.P. Lond., M.R.C.S., Guy's Hospital.

UNIVERSITY OF DUBLIN.—(The Tercentenary Honorary Degrees.)—On Tuesday there was a meeting of the Senate to consider graces proposed to be conferred in connexion with the approaching tercentenary celebration. When Professor Burdon Sanderson's name was mentioned some objection was made because it was alleged he was a vivisectionist, but after a short discussion the grace was passed. The following is a list of those who will receive the degree of Doctor of Medicine and the degree of Doctor of Sciences on July 6th:—

Doctor of Medicine.—H.R.H. Duke Charles of Bavaria; John Shaw Billings, Washington; Thomas Byrant, President, R.C.S. Eng.; Sir Andrew Clark, Bart., President, R.C.P. Lond.; Adolf Gusserow, Berlin; Jonathan Hutchinson, London; Prof. Grainger Stewart, Edinburgh.

Doctor of Sciences.—Prof. Burdon Sanderson, Oxford; Prof. Michael Foster, Cambridge; Prof. Ludimar Hermann, Königsberg; Sir G. M. Humphry, Cambridge; Prof. Julius Kellman, Basel; Prof. Macalister, Cambridge; Prof. Richet, Paris; Sir Wm. Turner, Edinburgh; Wilhelm Waldeyer, Berlin; Rev. Prof. Benney, Cambridge; Othniel Caleb Marsh, Yale College; Rev. W. Dollinger, London; Sir A. Guikie, London; Baron Adolf Nordensjold, Sweden; Abbé Renard, Belgium; J. Hall Gladstone, London; G. D. Liveing, Cambridge; Lord Rayleigh, Cambridge and London; Prof. Thompson, Cambridge; Prof. Thomas Thorpe, London; Prof. W. Tilden, Birmingham; Francesco Brioschi, Milan; Paul Gorden, Erlangen; Prof. Luigi Cremona, Rome; James Whitbread Glaisher, Cambridge; Ed. Routh, Cambridge; G. H. Darwin, Cambridge; Simon Newcomb, Washington; Isaac Roberts, Sussex; and F. Tisserand, Paris.

FISH SEIZED IN LONDON MARKETS.—During the past month fifty-one tons of fish were seized at Billingsgate as unfit for human food. The weight of fish delivered there in the month was 12,610 tons. At the Shadwell market 2 tons 13 cwt. were seized out of a delivery of 1481 tons.

LYTHAM COTTAGE HOSPITAL AND CONVALESCENT HOME.—The twenty-sixth annual report for the past year testifies to the increasing usefulness of the institution. Twenty-six more patients were admitted than in 1891. The year's receipts from patients were £171 15*s.*, and the total expenditure £415 12*s.* Local patients are admitted at a nominal charge, and the committee rely almost entirely upon the annual subscriptions and donations to maintain the work of the institution.

LITERARY INTELLIGENCE.—In commemoration of the opening of the Langenbeck House at Berlin last week, our enterprising contemporary the *Deutsche Medicinische Wochenschrift* (No. 23, June 8th) fills its columns with articles of surgical interest. First of all Dr. E. v. Bergmann gives an account of the foundation and objects of the new institution, Professor Czerny writes on the Surgery of the Gall-bladder, Dr. F. Trendelenburg on Vesico-vaginal Fistula, Dr. M. Schede on the Surgical Treatment of Perityphlitis, Dr. H. Kümnell on the Operative Treatment of Epilepsy, Dr. A. Barth on Nephrectomy, Dr. Roth on the occurrence and recognition of Vesical Hernia, Dr. A. Bier relates five cases of Abdominal Surgery, including a case of excision of an intussuscepted bowel, which, however, terminated fatally, Dr. K. A. von Bardeleben speaks strongly in favour of Bismuth as an application in the treatment of Burns, Dr. O. v. Büngner discusses the treatment of Fracture of the Clavicle, describing a new and simple form of bandage, Dr. E. Busch relates a case of Complicated Fracture of the Femur. There is also a *feuilleton* on the History of Military Surgery (15th to 17th centuries) contributed by Dr. Wolrendorff; whilst the reviews, reports &c., all have a surgical bearing.

WE regret to learn that M. Pasteur, who is at present resting at Villeneuve l'Etang, is very unwell.

MEDICAL MAGISTRATE. — Mr. Charles William Browne, M.R.C.S., L.S.A., of Middlebury, South Africa, has been appointed a justice of the peace for the districts of Rouxville and Wepener.

THE CORBETT HOSPITAL, STOURBRIDGE.—It is stated that Mr. W. O Foster of Apley has promised £1000 to the endowment fund of the hospital Mr. John Corbett, M.P., is founding for the Stourbridge and Brierley-hill district.

EDINBURGH MEDICAL MISSION.—The late Mrs. Sanson of Hawthorn Brae bequeathed the villa and grounds of Hawthorn Brae at Duddington to the Edinburgh Medical Missionary Society, for a convalescent home, to be known as "The Hawthorn Brae Convalescent Home." Mrs. Sanson endows the home with the residue of her estate, estimated at £8000.

ST. VINCENT'S HOSPITAL, DUBLIN.—The following prizes have been awarded at the termination of the Sessional Examinations recently held:—Senior Class: Bellingham Medal in Clinical Medicine—James P. Marnell. O'Ferrall Medal in Clinical Surgery—James P. Barrett. Third year's Class: Prize—John R. O'Brian. Junior Class: Clinical Prizes—John H. Davys and Patrick F. Morrissey (equal).

EAST LONDON HOSPITAL FOR CHILDREN, SHADWELL.—On Saturday, the Duchess of Portland opened a new wing for out-patients of the East London Hospital for Children and Dispensary for Women, Glamis-road. The need of this addition has been long felt. Besides the extra accommodation for out-patients, there is now a new dispensary, and over it ample sleeping accommodation is provided for the nurses. The outlay has been about £8000.

NEW EUROPEAN GENERAL HOSPITAL, ADEN.—This hospital, at Steamer Point, Aden, was opened on May 2nd by Brigadier-General J. Jopp, the political resident. The new buildings comprise the men's hospital, a pavilion for women and children, a pavilion for mental cases, an observation hospital, a native hospital, and quarters for the staff and servants, each in a separate building. The total outlay has been 120,000Rs., of which 20,000Rs had been contributed by the Aden Port Trust, representing the shipping interest, and 20,000Rs. by the admiralty, on account of naval patients. The yearly expenditure is 15 000Rs. Against this is to be placed a sum, approximately, of 3500Rs. received from in-patients.

THE GENERAL PRACTITIONERS' ALLIANCE. — A meeting of the Council of the above Society was held at the offices, 11, Adam-street, Strand, on Monday last, Mr. George Brown, president, in the chair. It was resolved that the annual general meeting of the Alliance be held at the Council Chamber, Exeter Hall, Strand, on the 29th inst, at 3 30 P.M. Dr J. W. J. Oswald, of Kennington-road, S.E., was nominated for election as president of the Alliance for the ensuing twelve months. It was also unanimously resolved that the best thanks of the Council be given to Sir Albert Rollit, M.P., for his support to the application made on behalf of the Council for the appointment of a general practitioner to serve on the Royal Commission on the proposed Gresham University.

PRESENTATIONS. — At a recent meeting of the "John Hervey" Lodge of Freemasons, No. 1260, a silver salver was presented to Mr. Jabez Hogg, M.R.C.S., who had been for over twenty years Treasurer of the Lodge. The salver bore the following inscription:—"Presented to P. M. Bro. Jabez Hogg, P.G.D., and one of the founders of the John Hervey Lodge of Freemasons, No. 1260, by the Members of the Lodge as a mark of their affectionate esteem for him and to testify their appreciation of the services rendered by him for so many years as Treasurer of the Lodge. June 1892"—A valuable "Carved Oak English Chime Clock" and carved Bracket to match, bearing an inscription, together with a set of massive Entrée Dishes, were presented to Dr. Worthington on Saturday, the 11th inst., by many of his patients upon the occasion of his leaving Sidcup for Bournemouth. Dr. Worthington had been in practice at Sidcup for many years and had enjoyed the confidence of a wide circle of friends.—Dr. James Hitchcock, of Macduff, has been presented with a case of laryngoscopic instruments and a purse of sovereigns by the members of the Macduff Ambulance Class.

MEDICAL NOTES IN PARLIAMENT.

Army Medical Staff.

IN the House of Commons on Monday, on the vote of £290,100 for medical establishments, Dr. Farquhar on referred to the use of titles by medical officers in the army, and asked whether the Secretary for War could not see his way to grant the use of compound titles to army medical officers who were practically on the Reserve list. He also asked the right hon. gentleman to consider the grievance felt by those officers in having their term of foreign service lengthened from five to six years, a circumstance which was found to be detrimental to health. He should also like to see the medical officers in the army granted certain periods of leave for study purposes.—Dr. Tanner had no sympathy with the cry of army medical officers for titles. He thought that those officers ought to be proud to be known as doctors, without any other military title attaching to them. He called attention to what he described as the disreputable condition of the army hospitals at Aldershot, where there was no hospital for infectious diseases.—Mr. Brodrick said that very considerable alterations were going on at Aldershot at present, and that the brick buildings were being completed as quickly as the contractors could proceed with the work. The authorities would welcome the moment when the wooden huts were discontinued and the hospital removed to the new buildings. No general officer commanding the troops had ever pressed on the work with such energy and zeal as Sir Evelyn Wood had displayed. With regard to the attendance of officers at medical schools on their return from foreign service, the authorities were quite prepared to consider whether arrangements could not be made to that effect. He could not enter into the subject of compound titles at present. The object of these titles was to give medical officers proper authority and status in the regiments to which they might be attached, or in a position in which they might be placed, and there was, he thought, no precedent for giving to officers subsequent to their retirement the same advantages as were given to officers on the active list. Sir F. Fitzwygram thought that some arrangement might be made by which medical officers could be given six months' leave on full pay to attend some medical school. The vote was agreed to.

Recruiting in London.

On Tuesday, Dr. Farquharson asked whether it was true, as stated in the *Irish Times* of May 30th and the *Army and Navy Gazette* of June 4th, 1892, that recruits rejected at other stations had proceeded to a large London recruiting station and been immediately accepted there, and that a medical officer had been recently removed from his post, as examiner of recruits, for not working in harmony with his superior officers by declining to pass into the ranks recruits who, in his opinion, were quite unfit for the service; and if so, whether this officer's removal was carried out with the approval of the Secretary of State.—Mr. Brodrick: The statement that recruits refused at some stations have in some cases gone to others and have been admitted is true in the case of London, and of other stations also, because medical officers, like other people, sometimes differ in opinion. The medical officer in question has not been relieved of his duties for the reason stated in the question; but the Secretary of State is, at the present time, personally looking into all the facts of the case which had not previously been examined by him.

Insurance Companies and Prison Records.

In the House of Commons on Thursday, Mr. Patrick O'Brien asked the Home Secretary whether it had come to his knowledge that a man lately discharged from Portland Prison applied to the governor for certain information from the medical record at Portland concerning his health during the last two years of his imprisonment there; whether he was aware that the information asked for was required by an insurance company before the man could have his life insured for the benefit of his family; and whether, under the circumstances, and as the information could only be supplied by the prison doctor under whose care the man was, he would cause the governor to give it.—Mr. Matthews replied that he was aware of the case. He had given directions to the medical officers to give any information in their possession to any insurance company that might apply for it.

The Yeomanry Committee.

In answer to Viscount Ebrington, Mr. Brodrick said that the recommendations of this committee had been under the consideration of the Treasury. Speaking generally, the Secretary of State for War was prepared to carry out the recommendations of the committee.

Queen's College, Belfast.

In answer to Dr. Tanner, the Attorney-General for Ireland stated that no application for a summer session in anatomy at this College had been made, nor was there any necessity for such a session.

Emanuel Hospital, Westminster.

The Attorney-General (Sir Richard Webster), in reply to Mr. William Lowther, said that after most carefully considering the whole of the evidence brought before him and given at the local inquiry, and personally inspecting Emanuel Hospital, he had come to the conclusion that, in the interest of the charity, it was not possible to maintain the whole of the existing buildings.

Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.*

Births, Marriages, and Deaths.

BIRTHS.

BRIGHT.—On May 29th, at Alvaston, Park-hill, Forest-hill, the wife of John M. Bright, M.D., of a daughter.

FARR.—On June 6th, at St. Heliers, Ealing, the wife of Ernest Farr, M.R.C.S., L.S.A., of a son.

GRAY.—On June 9th, at Holsworthy, North Devon, the wife of Walter G. Gray, M.R.C.S., L.R.C.P., of a son.

HUGHES.—On June 5th, at Queen's-road, Wimbledon, the wife of Dr. R. Jaffray Hughes, of a daughter.

JACKSON.—On June 10th, at Hedon-in-Holderness, the wife of John Lowthian Jackson, M.B., C.M. Edin., of a daughter.

MURDOCH.—On June 14th, at 12, St. John's-road, Annan, Dumfriesshire, the wife of William Murdoch, M.D., of twin sons.

THORNTON.—On June 9th, at 14, Cecil-square, Margate, the wife of Mr. Bertram Thornton, of a daughter.

WILLIAMS.—On June 12th, at London-road, St. Leonards-on-Sea, the wife of Arthur Williams, M.A., M.B., of a son.

WILLOUGHBY.—On June 15th, at 1, Queen Anne-terrace, Plymouth, the wife of W. G. Willoughby, M.D. Lond., of a daughter.

MARRIAGES.

BLAIR—LONGWORTH.—On June 9th, at St. Thomas's, Preston, Lancashire, by the Rev. W. J. Lake, M.A., Vicar, assisted by the Rev. W. Hugh Blair and the Rev. A. R. Blair, M.A., brothers of the bridegroom, Charles S. Blair, M.D., M.R.C.S., second son of the late Rev. J. T. Blair, M.A., Vicar of Killingworth, Newcastle-on-Tyne, to Mary Alice, only daughter of J. H. Longworth, of Willow House, Fulwood-park, Preston.

COLLINS—PADMORE.—On June 9th, at St. John the Baptist, Knighton, Leicester, by the Rev. J. Parker, Vicar, assisted by the Rev. J. W. G. Loder-Cother, Vicar of Yapton and Rector of Fora, Dr. E. Collins, eldest son of Dr. J. B. Collins, of Hawthorn Lodge, Yapton, Sussex, to Mabel Stepherson, eldest daughter of J. M. Padmore, Esq., of The Limes, Stoneygate, Leicester.

CROSSLEY—WILLEY.—On June 15th, at St. Mary's, Sheffield, by the Rev. George Crossley, M.A., Vicar of Breedon, Leicestershire, brother of the bridegroom, assisted by the Rev. J. W. Goodall, M.A., Vicar of Dalton, Arthur Crossley, M.R.C.S., L.R.C.P., of Leicester, youngest son of the late C. R. Crossley, J.P., to Lavinia Eilen (Lily), daughter of C. J. Willey, of Edinburgh.

DEATHS.

HARRISON.—On June 6th, at Berkeley-square, Clifton, John Harrison, Surgeon.

HILLIARD.—On June 10th, at Shefford, Bedfordshire, William Henry Hilliard, M.R.C.S., L.S.A., aged 79.

MATTHEWS.—On June 2nd, at Victoria, Vancouver Island, B.C., Joseph Beauchamp Matthews, M.R.C.S., son of the Rev. Andrew Hughes Matthews, Vicar of Weston-on-the-Green, Oxon.

MCCAULLEY.—On June 11th, at Dublin, Francis Waldron McCaulley, late Surgeon on board Allan Line steamer *Mongolian*.

SKUES.—On June 10th, at Shrublands, Linden-grove, Nunhead, William Mackenzie Skues, M.D., Brigade-Surgeon, A.M.D., Retired, aged 64.

SPRIGGE.—On June 8th, at 1, The Mansions, Earl's Court, S.W., the residence of her brother, S. Squire Sprigge, M.B., Elizabeth Cecil Sprigge, aged 20.

N.B.—A fee of 5s is charged for the Insertion of Notices of Births, Marriages and Deaths.

Notes, Short Comments, & Answers to Correspondents.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

All communications relating to the editorial business of the journal must be addressed "To the Editors."

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and address of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *to be addressed "To the Publisher."*

We cannot undertake to return MSS. not used.

PUBLISHER'S NOTICE.

A SECOND EDITION of THE LANCET, containing a special report of the meeting at the Mansion House which is to be held to-day (Friday) at 3 P.M., in support of the collection to be made on behalf of the Hospital Sunday Fund on Sunday next, will be issued early on Saturday morning.

CENTRAL AFRICAN THERAPEUTICS.

AMONG the adverse agencies with which the medical missionary has to struggle, witchcraft, as a means of prevention or cure, is one of the most formidable. We lately described the inveterate belief of the Spanish Jew in his greater and lesser "indulca"—a charm seen at its best (or worst) in Palestine. We have now to treat of another, the so-called Mwai rite, as practised in British Central Africa. Of this a graphic account has been given by the Rev. Adam Currie, M.A., missionary of the Church of Scotland, stationed at Mount Milanji in the region referred to. Mr. Currie, writing to his father under date April 10th, 1892, says he used to wonder why so few old people were to be seen in the village, till he found the cause of it in the Mwai rite. Death is popularly supposed to be caused by witchcraft. Wizards and witches are believed to charm the life out of human beings in order that, after the victims are laid under the shadow of the thick trees which serve as a cemetery, they may feast on their bodies. When a death has occurred the neighbours call in the witchfinder, who arrives with a bagful "of things horrible and absurd," such as Burns imagined "in Alloway's auld haunted kirk." He then dances himself into a frenzy, rushes to the woods, and there finds the name of the witch. The person he pitches on as thus indicated to him is generally an old, decrepit villager, or someone who is unpopular in the place. The man picked out is then seized upon and forced to drink a poison called "mwai." If he brings up this poison by vomiting, he is held to be innocent and his life is spared; but if the poison stays on his stomach, he is guilty and dies. Small-pox, says Mr. Currie, epidemic in the next village, had caused the death of several children Recourse, as usual, was had to a witchfinder, who pitched upon a picturesque old worthy, Che Chagula by name, whose grizzled head, white beard, long staff and monkey-skin bag which he always carried were a familiar sight in the mission courtyard. "One morning," proceeds Mr. Currie, "while Dr. Robertson and I were at

Digitized by Google

breakfast, my boy Gordon came and told me that he had heard the people were going to give "mwai" to Che Chagula that day." They started off at once to save the poor old man. But evidently the people had got wind of their approach and they were repeatedly put off the scent. Not till they were fairly exhausted in the pursuit, under a scorching sun, did they desist from their attempt to interpose between the victim and his murderers, among whom were his own brothers, with their wives and children. In the evening they heard guns firing in Che Chagula's village, "in token of joy that the wizard was dead." The whole narrative, as given by Mr. Currie in a letter which appears in the *Scotsman*, is most touching and brings vividly before the reader the gravity and complexity of the medical missionary's work, in which the healing art has to be practised in spite of the darkest and most sanguinary superstitions, all of which must be removed by moral and religious enlightenment before physician or surgeon can intervene with effect to his patient or with safety to himself.

Vox.—Our correspondent had better apply to Dr. Munk, the librarian. We should suppose that there has been some oversight in the matter.

FRIENDLY SOCIETIES' MEDICAL OFFICERS.

To the Editors of THE LANCET.

SIRS,—By publishing the enclosed circular, a copy of which has been forwarded to the various surgeons connected with these institutions, in your next issue, you will confer a great obligation on a large number of our medical brethren.

I am, Sirs, faithfully yours,

JAS. H. RODGERS, L.R.C.P. & L.R.C.S. Edin.

Lincoln, June 10th, 1892.

"8, Monks-road, Lincoln, 8th June, 1892.

"DEAR SIR,—In course of correspondence we have found that medical officers holding friendly society appointments have grievances. Being obliged to hold such appointments, can we not devise to meet at some central place for the purpose of forming an alliance to mutually benefit ourselves? We are writing to each medical officer for his view on this matter; and, if the majority are favourable, a meeting will be called at some future date, in July or August. The case of Dr. Martin of Stourport should incite us the more in this movement. An early reply will oblige yours faithfully,

"S. WHITWELL, M.B., 8, Monks-road, Lincoln.
J. H. RODGERS, L.R.C.P. & L.R.C.S., 5, Unity-square, Lincoln.
R. ROBERTS, M.R.C.S., L.S.A., Lincoln.
J. PEARSON, L.R.C.P., M.R.C.S., Lincoln.
T. KENNEDY, L.R.C.P., L.R.C.S., Northampton.
J. FRANCIS, M.B., M.R.C.S., L.R.C.P., Luton.
F. F. LYNCH, M.D., Walsall.
E. WATKINS, L.R.C.P., L.F.P.S.G., Nottingham.
W. GIBSON, M.D., Kidderminster.
S. FIRTH, L.R.C.P., L.F.P.S.G., Grantham."

To the Editors of THE LANCET.

SIRS,—Perhaps one of the most flourishing provincial towns at the present time is Reading with its 60,000 inhabitants. Flourishing, also, in its medical aspect. The hospital, with 150 beds and a large number of out-patients (seen three times a week), will bear comparison with any other similar institution, thanks to the influence of THE LANCET in furthering this end. There is a large and flourishing provident dispensary. Also, in addition to this, there is an amalgamated friendly society, which is managed by a committee, who admit members after a medical examination, and appoint the medical officers. At present there is a qualified medical officer receiving £300 a year, house rent free, horse and carriage provided, and all drugs found. There are over 5000 members. As it is impossible for one man to attend to all, there is an assistant appointed by the committee, who is unqualified. He receives £120 a year. I should like you to kindly answer the following questions: 1. How far is the qualified man responsible for the duties performed by the unqualified one appointed, not by himself, but by the committee? 2. Are the committee fulfilling their contract to provide medical aid in sickness if they provide an unqualified man? 3. If this arrangement is unjustifiable, what steps should be taken to remedy it? Thanking you in anticipation of your help,

I am, Sirs, yours faithfully,

Reading, June 13th, 1892. A HOSPITAL SURGEON.

ADMINISTRATION OF ANÆSTHETICS BY DENTISTS.

To the Editors of THE LANCET.

SIRS,—In the case of a fatal accident arising from the administration of chloroform, ether, or gas by a dentist holding a dental licence only, or registered as a dentist, what would be the position of the said dentist?

I am, Sirs, yours faithfully,

June 10th, 1892. CHLOROFORM & Co.

*** The practice of administering ether, chloroform, or any of the more dangerous anæsthetics by dentists, whether possessing the L.D.S. or merely registered, is, we believe, uncommon, and where undertaken to be strongly deprecated. The question as to the dentist's legal position should a fatal accident occur under such circumstances duly comes within our province.—ED. L.

A relative Lieut.-Colonel is referred to our Notes in Parliament for this week.

AN APPEAL.

MR. T. CLARK, L.R.C.P. & S. Edin., of Blair, Minehead, and formerly of Dunster, died very suddenly on March 25th, leaving a wife and several children very scantily provided for. A fund is being raised in the neighbourhood for the education of the two youngest children, and any contributions from members of the profession will be thankfully acknowledged by Mr. Ollerhead, Minehead, or the Rev. Y. U. Todd, Minehead, secretary of the fund.

"THE USUAL BOND."

To the Editors of THE LANCET.

SIRS,—Will you kindly put me right in this matter? In 1879 I went into a practice as unqualified assistant, worked hard in it for ten years, and then was obliged to give up owing to want of rest. This I did at Christmas, 1889. I signed some agreement when I entered on duties which was described to me as the usual bond, but I took it for granted that it was usual. I am now told by my late principal that I can come back to him again, but that he will not allow me to in any way practice or assist anyone else in any way within a radius of ten miles. Last summer, when I did three days' duty for another surgeon in the town whilst he was at the seaside, my late principal threatened to prosecute and obtain an injunction. It seems to me such an unfair thing that an unqualified man can be prevented from acting as assistant to another, that I have asked a young legal friend, and he tells me that it is a gross interference with the liberty of the subject, and that many if not all these so-called bonds are useless. I do not want to do anything wrong; but should I be doing so in engaging myself solely as in-door assistant to another surgeon in the town in which my late principal resides, and from whom I have been separated now two years and a half?

I am, Sirs, yours faithfully,

June, 1892. J. R. WHITE.

*** Our correspondent should procure a copy of the agreement, and then consult a solicitor.—ED. L.

FRIENDLY SOCIETIES' AGREEMENTS.

To the Editors of THE LANCET.

SIRS,—I would strongly advise all qualified men, whether as assistants or as medical officers to friendly societies, to refuse to sign bonds of the above nature, unless for a very handsome consideration. As an assistant recently in entire charge of a branch practice, which I in a great measure built up, I was shamefully treated under circumstances which, although too long to relate in this letter, exposed me to the expense of defending a possible action did I disobey an agreement I had signed, and which would, under all the circumstances, have, I feel confident, been disallowed in a court of law. Want of capital and the fact of being married, with a family dependent on me, prevented me submitting my fate to the glorious uncertainty of the law. I had to vacate my position from no fault of my own, and start to make a fresh living elsewhere—always difficult even with capital at command, but much more so *minus* capital and *plus* family. Hence I end this letter as I commenced, by advising a strenuous opposition to all bonds, unless a proper consideration is given. Certainly, the inadequate salary offered an assistant with the chance of finding oneself out of a living in three months is not such a consideration in the opinion of,

Yours faithfully,

June, 1892. ONE OF THE VICTIMS TO PROFESSIONAL GREED.

THE DANGERS OF SELF-TREATMENT.

To the Editors of THE LANCET.

SIRS,—I happened to be in a chemist's shop the other day when a well-dressed, elderly gentleman came in and asked for an ounce of chlorate of potash. The chemist had the curiosity to look at the paper which the gentleman held in his hand and saw written upon it citrate of potash. After an explanation this drug was supplied. Had he been given the chlorate of potash the results might have been serious. Several cases of poisoning have been reported. (Landerer in *Deutsch. Arch. f. Klin. Med.*, Bd. xlvii.; Wohlgemuth in *Therap. Monatsch.*, 1890; Vierordt in *Fortsch. für Med.*, No. 4, 1892.)

I am, Sirs, yours faithfully,

Hampstead, N.W., June, 1892. GEORGE PERNET.

INFECTIOUS DISEASES NOTIFICATION ACT, 1889.

To the Editors of THE LANCET.

SIRS,—Is it compulsory under the above Act for both medical attendant and householder to notify presence of an infectious disease? In a discussion on the subject at the local board meeting here it was stated that both must notify. When the medical attendant has done so, it seems unnecessary to compel the householder to do so likewise. By wrongly advising our patients on this point we may expose them to the enforcement of the Act against them, involving the money penalty. I fancy there are other practitioners in the same doubt on this matter as,

Yours faithfully,

Colchester, June 7th, 1892. ENQUIRENS.

PROFESSIONAL ETHICS AND THE MEDICAL COUNCIL.

AN extraordinary handbill, made up of various extracts from THE LANCET and other journals, Mr. Gunn's application for an assistant, &c., with comments, in which the findings of the Council are traversed, has been forwarded to us. We cannot approve of this treatment of a professional man whose case has been considered and adjudicated on by the Medical Council.

Mr. Chas. J. Stocker (Forest Gate).—Our correspondent should take such steps as a solicitor conversant with the facts may advise.

THE CARPENTER AND DUKES FUND.

To the Editors of THE LANCET.

SIRS,—It is proposed to close the above fund on June 30th. Many thanks for your kind and generous assistance in this matter. I regret to say there is a considerable deficiency. Thanking those who have so liberally subscribed to the fund, I shall be pleased to add the names of any who may wish to assist us. Allow me to acknowledge the receipt of £10 10*s.* from the Council of the South-Eastern Branch of the British Medical Association.—I am, Sirs, yours faithfully,

Croydon, June 13th, 1892. WM. F. COLES.

MEDICAL OFFICERS TO INDIAN RAILWAYS.

To the Editors of THE LANCET.

SIRS,—Will some of your readers kindly inform me how appointments as surgeon or medical officer to the Indian railways are obtained, what the starting salary is, and whether there is any restriction as to age? Any information will greatly oblige, Yours truly,

June 11th, 1892. CANARESE.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

COMMUNICATIONS, LETTERS, &c., have been received from—The Lord Mayor of London; Rev. J. Anderson, Harlesden; Mr. Acklin, Edinburgh; Mr. Bagley, Basingstoke; Mr. C. W. The Croonian Lectures

ON THE

CHEMISTRY AND THERAPEUTICS OF URIC-ACID GRAVEL AND GOUT.

Delivered before the Royal College of Physicians of London,

BY SIR WM. ROBERTS, M.D. LOND., F.R.S.

LECTURE II.

CHEMISTRY OF URIC-ACID GRAVEL. — PROPHYLACTIC TREATMENT.

MR. PRESIDENT AND GENTLEMEN,—In the preceding lecture I laid before you an account of those points in the chemistry of uric acid and the urates which seemed to have a bearing on the subject matter of these lectures. I showed that there were three orders of uric-acid salts, that in addition to the neutral urates and bi-urates, which had long been recognised, there existed a third order—namely, the quadri-urates, which in reactions and chemical constitution differed widely from the other two. It was pointed out that the neutral urates, from their mode of origin and reactions, could not, with our present knowledge, be regarded as having any possible concern in the vital history of uric acid. It was also pointed out that the bi-urates, although known to us pathologically as constituents of gouty concretions, were not really known to us with certainty as physiological constituents—neither of the blood nor of the urine. On the other hand, it was shown that the quadri-urates existed normally in human urine, and in the urine of birds and serpents; and it will be demonstrated later on that when uric acid is brought into relation with the bodily fluids—with the blood, lymph, and synovia—it enters into solution in the first instance, not as neutral urate nor as bi-urate, but as quadri-urate. From all these considerations it would appear that whenever and wherever uric acid exists in the healthy organism it exists exclusively as a quadri-urate. The quadri-urates may therefore be regarded as being in a special sense the physiological salts of uric acid, and as constituting the only form in which uric acid subsists in the living body in the normal state. It may, moreover, be further inferred that when uric acid gives trouble and originates morbid phenomena, the mischief arises proximately from the uric acid departing, in one direction or other, from this normal state of combination.

I now proceed to consider more particularly the state of uric acid in human urine—the conditions which surround it, and the factors which tend to determine its precipitation or to prevent its precipitation in that fluid.

Inherent Tendency of Urine to the Spontaneous Liberation and Precipitation of its Uric Acid.—The chemical reactions and physical conditions which are concerned in the production of uric-acid concretions are both varied and complex. Uric acid exists in the urine in combination with the alkaline bases. In perfect health these combinations maintain their integrity, not only while the urine is detained in the urinary channels, but even for some considerable time after it has been discharged. This, however, is not always the case. In certain contingencies these combinations are prematurely decomposed; their uric acid is set free and is precipitated from the urine in the crystalline form. In calculous subjects this event takes place in the kidneys or bladder, and gives rise to the incidents of gravel. In less urgent instances the precipitation takes place soon after the urine is voided, in the form of copious urinary deposits. But apart from these pathological cases, and cases which hover on the pathological borderland, it may be shown that perfectly normal urines betray the same tendency. A considerable series of observations were made on this point with the urines of persons who were entirely free from any proclivity to calculous disorders. It was found that all acid urines, provided they were guarded against septic changes, invariably deposited their uric acid sooner or later. The time of the occurrence of the precipitation varied greatly. It usually began within twenty-four hours after the urine was voided, sometimes in a day or two, and sometimes it was delayed for a week or even longer. When the process was at length completed—whether that was early or late—all the uric acid had disappeared from solution; the filtered supernatant urine gave not the slightest precipitate with hydrochloric acid, nor could there be detected in it, on evaporation to a small bulk and with careful search, any trace of uric acid. We must therefore recognise in normal acid urines an inherent tendency to the liberation and precipitation of their uric acid. This tendency only assumes a morbid significance when the event occurs prematurely, while the urine is still sojourning in the kidneys or bladder. Viewed in this light pathological gravel may be regarded as due to an exaggeration of conditions which prevail, in a less pronounced degree, in the normal state; and an elucidation of these conditions may be reasonably expected to throw a light on the etiology of gravel and calculus, and perhaps furnish hints which may be turned to therapeutical uses.

Chemical Explanation of the Spontaneous Precipitation of Uric Acid in Urine.—The chemical reactions which are concerned in the spontaneous precipitation of uric acid in acid urines are very interesting to trace out. It may be proved that uric acid always subsists in the unchanged urine as a quadri-urate. The urine in which this substance is dissolved is a watery solution, which contains a number of mineral salts. Among the salts the most important, in regard to the point under consideration, are the alkaline phosphates. These regulate, in the main at least, the reaction of the urine. The phosphates easily oscillate between the monometallic forms or superphosphates which have an acid reaction, and the dimetallic forms which have an alkaline reaction. When the former preponderate, as is usually the case, the urine is acid; when the latter preponderate the urine is alkaline. We have therefore in an acid urine the quadri-urate existing in the presence of water and of superphosphates. These conditions ensure the ultimate complete liberation of the uric acid. The first step in the process is the splitting up of the quadri-urate by the action of the water of the urine into free uric acid and bi-urate. By this reaction half the uric acid is set free. But the bi-urate resulting from this reaction is immediately retransformed in the presence of superphosphate, by a double decomposition, into quadri-urate. Two atoms of bi-urate with one atom of superphosphate (mono-metallic phosphate) change into one atom of quadri-urate and one atom of dimetallic phosphate, according to the subjoined equation:

$$2(MH\bar{u}) + (MH_2PO_4) = (H_2\bar{u}, MH\bar{u}) + (M_2HPO_4)$$

Bi-urate ... Mono-metallic phosphate ... Quadri-urate ... Di-metallic phosphate.

These alternating reactions—breaking up of quadri-urate by water into bi-urate and free uric acid, and recomposition of quadri-urate by double decomposition of bi-urate with mono-metallic phosphate—go on progressively until all the uric acid is set free.[1]

THE INGREDIENTS WHICH RETARD THE DECOMPOSITION OF THE QUADRI-URATES IN NORMAL URINE.

It has just been shown that uric acid exists in the urine in the form of quadri-urate, and that when the urine is secreted with an acid reaction—that is to say, for some sixteen or twenty hours out of the twenty-four—this compound exists amid conditions which, if they stood alone and uncontrolled, would lead to speedy precipitation of uric acid in the free state. But in the normal course no such speedy precipitation occurs; it only occurs as a remote and postponed event after the urine has been voided. It is obvious, therefore, that the urine contains certain ingredients which inhibit or greatly retard the water of it from breaking up the quadri-urates. Were it not for the presence of these inhibitory ingredients uric acid would be thrown out daily in the urinary passages, and everyone would be subject to gravel. Hence an inquiry into the nature of these inhibitory agents has a pathological as well as a physiological interest, and bears directly on the etiology of calculous disorders. The inquiry is not a simple one. The urine is a very complex fluid. It contains, besides urea, a number of saline constituents, together with pigmentary and other extractives. Where among all these are

[1] For full proof of this reaction I must refer the reader to my paper on the History of Uric Acid in the Urine, Med. Chir. Trans., vol. lxxiii. p. 258.

Digitized by Google

the inhibitory agents to be found? Attention was first directed to the *saline constituents*. It was found that when urine was dialysed, whereby its crystalline ingredients were for the most part removed, it lost to a considerable extent its power of retarding the decomposition of the quadri-urates. This observation indicated that the inhibitory power resided, partly at least, in the crystalloids of the urine. The chief crystalloids of the urine are urea, and the chlorides, phosphates, and sulphates of potash, soda, ammonia, lime, and magnesia. Solutions of these several substances in distilled water were prepared, and their effect on the quadri-urate was tested in the following manner. A speck of a purified specimen of the amorphous urate deposit was placed on a glass slide and intimately mixed with a drop of the solution to be tested. The covering glass was then applied and the result watched under the microscope. The time at which crystals of uric acid began to make their appearance was taken as a measure of the activity of the tested solution in decomposing the quadri-urate. The standard of comparison was distilled water, which usually caused crystals to appear in five minutes. Solutions of urea of various strengths acted precisely with the same speed as distilled water. It was obvious that urea had no share in the power resident in urine of retarding the decomposition of the quadri-urate. The chlorides and sulphates, in the proportion of 1 per cent. and upwards, imparted to water a considerable power of delaying the appearance of crystals. The potash salts were found to have more effect in this respect than the corresponding salts of ammonia and soda. The common di-sodic phosphate (rendered perfectly neutral to test-paper by the addition of phosphoric acid) showed about the same inhibitory power as sodium chloride. None of these solutions, nor any admixture of them, approached the natural urine in power of postponing the decomposition of the amorphous urate. More pronounced effects were obtained with the di-potassic phosphate. A solution of this salt, containing only 0·2 per cent. and perfectly neutralised, appeared to act almost as slowly on the deposit as a normal acid urine. Urines which were alkaline from fixed alkali had absolutely no decomposing effect on the amorphous urate. Attention was next turned to the *colouring matters* of the urine. The amorphous urates have an intense affinity for urinary pigment; the pigment cannot be removed from them by any solvent which does not at the same time destroy their integrity. I had noticed that deeply tinted urates were more slowly decomposed by water than pale-coloured urates. It had also been noticed that artificially prepared quadri-urates and the quadri-urates which constitute the urinary secretion of birds and serpents, all of which are devoid of colouring matters, are much more quickly broken up by water than the natural amorphous urate, which is always more or less tinted. Moreover, it was found that a urine which had been filtered through animal charcoal and thus deprived of its pigment acted very much more rapidly on the amorphous urate deposit than the same urine before it had been filtered through charcoal. It can, therefore, scarcely be doubted that the pigments of the urine play an important part among the ingredients which impart to normal urine its remarkable power of retarding the decomposition of the amorphous urate. In the febrile state and in other wasting disorders the urine is sharply acid and rich in urates, and yet such urines are not prone to deposit free uric acid, though very prone to deposit amorphous urates. In these cases the urine is always deeply coloured; and the pigments are probably the chief agents which prevent the precipitation of free uric acid under these circumstances.

CHEMICAL ETIOLOGY OF URIC-ACID GRAVEL.

The more remote and predisposing causes of gravel do not come within the scope of the present inquiry. Whatever these causes may be, they must be translated into changes in the composition of the urine before they can determine the occurrence of calculous accidents. No amount of morbid proclivity to uric-acid gravel can take effect if the urine be alkaline, nor if the proportion of uric acid in it fall below a certain point. The causes which will be here considered are those which lie exclusively in the chemical constitution of the urine itself. I have just given proof that the salines and pigments of the urine exercise a protective influence against premature precipitation of uric acid; and it may hence be inferred that a diminution of these salines and pigments may sometimes act, in a negative manner, as a determining factor in the production of gravel and stone.

Poverty of the urine in saline matters. — This is probably an influential factor in the disproportionate frequency of stone among the children of the poor as compared with the children of the well-to-do classes. The prevalence of stone among the natives of India is also probably to be explained in the same way. The children of the poor are fed largely on farinaceous articles—bread, gruel, oatmeal, and potatoes, with but a scanty allowance of milk, meat, and fish. Wheat-flour contains only 0·51 per cent. of mineral matter in proportion to the totality of the dry substance; oatmeal only 2·50 per cent.; potatoes only 2·50 per cent.; whereas milk contains 5·50 per cent., and the various forms of meat and fish 5 to 5·50 per cent. Rice, which forms so large a part of the diet of the natives of India, only contains 0·39 per cent. of mineral matter in proportion to the totality of the dry substance of the grain. These enormous differences in the amount of saline ingredients in the articles of food must of course make a corresponding difference in the proportion of the saline constituents of the urine, because saline matters pass out of the body almost exclusively through the kidneys. On the other hand, the well-known immunity enjoyed by sailors from stone and gravel depends, no doubt, as Mr. Plowright has shown, on the prodigious quantity of salt which seafaring men habitually consume with their food. The same observer has pointed out that the dwellers in a district of Norfolk called Marshland, where the drinking water is brackish, are singularly free from stone, as compared with their less fortunate neighbours in the adjacent districts of that county.[2]

Deficiency of Pigment in the Urine.—In chronic Bright's disease, with contracting kidneys, the urine is conspicuously pale, and is often indeed almost entirely devoid of pigment. There is no excess, but rather a diminution of the uric acid in the urine in these cases; nevertheless, deposits of uric acid are by no means uncommon, and sometimes actual renal gravel occurs. The percentage of salines is also low, and this doubtless contributes to the result; but probably the prepotent factor in the precipitation of uric acid in these cases is the deficiency of pigment in the urine.

Poverty of the urine in salines and pigments, however, only accounts for certain limited groups of calculous cases. There are other and larger groups in which the urine is neither defective in salts nor in colouring matters. The subjects of calculous disorders among the well-to-do classes—especially those of a gouty type—usually void a urine which is full coloured and abundantly rich in salts, and we must seek in some other direction for the cause of the morbid tendency. In these cases the chief determining factors are, I believe, to be found in the proportion of uric acid in the urine and in the degree of acidity of the urine. The influence of these two factors was investigated by a method which approximates pretty closely to the conditions of the actual clinical problem. In the earlier part of the lecture I showed that normal acid urines tended to deposit uric acid sooner or later; and the inference was drawn that this inherent tendency was the same in kind, though not so pronounced in degree, as the tendency existing in pathological gravel. If this inference be well founded, it follows that the controlling factors in the two cases are similar, and that the conditions which hasten or retard the precipitation of uric acid in a sample of urine preserved in a test-tube would, if they could be made applicable, hasten or retard the precipitation of uric acid in the urinary passages. The mode of experimentation was as follows: A series of test-tubes were each charged with 10 cc. of a normal acid urine. One of them was a control tube and had no addition made to it. To the others additions were made of known quantities of various substances, of which it was desired to know the effects on the time of onset of uric-acid precipitation. The contents of the tubes were protected against decomposing changes by the inclusion of a few drops of chloroform. The tubes were then corked and placed in the warm chamber at blood heat. The tubes were frequently examined, and the time when uric acid began to be deposited was noted. When the experiment was finished the acceleration or postponement of precipitation in the several tubes, as compared with the control tube, was computed.

Proportion of Uric Acid in the Urine.—A sharp distinction must be drawn between the proportion or per-

[2] See a paper by Mr. C. Plowright of King's Lynn, in the *Medical Times* for Oct. 10th, 1885.

Digitized by Google

centage of uric acid in the urine and its rate of secretion—that is, the total quantity excreted per hour or per day. The proportion of uric acid in the urine bears no constant relation to the rate of its excretion by the kidneys. During the digestion and absorption of food the hourly discharge of uric acid reaches its highest level, but its percentage in the urine is not at its highest, owing to the fuller volume of the urine at this time. On the other hand, after prolonged fasting and during sleep the hourly discharge of uric-acid sinks to its lowest point, but its percentage in the urine touches its highest pitch. Again, the occurrence of uric-acid gravel is not a reliable proof of an excessive output of uric acid; and it is certain that individuals may habitually discharge a daily amount of uric acid considerably beyond the average and yet be quite free from the symptoms of gravel. Nor is such an occurrence even a sure indication that the urine contains an undue percentage of uric acid. Cases are sometimes encountered in which the urine is caught, as it were, in the very act of depositing uric-acid gravel, cases in which the urine, as it is voided, sparkles with crystals of uric acid. On four occasions I have been able to estimate the uric acid in such urines. The results are shown in the following table:—

TABLE VIII.—*Showing the Percentage of Uric Acid in Four Urines which were in the act of depositing Uric Acid at the moment of Emission.*

No. 1 contained	0·084	per cent.	of uric acid.	
,, 2	,,	0·076	,,	,,
,, 3	,,	0·032	,,	,,
,, 4	,,	0·022	,,	,,

In the first and second cases the percentage of uric acid greatly exceeded the average, in the third case it was slightly below the average, and in the fourth case it was very much below the average. Notwithstanding all this, it would be an error to suppose that the quantum of uric acid excreted per day and its proportion in the urine are without influence on the formation of urinary concretions. It stands to reason that persons who daily void an excessive amount of uric acid must be more liable than those who only void the normal quantity to crises in which the percentage of that substance rises above the average, and it is susceptible of proof that, other conditions being favourable, a high percentage of uric acid in the urine becomes a potent factor in the determination of uric-acid precipitation. The following observations may be taken as evidence on this point. A healthy urine which had deposited a copious sediment of amorphous urates in a urine-glass was divided into two equal portions, A and B. A consisted of the lower portion which contained the deposit; B consisted of the upper or supernatant portion. Both portions were warmed to blood heat, and became thereby perfectly transparent. Both portions were identical save in one respect—namely, that A contained a much larger percentage of uric acid, in the form of quadri-urates, than B. The specimens were then tested by the method above described. Four test-tubes were charged each with 10 cc. of urine, composed as follows:—Test-tube No. 1 contained A alone, No. 2 contained equal volumes of A and B, No. 3 contained three volumes of A and seven volumes of B, and No. 4 contained B alone. The four test-tubes were then corked and placed in the warm chamber at blood heat. The following table exhibits the times at which uric acid began to precipitate in the several test-tubes.

TABLE IX.—*Showing the Influence of the Percentage of Uric Acid on the Time of Onset of Uric-acid Precipitation.*

Contents of the Test-tubes.	Time when uric acid began to be precipitated.
No. 1 contained A alone	2 hours.
No. 2 contained equal volumes of A and B	4 ,,
No. 3 contained three volumes of A and seven volumes of B	8 ,,
No. 4 contained B alone	20 ,,

Grade of Acidity of the Urine.—The degree of acidity of the urine exercises, as might have been expected, a powerful influence on the time of precipitation of uric acid. In some cases of gravel I found the acidity of the urine fully twice as high as the normal average; in two such cases the urine was found to decompose the purified amorphous urate as rapidly as distilled water; but when its acidity was reduced to the normal level by the addition of sodium carbonate, it had then no more power in this respect than healthy urine, showing clearly that in these cases the determining factor in the disorder was solely excess of acidity. It was also found, experimenting on normal acid urines, that the addition of an exceedingly minute quantity of an alkaline carbonate postponed the time of precipitation of uric acid very notably. The following table displays some of the results obtained by this mode of testing.

TABLE X.—*Showing Postponement of Precipitation of Uric Acid by the Addition of Minute Quantities of Alkaline Carbonates to the Urine.*

Additions made to the urine.	Time when uric acid began to be precipitated.	Postponement of precipitation.
No. 1.—Urine alone—control tube ..	2 hours.	—
No. 2.—Urine + 0·04% pot. bicarb. ..	4 ,, ...	2 hours.
No. 3.—Urine + 0·04% sod. bicarb. ..	5 ,, ...	3 ,,
No. 4.—Urine + 0·04% lith. carb. ..	10 ,, ...	8 ,,

The quantities of the alkaline carbonates added in this experiment were so small that the reaction of the urine, as tested by litmus paper, was not sensibly affected; and yet the postponement of precipitation was very considerable—considerable enough, had the events occurred in the urinary passages, to make the difference between the occurrence and non-occurrence of gravel. It will be observed that the sodium carbonate acted more powerfully as a retarder than the potassium carbonate, and that the lithium salt acted more powerfully than either. This, however, was solely due to the difference in their atomic weights. When these salts were used in quantities proportionate to their saturating power no difference could be detected between them. It need scarcely be said that if the carbonates were added in sufficient quantity to render the urine neutral or alkaline no precipitation of uric acid took place. The general results of the above inquiry into the factors which control the precipitation of uric acid in urine, and which operate to determine or to prevent the occurrence of pathological gravel, may be summed up in the following two propositions. The conditions of the urine which tend to accelerate the precipitation of uric acid are high acidity, poverty in salines, low pigmentation and high percentage of uric acid. And, conversely, the conditions which tend to postpone precipitation are depressed acidity, richness in salines, richness in pigments, and low percentage of uric acid. On the interaction of these factors the occurrence or non-occurrence of uric-acid gravel appears to depend; and probably the most important of these factors is the grade of acidity.

THERAPEUTICS OF URIC-ACID GRAVEL.

The treatment of calculous disorders at the hands of the physician must always in the main be of a preventive character. When concretions are once formed in the kidneys or bladder, and these are too large or too awkwardly lodged to be washed out by the flush of the urinary stream, there is little prospect that they can be dissolved away by imparting solvent qualities to the urine. In such circumstances we are constrained to have resort to surgical means; and it is a matter for congratulation that the brilliant advances in the surgery of the kidneys and bladder—advances largely due to the enterprise and skill of British surgeons—enable us now to face this alternative with greatly diminished anxiety. In the domain of prophylaxis, however, there remains to the physician a fruitful field of activity. Nowhere, perhaps, is the aphorism that "prevention is better than cure" more pertinent than in the case of calculous concretions. The force—the chemical force—which is requisite to prevent the precipitation of uric acid in the urinary channels is almost infinitely small as compared with the force which is requisite to redissolve a concretion already formed. In considering the medical treatment of uric-acid gravel it is important to fix our eyes on the urine itself. There is, perhaps, too ready a disposition to look for the determining causes of gravel elsewhere than in the urinary function—in the stomach or in the liver or in some general constitutional vice. It should be borne in mind that uric-acid gravel is constantly seen as an independent disorder, existing *per se* in persons who are in all other respects perfectly healthy. And if gravel be, not unfrequently, complicated, or associated with other morbid conditions, it only conforms in this respect to the common rule applicable to most other disorders. There is, however, no doubt that there exists a special relation between uric-acid gravel and gout; and the circumstance that uric acid figures as a common factor in both

Digitized by Google

has led certain persons to the opinion that the two complaints are substantially one and the same. This notion is certainly not correct, and from a therapeutic point of view it is, I believe, a mischievous notion. It is a matter of common experience that many gouty people are never troubled with gravel; and, conversely, that many subjects of gravel are never troubled with gout. In both complaints there is an aberration of uric acid; but the error is essentially different in the two cases, both in regard to its site and in regard to its nature. In gout the error occurs on *this* side of the kidneys, in the blood and tissues, and the uric acid is precipitated in a state of combination as a bi-urate. In gravel the error occurs on *that* side of the kidneys, and the uric acid is precipitated in the urine and in the free state. In the former the deposition takes place in the true interior of the economy; in the latter the deposition takes place in what is, strictly speaking, the exterior of the economy—that is to say, on the surface of a doubling of the external integument. These differences are, I believe, radical, and involve important distinctions both in regard to pathology and in regard to treatment. The fact that gout and gravel sometimes exhibit a kind of vicarious correspondence—that the one complaint alternates with the other at different periods in the lifetime of the same individual, or in successive generations of the same family, while indicating an undoubted relation, indicates also at the same time an essential distinction. Speaking from a somewhat long and large experience of these ailments, I cannot recall a single instance in which a paroxysm of gout and a paroxysm of uric-acid gravel broke out synchronously. And Sir Alfred Garrod, with a longer and still larger experience, gives me his testimony to the same effect. Some pertinent evidence on the point we are debating has been brought forward by Mr. Plowright of King's Lynn.[3] He remarks that, residing as he does in Norfolk, the chief stone district in England, he has been struck by the comparatively small number of cases of gout which have come under his notice as compared with the number of stone cases. He further shows, by reference to the Registrar-General's Reports, that there is no correspondence between the prevalence of gout and of stone in the several counties of England and Wales. Some of the counties which have a high death-rate from gout have a low death-rate from stone; and, conversely, counties with a high death-rate from stone have a low death-rate from gout. In Scotland, where gout is rare, stone is comparatively common.

These considerations lead to the conclusion that gravel should be regarded as a primary vice of the urinary function, that it requires to be studied by and for itself, and that the urine is the proper and natural field for the investigation of its etiology and therapeutics. We have just seen that the factors which chiefly control the precipitation of uric acid in the urine are: the degree of pigmentation, the proportion of salines, the percentage of uric acid, and, above all, the grade of acidity of the urine; and I shall consider the treatment solely with reference to the operation of these four factors.

With regard to the *deficiency of pigments* as a contributory factor in the promotion of uric-acid gravel, I have no facts or suggestions to offer which have a bearing on the therapeutical problem; and I doubt whether any help is to be got from further inquiry in this direction. The subjects of gravel among the well-fed population of this country, as far as my experience goes, present no deficiency of pigment in their urine.

With respect to the *proportion of saline matters* in the urine, it is worth bearing in mind that the evidence gathered by Mr. Plowright, as well as the experimental indications previously adduced by myself, point strongly to the suggestion that the subjects of gravel should be advised to take habitually with their meals as much culinary salt as their palates will tolerate. I may also remind those whose lot it is to practise among the children of the poor or among the rice-eating populations of tropical and subtropical countries, that it would be well, in cases of gravel, to see that the patient's food should contain an adequate proportion of articles rich in saline materials—that is to say, of milk, meat, fish, eggs, and salads.

The *proportion of uric acid* in the urine, as a controlling factor in uric precipitation, demands somewhat more notice. It is a common notion that the occurrence of uric-acid gravel depends simply on an excess of this substance in the urine (so-called uric-acid diathesis). This assumption pervades the entire argument of many writers on gravel, and dominates all their plans or treatment. I have already shown that the assumption is only partially true, and that the percentage of uric acid is only a subordinate factor in the determination of uric-acid precipitation. During the alkaline tide after meals the percentage of uric acid in the urine reaches often a high level, and yet there is less risk of precipitation at this time than at any other period of the day. It has, moreover, been demonstrated (see Table VIII.) that uric acid is sometimes thrown down in the urinary channels when its proportion in the urine does not exceed the normal average, or even when it falls considerably below the average. At the same time, it is true that when other favouring conditions coincide, a high level of uric-acid excretion, with a high percentage of it in the urine, is a valid factor in the production of gravel, and that a lowering of that level, if by any means attainable, is an important therapeutical indication. Attempts have been made in this direction by modifications of the diet and regimen. The advice given on this head by various writers is, however, very contradictory. Some recommend that the subjects of uric-acid gravel should avoid sugar and fruit and fat; others that they should take fat in abundance and avoid starchy matters. Some advise a vegetarian diet, others a mixed diet. The most reliable investigations indicate that fat, sugar, and starchy matters have not the slightest direct influence on the production and excretion of uric acid, nor has any proof been given that albuminoid substances of vegetable origin differ in this respect from albuminoid substances of animal origin. The only point that has really been made out is this—that the excretion of uric acid is diminished by lessening the albuminoid ingredients of the food, and that it is heightened by increasing these ingredients. But this class of aliments is absolutely essential to nutrition, and you cannot diminish them to any serious extent without injuriously affecting the nutritive equilibrium. After a careful examination of all the evidence on this point it appeared to me that the practical outcome was only this—that persons who are subject to uric-acid gravel and who are also troubled with a large appetite should seek to allay their cravings and to lessen the intake of nitrogenous material by the free use of farinaceous articles of food, with salads, fruit, and garden vegetables, all of which are comparatively poor in albuminoid constituents. I shall again revert to this subject in my fourth lecture when speaking of the dietetic treatment of gout.

I am satisfied from repeated observations that in the immense majority of cases of uric-acid gravel in this country the immediate determining cause of the precipitation is *excessive acidity of the urine*, and that the paramount indication of preventive treatment is to diminish this acidity. All other schemes of treatment sink into insignificance in comparison with this. The use of alkalising agents for the prevention of uric-acid gravel stands on a perfectly rational basis. It is chemically impossible for uric acid to be deposited from an alkaline urine; it may even be said that it is impossible for uric acid to be deposited prematurely—that is to say, within the urinary channels—from a neutral or feebly acid urine. And as we possess the means of harmlessly reducing the acidity of the urine at pleasure, we have in our hands, in principle at least, the absolute power of preventing uric-acid gravel. There are, however, some practical difficulties to be overcome. The disposition to uric-acid gravel has a certain persistency. It may last intermittently for months or years, and it would obviously be too great a strain on a treatment which is purely protective to require that a patient should take antacid medicines in sufficient doses and at sufficiently short intervals to maintain the urine continuously alkaline or neutral over so long a period of time. Nor is any such effort necessary. A study of the normal oscillations of the urine at different periods of the day and night leads to the inference that the liability to uric-acid gravel rises to a dangerous intensity only during certain limited portions of the twenty-four hours. The risk in gravel is almost confined to precipitations which take place within the precincts of the kidneys. Precipitations which take place in the bladder are harmlessly swept out at the next act of micturition. These latter probably only do harm when there is already a stone in the bladder to which the crystals

[3] On the Cause and Distribution of Calculous Disease. By Charles B. Plowright. London, 1886. Page 14.

Digitized by Google

can accrete, or when a pouch exists in the viscus to receive and detain the deposit. What most concerns us, therefore, is the state of the urine as secreted by the kidneys rather than the state of the product accumulated in the bladder. For the sake of brevity and by way of distinction, we may be allowed to speak of *renal urine* and *vesical urine*. These two products no doubt usually correspond sufficiently closely to enable us to judge from the urine of micturition what the character is of the urine secreted by the kidneys; but this is not always the case. Vesical urine represents the aggregate work of the kidneys for several consecutive hours. During this interval the renal urine may have undergone sharp oscillations, from acid to alkaline, from dilute to concentrated, from richness to poverty in uric acid, but the vesical accumulation which is at length discharged by micturition will have a mean or average composition which entirely masks these oscillations. To arrive at a correct knowledge of the state of the urine as it flows from the kidneys it is necessary to obtain the secretion and to examine it at short intervals. Some years ago I made an extended series of observations on these lines. The subject of experiment was a healthy man of twenty-eight. The urine was collected at hourly, or at most two-hourly, intervals throughout the twenty-four hours—except during the period of sleep, which was taken at a single interval. The inquiry embraced observations on thirty-two complete days, besides a good many more on portions of days. The results of the investigation were incorporated in two papers published in the Memoirs of the Manchester Literary and Philosophical Society[4] and in the *Edinburgh Medical Journal*.[5] Some of the conclusions arrived at have a direct bearing on the preventive treatment of urinary gravel. The character of the urine was shown to be most affected by the digestion of food, by prolonged fasting, and by sleep. It was found that a meal, whether it was composed of ordinary mixed food or of purely animal or purely vegetable substances, produced two constant effects—it depressed the acidity of the urine and increased its volume. And, conversely, prolonged fasting raised the acidity and diminished the flow of the urine. During the hours of sleep, which are also of course hours of fasting, the acidity of the urine reached its highest point and the flow of the urine reached its lowest point. The proportion of uric acid in the urine—that is to say, its percentage—was found highest during the time of sleep, but the hourly excretion was highest during the hours following a meal. Now, if we apply these facts in the light of the evidence previously adduced in regard to the factors which determine the precipitation of uric acid in the urine, we arrive at the conclusion that the period when there is most risk of precipitation in the kidneys is during the time of sleep, and especially in the early morning during the two or three hours preceding breakfast. The deposition of uric acid is most imminent when there is a conjunction of the several conditions—that is to say, when the flow of urine is very scanty, when the secretion is hyperacid, and when it is rich in urates. Such a conjunction is most fully developed during the period of sleep. Sleep is a time of fasting, and therefore a time of hyperacidity of the urine—a time of recumbency and bodily immobility, and therefore a time when the renal stream approaches nearest to stagnation, and loiters longest about the purlieus of the kidneys. On the other hand, during the day and the waking hours the recurrence of the meals keeps the urine at a low degree of acidity, or even renders it for a time neutral or alkaline, the renal stream is comparatively full and rapid, and its descent from the kidneys is favoured by the force of gravity. During these hours, therefore, the risk of uric-acid precipitation is reduced to a minimum, even in persons who have a distinct tendency that way. For, as I have repeatedly had occasion to observe, the urine of calculous subjects exhibits precisely the same cyclical diurnal variations as that of healthy persons, though not always in so marked a degree.

A study of these facts indicates that if we safeguard the night the day may be generally left to take care of itself. This theoretical deduction is fully in accordance with experience in the treatment of uric-acid gravel. In the milder cases a single full dose of the alkalising agent taken at bedtime suffices to prevent the recurrence of the colicky pains and the discharge of uric-acid concretions. For this purpose the citrates and bicarbonates of potash and soda are the most effective. The citrate of potash is, perhaps, on the whole, the best preparation to employ; it has very little taste, and it sits comfortably on the stomach. The dose for an adult should not be less than forty to sixty grains, dissolved in three or four ounces of water. In severer cases a single dose is insufficient, and the early morning urine will still exhibit a morbid disposition to precipitate uric acid. In such cases a second but smaller dose should be taken about the middle period of the hours of sleep. This is less difficult to manage with the subjects of gravel than in healthy persons. There is commonly in calculous subjects a certain restlessness and a certain irritability of the urinary organs which leads to an increased frequency of micturition, and such persons rarely pass the night without a call to empty the bladder. Advantage should therefore be taken of this break in the continuity of sleep to take the second antacid dose. In this way the entire night and early morning may be effectually guarded.

Cases of uric-acid gravel, however, are not always to be got rid of on these easy terms. Now and then instances are met with in which the perversion is so great that the urine is disposed to deposit almost the day through and in which the normal alkaline tide after meals seems to be well-nigh abrogated. Under these circumstances, additional doses of the antacid are required to afford the requisite protection; and the right times for these doses are two or three hours after breakfast and two or three hours before dinner. But, so far as I have seen, these extreme conditions only last a short time—a few days at most—and there is then a return to a less urgent state of things. It is, indeed, a marked character of uric-acid gravel that it oscillates in intensity—it comes and goes in paroxysms—reminding one of the waviness of gouty phenomena. For this reason it is desirable to frequently note the state of the urine and to ascertain its greater or less proneness to deposit uric acid, so that the administration of the antacid may be adjusted to the actual needs of the patient. There is no great difficulty about this. If a freshly voided specimen of the urine of fasting—say the urine of the early morning or the urine secreted just before dinner—be set aside in a glass vessel in a warm place (so as to prevent the deposition of the amorphous urates) the imminence of precipitation can be easily observed. If precipitation be morbidly imminent crystals of uric acid will appear perhaps at once, perhaps in an hour or a couple of hours. If precipitation be not morbidly imminent crystals will not appear for several hours, perhaps not for two or three days. It is possible in this way to gauge pretty accurately the intensity of the morbid tendency, and to regulate thereby the amount and frequency of the antacid dose, or to decide on its discontinuance.

There are still some points in regard to the use of alkalies in gravel on which additional information is needed. We want to know more exactly the length of time over which a dose of alkali extends its influence on the urine, the amount of dose required to reach an effective result, and the relative alkalising value of the different preparations in use. Dr. Luff has, at my suggestion, undertaken an inquiry with a view of clearing up these points. His investigation is not yet complete, but he has already arrived at some results of interest, which he permits me to mention. He finds that a dose of forty grains of citrate of potash taken at 11 P.M. extends its influence through the night and up to eight o'clock the next morning. The effect on the morning urine, however, was very slight. A dose of sixty grains had a more considerable effect, and often rendered the morning urine actually alkaline. Bicarbonate of potash acted in an exactly equivalent degree with the citrate. A corresponding dose of the acetate of potash appeared to act more rapidly, and its effect was less enduring than that of the citrate. The carbonates of lime and magnesia were found to be quite ineffective as alkalising agents on the urine.

A matter of some importance in the management of cases of uric-acid gravel is the *arrangement of meal times*. Each meal acts on the urine as a dose of alkali, and also as a diluent, and in both these ways operates as a protective against uric-acid precipitation. After the meal is absorbed and assimilated the urine becomes again increasingly acid and concentrated, and, as a consequence, increasingly prone to precipitate uric acid. Subjects of gravel should therefore be warned not to allow too long an interval to elapse between their meals. This precaution is especially needed as regards the interval between breakfast and the midday meal. The first meal of the day is with most persons very quickly

[4] A Contribution to Urology: Memoirs of the Literary and Philosophical Society of Manchester, vol. xv.
[5] On Some of the Daily Changes of the Urine: Edinburgh Medical Journal, 1860.

Digitized by Google

digested, and its effects on the urine correspondingly transient. At no time during the waking hours does the acidity of the urine tend to rise so high and the volume of the urine to fall so low as during the later portion of the interval between the first and second meal of the day. This interval should therefore be abridged. In this connexion the pleasant institution of afternoon tea may come in for a word of commendation, as serving to break the sometimes too long interval between luncheon and a late dinner. Some people interpose an unconscionable interval of twelve or fourteen hours between their last meal at night and their breakfast next morning. This is a very risky proceeding on the part of calculous subjects.

The essential thing in the prophylactic treatment of uric-acid gravel is to guard the urine from precipitating within the precincts of the kidney. And we shall practically have attained our object if we succeed not in altogether preventing precipitation, but in postponing it until the urine has quitted the kidneys. A postponement for a short time—even half an hour—may make all the difference between a precipitation which is fraught with pain and peril and a precipitation which is perfectly harmless. Now, the protective effect of an antacid dose extends a good deal beyond the point at which the urine is rendered actually alkaline. For, although all acid urines of medium density precipitate uric acid sooner or later, the time of the occurrence of that precipitation is immensely influenced by the degree of acidity of the urine. Other things being equal, the more acid the urine the earlier is the precipitation, and the less acid the urine the longer is the precipitation postponed. An antacid effect, therefore, which is too feeble to render the urine actually alkaline may be quite sufficient to depress its acidity to such a degree as shall postpone the time of precipitation until the urine has escaped from the kidneys and even from the bladder.

The use of mineral springs in the treatment of uric-acid gravel demands a word of comment. A sharp distinction must be drawn between alkaline springs and non-alkaline springs. Alkaline waters, such as those of Vichy, which are largely impregnated with carbonate of soda, have the power of alkalising the urine, and therefore absolutely protect against uric-acid gravel during the period of their use. But the non-alkaline waters have no such power, and their beneficial action is due to the fact that they greatly increase the flush of the urinary stream and thereby promote the carrying down of concretions already lodged in the precincts of the kidneys. Their efficacy in this direction is quite undoubted; but it is, I think, equally undoubted that the drinking of equivalent quantities of distilled water would be just as efficacious. A glance at the composition of the several non-alkaline springs which have acquired renown in the treatment of gravel supports this view and indicates that the neutral salts contained in them have little or nothing to do with their efficacy. Some of these waters are impregnated with sulphate or chloride of sodium; others with salts of magnesia; others, again, only contain minute quantities of sulphate of lime, and are scarcely distinguishable, except for their warm temperature, from ordinary drinking water. Yet all these most diverse springs claim equal powers in cases of gravel. Is it not plain that what alone gives them efficacy is that which they all contain in common—namely, their watery constituent? Subjects of urinary gravel who pay, as many of them do, an annual visit to one or other of these springs imagine that such a visit clears them from their calculous tendency for the rest of the year. This, I believe, is a delusion. Such persons, on their return home, stand, in regard to their morbid proclivity, precisely where they stood before their visit.

It is obvious that a preventive treatment of uric-acid gravel to be completely effective should be available all the year round, and be capable of timely application whenever the emergency arises. An adequate choice of substances which alkalise the urine is always at our disposal; their power of preventing uric-acid precipitation amounts to a chemical certainty; and in even moderately prudent hands no harm can follow from their use. I see no reason, provided vigilant watch be kept on the imminence of uric-acid precipitation in the fasting urine, in the manner before described, why sufferers from this kind of gravel should not, by a prompt resort to antacid remedies, be able at all times to protect themselves effectually against fresh formation of uric-acid concretions, and thereby save themselves from a world of pain and danger.

AN ABSTRACT OF

Lectures

ON THE

TREATMENT OF SURGICAL TUBERCULAR DISEASES.

Delivered at the Royal College of Surgeons of England, in June, 1892,

BY W. WATSON CHEYNE, M.B.ED., F.R.C.S.ENG.,

HUNTERIAN PROFESSOR; JOINT PROFESSOR OF SURGERY AT KING'S COLLEGE; SURGEON TO KING'S COLLEGE HOSPITAL, ETC.

LECTURE I.

THE question of the possibility and the mode of recovery from tuberculosis was considered in the first instance, and it was pointed out that in man there is a great tendency towards recovery. Mr. Cheyne then continued:

"Recovery may take place either after or before the formation of a communication with the exterior. Where a tubercular deposit has opened externally a considerable portion is evacuated, and when healing occurs only a fibrous induration, with sometimes a little caseous material in it, is left to mark the seat of the original disease. Where no communication has formed externally, the retrogressive changes are of various kinds, depending on the extent and character of the lesion, more especially on whether the tubercles are discrete or agglomerated into masses, or on whether caseation has occurred or not. Where the tubercles are discrete and not caseous at the time that the bacilli cease to act the probability is that the tubercle will disappear and leave practically no trace behind, the amount of resulting fibrous tissue being too small to be noticeable. How this takes place is not quite clear. In specimens from cases of synovial disease treated by tuberculin in which retrogression was occurring I found apparently two sets of changes. In the one the epithelioid cells of tubercle disappeared, their place being taken by smaller cells, which apparently developed into fibrous tissue (the most common appearance); in the other the epithelioid cells themselves became spindle-shaped and developed directly into fibrous tissue. Similar appearances may also be seen apart from the use of tuberculin, and under these circumstances a true cure results. Where the tubercular masses are larger or where caseation has occurred complete cure seldom occurs, though the disease may become quiescent. In that case a large amount of fibrous tissue is formed around the mass, and no doubt a good deal of the tubercular tissue disappears, or is converted into fibrous tissue or absorbed; but where the tubercular mass is large, remains of tubercles or portions of caseous material, often infiltrated with calcareous salts, are generally found towards the centre of the new fibrous tissue. Calcareo-caseous masses are more common in these deposits than tissue showing a recognisable tubercular structure, and in both the presence of tubercle bacilli has been frequently demonstrated, both microscopically and by inoculation into animals. Hence we can only speak of cure in cases where the result of the healing process is fibroid induration with complete disappearance of the tubercular material. Encapsulation of a deposit is not true cure, but its occurrence, nevertheless, illustrates the fact that the bacillus often has a hard struggle for existence in the human body, and often fails to make headway or even to hold its ground. These changes have been most carefully studied in the lungs, and reference was made to various statistics as regards their frequency, especially those of Heitler, Fowler, Sidney Martin, Coats, and Harris. The relative frequency of complete fibroid change—i.e., cure—and of encapsulation of tubercular deposits is given by Martin as 1 to 4, and his percentage of true cures in post-mortem examinations of patients dying of non-tuberculous diseases is 2·7 per cent. It is not, however, certain that all of these fibroid indurations have resulted from tubercle.

"With regard to surgical tuberculoses, healing or encapsulation of tubercular deposits is not at all infrequent.

Digitized by Google

should think that encapsulation of calcareo-caseous tubercular deposits occurs very frequently in glands, more often probably than anywhere else. In the case of tubercular glands, we frequently see that while some suppurate, others remain enlarged without suppurating, and as years pass gradually diminish in size; while we know, as the result of operations for the removal of tubercular glands, that these contain caseous material.

"As regards diseases of bones and joints, I should say that in the case of pure synovial disease we have in a good many cases a true recovery, though in others there often remains somewhere or other an encapsuled tubercular mass. Where recovery takes place at an early stage, while the tubercles are still discrete or only in small masses, it may be complete, and the amount of resulting fibrous tissue may be so small as not to interfere with the movement of the joint to any material extent. I have had two or three cases where expectant treatment was begun early and continued for a long time which have recovered completely as regards appearance and function, and with no apparent tendency to relapse. As a rule, however, the tubercular tissue is somewhere or other massed together, and in these cases there is always a considerable or even complete degree of stiffness left behind owing to the large amount of fibrous tissue formed; and not unfrequently, as I have said, there is encapsulation of tubercular material. In the case of deposits in the ends of bones encapsulation is the rule in the cases which recover without operation or abscess. In fact, although I have examined a considerable number of bones microscopically with old-standing quiescent tubercular deposits I have only once found appearances which justified the view that cure had really occurred; in all the other cases encapsulation and calcareous deposition had occurred, and the deposit remained as a constant source of danger. Where ankylosis has occurred in joints, although in the case of bony ankylosis I have seldom found distinct traces of tubercular tissue except where deposits were present, I have in most of the cases of fibrous ankylosis found remains of tubercular tissue somewhere or other. This is a point of great importance in connexion with the practical question of breaking down these joints with the view of obtaining better position or possibly movement. Experience has taught the great danger of such procedures, and the explanation is furnished by the fact which I have just stated."

The causes which oppose recovery were next considered under the heads of General and Local Causes. Among the general causes is the inheritance of a predisposition to tuberculosis either from the body being a better soil for the growth of the organism, or from the defensive arrangements of the body, the cells and fluids, being less efficient as antiparasitic and antitoxic agents. Reference was also made to the fact that the members of a tubercular family are in addition exposed to a much greater risk of infection and to a much larger dose of the virus from the dried secretions of the patient, in kissing, the use of the same food utensils, &c. A somewhat similar receptive condition of the body may be produced by confinement in close and badly ventilated localities, bad food, &c.; indeed, the predisposition of those already predisposed is often increased by the fact that if sickly they are kept in the house and taken care of to an unnecessary extent. The climate is also of importance, more especially if cold and damp, by setting up catarrhal inflammations of various mucous membranes, sore-throats, &c., thus causing local predisposition and opening up a point of entrance for the bacilli; and further, the same occurrences often lead to aggravation of the disease if it already exists. Such a climate may also lead to rheumatic affections which, especially when affecting joints, may again pass into tubercular disease. As regards food, of course if insufficient or poor in quality, the general nutrition of the patient is interfered with; and further, it is conceivable that too great consumption of certain substances may render the body a better soil. This view has been supported by Bidder as regards too much vegetable diet leading to an excess of potash in the tissues. Again, attacks of certain diseases, such as measles or scarlatina, predispose to tubercular infection, and also often aggravate an existing one. Even in the case of a mild disease like chicken-pox the lecturer had seen marked recrudescence of disease which had up to that time been improving.

"Of the local causes which interfere with the action of the tissues in repelling the parasite the most important are those which tend to set up and keep up a state of chronic inflammation in the part. I pointed out in my former lectures that the tubercular disease when spreading is always surrounded by a greater or less extent of tissue in a state of chronic inflammation, and that the disease tended to spread in the direction in which this tissue was greatest. Of the causes which increase the chronic inflammation, apart from the presence of the tubercle, movement of the affected parts and in the case of joints pressure of the joint surfaces against each other are the most important, and the improvement in the part when these two causes are removed is often very striking.

"Injury is also not only a potent factor in the production of these tubercular diseases, as I pointed out last year, but, as we all know, it is very apt to aggravate an existing lesion or to light up a disease which may have been quiescent for a long time. In the lighting up of a quiescent lesion the effect of the injury is either to rupture the fibrous capsule around the tubercular deposit, or, where this fibrous tissue is only small in amount, to lead to passage of fluid into the deposit, thus providing fresh pabulum for the growth of the bacilli. Its action in aggravating an existing disease may be partly due to the increase in the inflammation and partly to the accompanying swelling interfering with the lymph flow and producing a stasis of lymph in the part, a condition of matters which is favourable to the growth of the bacilli. Disturbances in the circulation of the blood must also be of importance; for example, where the disease affects the lower extremity, if the limb is allowed to hang, the free circulation of blood in the part and the removal of the waste products are interfered with, and, as we know, under such circumstances wounds do not heal, or only with great difficulty. Apart from these various factors on the part of the body, the conditions on the part of the tubercle bacillus itself may exercise a considerable influence on the spread of the disease; and although these conditions are not under the control of the surgeon, it is well to bear them in mind. I have formerly pointed out that the severity of an infective disease depends to a great extent on the initial dose, and this also holds good in tuberculosis. As cases of bone and joint disease no doubt arise not merely from individual bacilli carried to the part by the blood, but also, and, I think, most commonly, by actual emboli of tubercular material containing bacilli, and coming from some central focus, generally, I think, from the bronchial glands, the severity and acuteness of the disease will depend to some extent on the number of bacilli present in the original embolus. The virulence of these bacilli also varies to some extent, and it is found that if the virulence is diminished by artificial means these attenuated bacilli tend to set up local lesions resembling scrofulous diseases in man rather than the more acute general disease which is the usual result in the lower animals. On the other hand, it has been found that the virulence of certain organisms is increased by passage through highly susceptible animals, and it may be that in the case of tuberculosis in highly predisposed individuals the bacilli may gain in virulence, and thus the children, apart from their hereditary predisposition, are apt to get a more acute form of the disease as the result of the greater virulence of the bacilli and the large initial dose. Another thing which favours the growth of the tubercle bacilli is the concurrent growth of other organisms. In the case of the lung, the presence of other organisms, more especially of the micrococcus tetragenus, seems to have a great deal to do with the rapid breaking down of the tissue, and in open tubercular deposits elsewhere there is no doubt that the presence of the ordinary pyogenic organisms leads to extension and persistence of the disease to a very marked degree. This is a point to which I shall subsequently return."

Modes of combating tubercular disease.—Reference was in the first instance made to the question of prophylaxis, in so far as the other members of the household are concerned. This chiefly has reference to phthisis, but it also may be well to take some precautions where there are open wounds. The chief points in the prophylaxis are to disinfect the sputum, to prevent it from drying up, not to wipe the mouth with a handkerchief, no kissing, separate food utensils, disinfection of pillows, bed clothes, and sleeping room from time to time, &c. The treatment of the tubercular diseases must be considered under two separate headings—(1) Methods which aim at strengthening the body as

Digitized by Google

a whole or the affected part in particular, thus enabling the tissues to overcome the bacillus—methods, in fact, which do not act directly on the tubercular disease, but only indirectly through the tissues of the body; and (2) methods of which the essential feature is the removal or destruction of the tubercular tissue, and with it of the tubercular virus.

METHODS WHICH ACT ON THE BODY, AND NOT DIRECTLY ON THE TUBERCULAR DISEASE.

1. *General treatment.*—Allusion was first made to good hygiene and fresh air. In this connexion the question of climate naturally arises, and various points have to be considered in connexion with it. In the first place, the period of the disease at which the patient should be sent away. In surgical tuberculosis, in contrast to phthisis, a great deal can often be done by local treatment, operative or otherwise, and it is always a question whether the local or the climatic treatment is for the time being of most urgent importance. It is of course mainly in the early stage, while there is as yet no question of operative interference, that the change of climate is of greatest importance; or, again, after the necessary operative interference has been carried out. Where an operation is impending, or where such methods of treatment as extension are necessary, change of climate is for the time being inadvisable. The determination as to the place to which to send the patient will depend to a considerable extent on the view which one takes as to the action of climate in the treatment of tuberculosis. Two views are held with regard to this matter: the one that in the air of certain localities substances are present which possess an anti-tubercular action, and the other that the usefulness of climate depends on its effect in improving the general condition of the body, thus acting only secondarily on the tubercular disease. The first view is that which is generally held by the laity, more especially with regard to the seaside and sea voyages, and which is no doubt the mainspring of the remarkable pilgrimage to Margate, which seems to be the first and most essential part of the treatment in their minds—a pilgrimage undertaken without the slightest consideration as to whether that is the climate which suits the patient best or not. Indeed, the lecturer had known patients persist in staying at the east coast health resorts although they were never well there, on the idea that, though their bodily health was suffering, their tubercular disease was being cured by the specific substances—iodine, ozone, or what not—contained in the air. This is an erroneous and hurtful view, and the lecturer advocated the second view—viz., that the efficacy of climate depends solely on its action in re-establishing the vigour of the body, and enabling it to oppose successfully the tubercular invasion. From this point of view there is no one place which will suit all cases, and the decision must depend on a knowledge of the peculiarities of the patient and on the stage and situation of the disease. A point of great importance is to ascertain the temperature which suits the patient best, some preferring hot weather, others being well only in a cool place. The question of temperature must also be considered in connexion with the possibility of the patient taking active exercise in the open air. Where a patient is unable to walk the place chosen must be warm and dry, and it must also be sheltered from winds, because he ought to be out in the open air as much as possible. Many patients undoubtedly do best at the seaside, but there are others, and these by no means few, for whom high inland situations are the most suitable. In these cases it is best to send them to a cottage or farmhouse in a suitable inland place, such as Yorkshire in summer, or Devonshire in winter. Of seaside places, the South coast is probably the best in the early stage of the disease, and the east coast when convalescence is thoroughly established. The question of exercise is also important—the avoidance of pursuits which expose the patient to injury in an unusual degree, remembering the tendency of injury to lead to fresh outbreaks of the disease. Where the lower extremity is affected, it is best that the patient should be kept recumbent and not allowed to get about with crutches, as is so often done. He should be wheeled out into the open all day and exercise given him in the form of general massage. We know from the clinical history of ulcers and inflammations of the leg that the dependent position of the limb is a very great obstacle to healing, and the same must hold good with regard to a diseased joint, even though it be kept at absolute rest.

2. *Local treatment with the view of improving the resisting power of the tissues.*—One of the chief obstacles to recovery is the presence of chronic inflammation in the tissues around the tubercular area, which is kept up more especially by the various causes of unrest, such as movement or sepsis, and, in the case of joints, pressure of the diseased surfaces against each other. In combating this condition the first requisite is as far as possible to give absolute rest to the part—rest both from mechanical and chemical agencies, such as sepsis. Most surgeons are agreed as to the value of mechanical rest, but some, and notably Schede, do not share this view entirely. Schede thinks that too complete rest may do harm in joint cases, leading to atrophy of the capsule, diminution of synovial secretion, &c., and he allows his hip-joint cases to move and sit up in bed with an extension apparatus on. It is unnecessary to take up space in combating this view, but the value of rest in an organ, the urinary bladder, which is never at rest under ordinary circumstances, is indisputable. Quite recently Mr. Cheyne had had two cases of primary tuberculosis of the bladder, an exceedingly rare affection, which had been treated with great benefit by placing the organ completely at rest.

"CASE 1.—A man aged thirty-six had a week or two before consulting me in February, 1891, begun to suffer from frequency of micturition, accompanied by pain towards the end of the act. This had been getting worse for the last two days, and at the end of micturition pure blood was passed, with intense pain in the bladder and penis. The bladder was found to be very tender both above the pubis and per rectum. There was no tenderness or enlargement of the prostate or vesiculæ seminales; testicles normal; no kidney tenderness or swelling. Nothing felt on sounding, but the instrument caused great pain. Urine acid, containing blood and pus. Temperature 99°. The patient was pale and thin, and thought that he had been losing flesh lately. Some five or six years ago he had pleurisy, and at that time lost flesh greatly. No tubercular family history, but his only child has enlarged cervical glands, large tonsils, adenoids, &c. I sent him to bed and ordered the usual remedies for acute cystitis. For a few days he improved considerably, but about ten days later he had recurrence of the bleeding and strangury without any apparent cause. I watched him for about six weeks, during which time he had two attacks of pain and strangury and the prostate became somewhat larger than it was at first. By that time I had come to the conclusion that the case was one of tuberculosis of the bladder, although no other tubercular lesion could be detected; but before opening the bladder I had a consultation with an eminent man, who, having had large experience in the use of the cystoscope, examined him with that instrument at my request. He diagnosed a simple polypoid tumour close to the right ureteral orifice, and I believe a clay model was made of the tumour afterwards. Though I could not accept the diagnosis, it gave me the excuse for supra-pubic cystotomy, which I had been desirous to do. On opening the bladder above the pubis at the beginning of April I examined it most carefully, but there was no trace of a tumour. In the trigone, however, there were four or five spots about the size of peas, with slight ulceration on the surface, and in the surrounding mucous membrane a number of minute miliary tubercles could be readily seen. The spots were carefully scraped, iodoform powder rubbed in, and a drainage-tube inserted. For the first day or two he had a good deal of spasm of the bladder, but this soon passed off, and I kept up the drainage for six weeks. At the end of that time the tube was left out and the bladder closed during June, when he went to the seaside. He spent the summer lying in the open air, and he steadily gained in weight, but still passed pus in the urine. In September I allowed him to begin walking about, and since then he has steadily improved, though up to Christmas he had had two very slight attacks of pain and bleeding. Since Christmas he has had no further trouble, his urine has become free from pus, and he only passes urine about four times in twenty-four hours.

"CASE 2.—A man aged twenty-one, doubtful family history; uneasiness about bladder for more than a year; for last three months has had frequency of micturition; pain and blood on one or two occasions; losing flesh; other organs healthy; much pain towards end of micturition, which is fre-

Digitized by Google

quent; pus in urine; nodule felt in bladder wall just in front of right vesicula seminalis; very tender; no stone. Cystoscope showed ulcer in trigone; tubercle bacilli in urine. On Nov. 24th I performed supra-pubic cystotomy, found ulcer in trigone, and by exerting pressure on the nodule from rectum squeezed out a little curdy pus; ulcer scraped, bladder drained, albumoses from tuberculin injected; drainage continued for six months; now much improved, gained flesh, and lost old pain."

In the case of tubercular joint disease surgeons, with very few exceptions, are unanimous in recommending rest, and it is sometimes very striking how much improvement results, even in very bad cases, from absolute fixation of the affected joints. In many cases of joint disease, however, the unrest is not only due to movement, but also to a large extent to the tonic contraction of the muscles surrounding the diseased part, and causing pressure of the joint surfaces against each other. Where the bone has become affected, the joint is always found to be more or less completely fixed, the fixation being due in the early stage almost entirely to reflex contraction of the muscles surrounding it. The result is that the joint surfaces are kept constantly and firmly pressed against each other, and as a consequence the chronic inflammation in the bone is kept up, and rapid destruction of the part of the bone which is subject to the pressure takes place. This is seen in the hip-joint, for example, in the flattening of the upper surface of the head of the bone, and in the enlargement of the acetabulum in the upward and backward direction. This muscular contraction, especially in the early stage, may be looked on as symptomatic of bone disease; in pure synovial disease there may be marked thickening with comparatively little interference with movement within certain limits, certainly without complete rigidity. Hence, when the bone is inflamed mere rest of the joint as obtained by apparatus will not be sufficient; the muscles would still be able to contract and keep up the pressure and inflammation. It is therefore necessary in these cases to combine with the rest a moderate amount of extension sufficient to tire out the muscles and prevent this violent pressure of the joint surfaces against each other. Many surgeons object strongly to extension, under the impression that its object is to separate the joint surfaces from each other, and have pointed out that to effect this purpose very heavy weights must be employed, and that such weights would do injury to the joint by stretching the ligaments. All this is perfectly true; but separation of the joint surfaces ought not to be the object of the extension, and, even if it were readily possible, is not at all desirable. The object of extension is not to separate the joint surfaces, but to prevent them from being pressed together, two totally different things. Hence extension is chiefly of use in bone disease; where the case is one of pure synovial disease and where there is no marked rigidity of the muscles there is no object in applying extension unless deformity is present; indeed, it will probably do harm. And further, from this point of view it must be borne in mind that a weight which relieves the patient in the first instance may, if continued after the tonic contraction of the muscles has been overcome, cause a great deal of pain and mischief from stretching of the inflamed ligaments. To take a case under my care this winter: the patient, a man of about twenty-two years of age, was admitted with hip-joint disease of nine months' standing, complete rigidity and great pain, especially in the knee, and starting of the limb at night. The employment of a weight of 5 lb. along with a long splint at once relieved his pain. Thirteen days later he began to complain of pain about his hip joint, especially in front, and this was relieved by reducing the weight to 3 lb. Ten days later there was return of this pain, which at once disappeared on leaving off the extension and employing the long splint alone. In this case the muscular rigidity gave way more quickly than usual, and the fresh pain was the result of undue stretching of the inflamed capsule. It is therefore important in these cases to watch the extension and to diminish the weight as soon as it is evident that the muscular resistance has been overcome.

HOSPITAL FOR WEST FIFE.—It was resolved at a meeting at Dunfermline, held on the 15th inst., to erect an infectious diseases hospital at Milesmark, at a cost, with furnishings, of about £6000.

AN ABSTRACT OF

The Hunterian Lectures

ON

CERTAIN DISEASES OF THE BREAST.

BY H. B. ROBINSON, M.S., M.D. LOND., F.R.C.S. ENG.,

HUNTERIAN PROFESSOR OF SURGERY AND PATHOLOGY, ROYAL COLLEGE OF SURGEONS; ASSISTANT SURGEON TO THE EAST LONDON HOSPITAL FOR CHILDREN, SHADWELL; DEMONSTRATOR OF ANATOMY AT ST. THOMAS'S HOSPITAL.

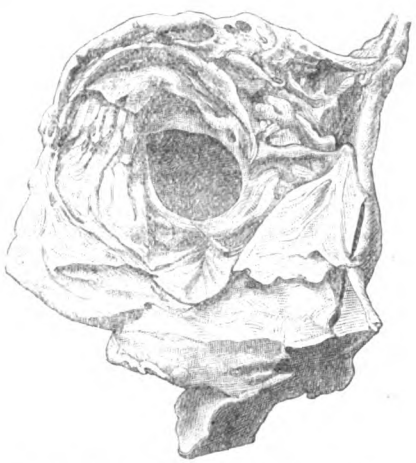
LECTURE II.

IN this lecture certain cystic diseases were first described, those occurring independently of any true tumour formation. Involution cysts are to be met with in the majority of fairly nourished women between fifty and sixty. They are small, not much exceeding a mustard seed, and contain a brown mucoid fluid. The question to solve is whether this change is a true atrophy or of inflammatory origin. Histologically there may be difficulty in deciding, but if the lesion is inflammatory, which seems unlikely, then inflammation must be almost universally distributed.

The following clinical forms of cysts are without doubt in relation with chronic interstitial mastitis:—

1. It is not by any means rare to have *small multiple cysts* distributed through the sclerosed tissue. In the softer forms of the diffuse disease they are very scanty, but in the firmer variety, where the breasts are typically cake-like and in the circumscribed lobular form, it is almost the rule to meet with them; they vary in size, but are yet so small as to give no marked nodulation over the surface of the breast. The signs associated clinically with chronic interstitial mastitis will be present. They are more numerous towards the periphery of the gland, and may be arranged in radiating lines from the nipple. The cysts contain fluid, the colour of which varies from yellow to a dirty brown, and in some cases there may be intra-cystic growths. Sir Astley Cooper's specimens in the College Museum (4744–4747) illustrate these cysts. (Fig. 1.) As to the age when they are found, this agrees

FIG. 1.



with that of chronic interstitial mastitis. Cases are not common under thirty-five, but in some instances these cysts may be met with in quite young women.[1] There is some difference of opinion as to the origin of these cysts. Gross states that both small ducts and acini give rise to them, but Broca says the acini alone. The former is undoubtedly correct, but it appears that probably the larger number arise from the small ducts. Age, however, is responsible for the relative proportion between the two, more cysts arising from the ducts in elderly subjects. The dilated ducts are usually lined by a single layer of a short columnar epithelium, the cell nuclei staining deeply, the dilated acini have a lining of flattened or sphenoidal cells, in some cases multiplying, which take the stain poorly. The cysts enlarge by the dilatation due to increased secretion, and also by the solution of the connective-tissue partitions between adjacent cysts.

2. The *single cyst* has been described under many names: "serous cyst," "lymphatic or muco-serous cyst" (Velpeau). It may be situated in any part of the breast, but is very rarely central, and may range in size from a small nut to an orange. If large there may be distinct prominence, and, perhaps, fluctuation, but when small and embedded in the breast substance, the cyst may give the impression of a solid tumour causing difficulty in diagnosis. This cyst is single in most cases in only a clinical sense, as we generally find small microscopical cysts in the tissue around, the latter being in a condition of sclerosis establishing its relation with chronic inflammatory change. Why one cyst should alone reach a large size is difficult to explain. Although the breast tissue shows the changes of chronic interstitial mastitis, it is remarkable that in a very small proportion of cases is there any thickening to be detected in the opposite breast. The cyst wall is smooth and shining without intra-cystic growths, and the fluid is clear and straw coloured. The cavity may consist of several loculi; between these septa project into the cavity. These features are well shown in Specimen 4752, Hunterian Museum, R.C.S., and in a case of Benjamin Travers (St. Thomas's Hospital, II. 7). (Fig. 2.) These cysts are rare under thirty-five, and more than half of the cases are in unmarried women; of those married many are sterile. The growth of the cyst is slow, very few cases giving a shorter history than six months. In 80 per cent. of cases the breast tissue outside the cyst gave distinct evidence of chronic interstitial

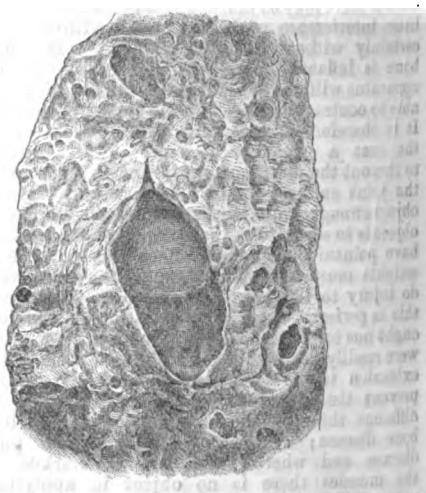

FIG. 2.

mastitis. The lining of the cyst is a cubical epithelium if small, and, if large, it may be flattened or absent. The diagnosis is very difficult in cases where the cyst is small, tense, and embedded in the breast. Its hardness may give the sensation of a solid tumour, especially a scirrhus, and, acting on such a supposition, amputation has in many cases been needlessly performed. In the following instance this was done after several surgeons had pronounced it an undoubted scirrhus:—A woman of forty had a very hard lump in the breast, with circumscribed outline and no fluctuation. The axillary glands were not enlarged, but the nipple was retracted. The tissue around was very indurated. After removal the tumour proved to be a very tense cyst about the size of a tangerine orange, with smooth walls and no intra-cystic growths. The surrounding tissue was white and fibrous with numerous small cysts in it. In treating these cases the moral is pointed that in any case of doubt aspiration should be first done. Should clear fluid be drawn off, the cyst may be laid open, wiped out with strong chloride of zinc solution and then allowed to heal up by granulation; or, what is better, it should be dissected out and the freshened surfaces brought in apposition by deep stitches; by this means recovery is undoubtedly accelerated.

3. *True cystic disease* is distinguished by the presence of multiple cysts varying in size. It has been described under many names. Sir A. Cooper,[2] speaking of "cellulous hydatids," says: "It is an enlargement growing for months or years, the swelling at first feeling solid, 'like simple chronic enlargement,' developing after a time fluctuating centres. These contain a mucilaginous serous fluid and the glands are not enlarged. On dissection the breast has chronic inflammation of the connective tissue with a large number of cysts of varying size distributed through it with tendency to grouping. The condition may be quite localised. Never seen the condition present in both breasts at the same time." Brodie[3] includes this and the "duct-cysts" under the term *sero-cystic disease*. Phocas,[4] as "maladie noueuse," has described nodular swellings of different sizes scattered through the breasts which he supposed from their hardness to be composed of fibrous tissue. He made no microscopical examination to ascertain the correctness of his conclusions and their fibrous nature was very doubtful. This disease is known in France as "maladie de Reclus,"[5] the latter considering that his cases were identical with those described by Phocas. These nodular swellings are usually situated more towards the periphery of the gland and König says especially on the posterior surface. (Fig. 3.) If small they are very hard, hence Phocas's conclusions; as they enlarge and if they come more to the surface fluctuation may be detected. They never attain a very large size, the average being about that of a walnut. Both breasts are as a rule involved, and the cysts develop progressively. The nodules are circumscribed, but the breast around is fibrous, and feels granular from the smaller cysts in it. They occur mostly between forty and fifty, and about half are found in single women. In only a small

FIG. 3.

proportion is pain complained of, but tenderness on pressure is more constant, and this is increased at the menstrual periods. There is no discharge from the nipple in over 80 per cent. of the cases; when this does occur it is usually clear, but rarely it may be blood-stained, due to some damage to the cyst wall or to the presence of intra-cystic growths. To meet with the latter in the larger cysts is unusual, in fourteen cases such a development being only met with once. The axillary glands are not enlarged. Histologically, as in chronic interstitial mastitis described before, the primary change is in the glandular structures, causing epithelial multiplication. This is attended by increased formation of connective tissue; but instead of the gland elements disappearing before this, we find that dilatation of both ducts and acini occurs, especially of the former. As the cysts increase in size, adjacent cysts become confluent by the solution of their party walls, their remains projecting into the cavity as septa. (Figs. 4 and 5.) The diagnosis must be made (*a*), if small, from fibrous nodules, Cruveilhier's fibrous bodies; (*b*) from carcinoma, with multiple spots of softening; (*c*) from duct-cysts.

The *duct cysts* have been so named by Birkett. Brodie and Reclus have included some cases in the descriptions of their diseases. Velpeau has a group, "muco-serous cysts," which are the exact analogues of Birkett's disease.

These cysts, which may be single or multiple, are situated centrally beneath the nipple, and they attain a much larger size than those in the preceding group. They arise beneath the areola by dilatation of the large ducts or sinuses, and are accompanied usually by nipple discharge. This is of a yellowish or brown colour, thin or gummy in consistency; often cholesterin is to be obtained from it. If the fluid is blood-stained it is an indication that probably a growth is developing inside

FIG. 4.

the cyst. The discharge may be the first symptom complained of, but soon the swelling beneath the areola appears, and then often the discharge stops. As the cyst enlarges the skin becomes thin and almost transparent, but is not adherent. One breast is alone affected, and the axillary glands are not enlarged. There may be tenderness on pressure, but pain is unusual. The cysts develop in the middle period of life, and the single and married are affected in about equal proportions. There is often

FIG. 5.

a history of menstrual irregularity, and in some cases a blow is stated to be the direct antecedent cause. The connective tissue may be sclerosed. On section, the cysts are globular, with thin walls, and lined by a single layer of short columnar epithelium; if multiple, they may be semilunar or flattened. The presence of these cysts in such a simple form is not at all a common occurrence. They are generally associated before long with the development of adenomatous growths, which we shall consider in the next lecture. The diagnosis has to be made from the true cystic disease. The latter is bilateral, with multiple cysts occurring with chronic interstitial mastitis, and with nipple discharge not a marked feature, whereas these duct cysts are unilateral, the cysts not invariably multiple, and nipple discharge almost a constant accompaniment.

The true *lymphatic or serous* cysts occupy a very doubtful position. For their development anywhere in the

FIG. 6.

body pressure seems a necessary factor; but here in the breast they do not solely develop in a part where such a cause may come into play. That they have a lining of flattened cells is quite true; but this is due to the pressure of the contained fluid, and not to their being endothelial, which would be the case if derived from connective tissue. In all the cases I have examined, the connective tissue showed distinct evidence of chronic interstitial mastitis, with small microscopic cysts. Now the latter are evidently

FIG. 7.

not derived from connective tissue, and I would hold that the same cause is in relation with the formation of the large cyst, and that the position of the true serous cyst is not proven.

The *blood cyst* has been described by many as a specific form. Its correct interpretation probably is that the blood is due to injury to an intra-cystic growth in a cyst, and that this soft growth becomes embedded in clot and so obscured.

In many sections from cases of chronic interstitial mastitis very marked changes in the epithelium lining the dilated ducts and acini may be noted. They are of importance pathologically from the fact that histologists are at variance as to their interpretation. This condition is on the border line between simple inflammatory and neoplastic formation, and from the point of view of prognosis it is desirable that we should have a fixed opinion one way or the other. We find that some of the cystic spaces, apparently derived from acini, are filled by a proliferating sphenoidal epithelium (Fig. 6), while others, which seem to be formed from ducts, have papillary vegetations which may fill up the cavity. (Fig. 7.) On these vegetations the columnar cells are arranged quite regularly, and the connective tissue does not show any signs of round-celled infiltration. Have we any reason to suppose or any evidence to offer that these changes are antecedent to carcinoma, either causally or as a stage in its development? We will, firstly, consider those cases of true cystic disease (maladie de Reclus) formed undoubtedly in relation with chronic interstitial mastitis, where at times these intra-cystic growths may be met with. French writers have particularly devoted themselves to the consideration of the subject. Brissaud and Malassez have called these changes intra-acinous cystic epitheliomas. Quénu describes them as an epithelial cirrhosis, and says it is a case of chronic interstitial mastitis, the lesions in the connective tissue being secondary to the irritation in the glandular part. Delbet[6] considers the changes are comparable to the contagious mammitis of cows and to the changes in psorospermosis as seen in the rabbit's liver. Both of these are due to irritants within the gland, the former to the streptococcus described by Nocard, and the latter to the psorospermiæ. Although no microbe has been isolated as a cause of this chronic mastitis, we might infer by analogy that one possibly exists, and that the changes it produces are only the analogues of those seen in psorospermosis, and that the epithelial overgrowth is no more malignant than in that disease. Billroth considers these epithelial changes undoubtedly benignant. At a meeting of the Anatomical Society of Paris in 1891, Pilliet brought up the subject, "whether this cystic disease of Réclus with growths, called intra-acinous cystic epithelioma, could behave like a malignant epithelioma and have secondary growths elsewhere." He brought forward two cases, but from their descriptions they seem to prove nothing. Many typical examples of cystic disease strongly suggest the evolution of carcinoma as a sequel, which fact may guide us in our prognosis and treatment. Valude quotes a case where a chronic mastitis was succeeded by secondary cancerous growths two years later. The following case was in St. Thomas's Hospital: "A woman, aged thirty-six, was admitted under Sir William Mac Cormac in 1887. Her mother died of carcinoma of the bowel. Five years before she had pain in both breasts, and two years later a lump was noticed in the left. This was treated by ointments, but did not disappear. A little later some circumscribed nodules were noticed in the right breast, but a few months after there was slight blood-stained discharge from the nipple, and the glands in the right axilla became enlarged. The nodules in the right breast became confluent, to form a hard nodulated mass, over which the skin was free and the nipple not retracted. She had lost flesh." If there is a relation between the cystic disease and carcinoma, how should this guide us with regard to treatment? Should there be any hesitation as to the nature of the nodules, then aspiration should be performed to ascertain their character. If they are proved cystic, how should we act? As the disease occurs in women towards the climacteric, where the breast is functionally inactive, and recognising that cancerous changes are not impossible in such a diseased organ, extirpation of the gland may be advocated, particularly where the cysts are multiple. This may be done without mutilation by leaving the skin and nipple. If one cyst has markedly enlarged, and the rest of the breast seems very little affected, we may temporise and employ local treatment, as incision; should growth be present in the cyst, the cyst must be removed, with a very wide margin. In cases of a doubtful nature, the surgeon is justified in removing the gland.

We now consider the relations of carcinoma to those cases of chronic interstitial mastitis where the connective-tissue changes are marked and the cysts only small and pea-like. That the two are often in association is a well-known fact. In many carcinomatous growths we get evidence at the margin of chronic inflammatory change, and the latter is possibly a stage in the evolution of the carcinoma. Raymond Johnson and Beadles at the Pathological Society in April last read papers on these changes, and were inclined to think that carcinoma has a distinct relation to chronic interstitial mastitis. This view has its strenuous opponent, who urge that such a condition is only an accidental association of two pathological lesions, and that there is no causal relation between the two. However, the greater the number of examples, the stronger the evidence in its favour, and I must own that previous mastitis seems to have some very definite relation to the subsequent carcinoma. Two rare cases of scirrhus have come under my notice, which form strong links in the chain, where scirrhous nodules were disseminated in breasts, showing the most marked signs of chronic interstitial mastitis. If we allow, then, that this chronic inflammatory change has some relation to the subsequent neoplasm, what bearing has this on prognosis and treatment? We must remember that in giving a prognosis other factors, as age and hereditary tendency, have to be reckoned with. After observing many cases of chronic interstitial mastitis, we see that the majority often remain stationary. With this knowledge the most advanced surgeon could not press strongly the claims for a more frequent removal; but, at the same time, with this knowledge certainly we are more on our guard, and any marked development of pain or increasing thickening or skin adhesion may be signs warning us that the time for hesitation is past and action must be taken.

ARTERIAL HIGH TENSION.[1]

BY A. FOXWELL, M.A., M.D. CANTAB., F.R.C.P.,
PHYSICIAN TO THE QUEEN'S HOSPITAL, BIRMINGHAM.

ARTERIAL high tension may be divided into three kinds: cardiac, degenerative, and vaso-motor. Cardiac high tension is that variety which results from an abnormal contracting force in the left ventricle, either owing to some temporary disturbance—as excitement, exertion; or to some permanent cardiac defect, which prevents this force being used so economically as usual—as in aortic regurgitation. Degenerative high tension is that resulting from a degeneration of the arteries, which makes their walls thicker and more rigid; therefore it requires greater force to drive the normal amount of blood through them than would be the case with healthy vessels having normally expansile walls. Vaso-motor high tension is brought about by increase in the contracting force of the peripheral arterioles, which thus, as in the degenerative form, necessitates more propelling power to pass a given quantity of blood through them than would be required by normally contracting vessels. It is evident that there is one condition necessary for the production of any form of high tension: there must be extra contracting force put forth by the left ventricle. Now, excessive use of any portion of the body is to be avoided; more especially of such an organ as the heart, which knows no rest. In so far, therefore, high tension is always objectionable, and unless there are counter-balancing reasons of great moment, it should be our endeavour always to do away with it. Speaking generally, there *are* such reasons in the forms I have called cardiac and degenerative, but not in the vaso-motor variety. In aortic regurgitation, which we may take as the type of the cardiac form, some of the blood forced into the aorta flows back into the ventricle; if, then, say, three ounces be the amount the individual requires to be sent into his arterial system at each heart stroke, when regurgitation exists a larger amount—say, four ounces—will have to be similarly propelled to allow of the reflux into the ventricle of one ounce. Four ounces will distend the aorta more than three, and the more an elastic tube is distended the greater is the tension of its walls—that is, the tension in the aorta will be increased, and therefore there will be high tension throughout the arterial system. But as there is no excess of resistance this

[1] A paper read before the Birmingham and Midland Branch of the British Medical Association, March, 1892.

Digitized by Google

high tension will force the blood through the arteries at a greater rate, so that the increase in fulness of the arteries will be of shorter duration than normal—that is, the pulse wave will be short, and the period of emptiness between the waves will be long. This is why the aortic regurgitant pulse is called the pulse of unfilled arteries—a condition due to the force of the heart being greater than is required by the peripheral resistance. So that, apart from the regurgitation of blood, the aortic pulse would still be one of high tension of short duration, followed by an unusually long period of very low tension in the arteries, the reflux of blood merely intensifying this latter condition. The high tension which occurs with the increased cardiac action during muscular exertion is of the same nature; but here the period of low tension—that is, the collapse of the pulse—is not so marked, as there is no reflux of blood into the ventricle. In the healthy subject this form of high tension is very transient, as nature quickly provides a corrective by making the peripheral resistance subnormal and so allowing the same cardiac force to keep up a more rapid circulation. Similar to this is the high tension due to palpitation, but the condition is a more serious one, and its mode of ending uncertain. We are dealing with a pathological state, and not a physiological one, as in the high tension of exercise. It is unlikely that the peripheral system will accommodate itself to the new condition and diminish its resistance: very probably the same causes which induced the palpitation will also have increased the peripheral resistance. Hence the heart fails to empty itself during its shortened systole against the increased pressure, and dyspnœa, oppression, or even faintness follows.

It is given to but few mortals to die altogether—from a universal failure of function. Unfortunately for man, as a chain's strength is that of its weakest link, so is the strength of his life dependent upon his weakest function. Death comes to most men through the failure of one function. To some it happens, either through inheritance or the character of the life led, that the arterial system is the first to decay; arteries thicken with the rigidity of fibrous tissue or calcareous deposit and their gentle, ever-varying elasticity is a thing of the past. The heart has to force the blood through a system of comparatively unyielding tubes and we know that this requires greater exertion. Hence, with too quickly decaying arteries the blood tension must be increased if a normal circulation is to be maintained. Health in its true sense is out of the question; at best there is but a pathological equilibrium. One of the hardest things a physician can have to determine is what tension is requisite for this. If he allow it to remain too high, cerebral hæmorrhage stares him in the face; while if it remain too low, then symmetrical gangrene, benumbed extremities, and all the woes of vascular debility make wretched the life of the patient. The character of this degenerative tension differs greatly from that which is primarily due to cardiac action. It is no question of forcing a larger amount of blood through pleasantly accommodating tubes, but one of pressing the same amount through tubes which will not enlarge. This necessitates that the tension throughout the *whole* of the period occupied by the passage of blood must be increased. There will be no period of subnormal or even normal tension. Moreover, as the system is rigid, the increase of tension conveyed by the ventricle to the aorta will be felt almost simultaneously throughout the system; hence the onset of tension will be sudden, as in the high tension due to cardiac action.

In high tension due to increased contraction of the arterioles while their elasticity remains normal, we again find the need to force a normal amount of blood through abnormally small tubes. The tension wave will thus, as in the degenerative form, be a long one, persisting through the whole of the diastole; but, as the tubes are not rigid, its onset will not be sudden. This increased contraction of the arterioles arises from undue excitement of the vaso-motor centre owing to some morbid element in the blood circulating through the medulla. This morbid element may have a very transient existence, or may continuously act for several days, as is exemplified in the varying duration of megrim from a mere headache of an hour to an utterly prostrating bilious attack of a week. It may frequently recur throughout life, as in chronic renal disease, and so lead to the deposit of fibrous tissue in the arterial coat with its consequent thickening; but even in chronic renal disease it is never always present. The tension may be constantly high, it is true, but this will be owing to the vascular degeneration; and however high this mean tension may be, there will be exacerbations of it when impure blood excites unduly the vaso-motor centre, just as megrim causes exacerbation of the normal tension; and, unfortunately, there will be depressions of it below this mean whenever the heart flags and fails to be equal to its perennial increase of toil, as nearly always happens in the later stages of renal cirrhosis.

From what has been stated it is manifest that the treatment of high tension is not always one and the same. Sometimes it is to be left as it is, sometimes it should be encouraged, and, perhaps oftenest, it is to be diminished. I say perhaps oftenest, not because it is necessarily this form which exists most commonly, but because it is the one which most frequently produces symptoms, and therefore is the one for which our aid will be oftenest sought. That we should most carefully differentiate these varieties need not be insisted upon, for the treatment required for one patient may be of an exactly opposite character to that required for another. The three forms I have described may be separated from one another by examination of the pulse. The pulse of cardiac high tension is felt beneath the finger as a wave of great size, but very short duration. It comes suddenly, strikes forcibly, and vanishes as quickly, leaving apparently nothing behind it to mark its passage. The wave of the degenerative pulse comes almost as suddenly, but is much smaller, and is so loth to go that much seems still to remain, even up to the time when its successor takes its place. The wave of vaso-motor high tension feels smaller than either of the others, and, unlike them, comes laboriously and slow. Its duration is long, but it appears to have vanished, or nearly so, before its successor arrives. So long as only one of these forms exists and remains quite distinct its diagnosis is easy; but generally two, or even the three, are all acting as components in the resultant high tension. Then the apportioning its correct value to each component is often a most delicate and difficult task, but one which it is of great importance to accurately perform. I always set about it in this way. First, I attend only to the shock of the impulse: is it large, small; compressible, incompressible; sudden, or slow-coming? This will tell me the condition of the cardiac action. Next, I feel for the state of the pulse after this shock is over: does it remain full or nearly so, or empty slowly, or vanish quickly? Does the tube feel large or small, compressible or incompressible? and so I learn whether the peripheral resistance, the vaso-motor contraction, is great or slight. Finally, I shut off the cardiac impulse with the other hand, and still feel for the comparatively empty vessel. Can it be felt, and if so how plainly? Is it nearly as evident as before, rounded and firm, or are its walls soft and flaccid? If it stand out firmly, does it feel tough, like a round leather bootlace, or ribbed, like whipcord? Then, having made these three distinct observations, I compare them together, and estimate how far one should correct the conclusion drawn from another. For instance, if I find the vessel is degenerated, then the incompressibility and suddenness of the impulse will have their significance lessened; and its smallness, if such exist, need not mean that the ventricle is acting feebly. Again, should the impulse be slow in coming and small, a sluggish and feeble circulation is indicated if the tension be normal or subnormal; but should this be high, then this slowness of onset is owing to the extra fight the heart has to make against the tightly distended aorta, and the length of its duration will make up for its smallness.

What I have more to say will be told best in connexion with some illustrative cases, to the relation of which I will now address myself.

A widow aged fifty-seven, of apparently robust physique, came to my out-patient clinic at the Queen's Hospital last October complaining of a stiff neck, an indefinite but painful swelling below the left ear, cramps in the calves, sleep disturbed, flatulence, alternate shiverings and flushings. Her tongue was thinly coated with a white fur, but her bowels were regular. Her aortic second sound was much accented, the tension in her radial was high, and the impulse was forcible. All her symptoms were no doubt due to a gastro-intestinal catarrh probably resulting from a chill, which, interfering with assimilation, had allowed morbid elements to circulate in the blood, some of which had irritated the vaso-motor centre, and so produced high tension. Here was a simple, uncomplicated case

Digitized by Google

of vaso-motor high tension, and treatment must be directed to the removal of the morbidity in the blood which had induced this. We must be careful not to look upon the high tension itself as the evil; it is, as we know, a preservative measure, to protect the tissues from the impure blood. But we naturally conclude that if we lower the tension we shall have removed the impurities in the blood which raised it. It is true that the malassimilation of gastric catarrh may have produced impurities other than those which raise tension; but they all appeared together, and we act in the hope that the drug which is capable of removing some will be efficacious in eliminating all. Now mercury, especially as the subchloride, is the drug *par excellence* for correcting high tension due to digestive derangement. It does not do this by virtue of its aperient action, for it is a slow acting aperient, while a single dose will often do away with high tension within two hours. Moreover, a small amount—a quarter of a grain—may be quite sufficient to lower tension, though entirely inadequate to open the bowels. I therefore gave this woman an eighth of a grain of calomel twice a day. She came to me again in a week with all her symptoms gone, or nearly so; practically well. Her tongue was clean and moist and the tension in her radial decidedly less, her pulse being correspondingly shorter and more sudden.

Mr. ——, aged fifty, a well-to-do tradesman, came to me in February, 1887, complaining of sleeplessness, from which he had suffered for three years—ever since he had lost his partner in the business; also of dyspnœa on even slight exertion, of occasional giddiness and swooning, and of much diffidence and depression. His history was very good, except that he had had two very slight rheumatic attacks, lasting two or three days each, four years ago, and that from a child he was always nervous, the least unusual thing making him turn pale—i.e., his cardiac government was unstable. His heart I found increased in size, with a diffused pulsation in the fifth and sixth spaces near the sternum. The sounds were slapping in character and the second aortic was unduly accented. His arteries were thickened and his pulse was 80; irregular, sudden, and incompressible. Here the condition was a complicated one. He had degenerated vessels. These I could not alter. His tension was high, but whether too high, considering the difficulty there must be in passing a due amount of blood through his diseased vessels, I could not determine at a first visit. But there was one condition I knew wanted something done for it; his heart was falling. With high tension his pulse should have been slow, but it beat 80 times in the minute; moreover, it was irregular both in size and rhythm; his heart was increased in size, and this increase was probably due to dilatation, as the sounds were not those of hypertrophy, and there was a diffused impulse over the right ventricle. I therefore prescribed the following heart tonic three times a day:—one drachm of the infusion of digitalis, one grain of nitrite of sodium, five minims of liquor strychniæ, five grains of bicarbonate of soda, compound gentian infusion to one ounce. I added the nitrite of sodium to counteract the action of the digitalis in raising vaso-motor tension, as I was not certain that this might not already be too high. I also gave him a drachm of paraldehyde to take at night should sleep refuse to come to him. He came again in a fortnight feeling much better, with a franker, brighter expression. His pulse was 67, not incompressible, of fair size and regular, except that it had eight intermissions in the minute, which were represented by abortive heart beats. The heart sounds were no longer slapping, but the second aortic was still increased. During eleven of the fourteen nights he had slept six hours without the paraldehyde, and on the other three he had slept four hours with it. He was ordered to continue the same treatment with the exception of the digitalis, which I withdrew, thinking it might account for the intermissions. Fourteen days later I saw him once more. His expression was now quite frank and open. His face had filled out, and his complexion become ruddy. He felt quite equal to his work, and took pleasure in it. He had had six hours' sleep on twelve of the nights. His aortic second sound was no longer increased; the pulse was 80, with four intermissions; but the abortive heart-beats corresponding to these were stronger than formerly. I was rather surprised at this result; with his thickened arteries I should have expected his machinery to work best with a tension above normal, but it is evident that a normal tension was most suited to him. Still this normal tension could not have allowed him to have a normal circulation; this must have been an enfeebled one and, consequently, he could never be equal to the work his constitution might have performed if there had been no thickened vessels, nor to that work he might have done if his heart had been strong enough to cope with thickened vessels. What happened was this: he found his circulation was most active when his tension was normal; if it rose above normal his heart failed, and if it became subnormal the thickened vessels too greatly cut off the supply.

It is in such cases as these that the medical attendant who has experience of his patient has such an immense advantage over the chance consultant. If I see this man again, I shall bear in mind that he works most easily with a tension which is the normal tension of the healthy individual.

Mr. ——, aged thirty-six, consulted me in May of last year, complaining of a chronic cough, with thick mucoid expectoration and attacks of præcordial oppression and faintness. Three years ago he had congestion of the lungs and, a week before I saw him, spat up a teaspoonful of bright blood just after he had assisted in getting a boat over a weir. There was a little crepitation at the base of the right lung, but no sign of phthisis. His heart's apex beat in the sixth space and left nipple line; the area of dulness being otherwise normal. The impulse was excited, but the first sound was fairly long and firm. His radial was thickened. Whilst he was standing up for me to examine his chest he was seized with one of these attacks of oppression, his heart's action becoming slow and laboured. He was quite calm, refused any stimulant, but said he must lie down on the floor and then the attack would soon pass off. He did so, and I kept my fingers on his pulse and my stethoscope on his heart. I noted that as the symptoms passed away the heart beat more quickly and with less strenuousness, while the pulse became full and soft. He told me that though he occasionally got palpitation on exertion, yet by far its more frequent cause was digestion. And so it seemed; for I told him at once to go and do what business he had in the City and then return to me. In about an hour he came back. He had been bustling about, and walking quickly, yet his heart was acting much better than when he left me. This then was an instance where impure blood raised the peripheral resistance to such a degree that his somewhat feeble heart was unable to cope with it. This is a condition very common amongst sedentary folk and brain workers. Their vascular nerves become very sensitive, whilst their heart muscle is not of the strongest. As a result, reflex action is too easily excited and the heart is too easily upset by the shock thus created. Especially are those people liable whose vessels are unduly rigid and who therefore already give their heart excessive work to do; in such subjects a small increase in the vaso-motor contraction may produce a result as great as a far larger increase in a subject with normal vessels. But to return to my patient. My prescription was: 1st. To lead an even, quiet life, with as much fresh air as possible, but no severe exercise of any kind. 2nd. Rhubarb powder, bicarbonate of soda, ginger powder, two grains of each; to be taken daily before dinner. 3rd. A quarter of a grain of subchloride of mercury to be taken twice or thrice a day during the dyspeptic attacks. 4th. Powdered Carlsbad Sprudel salt, a drachm to be taken before breakfast in hot water when required, and a tumblerful of hot water to be taken regularly night and morning. 5th. Five grains of antipyrin every half hour for three doses during the attacks of palpitation. He lived some distance off, and I did not see him again, but he kindly wrote, in answer to my inquiry, that he had received considerable benefit from the treatment, except from the antipyrin, a second dose of which several times made him feel faint. This action of antipyrin is, I think, a thing to be mindful of. It is a drug we should very charily prescribe in high tension (megrim, for example), unless we are sure of the heart's stability. I believe that its depressing effect on the heart occurs sooner than its action on the vaso-motor centre. But in every case where we use antipyrin we must remember it merely removes an effect, it does not touch the cause. Its action in depressing the vaso-motor centre is stronger than that of the impure blood in stimulating this centre. Another drug, such as calomel or rhubarb, which will prevent the formation of the impurity, must be given as well.

The effect of high tension upon sleep is a very important one; it is also a complex one, acting in different ways.

Mr. ——, aged fifty-six, suffering from syphilitic

Digitized by Google

phthisis of long duration, was sent to me on account of persistent insomnia, from which he had suffered for nine months, ever since the death of his wife. He told me that his average amount of sleep was less rather than above two hours, that during the rest of the night his brain was incoherently, yet pertinaciously active, and he spent the dark hours in tossing restlessly to and fro. But in the day things were very different with him; he was ever languid and drowsy, often dropping to sleep in his chair, and incapable of applying himself to business. His heart's apex was ill felt in the nipple line and sixth space; its dulness reached up to the third cartilage, and the second aortic sound was strongly accented. His pulse was 64, and though it appeared of fair size this was no doubt owing in a great measure to the thickened vessel, as the tension was very high. The urine was uratic. The explanation was simple. His grief had depressed his vital powers, including his digestive functions; malassimilation and high tension resulted. During the day his feeble heart was unable sufficiently to cope with this; on account of gravity the brain was the first to suffer from the consequent anæmia; hence the drowsiness &c. by day. But at night things were quite different: the heart had no longer to pump blood up to the brain or bring it up from the dependent legs, nor had it to spend its strength in exercise and the processes of digestion; the impurity of the blood would also lessen every hour since the last ingestion of food; hence the tension would relax. The brain would now be on a level with the rest of the body and hence gravity would no longer injuriously affect it. For all these reasons its blood supply would be much greater than by day, and hence sleeplessness. He had taken in vain many soporifics, including opium, with no good result. He was already on a tonic regimen, so I merely prescribed a quarter of a grain of calomel to be taken three times a day in addition. In a week he came again. He had slept from eleven to four every night, and on two nights had dozed after four. His urine was clear, his pulse 68, and its tension very slightly above normal.

Sudden exposure to cold often seriously embarrasses the heart by the superficial high tension it causes. To come out of a warm house on a frosty morning and run to catch a train is more likely to produce palpitation and breathlessness than the same proceeding on a warm day in summer. A fruiterer's assistant, with a double aortic murmur and a dilated aorta, came to me at the Queen's Hospital complaining of anginous attacks, which he said often occurred on his leaving breakfast to come out into the cold of the open shop to serve a customer, or when he drove out in his cart, if the wind blew coldly against him at starting. I gave him strychnia to strengthen his much broken-down heart, hydrochloric acid and hop to improve his digestion and soothe his nerves, with glonoin to take when his attacks came on. These attacks he had been having two or three times daily, and each lasted over an hour. During the next three months he only had four; and at the end of this time, though it was midwinter, he found himself able to face the cold with impunity. The great relief he got from the glonoin when he used it during the attacks showed that they were due to the injurious effect of suddenly occurring high tension upon an enfeebled heart; but when this organ was strengthened by the tonic regimen it was able to cope satisfactorily with this.

High tension may produce general œdema if the heart be weak.

J. R——, thirty-three, was admitted into the Queen's Hospital, under my care, on March 19th, 1891, on account of orthopnœa and dropsy. He had double aortic disease; his heart was acting in a banging, troubled manner, though regular; its apex beat one inch without the left nipple line in the sixth space, and dulness reached up to the second cartilage, though it was not increased to the right. His pulse was 100, collapsing; there was considerable tension between the impulses. Urine a cloud of albumen, but urea 2 to 2·8 per cent. On the 19th, the day of admission, he was given the following mixture three times a day: three minims of the tincture of strophanthus, one drachm of the spirit of nitrous ether, to one ounce of camphor water. On the 21st, when I first saw him, a grain of sodium nitrite was added to this, and he was also given a third of a grain of calomel every two hours; and on the 23rd the calomel was reduced to three doses a day. The effect on the urine, dropsy, and heart was remarkable. The urine passed during the first twenty-four hours after admission was 16 oz; on the 21st—i.e., the day the calomel was first given—the amount was only 22 oz; but, on the succeeding days, 108, 118, 119, 97, 96, 64, 54 oz. respectively. On April 1st the œdema was quite gone, and also the dyspnœa. The pulse was much more collapsing, though less forcible, the tension between the impulses being subnormal, and the heart was acting with comparative quiet, and comfortably. I think this result is instructive, for we usually raise tension to get rid of œdema. I should have done so in this case had it not been already high, and I feared the dangers of a too excessive tension on the damaged heart. I thought the heart was working up to its limit, and that any increase in tension would only weaken it and still further depress the circulation.

Many people complain of breathlessness after meals. This is usually put down to mechanical causes, such as flatulence, or a full stomach pressing up the diaphragm. But often there is no flatulence, or evidence of overladen stomach; the subjects of it are not seldom most careful in their dietary. In several instances I have found it to be due to high tension, resulting, no doubt, from imperfect metabolism. Often, I expect, when flatulence *does* exist, high tension also plays an important part.

Grief kills; but so, they say, does sudden joy. Joy quickens and stimulates cardiac action. "My heart leaps up when I behold a rainbow in the sky," sang Wordsworth. But suppose there is no field on which this joyful heart can display itself; suppose the blood canals are blocked with high tension! What then? The bounding heart is unable to suffuse with joy the peripheries of the body; its glowing warmth recoils discomfited upon itself. It cannot leap up. A great nervous revulsion occurs, and death comes. This is how it is that to some a great joy brings a ruddy glow and a feeling of the fulness of life, but to others death-like pallor and a sense of dread oppression.

Birmingham.

ON THE ADVISABILITY OF ADOPTING THE TERM "TROPICAL MEASLES."[1]

BY JAMES CANTLIE, M.B. ABERD., F.R.C.S. ENG.

A DISEASE of an unclassed type was prevalent amongst the foreign residents of Hong Kong during the months of September and October, 1888. Practitioners baptised the mild cases as a form of "German measles," and the severe cases as a form of "dengue." It is my intention to show that we are dealing with a distinct disease—neither German measles nor dengue fever, a disease running a distinct and definite course and presenting varieties of severity usual in all epidemic forms of illness. It is a tradition, built no doubt on sufficient experience, that measles in the tropics is a very slight ailment, and mothers of families rather welcome the disease before they take their children to Europe to be exposed to the more serious form met with there. Up to date it has been usual to call most cases met with "German measles," but on talking with my fellow practitioners they invariably say it is "what is called German measles," or "we call it German measles." The uncertainty of ascribing a definite name to the disease is extremely unsatisfactory, and implies a confession of ignorance to the laity which, although no doubt scientifically honest, is practically useless. The past history shows also an uncertainty in the minds of many, mild cases of the disease being stamped as a variety of German measles, severe cases being assigned to the category of "dengue." No one seems to have been bold enough to ascribe a separate designation to the disease, although all are convinced that it is not typical in any one instance of either its name or ancestry. In the present epidemic the same doubt holds good, as out of the few practitioners in the colony some designate certain of the cases "dengue," others "German measles," and others "a variety of German measles," and the opinion of any one man varies according to the case in hand. My purpose is to show that we are dealing with a separate disease, possibly a separate genus, but certainly a distinct species. The upholders of the theory that the disease is a variety

[1] Read before the Medical Society of Hong Kong.

Digitized by Google

of German measles state that there are exceptional cases in which the disease assumes a more virulent type and exceeds the limit of feverishness met with in German measles. They uphold their belief by quoting instances of variety in measles as met with in Europe, and also in scarlet fever. All the variations quoted, however, of, say, scarlet fever, point to variations in which a community of symptoms holds good: stating how that in scarlet fever epidemics some escape with a slight sore-throat, a coryza, feverishness without a rash, and so on, just as in the disease in question some escape with mere febrile disturbance without a rash, and so on. To these it is answered that the quotations are variations of a recognised type of a more severe trouble, a stereotyped disease which during its prevalence has mild expositions; but the disease is named not from its mild varieties, but from its typical course, its signs and symptoms as met with in the form we know. In the same way there are in the disease in question, as in all diseases, however typical, varieties of severity; but it is the cases that run a typical course, not the mild varieties, that establish the character of the ailment. It is arguing in the wrong direction to take a few mild types as *the* disease, and to regard the majority, although pursuing a definite course, and those behaving in a consistent fashion, as a mere freak. There is no doubt that the account of the disease reads, to begin, very like German measles; but many ailments read alike to begin with. It will be seen that the history of tropical measles is quite peculiar after the third day, and it would be more in keeping with logical form to regard German measles as a variety of tropical measles than *vice versâ*. With no wish to dethrone German measles, it is but continuing in darkness to allow the present vagueness to remain tacked on to a disease which seems to belong to a perfectly distinct species. During the months of September and October, 1888, the disease had been talked about very freely, owing to the fact of so many adults suffering from the complaint; and we have been able to observe more closely the exact course of the disease because of the fact that adults chiefly, and not children only, have been attacked.

Definition.—Rubeola tropica is a specific eruptive fever, the primary rose-red rash appearing on the face and neck on the second day of the illness; the second rash, miliary and papular, on the body, face, and occasionally on the limbs, on the fourth day. The third rash—of small, coalescent wheals—appears on the arms and legs, or legs only, on the sixth day, when the fever subsides. The more severe form of the disease chiefly attacks adults. It is epidemic, contagious, but seldom associated with catarrh or desquamation, and characterised by the intensity of the pains in the back, head and orbit, on the third and fourth days of the illness.

Exposure.—The period of exposure, as is usual with all zymotic diseases, cannot be definitely ascertained. In the majority, however, a distinct history of infection by contagion can be made out. In no case have I ascertained that the disease is communicable by a third person.

Incubation.—The period of incubation is, in ascertained cases, under seven days. This statement is made from carefully inquiring into many cases, the most distinct being that of a man who came to the colony from Australia, and who, on the seventh day after his arrival, developed the disease. How long, of course, he had been in the colony before exposure I could not find out, but from my inquiries into other cases it would appear as if six days were the extent of the period of incubation. Therefore, I conclude he had been not more than twenty-hours in the colony before exposure. Six days I would affirm to be the period of incubation.

The period of incubation passes with a growing feeling of discomfort and lassitude, loss of appetite and sleeplessness, until towards the sixth day, when the patient, unable to understand his condition, seeks advice as regards his illness. When seen on the sixth day the patient is pale, with a muddy complexion, headache affecting a line drawn across from one temple to the other, along the junction of the vault with the forehead; backache extending from the loins up between the shoulders. Tongue lightly coated, no hypertrophy of papillæ, no coryza, although very occasionally sneezing has been recorded. Pulse accelerated to 90 or 100; temperature 99·4°, one degree above the normal. The impression left on the doctor is that the patient is "in for something," and that that something is not ordinary fever; by that I mean any of the climatic fevers we are accustomed to in this colony (the tropics).

Invasion.—The temperature rises on the evening of the sixth day of incubation, and after a restless night the patient when seen next morning—i.e., second day of invasion—presents the following symptoms: headache and backache severe, intense pains at the back of the orbits. The face is red, amounting almost to rosy redness, the redness extending downwards over the sides of the neck, until, becoming more diffuse, it assumes a mottled appearance. The skin of the body and limbs feels hot and dry, and is injected to the extent that the impression of the fingers can be seen for a few seconds after pressure. The tongue is dry, but normal in colour and coating; the slight fur of the previous day has disappeared. At times, however, in very severe forms of the complaint, the tongue remains coated with a fine thick fur for days. Average temperature 102·5°; highest observed 103·4°. Pulse excited, 100 to 110. The patient feels very ill even when the temperature is as low as 101°, altogether out of proportion to the feverishness. Vomiting is present in one-seventh, and diarrhœa in one-tenth, of the cases observed. Nothing is more marked at this stage of the disease than the extreme discomfort and pain present with even a slight increase in temperature as ascertained by the thermometer.

The rash.—The redness of the face and neck, with the mottling at the lower part of the neck, more especially in the neighbourhood of the collar bones, must be regarded as the first evidence of the rash; it is distinct and characteristic—without it the disease could not be pronounced; by it the diagnosis is conclusive. It is not, then, a question of the disease threatening, but the symptoms are sufficiently pronounced to definitely state that the patient has the disease already. During this, the first day of the illness, the patient is very drowsy, sleeps a good deal, and takes nourishment. The temperature varies but little during the first twenty-four hours, is not affected by quinine, but can be reduced a degree or so by fifteen-grain doses of antipyrin. On the second day of the illness an exanthematous mottling of the back is apparent. The patient is now more restless, less drowsy, complains of having passed a bad night, and of the pains in the forehead, eyes, and back being greater. Average temperature 102°; pulse 100 to 110. On the third day the patient's chest, abdomen, back, and sides are covered with a profuse compound rash; the exanthem seen on the back is apparent in all these regions, and in addition and obscuring the exanthem is a miliary and papular rash in great abundance. The forehead shows papules, the chin likewise; but the limbs, in one-third of the cases only, are involved, the lower limbs much less frequently than the upper. The patient's face is still red. Temperature morning and evening average 101·5°; pulse 100 to 110. The pain in the back becomes very great, at times agonising, the patient groaning and calling out wildly. Headache and orbital pain severe. Tongue remains clean. Bowels throughout the disease may remain natural, but diarrhœa is present during the second and third days if it appears at all. The fourth day is spent in complaints of pain in the back and head, and orbit, and may be as severe as on the previous day. Temperature averages, morning and evening, 100·8°. The patient's face is less red. The rash remains, but with less redness. Appetite completely gone; taste of everything perverted. On the morning of the fifth day the rash is found to have almost subsided: here and there an angry papule exists, or even a small boil may develop in places. Temperature 100·1° (average morning and evening). On the evening of the fifth day or the morning of the sixth, crops of small coalescent wheals appear, and itching involves the hands and forearms, legs, and feet. The redness of the face and the body rash have faded. Temperature 98·8° (average); pulse 80 to 90. The patient is now almost free of pain; only soreness complained of. The only disturbing symptoms are itching of hands and feet, want of appetite and taste, and great weakness. The patient feels "over it," and talks of his illness as a thing of the past.

Sequelæ.—1. For three days the patient can eat but little and is so weak that he feels disinclined to attempt to walk. Soreness is experienced in the back and sides, but the aching of the head and orbit is gone, although giddiness is complained of. A marked symptom in all is complete absence of taste; champagne, vinegar, tea, and bread being sent away with an expression of disgust. This cannot be

Digitized by Google

put down to the state of the tongue, as is usual, but to a specific disturbance of the glosso-pharyngeal nerve. 2. A further sequela is a subcutaneous hæmorrhage from the capillaries of the legs; in severe cases so constant is this that it might be classified as a fourth rash, appearing on the sixth or seventh day. The mottling continues for a week, when it gradually begins to fade. 3. A recrudescence of the rash is observed in about half the cases, the reappearance being marked after a bath for three or four days. When it appears, however, it goes off in an hour or so. 4. A peculiar elevation of temperature took place in seven—i.e., one-seventh of the cases observed. Once a week for three or four weeks an elevation of temperature, headache, and restlessness disturbed the patient for about twelve hours. Temperature rose no higher than 100° in any of the cases. 5. In a few cases boils of a most painful nature, in crops lasting for about fourteen days, followed immediately upon the subsidence of the fever. 6. Well-marked desquamation took place three weeks after convalescence in three cases.

Diagnosis.—Is this a rubeola at all? Should it be classed with the genus measles? If it is measles, is it to be placed in a separate group, or with ordinary measles, or with German measles? The only other existing disease for which it may be mistaken is dengue fever. In the few cases with foul tongues and diarrhœa the suspicion of typhoid fever crosses one's mind, but the illusion is speedily dispelled. As regards the diagnosis from dengue fever, there is no doubt the reason why this term crept in is on account of the great pain experienced on the third and fourth days. The pain as described was in many cases agonising, and it seemed as though dengue alone could be associated with such. We have many prominent differences: 1. That the pain in dengue lasts for a long time, weeks or months, whereas in the disease we are concerned with it is only a question of a couple of days. The pain subsides with the fever, and is therefore dependent on a vascular fulness of muscle. Dengue fever, again, is extremely infectious when it gets into a family or school; the exception is for anyone to escape the epidemic. The exception in the disease we are dealing with is for a second person in the household to catch it. In only three families have I known it infect more than two of the inmates, and in most cases one adult only was attacked. In many instances the mother was laid up, whilst the children escaped, even although they had never had measles of any sort. From these the major considerations, as it were, of the differences between dengue and the disease in hand, we may rid ourselves of the belief that it is dengue fever. 2. From ordinary measles: (*a*) Measles attacks almost invariably children, while this disease attacks adults; (*b*) coryza, bronchial, and pneumonic complications are frequent in measles; they are almost unknown, except, perhaps, a little sneezing, with slight catarrh of throat, in this affection. In one case feverishness, with an intense watering at the eyes continuing for forty-eight hours, with headache and backache, left no doubt that the patient had the disease. These symptoms are important as showing some alliance to measles. (*c*) The dates of the eruption do not correspond with the time of the appearance of the rash in measles. One cannot positively say that it is measles the patient has until the fourth day, when the redness shows itself in crescents. On the first day of invasion of this disease, however, the diagnosis is convincing: the redness of face, mottling of neck, pain in the back, temperature 102·5°, character of headache and orbital ache, are perfectly distinct. (*d*) The character of the rash—a mixture of exanthem, miliary spots, and papules—is totally unlike ordinary measles. (*e*) Deaths are common in children from measles: in tropical measles it is unknown. (*f*) Pain in measles is but slight: pain in marked cases of tropical measles in adults is agonising. (*g*) Measles seldom occur a second time, and still more rarely a third time. A fourth time I have never heard of; yet there is one case I know of in which measles had occurred three times, and yet this person caught the disease. Taken altogether, there can be no confusion between ordinary measles and this disease to the professional eye; and mothers of families whose children have had measles in England are well aware that this is a different disease. Without further details as regards the sequelæ of measles, I will dismiss measles as a distinct species (if not genus) of disease. 3. The third disease from which it is necessary to separate tropical measles is German measles—Rötheln. That in the minds of most of us a difference does exist is plain, from the doubt there exists as to the name to be given. "What we call German measles" is an admission that we are not sure of our ground that some differences exist, and the newly arrived practitioner to China is told that measles is a different disease here. So different has the present epidemic as attacking adults been that, as mentioned before, some of us have gone the length of calling it "dengue fever." Now the definition of rubella or German measles—Rötheln—will suffice to bring the differences prominently before us.

Rötheln is a specific eruptive fever, the rash appearing during the first day of the illness, beginning on the face in rose-red spots, extending next day to the body and limbs, subsiding with the fever on the third day, and not preceded by catarrh or followed by desquamation (see Quain's Dictionary). In the disease under consideration we have no "spots" on the first day; the body rash appears on the third day, not the second, and looks like a profuse prickly heat. The limbs are not attacked until the fifth or sixth day, and the rash is like a nettle rash. Catarrh is sometimes present with tropical measles, and desquamation sometimes follows. Tropical measles lasts twice as long as German measles; there is some resemblance in many of the minor symptoms, but in the majority dissimilarity.

Varieties.—1. The first case of a measly nature I saw was in the month of August, 1888, when a girl six years of age was in bed with a temperature of 105°. She had been perfectly well the day before. On the day following my first seeing her she was covered with a prickly-heat-looking rash, and the temperature was 99°. The rash looked exanthematous, but both miliary and papular spots were present in abundance. The following day—that is, the third day—the temperature was 98·4° and the rash well-nigh gone. This was entered in my case-book as an example of fever with a short-lived rash. I did not venture on a name for it. 2. In some seven cases patients have been in bed with the exact symptoms of tropical measles, but with nothing more than a redness of the face and skin to mark the eruption. In all these cases a catarrh of the throat was present to some extent. The reason for believing this to be the same disease *sine eruptione* was that tropical measles was in the house at that time, or immediately before or after. That they were ill six days, that the headache and backache were characteristic, and the low temperature without intermissions or remissions—102° to 102·5°—was sufficient to separate it from malarial fever. 3. A third variety, occurring in three cases, was that all the symptoms were complained of, but for the first five days there was only redness of the face. On the sixth day, however, the characteristic wheals—like nettle rash with much itching—appeared on the hands and feet, when the temperature immediately fell. As an indication of the possibility of exact diagnosis in this disease, I relate the following: Two sisters—twins, in fact—were in the same bed with fever. On first seeing them I diagnosed that one of them was to have tropical measles, but that the other had remittent fever. I was bold enough to make this statement to the mother. The patient with the remittent fever lost her remittent type, and it became in two days a well-marked quotidian ague. The other continued day after day with only a red face, backache, headache; temperature between 101° and 102·5°; and it was not until the sixth day that the characteristic rash appeared on the hands and feet, when the temperature immediately fell and she was out of danger. I mention this to show that I have a firm conviction that the disease can be diagnosed from the first day of the illness. 4. A variety of a measly disease occurred in myself. I felt dyspeptic and low, with general malaise, for a day or two; all at once the cloud lifted, and so convinced was I that something had happened that I stopped at a lamp post in the street, and found by the light of the lamp that my hands, wrists, and forearms were covered with a fine pink exanthematous rash. This, with a slight prickling, extended in twelve hours over face, body, and lower limbs, and disappeared. In children under seven the disease, measles, as we meet with it in Hong Kong, is a much milder disease, than we know it at home. That real measles and German measles do exist I have not the least doubt; but that we have a distinct disease travelling, it may be, with them and occurring in different individuals there seems little doubt. Just as chicken-pox is epidemic at the same time as small-pox, so may tropical measles coexist with rubeola or rubella. Chicken-pox, however, gives no protection from small-pox, nor *vice versâ*;

Digitized by Google

so neither rubeola nor rubella gives protection from rubeola tropica.

The prognosis of this disease is fortunately favourable. No death has been recorded, and not only so, but, beyond a weakness and discomfort for five or six days after getting out of bed, no sequelæ of importance ensue. Shortly, the disease might be put as six days' incubation, six days' invasion and rash, and six days' convalescence.

Pathology.—One thing that struck me in this epidemic was the mild beginning, the growing severity, and the gradual diminution in severity as the end of the epidemic was reached. The first few cases lasted a day or two, with, in some cases, a temperature of even 105°. As time wore on and fresh cases were attacked, the intensity of the disease grew to a crisis, and after that the subsequent cases were mild. At first there was irregularity in the symptoms, but as the disease advanced they settled down into a groove and followed a marked type. Towards the end of the epidemic the mildness of the type was more marked than its irregularity. I have no hesitation in saying that this disease is dependent on a ferment, from the nature of its spread and behaviour, as in a cholera epidemic the irregularity of the commencement is marked by diarrhœa, colic, enteritis, cramp, and spasms. As the disease advances, the severity of the epidemic is marked by fatal cases; but towards the end of the epidemic, the severity being spent, colics, spasms, cramps, and severe purging fade away into slight diarrhœa and loose bowels. So with calf vaccine, its intensity increases as it passes from arm to arm for a time, and then its power fades as its ferment gets played out. In this, then, tropical measles follows the example of many other diseases, and the term "ferment" may be safely applied to the means by which it is spread and developed.

Questions.—1. Is this disease of the nature of measles? 2. Is it confined to the tropics, or met with in the tropics generally? 3. Is it distinct from dengue fever? 4. Is it German measles? 5. Is it a variety of ordinary measles or of German measles? 6. Would rubeola tropica or rubella tropica be the better term?

The treatment is simple, the only special requirement being a hypodermic injection of morphia during the third and fourth days of the illness in adults. Antipyrin did not relieve the headache or markedly reduce the temperature.

CONGENITAL DISLOCATION OF BOTH THUMBS ASSOCIATED WITH SPINAL DEFORMITY.

BY W. L. WOOLLCOMBE, F.R.C.S. EDIN.

CONGENITAL DISLOCATIONS have been observed and described from the time of Hippocrates, but it is only in the present century that any great amount of attention has been bestowed upon them. Since the time of Dupuytren, however, there has been a large amount of energy expended on the subject, and the observations of that great surgeon have been followed up by Breschet, Sédillot, Pravaz, Guérin, Robert Smith, and a number of others. In spite, however, of the searching investigations of these surgeons, we are left in considerable doubt as to the etiology of congenital dislocations, as is evident by the number and surprising variety of causes assigned by various observers, from some original defect in the ovum up to traumatisms inflicted on the pregnant uterus, and intra-uterine convulsions. Another class of cases, too, has been included by some in their descriptions and statistics, thereby still further complicating the question. I allude to those cases in which the disarticulated bone and its socket are both healthy and fully developed, as are the surrounding muscular and ligamentous structures, and in which the displacement almost certainly took place during forcible delivery. These cases should of course be included in ordinary traumatic dislocations, although often the practitioner is not conscious of the injury inflicted. It is because of its bearing on the etiology of congenital dislocations, as well as the fact of the joints implicated not being amongst those usually described, that I have thought the following case worthy of publication. In describing cases of this deformity, almost all writers have taken as their type congenital dislocation of the hip, whilst a similar affection of the fingers is only alluded to in a very cursory fashion, and by some authors is said to occur only in monstrosities, where almost all resemblance to the human form is lost.

M——, aged forty-six, a married man with no family, a tailor by trade, came for advice on account of loss of power in the first, second, and third fingers of the right hand, so that he was quite unable to use his needle. This was only of two weeks' duration. He came of a healthy family, having eight brothers and sisters, four older and four younger than himself, all particularly healthy and well-developed individuals. He had never heard that there was anything unusual in regard to his birth, and believed that he was born at the full time. His thumbs, however, had always been in their present condition. On examination the fingers mentioned were found well developed and healthy, and the cutaneous sensation perfect. On attempting to use his needle, however, they became useless. He was suffering, in fact, from an affection analogous to "writer's cramp." The thumbs of both hands presented the following appearance. The first phalanges were displaced forwards as their proximal ends, which lay in front of the corresponding metacarpals, and formed a well-marked projection in the thenar eminence, while the head of the metacarpal formed a still larger prominence on the dorsal aspect. The phalanges of both thumbs were much wasted or under developed, those of the right hand more so than those of the left, and thus the left thumb measured from the base of the phalanx to the tip of the nail 2⅜ in., while the right only reached 1¾ in. The thenar eminence on both sides was quite wanting, making the deformity appear much more striking than it would otherwise have done. The spine presented the following condition: In the neighbourhood of the upper sacral and two lower lumbar vertebræ was a prominence, consisting of a heaped-up mass of bone, forming a well-marked projection and covered with a tuft of *long* and dark but not particularly fine hairs. Above this, involving the lower half of the dorsal region, was an equally well-marked depression, so that the inner border of my hand could be sunk deeply in between the long spinal muscles on each side, giving the impression that the spines and laminæ of this part were absent, although the hollow was so arched over by the muscles of each side that a thorough examination was very difficult. The lower extremities were fairly developed, and there was no deformity of the feet; in fact, the only other abnormality was a deep depression in the mastoid process of the left side, which he says has always been there, and is not the result of an abscess or blow.

This case certainly lends colour to the theory of an error in development, dependent on an original defect in the ovum. The question of treatment does not arise, owing to the man's age. With regard to the loss of power in other fingers, for which he presented himself, a cure was soon effected by massage and electricity.

Plymouth.

THE ABSENCE OF ORTHOPNŒA IN (FATAL) CARDIAC DILATATION, ESPECIALLY WHEN AFFECTING THE RIGHT SIDE.

BY HENRY HANDFORD, M.D. EDIN., M.R.C.P. LOND.,
PHYSICIAN TO THE GENERAL HOSPITAL, NOTTINGHAM.

THE absence of orthopnœa in many cases of severe and even fatal cardiac disease is an old observation, but its proper significance has not yet been established. It has been suggested by the late Dr. Hilton Fagge that the absence of orthopnœa is characteristic of right-sided affections. It is certain that in the most severe cases of anæmia, even where there is some œdema of the extremities and the dilatation of the right heart is most marked, all tendency to orthopnœa is absent, and the patient is able to lie quite flat, although respiration is persistently quickened, and on exertion dyspnœa is extreme. Dr. Wm. Russell has suggested that the upright position, besides enabling the diaphragm to contract to better advantage and the muscles of extraordinary respiration to be brought more fully into play, facilitates the passage of the blood from the left

Digitized by Google

auricle into the left ventricle by the action of gravity, and diminishes the freedom of regurgitation from the ventricle back into the left auricle. The right auricle is placed too much to the right for the force of gravity in the upright position to be of much advantage in furthering the onward flow of blood. However much or little truth there may be in this explanation, it does not seem sufficient alone to account for such an important difference. The fact of the occasional absence of orthopnœa in the most severe cardiac cases is undoubted. A completely satisfactory explanation is still wanting.

The following cases were seen in private, and consequently were not completed by a necropsy. The first two had in common also the absence of all trace of dropsy and of any material quickening of the heart's action. This again is no new observation, but we are not yet able to say what forms of heart disease will proceed to their fatal termination without dropsy and without materially quickened action. The increase in the speed of the pulse and of the heart beats can usually be taken as an accurate measure of the heart's weakness; but not always, even apart from "the slow pulse of fatty degeneration" and of chronic myocarditis. Simple dilatation to a slight degree is very common and is readily compensated for many years, producing few or no symptoms except on exertion. Sometimes it leads to regurgitation through one or other of the auriculo-ventricular openings, sometimes not; but there is almost always incomplete emptying of the ventricle during systole. Serious dilatation is produced suddenly more frequently than is generally supposed, especially when the heart has previously been damaged by over-exertion, acute disease, anæmia, debilitating habits, or chronic non-progressive valvular defect. The disorders of cardiac innervation have received much attention of recent years, and the field is ever widening; but the influence of mental distress[1] and worry in enfeebling the heart has been too much neglected since the rapid advances of experimental physiology have enabled the mechanical theories of cardiac pathology to hold the field so exclusively. We may hope that in the near future the discovery of cerebral centres for the viscera (and among them for the heart) will render clearer many problems which at present neither physics nor morbid anatomy elucidate.

Cardiac dilatation in its severer forms, and especially when the right side is affected, is extremely fatal, and the only chance of successful treatment depends on the recognition of the earliest symptoms. In acute dilatation of slight or moderate extent, affecting young people, the heart may probably be completely restored by suitable treatment if sufficiently prolonged; but it remains unduly susceptible to fresh dilatation, which, if once or twice repeated, is likely to remain permanent. In a considerable number of instances, however, where restoration is assumed, it is in reality compensatory hypertrophy which leads to the disappearance of symptoms, and the cavities remain enlarged; but with healthy tissues, and no repetition of the increased strain, the heart may continue for many years in a state of perfect compensation. Where the dilatation is considerable, it is very doubtful whether any material contraction of the cavities can be brought about by treatment.[2] Digitalis and strychnine, cautiously employed, with iron if the condition of the gastric and hepatic circulation permit, are the most promising direct medicinal remedies. Theoretically strophanthus, by not contracting the small arteries, and so raising the peripheral resistance, should be more successful than digitalis; but practically it is found to be inferior, though at times a useful alternative. In acute cases the main principle is absolute rest for a short period: not long enough to lead to degeneration of the cardiac muscle, but giving sufficient time for compensatory hypertrophy; and afterwards a total absence of violent exertion for a very prolonged period. It is difficult to draw any sharp distinction between a temporary distension of the cavities, which subsides in a few minutes or hours when the cause is removed, and is physiological; and a more prolonged (or permanent) dilatation which is pathological. In chronic cases the aim must be to diminish the work of the heart by reducing vascular tension, if necessary by aperients &c., and by the strict regulation of diet and exercise. In fact, failing compensation, in so far as it is due to increased resistance, which can be diminished, or to depressing influences (tobacco, mental distress, worry, &c.), which can be removed, is very amenable to treatment; but so far as it is caused by degeneration of the cardiac muscle it can only be slightly benefited by cardiac tonics and general improved hygiene. Alcohol, even in quite small quantities, seems generally to be prejudicial in these cases. Without sleep very little progress is made. Sulphonal, though almost entirely free from danger, is in such cases often useless. Chloral causes more depression and entails greater risk. It gives only short periods of rest followed by increasing weakness and prostration, and leaves the patient drowsy next day. The preparations of opium, besides giving sleep, increase the force and volume of the pulse, and produce a feeling of well-being which may last until the next night. The use of opium undoubtedly involves more risk than in the case of sulphonal or chloral. Smaller doses than usual should be given, especially when used hypodermically ($\frac{1}{15}$ to $\frac{1}{12}$ gr. or less), and the patient should not be allowed to sleep too long (i.e., more than four or five hours) without being roused. The mere presence of albumen does not absolutely contraindicate the use of opium so long as the vascular tension is good and the quantity of urine normal or above normal.

CASE 1. *Chronic dilatation without valvular lesion; rapid failure of compensation; death without orthopnœa, dropsy, or materially quickened action.*—A tall, well-built, athletic man, forty-seven years of age, formerly had done a good deal of mountaineering, but had not, so far as he knew, damaged his heart by that violent form of exercise. About twenty years ago, after a throat affection which was suspected to be diphtheritic, his pulse was noticed to be very slow, and attention was directed to his heart, but nothing wrong was discovered. His pulse remained slow (40–50 to the minute), but it is not known whether it was so before his throat affection. He was shortly afterwards examined for life assurance, and passed as a first-class life. He had never suffered from rheumatism or gout, was very abstemious, and lived a regular life. He was accustomed to take a good deal of exercise, hunting and shooting, and felt no undue fatigue after a walk of twenty miles. For several years he had much anxiety and worry, which told upon him a good deal. In May he began to feel out of sorts, lost his appetite, became sleepless, but was still able to take long walks without any immediate ill results. From about this time he began to suffer from a feeling of tightness in the chest and dyspnœa on exertion. There appeared to be no cause for this except a new source of mental distress. His regular medical attendant had hitherto no ground to suspect any cardiac affection. In July he consulted a leading London physician, who told him that his heart was dilated, that he had better go in the country, and take three weeks' complete rest. He told the patient's wife her husband's life would probably not be a long one, but gave no indication of immediate danger. The man grew rapidly worse, and became unable to walk more than a few steps without great dyspnœa and alarming prostration. I saw him in the middle of August, from which date he first kept his bed entirely. The apex beat was feeble and diffused in the fifth interspace, an inch outside the nipple, and the heart's action was very irregular. There was no murmur, but the first sound at the base was very weak. The liver was engorged and tender, and the jugulars full and pulsating. The radial pulse was beating 70 to the minute. The tension was exceedingly low; but the vessel was full between the beats, and felt to the finger more like a tense and distended vein than an artery, giving the impression of there being little onward propulsion of the blood. There was a slight cough; but the bases of the lungs were quite clear, and remained free from râles, certainly until within forty-eight hours of his death. The urine was scanty, high coloured, and free from albumen at first, though later a cloud appeared, but no casts could be found. For the first three weeks that he was confined to bed he improved considerably, had less distress, and to some extent regained his appetite. But after that, without discoverable reason, he rapidly failed, and died in a few days, at the end of September. During the whole of his illness there was not the slightest trace of dropsy. He was able to lie flat and sleep with only one pillow under his head. As regards treatment, digitalis soon reduced the speed of the heart to 40—50, raised the tension of the pulse, and produced temporary amelioration. Aperients, especially a pill containing half a grain of calomel, caused alarming prostration. In the earlier stages,

[2] Dr. Solis Cohen (Therapeutic Gazette, Feb. 16th, 1891), in an article on Simple Dilatation, points out that we cannot restore the heart to its normal size.

Digitized by Google

before he was confined to one floor, he experienced the benefit of the old but insufficiently known device of going upstairs *backwards*, by which means much less breathlessness and fatigue were caused.

CASE 2. *Acute cardiac dilatation supervening upon an old non-progressive lesion; death in fifteen days, without dropsy, orthopnœa, or quickened pulse.*—The patient was a railway inspector, aged about forty, who three years ago had been told that one of the valves of his heart leaked; but he never experienced any cardiac symptoms until fourteen days before his death. Nine months ago he had influenza, and recovered rather slowly, but, as he considered, completely, and no heart murmur was then detected. During the frequent fogs of the late winter he had been anxious and overworked, as well as much exposed to the severe weather. An attack of bronchitis laid him up, and I was asked to see him in consultation on the thirteenth day after he had taken to bed. I found him pale and anxious, with an extremely small thready pulse, beating regularly 84 to the minute. He had a troublesome cough and copious blood-stained sputum, evidently due to pulmonary apoplexy. He was able to lie perfectly flat in bed, with only one small pillow, and there was not the slightest trace of œdema or dropsy. His urine had been free from albumen until the last few days, when a slight cloud appeared. The jugulars were not only full and pulsating (systolic), but were tense to the finger, and showed evident positive pressure. There was a heaving expansile pulsation over the liver, and on applying the stethoscope to it a systolic murmur was audible. The heart's apex beat was weak and diffused, and could not be defined. There was a mitral murmur propagated into the axilla, a weak systolic and a loud diastolic aortic murmur, and at the lower part of the sternum a systolic murmur quite startling in its loudness and undoubtedly of tricuspid origin. He was evidently moribund, and died within twenty-four hours.

I may add incidentally that in both these cases alcoholic stimulants increased the distress. From the history it is probable that there was an old aortic lesion; but from the absence of symptoms, and the fact that no cardiac disease was noticed nine months before his death, it is evident that compensation was well established, and that his fatal illness was not due to progressive heart disease—one cavity dilating after another,—but rather to an acute dilatation, in which the right side was chiefly affected, caused by fatigue, worry, exposure, and finally by an attack of bronchitis affecting a heart already damaged, and occurring in a man of feeble recuperative power.

In the first case there was almost certainly no valvular lesion, and the slowness of the heart in early life without any previous heart affection renders it very unlikely that there was at that time either sclerosis of the coronary arteries or myocarditis. It is probable that the exertion of mountain climbing caused a dilatation which was compensated by hypertrophy, but never disappeared. Dilatation so caused affects, I believe, chiefly the right side of the heart. During exertion the skin becomes warm, the systemic arteries and capillaries dilate, and so the great increase of the peripheral resistance is lessened; but the blood is returned more and more rapidly to the right side of the heart, which becomes overloaded. The area of the small arteries and capillaries of the lungs is smaller than that of the systemic circulation, so that an equal degree of dilatation does not to the same extent relieve the pressure, and meet the needs of the increased rapidity of circulation. The pulmonary capillaries become engorged, and there is great breathlessness. The thin walled right ventricle is not so capable of bearing strain as the thick-walled left, and consequently it dilates, and during systole does not completely empty itself. Dr. Clifford Allbutt's description of his own experience of dilatation of the right heart while mountain climbing is very graphic. If the dilatation is oft repeated or becomes permanent the left ventricle shares in it more and more. The left ventricle, by increasing the pressure in the capillaries, can hasten the venous circulation and help the right heart. Hence post mortem considerable dilatation of the right heart without involvement of the left is scarcely ever found. A younger brother of the first patient has since damaged his heart in the same way by excessive mountaineering, and now has to lead a more careful life; and the family tendency to cardiac weakness is further shown by some deranged action of the heart in a daughter. The pulse in the first case was peculiar, and between the beats closely resembled to the touch the external jugular of the second case. The size of the radial was no doubt due to the athletic life the patient had led, the low tension to the feebleness of the left ventricle, and the fulness between the beats to peripheral resistance. This latter might be owing to a slight degree of renal sclerosis, of which, however, there was but little evidence, but more to the backward pressure in the venous circulation blocking the capillaries. This makes it all the more surprising that there should be no œdema, even in the extremities. It would appear as if dropsy depended quite as much upon the state of nutrition of the tissues as upon the central organ of the circulation.

The next two cases, very shortly narrated, further illustrate the absence of orthopnœa in fatal cardiac affections. In both there was probably fatty overloading, with some dilatation. I agree with Fraentzel, who is of opinion that "fatty heart" alone as an independent morbid entity cannot be diagnosed. Both the most extreme fatty overloading and fatty degeneration may be found post mortem when there have been no cardiac symptoms.

CASE 3. *Acute dilatation partly due to mental distress, probably fatty overloading; rapid death without orthopnœa or dropsy.*—In August, 1890, I was asked to see Mrs. G—— in consultation, on account of great breathlessness, of about a week's duration. She was very stout, aged forty-six, had had eleven children, and had come over from America only a month previously. She had suffered severely from seasickness on the voyage, but otherwise considered herself quite well. She was much disappointed in the object of her journey, and had become very depressed, often crying for hours together. Her appetite failed, she lost strength, but she had been for a drive two days before and had slept well the previous night. There was no cough, headache, sickness, or œdema, but the urine was scanty and contained a trace of albumen, though no casts. The pulse was small, regular, and 120 to the minute. She was so exceedingly stout that it was impossible to ascertain by percussion or palpation the existence of any enlargement of the heart. The heart sounds were loud, distinct, and free from murmur or other abnormality except an accentuated aortic second sound. The extremities felt cold. She had no pain anywhere, and had had no anginal attacks. There was no orthopnœa, but she lay flat, most comfortably on the right side. She could not sit up or lie long on the back without a great increase of the breathlessness, which was her chief complaint. Any exertion caused alarming symptoms. She remained much the same during the night, in spite of the use of stimulants, digitalis, and aperients. The following morning, about eight o'clock, she became cyanotic, and died at nine. The emotional state had led to a diagnosis of hysteria, and the breathlessness was supposed to be neurotic, but the alarming increase of the dyspnœa on the slightest exertion decided its cardiac origin.

CASE 4. *Rapid cardiac failure due to excitement (anger): absence of orthopnœa.*—In 1888 I was sent for to go some distance into the country to see in consultation an old gentleman aged seventy, rather stout, but hitherto in fair health and active. He had been a little out of sorts for a few days, but going about as usual until that morning. I saw him a little after midnight, and found him lying quite flat and on his right side. His pulse was "running," of low tension, and uncountable. The heart's sounds were very feeble, and not distinctly audible. The cause of this sudden collapse was very obscure until we learned that he had had a violent quarrel that morning. He was very much upset, became quite prostrate, and died next day. The cause of death was evidently the failure of a weakened heart from mental shock. Orthopnœa was quite absent. It would appear that the upright position gives relief chiefly in failing compensation in valvular disease and in the failing heart of renal disease; but that in dilatation, especially when the right side is affected, and in degenerations of the cardiac muscle, as in anæmia, after fevers, diphtheria, septic poisoning &c., the tendency to faintness produced by the upright position more than counterbalances any other advantages.

Nottingham.

NEW INFIRMARY AT TOXTETH.—Mr. James Pratt, senior member of the Toxteth board of guardians, will, on Monday next, lay the foundation stone of this new infirmary, which is to be erected as an adjunct of the Toxteth workhouse, Smithdown-road.

ASPIRATION IN PNEUMOTHORAX.

BY G. A. SUTHERLAND, M.B. EDIN., M.R.C.P. LOND.,
PHYSICIAN TO THE NORTH LONDON CONSUMPTION HOSPITAL.

AMONGST the many complications of phthisis none causes greater anxiety than pneumothorax, the mortality of which, according to Dr. Samuel West's statistics, is 66 per cent.[1] The line of treatment usually adopted is expectant, but that some more active interference may be carried out with advantage is illustrated in the following case.

H. V——, aged thirty-two years, was seen for the first time on Dec. 15th, 1890. He had been in India for several years, and had suffered from ague and dysentery. He had had rheumatism occasionally, and when a boy had brought on a "strain of the heart" by running races. There was a family history of phthisis. He stated that he had had sickness and vomiting after dinner for a few days, accompanied by the old malarial symptoms. On the previous night he had coughed up blood seven or eight times. There had been no sweating or loss of flesh. He was poorly nourished, and looked very much pulled down. The chest was well formed, and no evidence of disease of the lungs was detected on physical examination. As regards the other organs, the only point noted was a reduplicated second sound at the base of the heart. There was a slight attack of hæmoptysis next day, and the temperature in the evening was about 101° for a week, after which all symptoms disappeared, and he resumed his work in the following month. Two months later there was a recurrence of the hæmoptysis, with cough and profuse mucoid expectoration, which was found to contain tubercle bacilli. The only sign of pulmonary disease detected was slight crepitation near the root of the left lung posteriorly. He was sent to Ventnor in March, preparatory to leaving England for the Cape at the end of the summer. In May, 1891, he returned to town very much worse. He had lost flesh and was troubled with violent cough, followed by sickness and great depression. There was slight pyrexia in the afternoon and sweating at night. The left lung showed dulness at the apex anteriorly, and over the upper third posteriorly, with blowing breathing and crepitation, and friction sounds were heard over the left scapula. No evidence of disease was detected in the right lung. On June 22nd, after severe and prolonged coughing, he was seized with acute pain in the lower part of the left chest, passing from the front to the back, and accompanied by headache, sickness, sweating, and great prostration. The temperature was 104°, pulse 120, and respiration 32. The decubitus was right sided. The cardiac sounds were inaudible to the left of the sternum, but louder than normal to the right of it. Expansion was very slight on the left side of the chest, and vocal fremitus was entirely absent. The percussion note over the front of the left lung, from the clavicle downwards, and including the cardiac area, was hyper-resonant, and this condition existed also in the axilla, and posteriorly from the middle of the scapula to the base. Over this area the breath sounds were almost inaudible, and the vocal resonance was very much diminished. The breath sounds were more audible along the left side of the spine. The expectoration was mucopurulent, blood stained, and contained many tubercle bacilli. The treatment adopted was nourishing fluid diet, alcohol, and morphia in full doses, both hypodermically and by the mouth, which soon checked the troublesome cough and retching, and the severe chest pain which these caused. He had occasional attacks of dyspnœa with cyanosis. The decubitus became left-sided, any other position causing him acute pain. The strength was well maintained until the third day, when the temperature again rose to 104°, and there seemed to be an increase of pressure in the chest, followed by progressive weakness. On the eighth day of the attack he became much weaker, and at midnight his condition was critical. There was muttering delirium, the respiration was 36 per minute and very laboured, and the pulse was so weak and irregular that it could not be counted. There was a uniform distension of the left side of the chest, with complete absence of expansion, and vocal fremitus. The area of hyper-resonance extended one inch and a half to the right of the sternum, and the cardiac apex was felt one inch internal to the right nipple. The breathing over the hyper-resonant area was distant amphoric, with occasional tinkling râles, and the "coin sound" was well marked. The heart sounds were faintly audible to the left of the sternum. It was resolved to puncture the chest for relief of pressure. The needle of an aspirator was inserted into the left pleura in the axillary region, but no air passed out. The aspirator was then attached, and the air in the receiving bottle was partially exhausted. On opening the connexion, air was at once heard to pass into the bottle, and by means of slow and interrupted aspiration a considerable quantity of air was removed from the pleural cavity. The process occupied about an hour, and the patient's condition was manifestly improved. The respiration fell to 24, and the pulse to 108, becoming at the same time fuller and stronger, while the heart sounds could be heard much more distinctly to the left of the sternum. On the following evening there was a recurrence of the cardiac weakness, and an area of dulness at the base of the left lung posteriorly was noted. Aspiration was again performed. At first air only was withdrawn, then air mixed with fluid, and finally nine ounces of clear fluid were evacuated. A friend who was present noted the change in the position of the cardiac apex during the process, and found that it moved three-quarters of an inch to the left, while the pulse again showed marked improvement. There was no cough on either occasion. A few days later expansion became evident on the left side, with sinking in of the intercostal spaces during inspiration, and the breath sounds became louder, blowing in character, and in parts amphoric, with tinkling accompaniments. At the end of a month, progress being delayed by a slow formation of fluid in the left pleura, with displacement of the heart to the right, the chest was again aspirated and thirty-four ounces of clear fluid were withdrawn. He then improved rapidly, and in September he was found to have gained eleven pounds and a half in weight, and could walk four miles without fatigue. There remained impaired resonance over the left side of the chest, but the expansion was fairly good, and the breath sounds, although weak, were audible all over. He sailed for the Cape on Oct. 8th, 1891, and has continued in good health.

Treatment by aspiration is not advised by the leading authorities in cases of pneumothorax. Dr. Douglas Powell[2] speaks of the timely introduction of a fine trocar, when there are signs of increasing pressure within the chest, but says nothing about aspirating the pleura for air. Dr. Wilson Fox[3] refers to the treatment by a simple trocar, but says that "aspiration is best avoided; it brings with it the danger of renewing the fistulous opening, and this effect has actually been observed in a secondary effusion following pneumothorax." Dr. Hilton Fagge[4] says an aspirator should never be used, on account of the danger of reopening the original aperture. It is evident that the use of a trocar will only be of service when the pressure of air in the pleura is greater than that of the atmosphere, which, according to Dr. Hilton Fagge, is by no means generally the case. On the other hand, Dr. Douglas Powell has shown that lateral displacement of the heart occurs in pneumothorax, owing to the normal elastic retraction of the sound lung, which drags over the mediastinum, even when the pressure of air is not greater than that of the atmosphere. If, then, the use of a simple trocar be accepted as the final treatment in the cardiac asthenia of pneumothorax, we cannot expect very great relief in cases in which the intra-thoracic pressure is not greater than that of the atmosphere. The dangers of slow aspiration in suitable cases have, perhaps, been exaggerated, and the above case shows that the benefit may be very marked. In considering the question of aspiration one point must not be lost sight of—namely, that an attack of pneumothorax, by giving rest to the affected lung, may be a most effective therapeutic agent in phthisis. This patient's phthisical condition at the onset of pneumothorax was very serious, and was rapidly getting worse, while two months later no evidence of active phthisical mischief could be detected, nor has any since appeared. It is probable that the compression of the lung, at first by air and later by fluid, had brought this about, and that a repetition of the aspiration, except when urgently called for, might

have prevented this good result. In the management of the above case I had the benefit of several consultations with Dr. Cheadle, to whom my best thanks are due for much valuable assistance and advice.

[NOTE.—Writing on May 2nd, patient states that a large amount of fluid was withdrawn from the left pleura in January, that no signs of phthisis are present, and that he is well and strong.]

Carlton-hill, N.W.

A CASE OF CERVICAL DISLOCATION.

BY DONALD MACPHAIL, M.D. GLAS.

THE following case is worth recording from the severity of the effect produced by a trivial cause.

Late on a Saturday night in April I was hurriedly called to see a man "in a fit" at a barber's shop in the village here. When I arrived at the place I found, extended on the floor, the dead body of a man whom I had known by sight for the last ten years. He was a collier, a strong healthy man, aged forty-three, about 5 ft. 9 in. in height, and weighed probably between 11½ and 12 st. He had always been a heavy drinker, but had otherwise been healthy. Those present told me that he had been lying on the floor for some time, supposed to be in a drunken sleep. It was evident that he had been dead for some time. The face was pale, with some faint, livid blotches, and there was a slight bruise on the left temple, the eyes were closed, and the pupils normal in size; the lips were blue, but the mouth was closed, and there was no froth about it; the tongue was not protruded or between the teeth; the moustache was saturated with colourless fluid, which had apparently flowed from the nostrils. There was no evidence of the man having vomited. My first thought was that he had been suffocated, and I tried to examine his throat. I found it very difficult to get my finger down between the back of the tongue and the back of the pharynx, and impossible to reach the glottis. There was no foreign matter to be felt. This state of affairs was very puzzling for a moment, but on turning the body on its face and palpating the back of the neck it was at once evident that there was displacement of the fourth cervical vertebra forwards to a very considerable extent. The body was at once removed, and attempt made to get a clear history of the accident. That was difficult to do in the midst of an excited crowd, some of whom were inclined to raise the question of foul play. I obtained an outline of the history at the time, however; and the police, by visiting a considerable number of persons during the night, were able to get details, all the different witnesses giving almost exactly the same story. The man had come into the shop very drunk, but able to talk, and had been shaved. He then made for the door, but some acquaintance waiting in the shop advised him to stay there, lest he might be apprehended as "drunk and incapable," for it was evident to them that he was getting more and more drunk every minute. He was led to "the waiters' bench," a long form, about fifteen inches high and nine inches wide, which was set close against a wall, and sat there for a short time till he fell off. He was helped up, apparently none the worse for that fall, and set upon the bench again with his legs stretched out straight in front of him, and his head hanging limply on his breast. In a few minutes he slipped forwards, without making any effort to save himself, and came down heavily in a sitting posture on the floor, his head being jerked back violently by the fall. He sat for a moment and then rolled over on his left side on the floor, "drawing his legs and arms up like one suffering from cramp" as he did so. He was allowed to lie, as those present thought there was no use setting him up so often, and he lay there for nearly two hours, till someone, coming in at the door and stumbling over his feet, drew attention to his stillness and pallor. I saw him a few minutes after that. No one had seen him move after the second fall. He had not vomited, and no one had noticed whether he was breathing or not while he lay on the floor. Next evening, with the aid of my assistant, Dr. James Muir, I made a post-mortem examination, which was a very imperfect one, for it had to be done in a small room, by dim lamplight, and in the presence of the dead man's brother. We made a longitudinal incision along the spine, and dissected away the soft parts on both sides. We found the fourth cervical vertebra displaced so far forwards as to allow my finger to freely enter the spinal canal in the fifth vertebra, the spinous process of the fourth resting upon the upper surface of the body of the fifth. The cord seemed to be completely divided. We felt the bones all round, but could find no evidence of fracture or of disease in the spines, transverse processes, or bodies of the vertebræ. No external marks of violence could be found on careful examination, except the slight bruise on the left temple and a doubtful one on the left side of the nose.

Whether this man died directly from the injury or from suffocation as he lay is would be difficult to say positively. It is well known that dislocation of the spine at this level is not necessarily immediately fatal, but the completeness of the displacement and of the rupture of the spinal cord may have caused death by shock. The "spasm" in which he rolled over on the floor suggests that he died at that time. I once saw an infant die instantaneously from an injury to the medulla oblongata or cervical cord, and it died with just such a spasm of the flexor muscles of the limbs. At all events, the appearance of this man's body did not suggest rapid suffocation as the cause of death. This case of fatal injury from a slight cause was made the more impressive to us from our having to examine next day a woman who had tried to commit suicide by jumping from a railway bridge, over 30 ft. high, on to the rails, but had fortunately sustained only a slight scalp wound and a thorough shaking.

Whifflet, Lanarkshire.

SEAMEN'S HOSPITAL, GREENWICH.

ANEURYSM OF COMMON CAROTID ARTERY; LIGATURE OF ARTERY; RECOVERY.—EPITHELIOMA OF LIP AND OF PENIS IN A MAN AGED TWENTY-FOUR.

(Under the care of Mr. G. R. TURNER.)

THIS was a very large carotid aneurysm, probably from its rapid growth traumatic in origin; and although on the right side of the neck, the internal jugular vein lay slightly to the inner side and in front of the carotid artery at the point where the ligature was applied to the vessel. It is difficult to see how this anatomical abnormality could have been caused by the aneurysm, as the sac had by its inward pressure caused considerable displacement of the larynx. For more than three weeks after the operation the size of the aneurysm remained nearly the same. This inactivity was then followed by a most rapid shrinkage and hardening of the sac, and consequent return of the larynx to the middle line; so that six weeks after the operation the man's neck was quite normal in appearance. Mr. Turner intended to have used a kangaroo tendon ligature, but not being able to get one exactly suited he substituted a stout catgut one. For the notes of the cases we are indebted to Mr. Jervis.

CASE 1.—B. B——, aged twenty-nine (?), boatswain, a native of Manilla, was admitted to hospital on Dec. 11th, 1891. The history of the case is imperfect and the details doubtful, as no competent interpreter could be found. Previous history: There was a doubtful history of syphilis but no signs could be found. For about two months the man had had a rather rapidly growing swelling in the right side of the neck, which had lately caused cough, some difficulty in breathing, and very severe shooting pains over the right side of the head and face. An officer of the ship who brought the man up remarked, "The abscess is ready to be cut, as we have kept poultices on it for a week."

On admission a tumour about the size of a clenched fist was found occupying the right side of the neck. It

Digitized by Google

extended upwards to the angle of the jaw, and pushed the larynx about three-quarters of an inch to the left side of the middle line of the neck. Downwards it reached to within an inch and a half of the clavicle. Its maximum breadth was opposite the thyroid cartilage. The tumour was fluctuating externally but rather hard internally. There was well marked expansile pulsation and thrill, with a loud and harsh systolic bruit. Voice hoarse and cough brassy. He evidently had very considerable pain in the head. The pulse in the right temporal and facial arteries was distinctly smaller than on the left side. The tongue was protruded with its tip to the right. The pupils were equal, and reacted well to light. The laryngoscope showed redness and thickening of the right vocal cord, but movement was only slightly impaired. The heart sounds were normal.

On Dec. 12th Mr. Turner made an incision in the usual direction but reaching right down to the sterno-clavicular joint. The fasciæ were divided and the omohyoid was seen at the extreme upper angle of the incision. The internal jugular vein presented, lying directly in front and to the inner side of the common carotid artery, which lay very deep. The needle was passed from within outwards and the vessel tied with a No. 6 catgut ligature. The wound was dressed antiseptically and was completely healed on Dec. 15th, no rise of temperature or discomfort occurring. Pulsation and bruit in the tumour ceased at once, as did the pulse in the right temporal and facial arteries. The retina (right side) was examined as the artery was being tied, but no alteration in the vessels was perceived. The pain in the head and the face was at once relieved and did not return. No cerebral symptoms ensued or lung complications. The tumour became slightly harder and but very little smaller till about between Jan. 4th and the 9th, when, without obvious cause, most rapid and perceptible shrinking and hardening began, until, on Jan. 31st, there was only slight hardness to be felt and no swelling to be seen. The larynx had returned to the middle line of the neck, and the cough, dyspnœa, and pain had all disappeared.

CASE 2. *Epithelioma of the lip and of the penis.*—C. F——, aged twenty-four, a French sailor, was admitted to hospital on Sept. 22nd, 1890. Parents living and healthy, also all his brothers and sisters. No history of malignant disease in the family. He was suffering from harelip and a warty growth on his lower lip, which had first appeared in April, 1890, and had been gradually getting larger. He had been accustomed to smoke clay pipes. The harelip was operated on and the epithelioma of the lip removed on Oct. 1st. Mr. Ritson, who has kindly furnished these notes, made a microscopical examination of the growth, and reported it to be distinctly epitheliomatous in character. It was now discovered that he had a similar growth on the penis, the existence of which he had hitherto concealed, and of which he gave the following history. He had first noticed in July, 1889, a small pimple about the centre of the sheath of the penis, which soon became ulcerated. He was in a hospital at Calcutta from October, 1889, to January, 1890, and was there treated by various caustics but without marked effect on the growth. In the following May (1890) he entered a New York hospital, where the growth was at once pronounced to be cancer, and removal of the penis recommended. He had refused to have the operation performed. There was no history of chancre or secondary syphilis. The sore on the penis was large and ragged, with hard, somewhat everted edges, chiefly on the dorsum and nearly surrounding the whole penis, commencing about half an inch from the end and extending to about the same distance from the root. There was no marked enlargement of the inguinal glands. He was treated by local calomel fumigation and general antisyphilitic treatment, but without deriving any benefit. Although he would not give his consent to amputation of the penis, he was willing to have the growth itself removed. This was done on Oct. 28th, and involved the removal of a considerable part of the penile coverings. The corpus spongiosum and corpora cavernosa were luckily not invaded. The operation wound healed rapidly, with healthy granulation. The man left the hospital apparently well on Dec. 31st, 1890. He was told to report himself at once on any recurrence either on the lip or penis, but has not been seen since his discharge.

Remarks by Mr. TURNER.—It is rare, I think, to find epithelioma in two places so remote from each other as the lip and penis, in a man, too, as young as twenty-four. Both clinically and microscopically there could be no doubt as to the nature of the growths. The negative result, too, of syphilitic treatment further corroborated the diagnosis.

DEVON AND EXETER HOSPITAL.

A RAPIDLY FATAL CASE OF ULCERATIVE ENDOCARDITIS.

(Under the care of Mr. ARTHUR GOULSTON and Dr. ARTHUR G. BLOMFIELD.)

THE case of ulcerative endocarditis related by Mr. Goulston and Dr. Blomfield is a further useful contribution to the already abundant literature of this obscure and fatal affection. The symptoms of which the patient complained were severe and general, the cardiac phenomena, as is often the case, being subordinate to those of systemic infection. The hyperpyrexia, combined with the characters of the urine, were suggestive of a septicæmic process, which was confirmed next day by the appearance of a universal dusky rash. The presence of an apical cardiac bruit, together with a past rheumatic history, served to indicate its possible origin. The rapid onset of hemiplegia was no doubt due to lodgment in the cerebral vessels of portions of the disintegrating necrotic vegetations. It was no doubt difficult to distinguish the case at first from rheumatic hyperpyrexia, but the limited necropsy quite bears out the diagnosis of ulcerative endocarditis. As has been observed in some instances previously, the acute process in the heart involved the auricular endocardium rather than the mitral valve-cusps themselves, the auricle exhibiting three ulcerating surfaces covered with typical exuberant necrotic granulations. The exciting cause of the acute and fatal attack remains obscure. Dr. Coupland[1] has published an interesting series of these cases, in which he drew attention to the irregular and pyæmic type of the pyrexia, which in one instance was so strikingly periodic as to nearly simulate intermittent fever. In 1885 Dr. Osler of Philadelphia delivered his classical Gulstonian Lectures on this subject; he collected a large mass of facts and divided the various classes of cases into clinical groups. As to terminology, there has been, and is still, great difference of opinion. Dr. Coupland, in the communication before referred to, uses and defends the term "malignant" as applied by Virchow to the graver form, and he shows that a case of ulcerative endocarditis must have another element superadded to it to produce the peculiar malignant clinical type. Dr. Sansom, in discussing this subject later,[2] preferred to apply to those aberrant forms which presented grave clinical symptoms the term "severe" endocarditis; while Dr. Stephen Mackenzie, on the same occasion, thought the term "essential endocarditis," while taking no cognisance of its etiology or pathology, would meet the clinical requirements of the case. In Dr. Sansom's paper will be found, not only a *résumé* of the bacteriology of the subject, but also some very valuable considerations as to treatment. He advocated strongly the plan of administering the sulpho-carbolate of sodium, or other suitable antiseptic, in sufficient doses in these cases, and Dr. Mackenzie also thought he was able to report a favourable result after the administration of benzoate of sodium. Cerebral embolism often occurs in these cases, contributing to the rapidity of a fatal result. An interesting case in this connexion has been placed on record by Dr. Ormerod,[3] in which the hemiplegia was not absolutely sudden in its onset. This, as he there suggests, was probably because the obstruction from the embolus was incomplete, and secondary thrombosis was necessary to seal the vessel absolutely.

R. S——, aged twenty-one, single, has had rheumatic fever twice, the last attack being four years ago. It was quite a mild one, but since then she has never been able to go upstairs without attacks of breathlessness. For about a week before May 5th she had felt unwell, having to give up her work as a domestic servant, and on May 9th Mr. Goulston was sent for. At his visit he found her complaining of general malaise and weakness, with pain

Digitized by Google

down the middle of the back, and stiffness and pain on movement in the muscles at the back of the neck. Much headache, a furred tongue, constipation, scanty high-coloured urine, sp. gr. 1020, acid, with distinct trace of albumen. The skin was dry and burning; the temperature was 105° F.; the pulse 140, soft and compressible, and respiration 25. The liver was somewhat tender on pressure, but the spleen was not apparently enlarged. A loud systolic murmur was heard at the apex of the heart. The heart was enlarged, and there was also a thrill to be felt over the apex. On May 10th the face was flushed, and there were dark rings round the eyes, a general dusky erythema of the whole body, and severe pains in the back of the neck, and there was some delirium. Temperature 105°. The same evening she became worse, delirious, and very talkative. Temperature 104°; pulse 120; urine scanty. On May 11th the temperature rose to 105°; pulse 140; increasing delirium, and trying to get out of bed; sweating profusely. On this day Dr. Blomfield saw her with Mr. Goulston, and it was agreed that with the history of previous rheumatic attacks her condition was one of hyperpyrexia, and Mr. Goulston suggested ulcerative endocarditis. On the same day she was removed to the Devon and Exeter Hospital and treated without success by the wet pack; but she became worse, and at 10 P.M. had an attack of left hemiplegia with tonic spasm in the right arm and leg. From this condition she did not rally, but died the same night.

For the post-mortem notes we are indebted to Mr. Martyn and Mr. Andrew, house surgeon and assistant house surgeon, Exeter Hospital. Permission only was granted to examine the heart, which was enlarged. With the exception of the mitral valve, which was thickened by old endocarditis, the valves were healthy. Just inside the left auricle, and close to the mitral valve, were three soft ulcerating surfaces covered by prominent granulations. The body was decomposing rapidly, although death had only occurred twenty-four hours previously.

Remarks by Mr. COULSTON and Dr. BLOMFIELD.—We venture to report this case because the diagnosis of ulcerative endocarditis is by no means certain. The collective symptoms are often vague and liable to be mistaken for those of tuberculosis, typhoid fever, chronic pyæmia, ague; and, with the late epidemic of influenza fresh in our minds, possibly also with that disease. The patient had had two attacks of rheumatic fever before her fatal illness, and therefore in this case the ulcerative condition was secondary to chronic valvular disease; the why and wherefore remain a mystery.

Medical Societies.

OBSTETRICAL SOCIETY OF LONDON.

Ectopic Pregnancy.—Hysterectomy.—Growth of the Placenta after death of the Fœtus in Ectopic Gestation.

A MEETING was held at 20, Hanover-square on the 1st inst., Dr. J. Watt Black, President, in the chair.

Mr. LAWSON TAIT read a paper on a case of Ectopic Pregnancy in which the fœtus seems to have been developed to the full time in the peritoneal cavity, still retaining its amniotic covering. The patient, aged thirty-six, had two children, the last three years ago; no miscarriages. Her last period was in the middle of July, 1890; then she saw nothing till May 20th, 1891, and during that period has been getting larger, has had morning sickness, and milk appeared in the breasts in February, 1891. In September, 1890, she is said to have had "inflammation of the covering of the bowels," and was in bed a month. She first felt the child move about Christmas, and in January she fainted whilst dressing, and had to be carried to bed. She then had pains like labour. These gradually passed away, and at the end of a week she got up. All fœtal movement ceased suddenly on May 8th, and from then till October she noticed she got considerably smaller round the waist. On examination, the uterus was only slightly enlarged, but filling up the pelvis was a large globular, tender, boggy mass. On abdominal palpation a large movable mass was felt, in which distinct parts of the fœtus were detected. Abdominal section was performed on Oct. 12th; the umbilical cord ran down to the pelvis, and was inserted into the boggy mass felt there. The child was lying loose in the abdomen, except that all its upper surface had become adherent to the omentum and to the anterior parietal peritoneum. The child was enclosed in its membranes, but the liquor amnii had disappeared. The placenta peeled out of the pelvis easily, and was found to come from the right Fallopian tube. The patient made an uninterrupted recovery. From the history and specimen removed, Mr. Tait thought the patient became pregnant in July, and then in September, at about the tenth week of gestation, the tube ruptured, giving rise to what was called by her medical man "peritonitis"; the fœtus in the amnion was extruded entire through a rupture in the Fallopian tube, and the entirety of the placenta retained in the tube. The case proves that a living fœtus at ten weeks of age can resist the digestive powers of the peritoneal cavity if the amnion be unbroken. The case explains one of the varieties of so-called "abdominal pregnancies," and probably indicates the true solution of all the cases of this variety.—Dr. HORROCKS asked whether Mr. Tait advised operation as soon as the diagnosis of extra-uterine gestation was established, or whether he recommended waiting until the child was dead or until the full period of gestation had passed. His own experience was in favour of operating as soon as the diagnosis was made, whether the child was viable or not.—Dr. GRIFFITH inquired how Mr. Tait explained the direct adhesions of the omentum and abdominal wall to the fœtus itself, with the amnion sac remaining intact, and pointed out the great difficulty in defining the limits of the tubal wall from other constituents of the wall of the sac, even at so early a period as the fourth month. He did not think the evidence given that the placenta was entirely in the tube at all conclusive; it certainly was most improbable.

Mr. LAWSON TAIT also contributed notes of two cases of Hysterectomy. The first patient was fifty-two years of age, had ceased to menstruate two years ago, and during the two months before Mr. Tait saw her the tumour had grown more rapidly. It reached up to the sternum, and pseudo-fluctuation was distinctly present. When the abdomen was opened the tumour was seen to be a myoma, and fluctuation was so distinct that a trocar was plunged in and six pints of fluid removed. The tumour (which weighed about 5lb.) was clamped and removed. The patient made an uninterrupted recovery. The second case was that of a woman aged forty-two, who had had three children, all the labours being normal. When thirty-seven years old she began to lose profusely and then noticed a substance in the lower abdomen. A large multi-nodular myoma reaching above the umbilicus was found on admission, and the appendages were removed on May 13th, 1888. She reported herself on July 26th, 1890. Menstruation had not recurred, and she felt perfectly well. The tumour was found to have nearly disappeared. Later on metrorrhagia recurred, the uterus was explored for polypi, but none were found, and the endometrium was curetted, with temporary relief. The discharge came on again, and the tumour had again increased in size; so on Oct. 12th, 1891, hysterectomy was performed. The old multi-nodular myoma was hardly to be seen, but a large independent growth of a soft œdematous character had grown to the size of the original tumour. The patient made an uninterrupted recovery. The case was a unique example of a soft myoma springing up after a multi-nodular one had been removed, and Mr. Tait considered that whilst the latter variety of myoma is a disease of menstrual life, the former is not so.—Mr. ALBAN DORAN believed that the œdematous fibroid of women who had reached the menopause or passed that epoch was a special form of tumour. Œdematous fibroid in the sense of œdema of an ordinary fibroid from definite causes was quite another kind of disease. Thus a partly impacted tumour was sometimes removed by operation. A few hours after its removal it would be found shrunken to half its size; the impacted tumour had caused true œdema, which of necessity disappeared for mechanical reasons after the knife had passed through the tissues of the tumour. The "œdematous fibroid" of the menopause was often unaccompanied by any visible cause of œdema; its vessels might be seen passing between its surface and its capsule free from any sign of pressure without or plugging within, whilst its entire mass lay free from any severe pressure in the abdominal cavity above the pelvic brim. These tumours did not lose much by draining off their fluid after removal, though, like all soft tumours, they shrank when immersed in spirit.—Dr. DUNCAN asked

Digitized by Google

whether the fluid removed had been examined chemically, also whether the lining membrane of the cyst had been microscoped, as it was known that some of these œdematous fibroids owed their condition (as Virchow had shown) to dilated lymphatics.—Dr. HORROCKS said that in all probability the word "fibroid" included a group of different tumours. We already knew of differences in the clinical histories of these tumours, and no doubt there was a difference in their pathology. In his own experience he found the ordinary hard fibroid a non-malignant tumour, which but rarely caused death, and then only by accident as it were. These tumours might become œdematous, as Mr. Doran had observed, but the œdema was different from that of the so-called soft œdematous myoma.—Dr. HAYES could not accept the conclusion arrived at from the report of the second case. Precise details were wanting. Abdominal tumours had an odd habit sometimes of disappearing and reappearing under the ken even of competent observers. Mr. Tait's teaching for a long time back was clear—viz., removal of the uterine appendages in the case of the hard myoma was frequently followed by its shrinking or disappearing, but in the case of the soft fibroid the operation was valueless. He would now have us believe that not only will the hard myoma shrink, but the soft myoma will originate and grow after the removal of the uterine appendages. He (Dr. Hayes) thought Mr. Tait was mistaken in that the softer fibroid was present when the first operation was performed.—Dr. LEITH NAPIER remarked on the different degrees of hardness found in myomata. Doubtless imbibition of fluid and inflammatory changes in the capsule accounted for conditions differing widely from the degree of hardness generally met with; but if we regarded certain of these soft œdematous fibroids as examples of myxo-fibromata, and recognised that degenerative cystic changes in these might originate general softening in some cases, and in others cause larger cysts to form, it would be a nearer approach to what seemed the true pathology. It was extremely difficult to draw clear distinctions between a soft œdematous fibroma and a true myxo-fibroma. He mentioned a case in which abdominal section was performed in order to remove the uterine appendages, but when the abdomen was opened the central portion of the tumour was found soft and fluctuating, having undergone mucoid degeneration, so that hysterectomy was considered advisable.—Dr. GRIFFITH said there were three well-recognised conditions which may cause enlargement of fibroids after the climacteric—first, simple œdema; second, liquefaction of the constituent muscle cells and connective tissue leading to the formation of large and small irregular, cyst-like cavities, with ragged walls, and generally associated with calcification of other parts of the tumour; and third, the development of true cysts with a smooth glistening wall, but usually without an epithelium. There is a comparatively rare form of soft fibroids which grows much more rapidly than the usual kind, and which contains a large amount of what appears to be lymphoid tissue. All these forms he had exhibited at meetings of this Society, with microscopical sections.—Dr. LEWERS thought that some tumours were included under the name of "fibroid" that had an entirely different clinical history and pathology from the common variety. He had seen two cases in point, where there were large uterine tumours composed of a large number of small cysts separated by fibrous tissue. In neither was there menorrhagia, nor was the length of the uterine cavity increased, though in one of the cases the tumour reached up to the epigastrium. In this case the menopause had occurred a year previously; in the other the patient was a young woman about twenty.

A paper on the Growth of the Placenta after Death of the Fœtus in Ectopic Gestation was next contributed by Mr. LAWSON TAIT and Dr. C. MARTIN. A patient was sent to Mr. Tait with this history: She was twenty-eight years of age, and had had one child two years before. Two months before being seen by Mr. Tait, after having seen nothing for seven weeks, she was suddenly seized with acute pain in the left lower abdomen. Protracted syncope set in, and then the temperature went up, and for some days the abdomen became extremely tender. A fortnight later she was again seized with acute pain, followed by syncope, pyrexia, and general abdominal tenderness, which was most severe in the left iliac region. On examination the uterus was large, irregular, and somewhat fixed, and a firm, tender mass was to be felt to the left of it. There was no history of the passing of decidua, and the patient had no idea she was pregnant. When the abdomen was opened it was found to contain a quantity of old and recent blood-clot. The right appendages were adherent, but otherwise normal. The left Fallopian tube was the seat of an ectopic gestation, and when removed was the size of a large orange. There was a considerable rent in one side of the tube, and on splitting open the gestation sac there was seen to be a small cavity lined with amnion, and containing a very little liquor amnii. Sessile on this amniotic cavity, there being no umbilical cord, was a small fœtus less than an inch in length, much flattened, shrunken, and macerated. The greater part of the gestation mass was composed of placental tissue, infiltrated to a very slight extent with blood-clot. Microscopical sections by Dr. Martin proved that this mass was placenta, and not blood-clot. The authors thought the interesting point of the case was that the placenta had gone on growing after rupture of the tube and death of the fœtus, for it far exceeded in amount that which is normally present with a fœtus in so early a stage of development. The placenta was that of a four months' pregnancy, while the fœtus was only seven weeks old. They thought the case proved conclusively that the placenta, after the death of the fœtus, may in some cases go on growing and be a source of disaster to the patient; for had the pregnancy not been removed by operation, the patient would no doubt have been subject to a third attack of rupture and syncope, and possibly would have succumbed from internal hæmorrhage, and this in consequence not of the continued growth of the fœtus, but of the placenta.—Dr. GRIFFITH first inquired if Mr. Tait, in describing growth of the placenta, referred to the fœtal or maternal, or both portions. [Mr. Tait replied fœtal only.] Dr. Griffith then stated what a difficult task was attempted by those who held similar views—namely, to satisfy themselves at least that the fœtal placenta a part of the fœtus continued to grow after the fœtus itself was dead. It must be remembered that there is greater variety in size in extra-uterine even than in intra-uterine placentæ, and very large ones were well known in cases in which post-mortem growth was impossible. Again, we ought to have undoubted proof of intra-uterine post-mortem growth in cases where the chorion remains attached to the uterus for some weeks; but all the evidence on this point is certainly against the occurrence of any such growth. The cystic degeneration referred to as evidence cannot be accepted in the face of this fact; besides enlargement of villi due to such degeneration is not growth.—Dr. HORROCKS believed it possible for the chorionic villi or placenta to grow after the death of the fœtus. He thought it would be difficult to account for the relative smallness of the fœtus in certain cases of both intra- and extra-uterine gestation on any other hypothesis. When the fœtus was dead it could get no nutrition for itself, owing to the cessation of the circulation, but the chorionic villi were in a different position. They were embedded in maternal structures, and it was not very conceivable that they might derive nutrition from the vessels of these structures, but it was quite certain that they did so in the case of hydatidiform degeneration, where there was great increase in growth, the nutrition for which must come from the maternal vessels, inasmuch as the fœtus was in most cases dead from quite an early period of gestation. He mentioned a case in which he had operated where the fœtus had died so early as to be undiscoverable, and yet where the tumour had continued to increase in size apparently by growth of the chorionic villi.

The following specimens were shown:—

Dr. MALINS: (*a*) Ruptured Extra-uterine Gestation; (*b*) Hæmato-salpinx.

Dr. CULLINGWORTH: Unruptured Tubal Gestation.

Dr. WHEATON: Microscopical Sections of (1) Polypoid Growth from an Infant's Umbilicus; (2) Fibroid Tumour; (3) Endometrium of an Eight-month Fœtus.

Mr. J. R. RADCLIFFE: Uterus Bicornis.

EPIDEMIOLOGICAL SOCIETY.

MAY 18TH.

Dr. JOSEPH EWART, President, in the chair.

The Seasonal Prevalence of Enteric Fever in London.

A PAPER contributed by Dr. Louis Parkes, under the above title, was read by the Secretary in the absence of the writer. He began by saying that the reduction in the death-rate from enteric fever in London from 337 per

Digitized by Google

100,000 in the earlier to 150 or 160 in the later years of the period 1870 to 1890—i.e., since it had been officially distinguished from other forms of "fever" observed throughout the country—was doubtless due no less to better domestic sanitation, especially in the dwellings of the poor, than to the improved water-supply and sewerage, which had been for some years previously practically the same as since. But he would confine his observations to London, the enormous population of which minimised the disturbing effects of local outbreaks due to accidental causes, and where the largest aggregation of persons living under nearly identical conditions was to be found, his purpose being to inquire into the relations, if any, between the greater or less prevalence of the fever and the special meteorological conditions and rainfalls of the different years. More exact information would in the future be available through the notification of cases, but the death-rate of enteric fever showed so constant a curve that it was easy to determine the average number each week over a long series of years, and drawing a base line for the mean to represent the percentage of weekly excess or defect; while the duration of the disease and of the incubation period being known one could infer the season of greatest activity. The curve, as drawn by Buchan and Mitchell, showed a rise from its lowest point at the end of June, crossing the mean in August, suddenly rising in October to its maximum, falling slowly in November, rapidly in December, recrossing the mean line in January, and, with the exception of short rises in February and March, sinking continuously till the end of June; the highest point being 40 per cent. above, and the lowest 30 per cent. below, the mean. A temperature above 60° F. being as a rule necessary for the development of the highest degree of virulence in the enteric bacillus, whether in the soil or water, it was but natural to expect that, as Dr. Murchison had maintained, the hottest seasons would be the years of greatest, and the coldest of least, prevalence. Hot seasons were mostly dry, and wet ones cold, but heavy rains, the weather being warm, might pollute wells in rural districts or flush the sewers in towns, which would explain the discrepancies between the actual prevalence in London and the provinces and the temperature in certain years. Giving three weeks for the incubation and the same for the duration of fatal cases, its greatest activity would be in September. The highest temperature of the soil was indeed reached some three weeks earlier, but the interval represented the period of development and general diffusion of the bacilli, which retained their activity for some months after the temperature had begun to fall, the effect of cold being far less marked on enteric fever than on diarrhœa. He showed a series of tables in which the years were arranged in order of the temperature, the rainfall, and the prevalence of fever in the last twenty weeks of each; and another in which they were grouped as A, years conforming well to the rule which asserted a relation between the prevalence of enteric fever in the autumn and the temperature and rainfall of the preceding summer; B those conforming approximately to this rule; and C those not conforming thereto either (1) of low summer temperature, but much autumnal fever, and (2) of high temperature and little fever. Under A were included 1887, 1873, and 1888. Under B 1877, 1886, 1874, 1880, 1875, 1882, 1876, and 1885. C (1) included 1881, 1889, 1883, 1871, and 1879; and C (2) 1870, 1878, 1884, and 1872. The ascending curve crossed the mean line in July in three years—viz, 1870, 1884, and 1886, so that the autumnal excess of deaths was really greater than shown by the last twenty weeks only, and 1870 and 1884 were more conformable to the rule than they appeared to be; but the temperature of these summers was not exceptionally high. In eight years it crossed in August, in eight in September, and in one early in October. No positive conclusions could be drawn from a series in which the exceptions were nine and the examples of the rule eleven; but this was probably explained by the equability of our climate, the mean summer temperature of the hottest, 1887, having been only 5° F. above that of the coldest, 1879, and its maximum 8·6° above the mean of the maxima. Even 1881, with the enormous mortality of 74 per cent. above the mean of the twenty weeks, was a year of average temperature, and with a rainfall for that period of only one inch in excess. The differences in the rainfalls were much greater, but did not seem to exert any marked effect on the mortality. There were, therfore, he believed, other influences to be investigated, some favourable and others antagonistic, which in this country served to conceal the influence, however real, of temperature and rainfall on the seasonal prevalence of enteric fever.—Dr. LONGSTAFF, criticising the paper, said that Dr. Parkes had not taken the best means for arriving at a sound conclusion in assuming that all other conditions were alike throughout the period of twenty years, for the maximum mortality from nearly all fevers was in 1869, and there had been a general decline to a minimum within the last few years. Dividing the period in question into three—viz., the ten years 1869–1878, the six 1879–1884, and the seven 1885–1891,—the mean annual deaths in each were: from typhus fever, 293, 63, and 15; from scarlatina, 347, 117, and 50; and from enteric fever, 903, 898, and 602 per 100,000. During the first of these periods enteric fever was nearly stationary, while the others were declining as rapidly as in those that followed. The maxima were: for typhus fever, 716 in 1869; for scarlatina, 615 in the same year; and for enteric fever, 1069 in that and 1033 in 1878, or the last of the first decennium; while the minima were: for typhus fever, 8 in 1891; scarlatina, 35 in 1888; and enteric fever, 538 in 1889. The identity of the curves, irrespectively of the actual number of cases in any year, showed that season had a positive and real influence; while the decline in all fevers, though extending over different periods, proved that factors other than meteorological—perhaps social conditions no less than sanitary improvements—were also at work. These were facts that could not be gainsaid, however unable we might be to explain them. The "mean temperature" of the year or season was worthless; far better would it be to take the number of "hot" and "cold" days in any period, understanding by "hot" days those in which the mean temperature was over 60°, or preferably 62°, and by "cold" under 34°.—In reply to Dr. Pringle, Mr. MURPHY admitted that there was more enteric fever among the populations supplied with Thames water than in the district of the Kent Company, but that water was not the only factor, and the social conditions of Whitechapel and of Blackheath were very different.—Dr. WILLOUGHBY remarked that Dr. Parkes had discussed the factors of temperature and rainfall in the current and preceding years, but had wholly ignored their resultant, the level and fluctuations of the ground water, the influence of which on the soil poisons of enteric fever, cholera, and diarrhœa was undoubted; and which, as Pettenkofer had shown, explained the prevalence of the same disease at different seasons in different places, especially of cholera in Europe in the warm, and in India—for example, Calcutta—in the cool season. The connexion between meteorological conditions and the spread of scarlatina was far more difficult of explanation, yet its seasonal prevalence was at least as clearly marked, and what was most remarkable, the curves of mortality from scarlatina in London and in New York, though equally constant, were the converse of each other. These were problems that were capable of solution if we could but discover the factors, since they were evidently the result of laws and not of chance.

Notices of Books.

Essentials of Bacteriology: being a Concise and Systematic Introduction to the Study of Micro-organisms for the Use of Students and Practitioners. By M. V. BALL, M.D., late Resident Physician, German Hospital, Philadelphia; Assistant in Microscopy, Niagara University, Buffalo, New York. With Seventy-seven Illustrations, some in Colours. Philadelphia: W. B Saunders. 1891.—This little book contains in a very condensed form much of the information that is required by the student of bacteriology. It gives the more recent methods, keeping very well up to date in this respect, but does not always give them sufficiently definitely or fully to enable one who is ignorant of bacteriology to make use of them, though it must be said that in most instances this is not the case. A short and accurate account is given of the more important pathogenic and non-pathogenic organisms. Yeasts and moulds are treated of, the hæmatozoa of malaria are considered along with the bacilli that are described in that disease, and then a short account of the examination of air, soil, and water is given. Altogether this is a useful

Digitized by Google

little book for the student of bacteriology who has not much time to devote to the more elaborate descriptions given in the larger text-books. We are sorry for Dr. Dixon's sake that the author again puts forward a claim to priority as regards Koch's method of treating tuberculosis, as anything published by Dr. Dixon previously to Koch's published statements was so exceedingly sketchy, so general and theoretical, and in some cases manifested such a very crude knowledge of certain bacteriological facts, and contained so little definite information, that we should have thought that this matter had been better left in the background. We should also like to draw attention to the fact that the source of some of the drawings contained in this book is acknowledged, but in many instances no such acknowledgment is made, at least five drawings being taken from one source without that source being mentioned, although two others taken from the same book are acknowledged. This holds good in several other cases, though we have taken the trouble to look up one book only for the complete set. It would be far better to allow students to refer to the original sources in all cases, and would certainly not detract in any way from the merit of the work.

THE March number of the *Journal of Comparative Pathology and Therapeutics* contains several very interesting pathological papers. One on Pyæmic Umbilical Infection in Foals by W. Gmelin is of considerable importance. It is pointed out that foals succumb to pyæmia at an average age of about twenty-six days, that the disease becomes apparent about the seventeenth day, and that the peritoneum is very frequently not affected. The essentials for treating this condition are cleanliness immediately after birth and the continued use of antiseptic methods. An important paper by Professor M'Fadyean on the Virulence of the Blood and Muscles in Tuberculosis would lead us to conclude that both blood and muscles of tuberculous animals, except where the tuberculosis is very extensive, are innocuous. Of eighty-four experiments recorded, Professor M'Fadyean thinks that only fifty-five can be accepted as unobjectionable, and of these fifty-one gave negative results; in the remaining four only was there any evidence that tuberculosis followed inoculation with meat juice; and Professor M'Fadyean points out that some even of these positive results may be due to experimental error. Dr. Hunter's contribution to the discussion on Phagocytosis and Immunity is here published; an account of an Interesting Abnormality in a Fœtal Lamb is given; and Messrs. George R. Murray, B.A., M.B., and Clement Stephenson, F.R.C.V.S., contribute a paper on Swine Erysipelas, which is supplementary to Professor M'Fadyean's paper on a similar subject published in the December number of this journal. Other interesting items are "the prevalence of tuberculosis amongst cattle in Great Britain," "on an anthrax [illegible] sold for human food," and "on tuberculosis in [illegible] and goat"; whilst the abstracts and reports [illegible] of considerable interest to both the clinician [illegible] number is certainly one [illegible] read for some time.

THE Jr [illegible] ens with a communicat [illegible] Theobald Smith on the [illegible] Ficks, f[illegible] we ge[illegible] globi[illegible] in t[illegible] due[illegible] of [illegible] de[illegible] fe[illegible] ip[illegible] [illegible] on [illegible] [illegible] [illegible]

THE LANCET.

LONDON: SATURDAY, JUNE 25, 1892.

AS medical journalists, we hold aloof from the strife of parties, reserving our sympathies for whatever political organisation is truest, for the time being, to that best of all programmes, "Salus populi, suprema lex." As citizens, we exercise our right of private judgment and give our "vote and interest" accordingly. In this latter sense the profession takes as keen and as intelligent a part in public affairs as any body of men in the community. "Every man," said COLERIDGE, "is by nature a Parliamentarian or a Royalist, a Whig or a Tory, a Liberal or a Conservative," and the remark has its justification in medical annals no less than in those of parallel callings. THOMAS SYDENHAM, "the English HIPPOCRATES," was all for Puritan and Parliament; WILLIAM HARVEY, "the COLUMBUS of physiology," ranged himself with King and Cavalier; JOHN ARBUTHNOT, who, SWIFT sarcastically observed, "knew his art but not his trade," according to SAMUEL JOHNSON was an ideal Jacobite and High Churchman; RICHARD MEADE, "the great and good," would have died for the Hanoverian dynasty and the Protestant succession. Late in last century, medicine gave to Whig politics the vindicator of the French Revolution, Sir JAMES MACINTOSH, and in the first half of the nineteenth it gave to Toryism Sir ASTLEY COOPER and Sir ROBERT CHRISTISON, and to advanced Liberalism, long before such Liberalism was fashionable or even safe, THOMAS WAKLEY. Equally with every other vocation in life that of the healing art is divided in politics, and, if it has hitherto contributed comparatively few representatives to Parliament or office, the explanation is to be sought in a sense of duty honourable to itself and to its professional ideal, certainly in no incapacity for dealing with affairs or for enlightened and philanthropic legislation. Of late years the medical profession, more than any other, has undergone profound and far-reaching developments. It is enrolling in its ranks an ever-increasing number of votaries who adopt its education as the most humanising the age can offer—men who assume its qualifications with no fixed intention to practise, but simply as a guarantee of culture and of humanistic knowledge available in careers hitherto not opened up. The vast domain of public health—the hygiene of the social organism—affords one of those outlets for medically trained ability and enterprise, whether in sanitary engineering, in hospital extension and administration, in food protection, or in the wide and eminently debatable field of preventive or prophylactic medicine. Add to this the number of duly qualified practioners who retire at an age still compatible with sound and active headwork not only in municipal and social, but even in Imperial departments, who have much valuable knowledge, experience, and capacity to put at the disposal of the State, and who only require the opportunity to give direction and practical force to national legislation, and we have established a case for the accession to Parliament of a medical representation hitherto—if not entirely excluded—at least unduly denied its proper numbers and weight. Long before the appearance in contemporary civilisation of this ever-multiplying contingent of non-practising medical men, or of emeritus-practitioners still in the prime of their mental energies, we have had evidence, mainly, it is true, from abroad, of the value of such representation in national Legislatures. Continental Parliaments can point to medical statesmen not inferior to those sent forth from the traditional sources of political supply. A VIRCHOW in Berlin, a LANZA and a BACCELLI in Rome, a RIBERO in Madrid, have added to the deliberations of the Lower Chambers of Germany, Italy, and Spain a capacity for affairs, a power of conceiving and carrying out salutary innovations, to which these countries owe much of whatever prosperity or advancement they can boast; while in their Upper Chambers or Senates the infusion of distinguished physicians and surgeons is still larger and more effective, so as to give outline and colour, body and direction to legislation which, but for such an element, would be proportionately less sound, less practical, and less complete.

In all Parliaments there has too long been a plethora of the legal or forensic calling. In days when the gift of public speech or of dealing with private or public interests was supposed to be a peculiar possession of the barrister or practising lawyer, there was some reason for such a preponderance of that profession in the Legislature. But these days are past, and the "gift" in question is shared in due proportion and effectiveness by other professions—not least by the medical. Practice gives proficiency; and we are sure that to many a retired professional brother or medically trained man of means and leisure the opportunity only is wanting to evoke from him an amount of useful Parliamentary work hitherto looked for in vain from the traditional member of Parliament. We hope, therefore, to see in the general election now imminent a strong contingent of such candidates; and we know that all parties in the State can point in their ranks to men of the type we mean—men able, willing, and ready to put themselves in nomination for constituencies of their own political colour. But there is no time to be lost. Seats where the sitting members or adopted candidates are unopposed are daily becoming fewer and fewer. The ambitious barrister or the monied aspirant to social position are already in great force at the front, and the less pushing and more truly public-spirited candidate is in danger of being elbowed aside or relegated to a "back seat." The constituencies themselves are deeply interested in the quality of their representatives; but in many cases they are driven to put up with what they can get. Let it be from no fault of the profession, abounding as it does in eligible candidates, if the area of choice is too restricted and if representatives of the notoriously familiar type are returned, to the exclusion of men whose culture, whose experience, whose sympathies, and whose capacities have led them to the adoption of such watchwords as "Sanitas sanitatum, omnia sanitas," or its practical culmination, "Salus populi, suprema lex."

A PAMPHLET which has recently been issued, entitled "The Bird that laid the Vaccination Egg,"[1] well exemplifies

[1] P. S. King and Co., 5, King-street, Westminster.

Digitized by Google

the present phase of so-called "scientific" opposition to vaccination; indeed, its author, Mr. J. H. LEVY, gives to his paper the alternative title, "An Excursus on Scientific Authority." The burden of the story is a curious one, relating as it does to a point in the natural history of the cuckoo. Assailing, in the first instance, the "brutally enforced doctrine" which is based on JENNER'S discovery, and quoting Dr. CREIGHTON on what the latter terms this "nonsensical" doctrine, together with his sarcastic reference to "the standard of logic in the medical profession," the author proceeds to show that the success of JENNER'S theory rested on his scientific reputation. This reputation, in turn, rested on JENNER being an F.R.S., and this distinction was due to a paper which JENNER had read before the Royal Society in March, 1788. On the truth or otherwise of the points adduced in this paper the value or worthlessness of vaccination would, according to the author, consequently appear to depend; hence the paper is discussed and largely quoted in detail.

Briefly summarised, JENNER'S paper announced the discovery on his part of the circumstance that after the hatching of the cuckoo's egg in the hedge sparrow's nest, the newly hatched cuckoo proceeds to dislodge from the nest both the young hedge sparrows, as soon as they are hatched, as well as the unhatched hedge sparrow's eggs. The mode of accomplishing this was explained by JENNER to be very curious. The little animal, he says, "with the aid of its rump and wings contrived to get the young bird upon its back," the process being facilitated by the existence of a hollow in the middle of the back; and the bird or egg being thus safely deposited, the cuckoo clambered to the edge of the nest, and by means of a jerk cast its burden overboard. More than a century has elapsed since this more than "Irish landlord power of eviction" was, according to Mr. LEVY, first discovered, and though its truth has been generally accepted, yet Mr. LEVY finds himself able to dispose of it and by implication to dispose therefore at the same time of the theory of vaccination as a protection against small-pox. Other authorities, including DARWIN himself, have quoted or adopted JENNER'S view as to the ejection of the young hedge sparrow, but at last "the scientific pet of a century ..... is gathered to the category of extinct animals," and Dr. CREIGHTON, who has found out JENNER in so many other enormities, has "the chief honour of the execution ..... of cock-robin."

JENNER had declared that his statement was based on actual observation. He had announced that he could "distinctly see" what was going forward in the nest; but Dr. CREIGHTON, who is quoted by the author, is stated to have shown that what JENNER "said he saw" is "incredible"; that, having discovered "the untrustworthiness of JENNER on the vaccination question," he was led, apparently in a similar spirit of inquiry to that displayed in his previous work on JENNER, to examine the credentials of the "cuckoo story," and, according to Mr. LEVY, he found out, as the result, that this story, with its explanation founded on scientific authority for a century, had been based upon the imagination of a boy whom JENNER had employed to see what he had declared that he had seen himself, and that it is, in fact, nothing but "an urchin's hoax and a charlatan's lie." Then follows a triumphal peroration on Dorsetshire milkmaids, superstition, vulgar imposture, absurd credulity, and bias, and vaccination has evidently received the deathblow which everyone had hitherto imagined had been the lot of the unfortunate hedge sparrow in its fall from the nest to the cruel earth below. *Sic transit gloria mundi.*

We had reached this stage in Mr. LEVY'S singularly conclusive pamphlet, when we took up "The Zoologist" of May, 1886, which is edited by Mr. J. E. HARTING, F.L.S., F.Z.S.,[2] and which, oddly enough, contains a paper by Mr. JOHN HANCOCK, entitled "Facts in the Life History of the Cuckoo." Mr. HANCOCK tells in great detail a series of his own observations as to a hedge-accentor's (hedge-sparrow) nest in which he found, besides four eggs of the hedge accentor, one cuckoo's egg, the nest being in a bramble-bush near the bottom of a sloping terrace at Oatlands. These observations were continued from June 17th to July 5th, 1884; they record the hatching of the cuckoo's egg on June 27th, followed next day by the hatching of two young accentors. With a precision, that is somewhat aggravating after reading Mr. LEVY and Dr. CREIGHTON, the author proceeds to explain that at a few minutes after 5 A.M. on June 28th the young cuckoo succeeded in getting one of the accentor's eggs "on its back in the most clumsy manner," and after a series of efforts the egg "was put on the edge of the nest by the young cuckoo in my presence," and ultimately cast out into the bush below. A young hedge sparrow was next tackled, the cuckoo "moving its wings like hands;" and, after several unsuccessful struggles, the young hedge sparrow was "about 11 o'clock ..... put over the edge of the nest" by the young cuckoo. But, unfortunately for the disposal of the vaccination theory, Mr. HANCOCK'S observations were shared by others, for he explains that the second egg was pushed out of the nest by the young cuckoo "at 1 P.M., in the presence of myself, Miss ABBS, and my sister, whom I had specially invited to come and see the proceedings of the young cuckoo." Summarising his account, Mr. HANCOCK explains that the eggs of the cuckoo and the accentor "were found in the nest of the accentor on June 17th. On Friday, June 27th, the cuckoo's egg and two eggs of the accentor were hatched. On Saturday, June 28th, one attempt to put out accentor's egg did not succeed. At 10.30 A.M. first egg was put out of nest. About 11 A.M. the first young accentor was pushed out. At 1 P.M. the second egg was pushed out in the presence of three witnesses. The last of the lot, the second young accentor, was removed between 1 and 3 o'clock P.M., during the time I was away or absent."

We ought, in justice to Mr. LEVY, to say that in issuing his pamphlet he does not profess to be either a student of natural history or of medicine, but introduces himself as a "lecturer on logic."

THROUGH the courtesy of the Agent-General for the Cape of Good Hope we have received a copy of a *Gazette Extraordinary*, dated May 18th, 1892, issued by the Government of that colony. This *Gazette* contains the official promulga-

[2] John Van Voorst, 1, Paternoster row, E.C.

Digitized by Google

tion of "The Leprosy Repression Act, 1884," and a statement of regulations made under the Act. The object of the Act is thus stated: "To check the spread of the disease known as leprosy." In the first paragraph of the Act there is a very important statement; and its importance is not lessened, but is rather increased, by the fact that it has recently been asserted that leprosy tends to diminish with the spread of civilisation and, consequently, of sanitation in countries prone to this disease. This is the statement: "Whereas the disease of leprosy is prevalent in this colony, and has lately been spreading and continues to spread ....." Here, then, is an official announcement of the fact that leprosy "continues to spread" at the Cape of Good Hope. The Act provides that when it is certified by any "duly qualified medical practitioner" and by a "field cornet," or justice of the peace that any person is a leper, "and that the fact of such person being at large is likely to spread such disease, the Governor (of the colony) may, by warrant under the hand of the Colonial Secretary or Under Colonial Secretary, order that such person shall be removed to such asylum or hospital as he shall appoint, to be there detained during the Governor's pleasure, and kept apart from contact with all other inmates of such asylum or hospital who are not afflicted with the same disease. Provided always that every such person, while so detained, shall have the liberty and privilege of seeing his friends and legal advisers at all reasonable times under such regulations in force for the time being as the Governor may approve in that behalf." The Act also gives power to compel the keeping of male and female lepers in separate asylums; provides for the maintenance out of the colonial revenues of all pauper lepers and the making by the "superintendent or keeper" of the hospital or asylum of a special agreement with any well-to-do leper which would require such a leper to pay his own expenses while he is detained in the asylum; prescribes the payment of fees to medical men employed by the proper authorities under this Act; and the giving to the local authority, or to any resident magistrate, by all district surgeons and medical officers," when they are requested so to do, of "any information which may be required in regard to the disease referred to in this Act. ..... Power is given to the Governor to at any time make, alter, and amend such regulations as he may deem to be advisable for the better and more effectually carrying out the provisions of this Act."

The Governor, with the advice of the Executive Council, has made, within the last five weeks or so, some important "General Regulations" under the provisions of the "Leprosy Repression Act." It now is the duty of "every field cornet and police-constable forthwith to report to the resident magistrate of the district the existence of any case of leprosy which may come to his knowledge." Europeans who are lepers are to be kept in wards into which "native or coloured" lepers are not allowed to go; the sufferers are to be classified "as far as possible" according to their condition of disease; notice of the serious illness or death of a leper is to be at once sent to his nearest relative by the medical officer in charge of the case. Visitors are not to be allowed "to enter any ward set apart for lepers or to visit a leper" without a permit from the medical officer in charge. The only person who has right of private access to a leper is his legal adviser.

To the very stringent legislation here set forth the leper in the colony of the Cape of Good Hope must now submit. As we read the Act, it is still legal in the Cape Colony for a leper to remain in his own home, provided the local authorities do not take action in his case and remove him to an asylum or to a hospital. It seems, however, very unlikely, judging from the tone of the Act, that the local authorities will allow lepers to remain in their own homes unless the authorities are convinced that while in his own home the leper will be carefully isolated and properly attended to in everything necessary to his own well-being and to the protection of his neighbours against the infection of leprosy. Here, we suspect, the authorities at the Cape will find some difficulty in carrying out the Act, both as to its letter and its spirit. But we must not forget that the colony is a community strong in the belief that leprosy, whether aided by insanitary surroundings or not, can only make new victims by virtue of the fact of its own infectiveness. Granted that the people have clearly apprehended the meaning of the inevitable consequences of such a belief as this, and have determined to carry their belief into action, then, in this event, it would be indeed venturesome to attempt to measure the amount of success which may crown their efforts. Much—practically everything—will depend upon how this Act is enforced at the Cape. In the interests of the healthy community, and of the lepers themselves, we hope the Act will be strictly carried out now that the people of the colony have decided to try the effect of compulsory segregation in their heretofore unsuccessful attempt to check the spread of leprosy among themselves.

We do not gather from the wording of the Act that the authorities at the Cape have reserved to themselves under it any power of inflicting definite penalties in the case of persons who break the law which it enacts, or even when its provisions are openly set at defiance. Perhaps the authorities have at command some means, which, however, do not seem to be mentioned in the Act itself, wherewith to enforce obedience to its requirements. Should this prove to be a weak point in the working of the Act, we would recommend the authorities at Cape Town to peruse the Act touching the question of the prevention of leprosy which is now in force in the colony of New South Wales. This Act is given in full in Dr. THIN'S excellent work on "Leprosy." The New South Wales' Act seems admirably suited to the purpose which its authors had in view—namely, to enforce, in the most thorough way, the segregation of lepers, and to punish promptly all persons attempting to evade or to thwart the working of the Act.

In the Cape of Good Hope and in New South Wales we see the principle of the segregation of lepers being rigidly enforced. Among our fellow subjects who follow this line of treatment in dealing with leprosy there is no evidence of any tendency on their part to lose faith in what they are doing in that direction. They believe that leprosy spreads among healthy people because it is an infective disease, and they decline to postpone to an indefinite future the possible eradication of the disease by trusting to obtain this end by gradually improving their personal hygienic surroundings. The inhabitants of the Cape Colony have leprosy at their doors. We are told there are

Digitized by Google

not wanting there certain sad examples of the truth that no person, in any grade of society, in a country where lepers are free to go about as they please, is safe from attack by this most horrible disease. It is not for us in England to judge harshly of people circumstanced as are the Cape colonists with regard to leprosy or lightly to blame them for enacting severe laws against the leper. Many people are always eager to show with what calm, philosophical resignation they can regard the dangers and sorrows which, leaving them untouched, fall heavily upon their neighbours. Shall we be reproached for such an expression of opinion as this when to-day in British India lepers are allowed to act as salesmen in the bazaars and to move about just as they please in the crowded thoroughfares of Indian cities?

IT is the experience of the Council of the Metropolitan Hospital Sunday Fund that the amounts collected throughout the metropolis at its various places of worship are not all gathered in at the Mansion House for some week or two after the appointed day. Many causes contribute to this delay, among others the desire on the part of some of the authorities to afford an opportunity of contributing to such members of their various congregations as may have been prevented from taking part in the good work at the appointed time. Such delays it is quite impossible to regret, but it is none the less a consequence that not for some considerable time after the taking of the collection—not, indeed, until the public interest has begun somewhat to wane—can the result be ascertained. We are, however, very glad to learn from the Mansion House and from those gentlemen who have kindly furnished us with particulars of their Hospital Sunday collections that so far as it is at present possible to forecast the result which the next few weeks will bring to light it promises to be a favourable one, and it is possible to be sanguine that the collection of the present year, if it does not realise all that has been asked for or even all that has perhaps been hoped for, will compare very favourably with the past. It is, however, a matter worth the consideration of all whom it concerns whether something more cannot be done to bring home the claims of this fund to the minds and consciences of Londoners than is done at the present time. At the meeting which was held at the Mansion House on the Friday in last week great stress was laid—and very properly—upon the responsibilities of the press in regard to this matter. The pulpit has proved itself to be a most efficient organ for the diffusion of information concerning the needs of the metropolitan hospitals and the presentation of their annual appeal to the congregations of the metropolis. But the success of the pulpit cannot absolve the press; on the contrary, it rather tends to show how great is the opportunity which, for the most part, our contemporaries systematically neglect. But though too often overlooked, the opportunity is not wholly neglected, and we have noted with singular pleasure that several of our more influential contemporaries have this year used their influence in the promotion of this most worthy object. This was notably the case with the *Daily News*, which, on the Thursday preceding Hospital Sunday, published a leading article that cannot well have failed to produce an effect upon the Sunday's offertory. We trust that another year may witness a large development in this direction, and that the press of the metropolis will acquit itself of the responsibilities of its position in a way that will leave little, if anything, to be desired. The fact that a matter of so great importance should have awakened only an inadequate amount of public interest is partly, no doubt, to be accounted for by the circumstance that London is so vast as to be hardly conscious of its essential unity, and that, being the metropolis, it is apt to be so much occupied with matters of imperial concern as to relegate its own local matters, even though matters of the greatest importance, to a subordinate position. These causes have conspired to affect—and prejudicially to affect—every department of the municipal life of London, and perhaps no surprise ought to be felt that its hospitals should suffer in common with practically all the institutions in which municipal life finds expression and organisation. But, on the other hand, there has in recent years been a very remarkable growth of the sense of corporate unity throughout the metropolis, and improvements in its municipal government realised and promised bear testimony to the reality and importance of this awakening. It would be a strange and a hard case if the hospitals alone should profit nothing by the higher organisation and better government of London, and we refuse to believe that the quickened sentiment and the awakened interest which have done so much in other directions are not capable of being turned to good account in this direction also. The value and efficiency of forces of this kind when directed to a good end have been demonstrated over and over again, and seldom demonstrated in any more striking way than by the very movement now under discussion. Twenty years ago it was a distinctly unusual thing to have a collection in a place of worship for the benefit of any hospital, and in the metropolis a thing not yet heard of that a collection should be made for the benefit of hospitals in general. To-day such a collection is not only an established institution, but it is one that yields a definite revenue that can be calculated with some nicety and relied upon with ample confidence. This great result has been brought about by organising the clergy for the purpose. More recently THE LANCET has been instrumental in securing for this movement a large measure of interest and support among our professional brethren in the metropolis, and we trust that the effort which it has been both our privilege and our pleasure to put forth on behalf of the movement has assisted in some measure to enlist the sympathy and aid of not a few beyond the circle of our ordinary readers. By means like these a great result has been brought about and one which we can all contemplate with a large measure of satisfaction. It is, however, impossible not to perceive that if the people of London could be really awakened to an adequate sense of what are the needs and what the services of the hospitals established in their midst, we should see a development of the Hospital Sunday movement that would place their work on a new and very different footing from that upon which it is at present carried on. There is one, and only one, voice which can effectively supplement for this purpose the

Digitized by Google

agencies at present engaged in urging the case for the sick poor and that is the voice of the metropolitan Press. This view is one to which it will be our duty to recur at a future time. We indicate it at the present moment because it may well be supposed that on the morrow of Hospital Sunday everybody—not excluding the journalist—is in the humour to consider, and consider favourably, any suggestion which relates to the success of a movement to which London is so deeply committed, alike by interest and profession, as the adequate maintenance of its hospitals and, as a means thereto, the liberal support of the Mansion House Fund.

Annotations.

"Ne quid nimis."

THE REGISTRATION OF MIDWIVES.

THE following is the report of the Select Committee of the House of Commons appointed to consider the question of the compulsory registration of midwives:—"Your committee have sat six times, and have taken most valuable and important evidence from medical men and practitioners in various spheres of practice both in favour of and opposed to the registration of midwives, and also from trained and experienced midwives. This evidence has shown that there is at present serious and unnecessary loss of life and health and permanent injury to both mother and child in the treatment of childbirth, and that some legislative provision for improvement and regulation is desirable. They have also had evidence showing that there is a wide field for training in midwifery now unused connected with parish infirmaries and home practice in populous places. Their inquiries have been cut short by the approaching early dissolution of Parliament, and they therefore report the evidence and recommend a continuation of the inquiry in the next session of Parliament." In the draft report which was submitted by Mr. Rathbone there was a paragraph to the effect that "the evidence taken so far is strongly in favour of some sort of certificate, register, or licence." The committee, however, decided to strike out this paragraph. We hope to be able shortly to place before our readers an exhaustive analysis of the evidence given before the committee by the various witnesses.

THE ELECTION TO THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

THERE are no less than ten candidates for four seats on the Council of the Royal College of Surgeons. Two—Mr. Thomas Smith and Mr. A. E. Durham—are seeking re-election, and the remaining eight—Mr. George Cowell, Mr. Howard Marsh, Mr. J. McCarthy, Mr. A. O. MacKellar, Mr. Henry Morris, Mr. Warrington Haward, Mr. John Tweedy, and Mr. William Anderson—are contesting the two vacant seats. Both Mr. Thomas Smith and Mr. Durham belong to large hospitals, where they are deservedly popular, and can command a considerable personal following. Mr. Thomas Smith is also well known as a liberal-minded and progressive member of the Council, where he has done good service in counteracting influences which have not tended to unite the constituency of Fellows or to bring them into harmonious relations with the Council of the College. There is, therefore, every prospect that Mr. Thomas Smith will be returned—and deservedly returned—at the head of the poll, and if so perhaps he may be induced to reconsider the decision at which he is known to have arrived not to accept the office of President of the College. Mr. George Cowell's supporters on a previous occasion were not sufficiently numerous to make us sanguine that he will be successful now; but his views are substantially in accordance with those of the more enlightened section of the Fellows, and we should be glad if he secured a seat upon the Council of the College. Mr. MacKellar and Mr. William Anderson seem to be standing rather as champions of the interests of St. Thomas's Hospital than of the Fellows. Mr. Howard Marsh, Mr. Warrington Haward, and Mr. J. McCarthy are to some extent "dark horses," but as two of them are members of the Court of Examiners, which has already six of its members on the Council of the College and the other has been mentioned as the nominee of the conservative element in the Council, we must regard them as sympathising at all events with official views of College politics. The two remaining candidates are Mr. Henry Morris and Mr. John Tweedy. Mr. Henry Morris formerly belonged to the Association of Fellows, and his views are generally in harmony with those advocated by the Association at the present time. The main point of difference concerns the election of the President of the College, which he in common with many others would wish to see retained in the hands of the Council; but the election of the President by the Fellows can scarcely be regarded as within the immediate range of practical politics. The cardinal point of all reform so far as the Fellows are concerned is consultation of the Fellows by the Council on all important matters, and, as Mr. Morris is strongly in favour of this course, he ought to be supported by the members of the Association of Fellows and all who desire to see the Fellows acquire their proper influence in collegiate affairs. Of Mr. John Tweedy it is impossible to speak too highly. No one is better acquainted with the past history of the College and with all the details of its constitution. No one possesses a warmer sympathy with the legitimate aspirations of the Fellows of the College or is more capable of giving expression to his views effectually in the Council. The Fellows are largely indebted to Mr. Tweedy for the advantages which they have recently gained from the Council of the College and it would only be an act of justice and gratitude if the electors returned him to the Council in close proximity to Mr. Thomas Smith. The influences which are at work in a College election are very various and it is impossible to exclude secondary and even tertiary considerations. There is a school vote, a personal vote, a provincial vote, a sentimental vote, a professional vote, a canvassed vote, often promised without due consideration, and a party vote, and of these several take precedence of the vote that is given to a candidate because his views of College politics are in accordance with those of the elector. It is this which renders the result of any election at the College uncertain and which prevents the election from being a real test of the opinions of the electors on the collegiate questions of the hour. It is this which gives an advantage to official candidates, for, generally speaking, they belong to the schools which are numerically the strongest. Nevertheless, we have faith in the ultimate triumph of the principles which we have upheld for so many years and, if the electors at the College desire to see those principles prevail, they will return Mr. Thomas Smith, Mr. John Tweedy, Mr. Henry Morris, and Mr. George Cowell to the Council by very substantial majorities over candidates whose opinions have never been expressed or ascertained.

HOME: RURAL, URBAN, OR SUBURBAN?

A VARIETY of excellent reasons have contributed to the formation of the common opinion that it is good for persons engaged in city business houses during the *day* to spend their hours of rest amid the healthier surroundings of a

Digitized by Google

rural home. Adults are, in some ways, gainers by the exchange, and, in a much greater degree, so are their children. The smiling cottages and villas which are springing up round every large town possess evident advantages over many older street dwellings. In and around them there is greater cubic air space, they are better lighted and ventilated, even the less pretentious have their baths with an ample water-supply, and domestic sanitary arrangements, if often imperfect, are usually much more in accord with scientific rule. Last, and far from least, in importance are the benefits conferred by freer and purer air and out-door recreation. There is little wonder, then, that children especially thrive among such favourable circumstances. The picture is a bright one but it would not be real without some shadows. These, though fortunately not such as to overcloud the whole, are still not without a decided influence upon its general tone. One in particular cannot fail to attract notice. We might call it an effect of distance. It is, we must admit, largely remediable, and even self-adjusting. It consists in the frequent inconvenience incurred by railway journeys to and from school or business. It is not altogether easy to recognise at first sight the effect of this little cloud upon the landscape. The children of a family which has migrated are not much affected by it, nor are the majority of men and women while still in the vigour of their youth. The case of the parental breadwinner of middle age is different. For him the change implies the addition of various small worries to those which form his daily environment. There is the morning bustle, with its hastily swallowed meal, and its rush to catch an early train; and again the push to finish work in time to begin, perhaps at a late hour, the return journey. These may seem to be mere trifles, as they are if taken severally, but they are such as tell decisively against health and temper during years of repetition. We have often questioned whether the grey hairs thus prematurely added are fully compensated by the freshness of sleep and of Sunday rest in a relatively pure atmosphere, and we would say that the privilege is often too dearly purchased at its cost. Doubtless it is also often preferable, though not in every case, to life on a city flat. Health and comfort in our opinion, however, are more wisely sought by those who follow amiddle course. Life in some suburb near the scene of business activity affords a better solution of the difficulty as to atmosphere and sanitary convenience. Under no ordinary conditions of rural amenity would we exchange for this the rush and rattle of a tedious and often repeated railway journey between town and country.

THE BRITISH MEDICAL ASSOCIATION.

THE sixtieth annual meeting of the British Medical Association will take place at Nottingham from July 26th to 29th. The President-elect is Mr. Joseph White, F.R.C.S. Edin., consulting surgeon to the Nottingham General Hospital. Dr. James Cuming of Belfast will deliver an address in Medicine; Dr. W. H. Hingston of Montreal one on Surgery; and Dr. Sims Woodhead of London one on Bacteriology. In the Section of Medicine (Dr. W. H. Ransom, President) there will be special debates on Peripheral Neuritis, and on the Treatment and Prognosis of Ascites. In the Section of Surgery (Mr. J. Croft, F.R.C.S., President) there will be debates on the Surgery of the Thorax, the Surgery of the Liver and Gall-bladder, and the Treatment of Spinal Abscess. In the Section of Obstetric Medicine (Dr. A. L. Galabin, President) the special subjects for discussion are: (*a*) The Treatment of Uterine Fibroids and (*b*) Post-partum Hæmorrhage. In the Section of Public Medicine (Sir Walter Foster, President) a list of no fewer than seventeen subjects has been put forward as suitable for discussion, including the Legal Restraint upon the Employment of Women in Factories before and after Childbirth, Infantile Insurance, Coroners' Inquests, the Disposal of the Dead, Isolation Hospitals, Measles, Small-pox, Scarlet Fever, Offensive Trades, Tuberculous Meat, Epidemic Influenza, and the Disposal of Town Refuse. Dr. Rentoul has given notice of a resolution to the effect that all stillbirths after the fourth month of intra-uterine life should be registered. In the Psychology Section (Mr. Bevan Lewis, President) the special subjects are Psychoses after Influenza, Insanity as a plea for Divorce, and Neural Action corresponding to the Mental Function of the Brain. In the Ophthalmology Section (Mr. Priestley Smith, President) a discussion on the Diseases of the Lacrymal Apparatus will take place. In the Section of Diseases of Children (Dr. Lewis W. Marshall, President) the Diagnosis and Treatment of Croupous Pneumonia in Children and the Treatment of Severe Club-foot will be discussed. In the Section of Pharmacology and Therapeutics (Dr. J. O. Brookhouse, President) the special subjects are (*a*) Cardiac Tonics and the Indications for their Use, and (*b*) Dyspnœa and its Treatment by Drugs. In the Laryngology Section (Dr. R. A. Hayes, President) the Etiology, Pathology, and Treatment of Nasal Neurosis, Catarrh of the Nose and Throat, and Granular Pharyngitis are the three topics selected for consideration. The social arrangements of the meeting comprise a Conversazione at the Castle, given by the Mayor of Nottingham; one at the University College, given by the President and the Midland Branch; the public dinner of the Association, to be held in the Mechanics' Institute; garden-parties; and a series of attractive excursions to Belvoir Castle, to Sherwood Forest and the Dukeries, to Haddon Hall and Chatsworth, and to Lincoln.

MEDICAL CHARITY IN FLORENCE.

THE Tuscan capital has long signalised itself by the public spirit, professional as well as lay, which it devotes to the rescue or relief of the sick poor. Its organisation of the Misericordia, which so deeply interested Queen Victoria during Her Majesty's sojourn in the city four years ago, includes members of every grade of society, peer and peasant, artist and shopkeeper, scholar and mechanic; and as its detachments thread the streets on their way to or from the houses of the ailing, the dying, or the dead—its members indistinguishable from each other in their black or white stoles, which cover the whole person, all except the eyes—they offer a spectacle unique, it is said, in the civilised world as an embodiment of a philanthropy which ignores all claims but those of afflicted humanity. "Res sacra, miseria"—a sacred thing is suffering. Such is the watchword to which it marches, while the lesson it conveys is fraught with fruit of charity in every sympathetic eye-witness throughout every hour of the passing day. That the spirit which inspires it has lost nothing of its honourable contagion is manifest from the association recently established in Florence under the title of "Guardia Medico-Chirurgica Permanente"—or permanent medico-surgical guard—to the constitution and work of which we have from time to time drawn our readers' attention. The report of the first "quadrimestre" of 1892 is now before us, and its record of illness relieved and recoveries completed attests the skill and assiduity with which the association works. Its *personnel* is composed chiefly of young physicians and surgeons recently graduated or still in the undergraduate stage, and its honorary president is the well-known public-spirited layman, the Commendatore Egisto Fabbri, to whom Florence in general, and her medical men in particular, are under such deep obligations. Its moving agent was primarily a young physician, Dr. Roster, and its actual director, ably reinforced by the judgment and, on occasion, by the purse, of the Commendatore Fabbri, is Count Carlo degli

Digitized by Google

Alessandri. The circumspection with which its operations are planned is only second to the enthusiasm with which they are carried out, as is evident in the increasing confidence they inspire among a poor, uneducated, superstitious, and therefore irrationally jealous proletariat. Of this absolutely penniless *clientèle*, whose wants used to encroach on the valuable time of the working practitioner, 176 urgent cases were relieved in the month of January last, 131 in February, 93 in March, and 102 in April. The consultations in the *locales* of the "Guardia" reached in those four months the high number of 6843. Vaccinations and revaccinations were also vigilantly practised, so that, all told, the work of the "Guardia" for the "quadrimestre" ending April 30th, 1892, may in the language of the report be called not only "importante" but "completo." Already the well-to-do classes have begun to take a warm and effective interest in the Association, and the report dwells with reasonable satisfaction on the support the work now receives in quarters supposed to stand aloof from popular sympathy. From Florence we hope the example will spread to other Italian cities so as not only to bring comfort, relief, and rescue to the suffering poor, but also to set free the hands of large numbers of the profession hitherto prevented by such unremunerative practice from adding to those achievements in pathology and therapeutics in which Italy is beginning to resuscitate her long-past fame.

LARGE "TRANSACTION OF BUSINESS" IN PROVIDENT DISPENSARIES.

THE Leicester Provident Dispensary claims to be the largest in the kingdom. At the Council meeting, presided over by the mayor (Alderman Wright), satisfaction was expressed at the largeness of the membership—36,000. The rush to the dispensary had been increased by the influenza last year. The death of one member of the medical staff, DR. Oliphant, was much regretted. The illness of another had compelled his resignation. The work of the medical men and their remuneration are not given in the newspaper report which we have before us. But we can easily imagine what the work must have been. The dispensary is governed by a board of independent gentlemen, from whom the mayor says the doctors always get justice. We are glad to hear it. But in few of these institutions is the reward of the medical man what it should be. The subscription list is about £300 a year. To meet the expenses £500 would be necessary. There is a deficit in last year's account of £150. Too great an air of "business" pervades the reports.

CHOLERA INTELLIGENCE.

IN addition to the stations for observation and detention appointed by the Russian Government in the Caspian Sea, somewhat similar stations have been appointed near the Perso-Russian frontier at Beliasovar, Julfa, and Jebrail, with a view of preventing the extension of cholera into the Russian empire. In the meantime no change is reported as regards the epidemic at Meshed, which place has been abandoned by Europeans, the mortality there from cholera last week having reached 250 a day. Nishapur and Sabzevar have also suffered to some extent. These two towns are both to the westward of Meshed and on the main road to Astrabad. As far as possible the movement of pilgrims has been stopped and a quarantine of six days has been imposed on the Russo-Khorassan frontier. Great alarm is felt at Tashkand at the extension of cholera both in Persia and in Afghanistan. Ten days' quarantine has been imposed in Cyprus on arrivals from Bassorah; but as yet we have no intelligence as to the existence of cholera in Southern Mesopotamia, or indeed in South-western Persia. An alleged occurrence of cholera on board the *Crofton Hall*, which sailed from Calcutta to Hull on June 3rd, probably calls for some different explanation from that assigned to it in the public press. After leaving with all hands well, the vessel returned on the 13th "stricken with cholera," and out of twenty-nine persons on board twenty-four were seized with illness, and six died. The disease is stated to have been associated with the use of pickled beef which was offensive when served out, and those only who ate the beef suffered from illness. So, also, those who ate most heartily suffered most severely and fatally. This, according to Dr. Simpson, was the cause of the disease; if so, it is more likely to have been one of those cases of meat-poisoning such as have been reported in this country during recent years than an outbreak of cholera as that disease is commonly understood.

EYE-STRAIN AS A CAUSE OF NERVOUS DERANGEMENTS.

DR. AMBROSE RANNEY, in the *New York Medical Journal*, draws attention to the view that "eye-strain" may be a frequent and extremely important factor in causing many forms of nervous derangements—even in such as are commonly regarded as organic diseases—as, for example, epilepsy, chorea, and insanity. Among the cases reported by Dr. Ranney which were cured by the use of spherical, cylindrical, and prismatic glasses, combined occasionally by tenotomy of certain of the ocular muscles, may be mentioned the following: Four of epilepsy; several of nervous prostration of so severe a form as to justify the most serious doubts of a perfect recovery being possible; one case of mental collapse to an extent which rendered the patient unable to dress himself until told which article of apparel first to put on; one case of melancholia with morbid impulses, the patient walking about the streets touching every tree and lamp-post he met; one case of epileptic mania in a patient who required a padded room; several in which confirmed inability to sleep, severe neuralgic paroxysms, constant headache, &c., formed an important feature in the clinical histories; one case of very severe neuralgic paroxysms of the face which drugs would not control; and other cases of various conditions that were equally distressing to the patients, and that had withstood all therapeutical measures.

THE TREASURERSHIP OF ST. BARTHOLOMEW'S HOSPITAL.

THE resignation of the treasurership of St. Bartholomew's Hospital by Sir Sydney Waterlow is an event of importance. His administration of the affairs of the hospital has been characterised by great ability and efficiency, with much personal trouble and supervision. One proof of this is that during the eighteen years he has held the office the income of the hospital has increased from £45,551 to £71,833, in spite of a falling-off of nearly 50 per cent. in agricultural rentals. The medical school has been enlarged, and the medical and surgical staff of the hospital has been increased from thirty (with nine residents) in 1874 to fifty-seven (with thirteen residents) in 1891. Special departments for the better teaching of ophthalmic and other groups of disease have been established. Isolation rooms have been provided. The nursing department has been entirely reorganised by the establishment of a training school for nurses. The female nursing staff of the hospital has been increased from 120 in 1874 to 232 in 1891. Hydraulic lifts have been established in each of the four wings of the hospital for the use of patients and of the staff. The entire system of main drainage has been reconstructed and the sanitary arrangements of each ward remodelled at a cost exceeding £25,000. The hospital has secured a convalescent home with seventy beds at Swanley in Kent. No doubt the changes thus epitomised were called for either in the

Digitized by Google

course of the natural development of the hospital, with its unequalled wealth, or more urgently on sanitary grounds; but it is to the credit of Sir Sydney Waterlow that he perceived the necessity and so husbanded the resources that they could be easily executed. It is gratifying to know that he does not retire on the ground of ill-health, but in deference to the advice of his friends and of his physician who advises him to winter in the Riviera. It is understood that Sir Trevor Lawrence will be asked to accept the honourable post so well held and now vacated by Sir Sydney Waterlow.

THE CASUAL WARDS BILL.

THE Casual Wards Bill for London, which is about to be brought up before the Lords, requires that the Metropolitan Asylums Board shall establish a central system of communication with casual wards in the metropolis, and, when necessary, provide for the conveyance of any person in need of accommodation to the ward where that accommodation can be most conveniently obtained. This no doubt is a step in the right direction, and the disgraceful delays which have so frequently shocked the public conscience in the removal of sick and dying casuals to a place of shelter will, it is to be hoped, cease to occur. At the same time it is a pity that the Bill has, owing to the exigencies of the dissolution, to be hurried through Parliament without more discussion. In fact we should have been better pleased to have seen the whole management of the "casual ward system," not only of the metropolis but of the whole country, transferred from the board of guardians to a central authority. The present Bill we are convinced is only an instalment of that wider measure which will some day regulate our vagrant population, which will afford proper shelter and accommodation for the honest labouring man in search of work and help him on his way, whilst the lazy and habitual tramp should be dealt with more sternly. Above all, special assistance for those taken sick upon the road should be bountifully provided. We have repeatedly pointed out the means by which such measures can be effected, and they are neither cumbersome nor expensive. In the meantime we shall view with pleasure anything that diminishes the power of the boards of guardians over the vagrant poor.

ADVANTAGES OF FOGS.

No less an authority than the president of the Institute of Civil Engineers has declared that the sulphurous vapour produced during the combustion of coal is most beneficial to the health of the inhabitants of London, disagreeable though it undoubtedly is. As many as 350 tons of sulphur are thrown into the air in one winter's day, and the enormous quantity of sulphurous acid generated from it deodorises and disinfects the air, destroying disagreeable smells emanating from refuse heaps and sewers and killing the disease germs which find their way into the atmosphere. There may be a good deal of truth in this view, but there is undoubtedly another side to the question. It is an old comparison that a doctor and his drugs bear a relationship to the patient and the disease like that of a policeman towards a householder attacked by a garotter. The policeman lays about with his truncheon, sometimes he hits the householder, sometimes the garotter, and the good or ill which results from his interference will depend upon which party happens to get the most and the heaviest blows. This simile is admirably suited to sulphurous acid in London fogs, for although it may be beneficial to the London householders by destroying microbes, it certainly frequently does them harm by attacking their lungs and bringing on bronchitis and asthma which sometimes prove rapidly fatal, to say nothing of the minor discomforts of a disagreeable taste, filthy smell, stuffed nose, husky throat, smarting eyes, and headache. We think that, healthy though the London fogs may be, the discomforts they cause are so great that Londoners would be really better without them, and that less disagreeable and equally efficient means might be found to clear the air of microbes, while at the same time these other remedies would be enormously cheaper, for they would not entail the almost complete stoppage of traffic or the enormous expenditure of gas and electric light which a bad fog occasions.

THE SCARLET FEVER CASE AT FULHAM.

THE Fulham case of disputed diagnosis of scarlet fever continues to be the principal topic of interest in the local papers. The Board of Guardians have passed a resolution directing the attention of the Local Government Board to Mr. Cooney holding the two offices of district medical officer and medical officer of health, with an expression of opinion that the two offices should not be held by one person. Another question on which the Local Government Board and the vestry seem to hold opposite opinions is that of the medical officer of health being required to give his whole time to the duties of his office. The Local Government Board think he should be so required. It seems but reasonable that a population of 92,000 should have the entire time of a medical officer. The appeal on the case as decided by the magistrate is to be heard on July 9th. It really bristles with fine questions of duty in magistrates, parents, and medical men. It is well worthy of a very deliberate re-hearing in the most judicial frame of mind that can be commanded.—At a public meeting held at the Walham Green Hall, Effie-road, Walham Green, on Tuesday evening, June 21st, it was moved by Mr. Barry, and seconded by Mr. Spencer Lawrence, "That this meeting of the inhabitants of Fulham beg to tender their sincere gratitude to William Cayley, M.D., and Sidney Phillips, M.D., for their valuable opinion in the correct diagnosis of the illness of Emily Williams, given without fee, and wish to express their unabated confidence in the aforesaid gentlemen and in the management of the Middlesex Hospital, notwithstanding the uncharitable and uncalled-for strictures passed by Mr. Curtis Bennett lately at the West London Police Court." It will be seen from our Parliamentary column that the matter was before the House of Lords on Thursday night. A meeting will be held on the 30th inst. at 8 P.M. in the Fulham Town Hall in connexion with the case.

RIVER TRAFFIC AND ITS REGULATION.

THE sadness of what in itself may seem to be an unqualified evil—such, for example, as preventable death—is often brightened by the reflection of a prospective good which comes of it. Every shipwreck, every railway and roadway disaster, shows this, and teaches us—as if in compensation for the tribute of life which it exacts—a lesson of caution for future guidance. Thus viewing the matter we can even extract some grains of consolation from the history of two fatal and avoidable boat accidents which lately occurred on the river Lea. Both resulted from collisions and in each instance a young man lost his life. At the subsequent inquest it transpired that at present the traffic on this river is subject to no recognised system of regulation, that boat-hirers are equally free from any effective means of control, and that the supervision exercised by the Lea Conservancy officials is of the most imperfect kind. The coroner's jury therefore added to their verdict a rider which it will readily be allowed was entirely consistent with the evidence brought before them This was to the effect that a register should be kept of the names and addresses of persons hiring boats, that the regulation of traffic should be ensured by published

Digitized by Google

instructions, and that the execution of these provisions should be enforced by the river police. The first suggestion is evidently a useful one. It is true that it would impose a restraint not hitherto considered necessary upon boat-hirers, and that after all its practical efficiency must depend upon the personal honour of the latter. Still we cannot see how a system of mere boat registration could serve the same purpose with an equal prospect of success. The necessity of the two other recommendations above mentioned is too obvious for discussion. We trust that the needful rules of the river will be posted at every boat-house and landing-stage. We would also add a hope that the lessons learnt from these accidents on the Lea will not be allowed to pass unheeded by those who have to do with the management of other equally neglected water-ways.

DEATH CERTIFICATION BY UNQUALIFIED PRACTITIONERS.

AT Liverpool an unqualified assistant has been fined £5 and costs for filling up a medical certificate of the death of a child whom he had attended and signing the name of his principal without the principal's knowledge or consent. The excuse was that he did it out of pity for the parents and to avert an inquest. His principal, Dr. McCormick, spoke apologetically for him on the ground that he had completed his curriculum and was prevented from passing by want of fees rather than want of ability. But the magistrate said truly that this constituted no mitigation of the offence. It is amazing that men are still found to put themselves into this false position in spite of repeated warnings.—Mr. Michael Anthony De Quadros, on the 20th inst., at the Lambeth Court, was fined £5 and £2 2*s.* costs for granting a certificate of death in the case of a child he was alleged to have never seen.

UNITED STATES MARINE HOSPITAL SERVICE.

WE have received a copy of the annual report of the Supervising Surgeon-General of the Marine Hospital Service for the United States for the fiscal year 1891. On account of the number of applications, and because of the necessity of maintaining the professional excellence of the medical corps, it is stated that the standard to be attained on examination for admission into this service has been placed at 80 per cent., while the physical examination is also exacting. The medical corps of the service now consists of the supervising surgeon-general, fifteen surgeons, twenty passed assistant surgeons, eighteen assistant surgeons, and seventy-nine acting assistant surgeons. The force of medical officers in the bureau at Washington as assistants to the Surgeon-General consists of one surgeon in charge of the quarantine division, one in charge of the purveying division, one passed assistant surgeon in charge of the laboratory of the service, and another as bureau executive and acting chief clerk. During the year ending June 30th, 1891, the total number of patients treated by the service was 52,992, of which number 15,349 were treated in the hospitals and 37,643 in the dispensaries connected therewith. There are eighteen United States marines hospitals, not including the quarantine hospitals belonging to the service, and one hospital at the port of New York occupied under lease, the purchase of which by the Government is recommended. The Supervising Surgeon-General's report embraces a good deal of information arranged under the heads of Public Health Division, Purveying Division, and those of Quarantine Service, Inspection Service, Immigration, Laboratories, Sanitary Reports, and Statistics, with a number of special papers, medical and surgical, and reports of fatal cases, with necropsies. Many of the papers are distinctly interesting, such, for example, as "studies in service statistics dealing with diseases of the circulatory system and the frequency of heart clot"; "ten years' personal experience of enteric fever," and "influenza or 'grippe,'" together with other papers and clinical reports of cases too numerous to mention.

"CURES" FOR INEBRIETY.

IT is satisfactory to observe that the words of caution which we published last week have not passed by unheeded, and that in consequence the meeting which was announced to be held on Friday, the 17th inst., under the auspices of the Church of England Temperance Society and the chairmanship of Bishop Barry, has been postponed—we trust *sine die*. We respect and fully sympathise with the laudable and earnest efforts of these gentlemen to further the great cause of temperance, and we are for that very reason well pleased that they have not permitted their zeal to outrun their discretion. The interests of that sad, but alas, numerous class of the community, habitual drunkards, are not likely to be served by a hasty and ill-considered attempt to advertise a method of treatment secret in its nature, commercial apparently in its bearings, and not duly submitted for trial and judgment to members of the medical profession who alone are capable of estimating its value or its worthlessness.

HOSPITAL ABUSE AND ITS CRITICS.

THE *Rock*, disclaiming all sympathy with charity reformers, asks for one very drastic measure—*pace* Sir Andrew Clark—the abolition of the out-patient department and of free dispensaries, and would substitute graded provident dispensaries, so as to meet the requirements of every section of society, from the artisan to the small tradesman: the poor to have free cards given them by the benevolent, who would be required to pay a guinea for four cards. These benevolent persons are to be warned by the medical man in attendance of any imposition or unfitness in the recipient. Such conditions involve a large number of benevolent persons and assign an unpleasant duty to medical men. The *City Press* has some sensible observations on the abuse of hospitals and dispensaries by those who can afford to pay. It thinks that the Council of the Hospital Sunday Fund should mark its sense of this evil by withholding grants from institutions which make no attempt at eliminating unfit persons.

POISONING BY HEMLOCK.

IN the *Newcastle Journal* of June 16th is an account of an inquest held on two children, aged respectively nine and four years, who were believed to have died from the effects of eating hemlock. It appears that the children had been playing in a field where their mother was at work. In the evening they complained of fatigue, but this was attributed to the heat. The younger of the two children died the same night and the elder the following night. We have no account of the symptoms or intimation that a post-mortem examination was made. That the deaths were due to some toxic agent is more than probable, and that this agent was the alkaloid of one of the hemlock family not unlikely. At the same time the evidence before us does not warrant us in accepting the explanation embodied in the finding of the jury—viz., that the children were poisoned by hemlock. Was there vomiting, and if so, was the vomit examined for portions of the plant? Was there muscular paralysis proceeding from the legs upwards? What was the condition of the pupils? In most of the recorded cases death from hemlock poisoning has ensued more quickly than happened in the above instances. A man died in three hours and a quarter after eating hemlock (Conium maculatum) in mistake for parsley. A child died in an hour after drinking a decoction of the same plant,

Digitized by Google

Water hemlock, or cowbane (Cicuta virosa), has proved fatal. Hemlock water drop wort (Œnanthe crocata) is another deadly poison of the same order. Two men died in an hour and a half after eating the roots. Three boys partook of the roots and stems, and two of them died within a short distance of the place where the hemlock grew. In all cases of suspected poisoning, and especially where the poison is of vegetable origin, it is advisable that every precaution should be adopted to obtain all available information both before and after death.

THE PROGRESS OF SMALL-POX.

THE outbreak of small-pox at Pembroke Dock does not appear to have ceased, and eight fresh cases were announced in the last report of the medical officer of health. Amongst other provincial towns to which the disease still clings are Plymouth, Liverpool, Dewsbury, Heckmondwike, Liversedge, Bradford, Wakefield, North Shields, and Halifax, six fresh cases having been recently reported from the latter place. There are also isolated attacks in other towns, and it is probable that similiar attacks are occurring in districts whence the disease is not reported. In the metropolis small-pox is abating; and, having regard to the season of the year, it may be assumed that the special danger of extension in epidemic form is postponed until next winter and spring.

POLLUTION OF THE RIVER AIRE.

A LIVELY conference of the sanitary authorities of the West Riding was held at Leeds on the 16th inst. to discuss the great evil of the pollution of the river Aire. The Marquis of Ripon presided as chairman of the County Council of the West Riding. It required all the suavity and firmness of the Marquis to preserve the order of the meeting, many speakers being disposed to question the jurisdiction of the County Council in the matter. An amendment favouring the creation of a conservancy board to carry out the objects and to enforce more care against pollution on the part of the various authorities on the river was lost by a large majority. In the end resolutions were passed calling on the authorities to make good any defects of drainage or of sewage purification and to take steps to exclude from the river and streams all domestic sewage and trade effluents till they were sufficiently purified, also to exclude from the streams solid refuse and rubbish.

WOOLWICH COMMON.

A CERTAIN amount of dissatisfaction is felt in Woolwich in consequence of a recent notice by the military authorities that football and cricket would henceforth be restricted to a somewhat rough and at times damp piece of ground at the back of the Royal Military Academy, which it seems cannot very easily be drained. There was no difficulty about games on the common until within the last year or two, during which the popularity of football has very largely increased, and this game has attracted numbers of young men and boys belonging to the artisan and labouring classes during the hours when they were not at work. It is, however, impossible to play football constantly on any piece of grass without entirely spoiling it, and the consequence was that part of the ground which is ordinarily used for military manœuvres was so much damaged that the games of the civilian inhabitants were restricted to a small portion of the common, which is not generally used for military purposes, close to the houses where many of the officers reside. The incessant playing—often from six in the morning till late at night—and the somewhat rough behaviour and language of some of the players, naturally brought a crop of protests from the residents, and the military authorities have felt obliged to issue the order complained of. Letters and deputations have been sent to the commanding officer asking that a better piece of ground might be granted for games, and that an exception to the rule might be made in the case of young boys, but the reply has been a *non possumus*. The only thing that remains, therefore, is for the local authorities to do their best to drain and level the piece of ground which has been granted, otherwise there will be but little football during the coming winter for the thousands of Arsenal and Board School lads in Woolwich.

THE ASSOCIATION OF FELLOWS OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

OWING to unavoidable delay in issuing the report of the Committee of the Association of Fellows, the annual general meeting and the dinner of the Association have been postponed till Thursday next, the 30th inst. The meeting will be held at 5 P.M. at the rooms of the Zoological Society, and the dinner will take place at the Criterion, Piccadilly-circus, at 7.30 P.M. Mr. George Pollock, the President, will occupy the chair both at the meeting and at the dinner.

THE NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC

THE inaugural address on the occasion of the opening of a new clinical theatre at the National Hospital for the Paralysed and Epileptic, Queen's-square, was on Thursday, the 23rd inst., delivered by Sir James Paget, Bart. The chair was occupied by the Right Hon. the Earl of Stratford. Sir James Paget, in the course of his remarks, made allusion to the vast progress made in neurological science during the past twenty or thirty years, when surgeons only undertook operations upon the brain with the greatest trepidation, and when trephining was only performed as a last resort in cases that were likely to die. "The mortality from that procedure," said Sir James Paget, "could not be accurately ascertained, but it must have been enormous." At the present time these operations had, by the coöperation of scientific experiment with scientific observation, so advanced that they were undertaken now with a feeling of security. He referred to the localisation of the faculties of the brain as a direct outcome of researches made in connexion with hospitals of this kind. Sir James Paget said that in the profession there was an understanding, rather erroneous, that the licence or diploma of a medical man was a thing which not only conferred a legal right but a sort of moral right to practise. Sir James Paget maintained that it declared nothing more than that on the day on which it was conferred the person receiving was fit to practise. Whether he would be fit ten years afterwards must depend upon himself entirely. So rapidly did medical knowledge progress that no man was fit to practise twenty years after he had gained his qualification unless he had been constantly a student. The chairman proposed, and Mr. Victor Horsley seconded, a vote of thanks to Sir James Paget, and Dr. Buzzard proposed and the Hon. H. D. Ryder seconded, a vote of thanks to the chairman, both of which were warmly accorded. We propose in our next issue to give a fuller account of Sir James Paget's speech.

FOREIGN UNIVERSITY INTELLIGENCE.

Breslau.—An ear out-patient and in-patient department, erected by means of the legacy of the late Dr. L. Jacoby, has just been opened under the direction of Dr. Oscar Brieger.

Digitized by Google

Strassburg.—Professor Eduard Schär of Zurich has been offered the chair of Pharmacognosis in succession to Dr. Flückiger.

Vienna.—Dr. Moritz Schustler has been recognised as *privat-docent* in Surgery, and Dr. Foltanek as *privat-docent* in Children's Diseases.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.

THE deaths of the following distinguished members of the medical profession abroad have been announced:—Surgeon-General Roth of Dresden.—Dr. Roussel, Honorary Professor in the Nancy Medical Faculty.—Dr. Rudolf Thiry, *privat-docent* in Ear Diseases in Freiburg.—Dr. Rudolf Demme, Professor of Children's Diseases and Pharmacology in the University of Berne, after a long illness.—Dr. D. P. Skalozuboff, Professor of Nervous Diseases in the University of Kazan.—Dr. Amancio de Andrade, Professor of Medical Botany and Zoology in the Faculty of Medicine, Bahia.

ITALY'S wealth in natural mineral waters is just beginning to be adequately appreciated, even by her own sons. Piedmont especially abounds in these, and on the 16th inst. there was added another to her many "Stabilimenti" for the use of such waters at the Santuario di Mondovì. Dr. Guido Baccelli, who was hindered by professional engagements from presiding at the opening ceremony, telegraphed from Rome his congratulations to the promoters of the "Stabilimento" on their having at last made available for therapeutic purposes a mineral water well-nigh unique for its alterative and depurative properties.

"A FURTHER ACCOUNT of the Proceedings of the Association of Fellows of the Royal College of Surgeons of England from March, 1890, to June, 1892," has just been issued to the members of the Association.

THE annual exhibition of specimens added to the Hunterian Museum of the Royal College of Surgeons of England during the past year will be open for inspection on July 5th, 6th, 7th, and 8th.

THE report of the Committee of the House of Lords on Metropolitan Hospitals is completed, but will not be published for several days.

THE LONDON AND COUNTIES MEDICAL PROTECTION SOCIETY.—A meeting of the Hammersmith and West Kensington Branch of the above Society was held at Southerton House, Hammersmith, on June 15th, Dr. Alderson in the chair. The meeting was very well attended. The minutes of the last meeting having been read and confirmed, the chairman explained that the objects of the Society were—(1) Medical Protection; (2) A Central Council, permanently situated in London; (3) Establishment of local branches with officers. Dr. Winslow during the discussion remarked on the benefit the Lunacy Amendment Act conferred on medical men. By this clause if it could be shown before a master in chambers that proper precautions had been used by the signer and that he had acted *bonâ-fide*, the action then and there came to an end. He submitted to the meeting that if it could be shown that the medical man had not exercised due precaution and had not acted *bonâ-fide* and that the master declined to annul the action, then the responsibility of the Society should cease and should not be responsible for further legal claims beyond the preliminary hearing. It was resolved that the central committee be asked to confirm the following appointments:—Vice-Presidents: C. B. Keetley, F.R.C.S.; J. Savage, L.R.C.P.; Forbes Winslow, M.B., D.C.L.; F. C. Dodsworth, L.R.C.P.; F. Lawrence, M.R.C.S., and E. O. Fountain, M.D., B.A. Council: Chas. Andrews, M.R.C.S.; A. H. Clemow, M.D., and S. D. Clippingdale, M.D., F.R.C.S. Hon. Sec.: Herbert Alderson, M.B.

METROPOLITAN HOSPITAL SUNDAY FUND.

APPEALS MADE ON BEHALF OF THE FUND.

IN accordance with custom, we give below some reports of appeals which have been made in support of the Hospital Sunday Collection. The Mansion House meeting was reported in a second edition of THE LANCET, which was published on Saturday last; but as this edition would not reach the hands of many of our readers, we reprint the report to-day. For the reports of sermons we are indebted to many correspondents, to whom we offer our best thanks for the assistance which has enabled us to place their pulpit appeals on record.

MEETING AT THE MANSION HOUSE.

(The following report appeared in our Second Edition last week.)

THE usual public meeting in connexion with the Hospital Sunday Fund was held to-day (Friday afternoon) at the Mansion House. There was a very large gathering of ladies and gentlemen. The Lord Mayor presided, and among those present were—Sir Sydney H. Waterlow, Bart., Vice-President; Sir Andrew Clark, Bart., M.D.; The Rev. Prebendary E. A. Eardley-Wilmot, Rev. Canon Ingram, Mr. A. Egmont Hake, Rev. T. G. Garten, Rev. John Kennedy, D.D.; Rev. Dr. Marks; Rev. Wm. Hunt, M.A.; Rev. Prebendary Whittington, Lieut.-Col. Nevill, Rev. J. H. Wilson, D.D.; Rev. J. D. Wyatt, Rev. Dr. Löwy, Rev. The Hon. Canon Leigh, Rev. Canon Nisbet, Admiral Trollope, Rev. E. J. Beck, Rev. H. Curtis, Mr. Wakley, Rev. S. A. Barnett, Rev. G. A. Ormsby, Dr. J. G. Glover, Rev. W. T. Du Boulay, and Rev. W. P. Barlow.

The LORD MAYOR, who was received with applause, said: Ladies and Gentlemen,—It is by no means unusual for the Lord Mayor to be addressing a gathering such as I see before me for the special object of aiding the Hospital Sunday Fund; for I may remind you that ever since the foundation of the Fund the Lord Mayor for the time being has always taken the chair, and endeavoured to his utmost to further so good and excellent a movement. Well, now, we are on the eve of Hospital Sunday, and of course our object is to make that day of collection a very substantial and great success. Last year, I believe, there was collected the sum of £45,000. That may strike you as being a substantial amount; but, substantial as it may be, it falls short of the actual requirements of this great movement of ours. Naturally, £45,000 suggests at once that this year, at all events, the sum should be made up to round figures. It was so near £50,000 that naturally we look this time to secure at least that amount. But assuming that we do, we are still very far short of the actual requirements. We want £100,000, and we hope to get it in time. We are all agreed of course that the hospitals, both within the metropolis and without it, are necessary to poor suffering humanity. If we actually endeavour to gauge what the total cost is each year in keeping our hospitals going, we shall find the sum required reaches the enormous amount of at least £800,000. So that what we desire to do by this movement is to contribute towards that amount one-eighth—namely, £100,000. Well, I hope we may succeed in getting it. Let us try. The object is a good one; and I am sure that there are many present to-day who in the past have done a great deal to further and aid this movement. I am sure the inclination to help is strong. Let us see, one and all, whether we cannot add to the amount we have hitherto contributed. Those who have in the past given £10 may possibly see their way now to add £5, or perhaps even to double their subscription. If we can reasonably afford to do so, pray let us do it. Let us not, in appealing to others, forget our own contribution. I am not one to [illegible] that any individual should address [illegible] appeal unless he has set the example [illegible] place, set the example, so that [illegible] friends, and be able to say: "Can [illegible]

Digitized by Google

movement? According to my best power, and my means, I myself have subscribed." You will have learned from the notice convening the meeting that we are to be favoured with an address from Mr. A. Egmont Hake, and I am sure we shall all have much pleasure in listening to it.

Mr. A. EGMONT HAKE then addressed the meeting. He said—

My Lord Mayor, my Lords, Ladies, and Gentlemen,—My purpose in coming before you to-day is threefold: first, to remind you of the sufferings of our fellow-citizens; secondly, to clear away certain misconceptions which have arisen concerning those institutions whose mission it is to succour the suffering poor; and, thirdly, to consider how we may best join hands in support of our hospitals in their courageous battle with disease. The universal interest which is now manifested throughout this great city in the general condition, the fierce struggle, the poignant sufferings of the destitute bears witness to a mighty awakening, to a free and frank recognition of the claims which the unfortunate many must ever have upon the fortunate few. For I think we must all agree that the privations of the people have for some time been a subject of genuine and widespread lamentation. The presence of fabulous wealth side by side with ghastliest poverty; the long-continued depression in industry and trade; the bitter complaints against the severity of competition; the constant recurrence of strikes; the exposure of that vile and disgraceful form of slavery, the Sweating System; the constant and contradictory cry of over-population and over-production; the devices for depriving this country of its best blood by the agency of emigration; the anxiety to banish the destitute foreigner from our shores,—all these circumstances serve to show that the condition of the poorer classes is the foremost question of the day.

The sufferings of the poor are great and bitter, and the outlook is dark enough to call for large-minded patriotism and wise philanthropy. But, amid the comedy and tragedy of our own lives, amid the ponderous erudition of the controversialists, amid the passionate ardour of the politicians, amid the aggressive clamour of the agitators, one of the greatest and most immediate causes of social misery is in danger of being clouded, lost, or forgotten. Still, in the confusion of tongues, in the war of the remedies, in the conflict of clashing opinions, let us remember that if we cannot forthwith bring about the amelioration of the people's condition, we can and must strive to lessen those sufferings which arise from bodily ailments, and which are made doubly poignant by the presence of poverty and privation. Besides the responsibility which rests with the leading classes, with what may be called the flower of the nation, there is another motive which should induce the wealthy to maintain our voluntary hospitals in a state of prosperity—namely, the motive of self-interest. For the advance of medical science, the thorough practice of surgery, the training of nurses, the arrest of epidemics, the development of hygiene — all these advantages, conferred by well-managed hospitals on society, are of as vital importance to the rich as to the poor. And all of us here present, save those who may be suddenly stricken down, must by personal experience one day come to realise these facts.

But, my lord, it is my conviction that there is no need to appeal to the self-interest of those who are in the happy position of being able to come to the rescue of our hospitals. The magnificent charity of wealthy London is universally recognised, for during recent generations it has compassed the world. And if charity with us Londoners does not always begin at home; if the rich are apt to lavish their bounty upon alien races and in foreign climes; if, in the meantime, deserving Englishmen, struggling Englishwomen, and hosts of tiny children representing England's future, are left untended and alone, it is because to many of us squalor and indigence are unfamiliar sights, because suffering is courageously endured and often hidden in the homes, and because the sore needs of the sufferers in this city are seldom so vividly flashed before our eyes as are the appalling needs of the victims of devastating catastrophes abroad. Nothing, however, is further from my intention than to deprecate by a single word that grand and truly Christian charity towards sufferers in distant lands which places our nationality so high in the estimation of the world, and which is such a fit appendage to England's power.

That this vast city is opulent enough to adequately support its voluntary hospitals without interruption to its international charity is a fact of which you, my lord, are well aware; for not long ago you gracefully presided over a meeting convened to assist the victims of the hurricane at Mauritius, and leading Londoners will, I am confident, justify the high opinion of their generosity which you now evince by presiding over us to-day. And never was there a movement that called for deeper sympathy than the hospital movement, for the hospitals combat one of the most potent causes of poverty and misery—namely, sickness. We are disposed to judge calamities by their effect upon ourselves and upon our particular circle. But let us not forget that circumstances may enormously augment the poignancy of misfortune. For example, the loss of sight or hearing is a sore affliction to anyone; but when the light fails the far-famed artist his loss seems unfathomable, and a Beethoven stricken with deafness is a tragedy that must for all time move the world. To us all sickness and disease are terrible enough, but when they fall upon the struggling poor they should evoke the sympathies of every human heart. For what are the London poor? A huge population of workers fighting bravely, but often vainly, for their lives; shelter or no shelter, a mere lottery; their worldly goods week by week in pawn, and, in their struggle to beat back the demons of penury and starvation, risking existence to win a day. And when sickness comes, and lack of charity has shut the hospital door, a new terror has crept into their lives. And the families that can trace their ruin to a case of illness may be counted by the thousand. For how is it possible for the poor to tend their sick when one-third of the population of this city have barely a pound a week with which to support a whole family. Who, then, among us dare say that the suffering poor have not a powerful claim upon the charity dispensed by the voluntary hospitals?

Now I hold that our voluntary hospitals would be in a more flourishing condition were it not for certain misconceptions concerning them. For there are certain people who suppose that the hospitals are Government institutions upon which an unlimited demand may be made, and not voluntary institutions supported by charity; there are certain people who forget that hospital management should not be criticised without technical knowledge, and who seem unaware that rash and irresponsible criticism of them hampers those citizens who bear the burden of their administration; there are certain people under the impression that the hospitals have a sufficient number of hands, while the fact is that personal services are almost as sorely needed as funds; and there are certain people who make no distinction between voluntary hospitals and rate-supported hospitals, and are apt to condemn the former for the shortcomings of the latter. But, in addition to all this, there is a prevailing prejudice which most seriously militates against contributions to the voluntary hospitals. I mean the prejudice in favour of their socialisation. That our hospitals should be taken over by the Government or the municipality and be supported by the rates is an oft-repeated parrot-cry, the full meaning of which is seldom understood.

We all know how such cries become popular. And who are the people who boldly recommend socialisation, and would fain convey the impression that they have mastered the question and have found the solution? I am afraid a large number take up the cry simply from a fear that they may be suspected of want of apprehension. It is Hans Andersen's story of the king's clothes over again. You may remember that only the clever ones were supposed to see the king's clothes, and so everybody pretended to see them, and lavished their praises upon them, save and except one crazy man, who had no hesitation in shouting out in the market-place that the king was—well, what shall I say?—bare-footed up to the neck! For my part, I have no hesitation in following the example of that crazy man, and I declare that there is not a single argument in favour of the socialisation of our hospitals. But of objections to their socialisation there is a formidable array, of which I will mention a few. To place the hospitals upon the rates would be to subject them to bureaucratic management, would be to drag them down to the low level of State hospitals abroad, would result in a better accommodation for the rich than for the poor, would raise up prejudices against hospital treatment, would degrade hospital patients as

the workhouse degrades its inmates now, would bring extra taxation upon employers of labour, and thus increase the number of the unemployed and reduce wages, would deprive the wealthy classes of the high privilege and opportunity of exercising brotherly charity towards their fellow men, would widen the gulf between the classes, and would pave the way for complete State tyranny.

And so, there is only one way of remedying the present state of things. And what is that? Charity—liberal, brotherly, open-handed charity. All that is needed is to remember, and to make our friends remember, that there is this great national humanitarian work waiting for us. No matter to what class we may belong, no matter what our means, no matter what our age, we can all easily find a way of taking a part in this glorious work, and of thus enriching our lives.

Sir ANDREW CLARK proposed the first resolution, thanking Mr. Hake for his address, and pledging the meeting to use every endeavour to arouse the inhabitants of London to the importance of maintaining the hospitals and medical charities in complete efficiency, and calling upon the editors of the daily press and upon the clergy to make an earnest appeal to the people to increase their contributions in order to secure not less than the sum of £100,000. He said:—

My Lord Mayor, Ladies, and Gentlemen,—But a few days ago a very sad accident happened at Bishopsgate station. A few of the passengers were killed, some have been crippled for life, many have been injured, and more than fifty households have been invaded with anxiety, with alarm, or with sorrow. Now, ask yourselves for a moment what would have happened if there had been no general hospitals. Suppose these fifty injured sufferers had been taken each to his own home, and suppose—it is no great demand upon your faith—that each of these homes had the common characteristics of the poorest of dwelling-places. Fancy one of these sufferers with what is called a "compound fracture of the leg" taken to his own room, ill lit, badly ventilated, with noisy but affectionate children, a care-stricken wife, bad food, and only occasionally visited by the local doctor. Imagine what the probable course of that man's sufferings would be! The probable issue would be death. If you will cast your eyes for a moment beyond the sufferer himself, and ask what would be the probable future of his family—— Ah! if I were to forecast that future from the facts with which I am familiar from a knowledge of the sick poor, it would be so terrible a one, that I dare not present it before such an audience as this. What did happen to these sufferers? The general hospitals were there; their doors were opened; no delays were interposed. The sufferers were taken at once into bright, airy, comfortable wards; they were put into easy beds; the highest surgical skill was immediately put at their service; trained nurses carried out the doctors' instructions, and everything was done that could be done for a sick man if he were the greatest in all the land. But there is more to be told about our hospitals. What would London be if there were not hospitals for infectious diseases? Imagine what a pest-house of disease it would become. But, furthermore, imagine that there were no general hospitals. Well, London is one of the greatest, if not the greatest industrial centre in the world; and London—with its docks and its shipping, its railways and their stations; its level crossings and its unparalleled traffic—is continually exposing the dwellers therein to accidents which are at once very numerous and quite inevitable. Imagine if, with the many accidents which happen daily in this great city, there were no general hospitals to which to take the sufferers. I need not tell you—you know as well as I can tell you—that innumerable lives would be lost which might be saved; and that the State and the family would be burdened with burdens almost unbearable, and that life itself in a great city like this might at last become impossible. Such would be our fate in all probability if there were no general hospitals. Now I have said a word in praise of the character of the work done in the hospitals of London. Let us advert for a moment to the amount of the work, and for these details, and for many of the admirable details which my memory will not enable me to give, I refer you to THE LANCET of June 18th, and therein in the Supplement to the ordinary number of THE LANCET you will find particulars concerning this great work which will carry more strongly home to your heads as well as your hearts the importance of this work than anything that I can say. I cannot mention THE LANCET without casting my thoughts back for a moment to 1869, when—I will not say solely, because I am not sure—when, mainly in consequence of the earnest advocacy of that good man, Dr. James Wakley—in consequence of his untiring advocacy, of his unfailing enthusiasm, and of his munificent benefactions—he, assisted by Sir Sydney Waterlow, by Canon Miller, by Sir Edmund Hay Currie, and by Mr. Martin, set upon sure foundations that Hospital Sunday Fund which we are present to-day to advocate. I feel, and I do not think I am boasting, when I say that but for these men whom I have named, it is infinitely probable that this great work would have broken down with its own weight. Last year there were 99,000 in-patients, and of these there were cured 44,000, and relieved 39,000, and 7000 remained in the hospital at the close of the year. Furthermore, there were visits of over 2,000,000 of out-patients. I must pause for a moment in alluding to out-patients. There is a very strong and I think a very mistaken desire to shut up the out-patient departments of the hospitals. I hope it will have some influence with others who have influence in this room, when I say that but for the out-patient department I do not know how any doctor would ever come to acquire a full knowledge of the early aspects of disease. What does that mean? It means everything that is highest in the doctor's work, for if he is thoroughly acquainted with the early aspects of disease and knows its approach, he is ready to grapple with it; and it is then, and then only, that he is sure of having the victory over it. Pray do not sacrifice your out-patient work, for it is the mainspring of all the work that takes place in the hospital. Now, the cost of this work—I think the Lord Mayor did allude to that, I am not sure if it made that impression upon those assembled that it ought to have done. The cost of that work is nearer £900,000 than the £800,000 which my Lord Mayor gave to it. Now, there are three methods in which we strive to collect this. One is by the voluntary contributions of benevolent people. The second method is by receiving sums of money which from time to time have been left for the hospitals by right-minded people. Lastly, by means of the Hospital Sunday Fund. Now, I will say about this Fund that it has not, so far as we can ascertain from returns, injured the amount received from the voluntary contributions of benevolent people by the hospitals, and that is a good thing to be able to say. I will say also that it places upon us to-day a sort of responsibility for raising the sum of £100,000. These hospitals and dispensaries are under responsibilities in carrying on their work to the extent of £100,000. Well, I will not detain you longer, having to move the first resolution. I earnestly request that you will yourselves give, and use all the influence you possess to make others give also. There are many reasons for giving to this Fund and, what is of more importance, I regard the reasons as unanswerable. First, this Fund offers an opportunity of collecting in the cheapest way small sums of money that probably would never reach the hospitals at all. Then it gives—not a light thing—a personal interest to all those who contribute on the Sunday to this great work, and it establishes a feeling which I hope will be a growing feeling, a sort of brotherhood in charity in the sustentation of these hospitals. There is another reason for making small contributions express large sympathies. The small contribution that the widow may give on Sunday enables her to open her heart to those charities for which she feels without the humiliation of giving a penny here and a halfpenny there. Then there are two other big reasons indeed, and I am afraid some of my hearers will not like to hear them. The first of these greater reasons is that the Council is keeping a vigilant eye upon the working and the spending of all the hospitals, for it controls its disbursements, and this accordingly enables it to exercise not only a salutary but a very powerful influence on the management of these hospitals. Surely, in supporting this you are supporting all that is best, and enabling the highest work to be done in the most economical manner. Now I am aware of the objections with which the appeal will be met with. "Times are hard, business is bad, claims are multiplying, expenses are increasing, and I do not see how I am to give more than I am giving." That is the position of the Lord Mayor. He said most considerately and much more charitably than I would: "We are to give if we are able, we are to give reasonably." Now I

Digitized by Google

venture to say, admitting all this is true—and I am afraid it is too true; business is bad, claims are increasing—I venture to say these are just the very circumstances in which you ought to exercise your charity, just the circumstance which teaches charity—that fire from heaven; it is just the very circumstance which, transfiguring the sacrifice, makes it divine.

The Rev. Prebendary EARDLEY-WILMOT seconded the motion. He said he no doubt owed the honour and privilege of this position to the position which his congregation had maintained with regard to Hospital Sunday collections through the energy and devotion of his predecessor, now the Dean of Worcester. Last year the collection reached upwards of £45,000, and, taking an average of the last nineteen years, the sum would amount to £32,000 per annum, which had been administered at a rate not exceeding 3½ per cent. of the amount collected annually, thereby affording the cheapest method of obtaining large gifts, and also of collecting a vast number of small sums which otherwise would not come to the hospitals at all. It appealed secondly to them as philanthropists. Philanthropists would, he thought, acknowledge the benefit of the system of distribution of funds which secured that the distribution should be carried out in the most complete and careful way, and which, at the same time, allowed a vigilant eye to be kept on the expenditure and work of the various institutions, and introduced a salutary influence on the administration of their funds. Lastly, it appealed to them as Christians. In these ways the Hospital Sunday Fund was one which demanded their most urgent support, and he trusted the appeals made to the public of London from that platform and elsewhere would result in a most substantial and munificent contribution to the Fund.

Mr. H. C. BURDETT, in supporting the resolution, made special reference to that part of it which dealt with the appeal to the metropolitan press. No one, he said, was more grateful than himself for the great services which had been rendered to the Hospital Sunday Fund by the metropolitan press. He could not fail to remember that when the Fund fell off very considerably some ten years ago, and they made an appeal to the editors, these latter responded by giving great space in their columns on each of the six days preceding Hospital Sunday. The hospitals used the advertising columns of the press; and he would like to ask the editors to see whether they could not give a special column or half column for each of the days of the week preceding Hospital Sunday to the subject. If they did, he believed it would result in a contribution of something like £25,000.

The resolution was carried unanimously.

Sir SYDNEY WATERLOW, in proposing a vote of thanks to the Lord Mayor as President, said he felt it to be a great privilege for the twentieth time to stand upon that platform to say a few words in support of a movement with which he had been closely connected ever since it was begun. From that beginning to the present time, with one or two exceptions, the collections for this Fund had been yearly increased, and he hoped and believed that the collection to be made this year would, in spite of many difficulties, exceed that which had been made in previous years. When they began in 1872 there were just about 100 institutions applying for help, and this year there were over 150, and many of the old institutions had larger demands and claims upon their funds because they were doing a much larger portion of this absolutely necessary work. There were over 2000 beds which could not be occupied because the hospital authorities had not the assistance they required. He moved the resolution entrusted to him with the greatest pleasure.

The Rev. Dr. KENNEDY said he had the greatest possible pleasure in seconding the motion.

The resolution, which was put by Dr. Kennedy, was carried with acclamation.

The LORD MAYOR, in response, said:—I thank you, Sir Sydney Waterlow, for the very kind manner in which you have submitted my name, and this company for the cordial and warm manner in which they have received it. It is needless to say that it affords me the very greatest possible pleasure to preside over this numerous gathering. We have had a very great treat this afternoon in listening to so many very able speakers. This is not a new movement. It is an old one, and has been nearly, if not quite, twenty years in existence. Sir Sydney Waterlow originated it during his mayoralty, in the year 1872, and from that time down to the present it has gradually, but nevertheless substantially, grown to the position which it occupies to-day. We do not wish to under-estimate the charity and good support of our friends, but nevertheless the institution is capable of greater support, and we do one and all of us desire to see that the contributions shall reach the amount really required—namely, £100,000. At the risk of repetition, I say that the only practical method in which this can be done is not only by giving what we feel we are ourselves able to give, but by interesting others in the movement. We have not done with our obligations, when we have put our hand in our pocket and taken out a sovereign, or when we have written out a cheque for £5, £10, or £20. It is very easy to write out a cheque, especially if you are so disposed and have a balance at the bank. But there is something more required of a man than that. I know the position very well, and shall I give it to you by way of illustration, for I am a culprit myself? If you wish to bestow something suitable on your friends who are to be married, you go out of your way at some self-sacrifice and some loss of time, to choose something which will be suitable and agreeable to them. So it should be in the way of charity, that when you have written out your cheque of £5 or £10 or £20 you should not think that is enough, though it may be generous, but in addition to that you should also take a more active personal interest in the charity to which that cheque is going, and also get your friends to take an equal interest in it. You would be doing double service and an increased amount of good. Here at this meeting we have the presence of many. I take it you are not here from mere curiosity or without anything better to do. You are here with a desire to further this movement. We are grateful for your presence, but all we desire from this platform, and I from the chair, is to tell you that merely coming here and contributing is not sufficient. We expect more at your hands. With the knowledge here imparted to you, and by the smallest exertion on your part, you will be able to interest some other persons to share your sympathies, and to accord their services to this grand movement. Then the object will be attained, the future of the Metropolitan Hospital Sunday Fund will be assured, and even the amount we look for—namely, £100,000—will be secured.

SERMONS PREACHED IN LONDON IN AID OF THE HOSPITAL SUNDAY FUND.

ST. PAUL'S CATHEDRAL.

THE Rev. Dr. Baker, Head Master of the Merchant Taylors' School, preaching at St. Paul's Cathedral upon "The Law of Love," took for his text 1 St. John iv., 10, 11: "Herein is love," &c. Arguing that Christianity based morality upon religion, the preacher showed how St. John summed up the whole of Christian faith and Christian practice in the one word—love. The revelation of God's love for sinful man in the person of Jesus Christ introduced into the world an entirely new principle and ideal of morality. The ruling idea of the ancient world was selfishness. Christianity first destroyed this ideal, and made brotherly love the law of Christian life. This law is not only constantly insisted on in the New Testament, but has been strikingly illustrated in the history of the Christian Church, which is the history of philanthropic institutions. In the middle ages each priory and monastery had its hospital and dispensary. St. Bartholomew's Hospital, originally founded by Rahere in the earlier part of the twelfth century, was a famous illustration, comprising an infirmary for the sick and aged poor, with a lying-in hospital for women and staff of sisters, under the rule of a prior and canons of the Augustinian Order. The beautiful old Norman church of the priory, now known as St. Bartholomew-the-Great, and in process of restoration just opposite St. Bartholomew's Hospital, was an interesting witness to the historical connexion of the church with works of philanthropy and mercy. The many philanthropic institutions of the present day—hospitals, orphanages, refuges, homes, asylums—were all due to that spirit of brotherly love which Christianity was the first to inculcate. By showing this love to our fellow men we might test, as with a thermometer, of the warmth of the love of God.

The Hospital Sunday appeal was probably one that needed fewer words to commend it than any other that could be made. If it had been generously responded to in former years, still how little had been done in comparison with the need and in comparison with the ability to help. This year the need was exceptional, and the appeal also came home with exceptional force after a prolonged winter, in which sickness and suffering had visited nearly every family in the land, and sorrow, national and private, and loss of friends had been only too familiar to all. The exercise of Christian charity was the best and surest way of bridging over the gulf that separated class from class and creed from creed. To-day all joined in professing a common creed, "God is love." By self-sacrifice and unfeigned love of the brethren our hearts would be most surely kept in the knowledge and love of God and of His Son Jesus Christ.

ST. JUDE'S, SOUTH KENSINGTON.

At St. Jude's, South Kensington, the sermon at the morning service was preached by the Vicar (the Rev. Prebendary Eardley-Wilmot), who took for his text 2 Cor. v., 14, 15. The first part of the sermon was a vindication of Christianity from the charge of selfishness and individualism, and an assertion of a claim for the Gospel of Jesus Christ of a distinct superiority over the ethical systems of the day as yielding the highest possible motives for conquering human selfishness and relieving human wretchedness. Coming to the special and practical application of the subject he said: "You are asked to-day, brethren, in common with your fellow Christians throughout the metropolis, to make a very special effort of liberality on behalf of the hospitals, infirmaries, and dispensaries which exist for the relief of the sick and suffering poor—a noble cause, a sacred cause, a cause in which the very tinge of sadness that runs through it makes the more powerful its appeal to the Christian heart. There is no need to enlarge upon the necessity for hospitals or dilate upon the sufferings and dangers they are intended to relieve. Sickness and sin, irreparable consequences of our fall from God, still exist in the world, still are found amongst us, the fruitful sources of the misery and suffering we see around us. The love of God, manifested through the love of Christ, has been exercised to remove the one. He calls upon us by the constraining influence of that love to do our utmost to lessen the other. ..... There is not anything, I will venture to say, for which we should be more thankful in this Christian land than for the many hospitals and dispensaries which Christian charity is sustaining for our sick and suffering poor. Speaking as one who knows something of what work among the poor is, I will even add more. I say that, brought into contact as we clergy are with the sufferings and privations of the poor, our position would oftentimes be intolerable and our duties depressing beyond expression if such blessed institutions as these did not exist. They are, as you know, scattered broadcast over our land and everywhere their usefulness is only equalled by the occasions of usefulness that arise. Eighty-eight hospitals, twenty-one convalescent hospitals, fourteen cottage hospitals, and fifty-six dispensaries are asking the Fund for which we appeal to-day to relieve their pecuniary wants—wants which exceed £100,000. It is perfectly clear, therefore, that the Hospital Sunday Fund, large though it is, magnificent as it is, already must be considerably increased if these hospitals and medical charities are to be maintained in complete efficiency and do to the full their beneficent work among the suffering and the needy. It is a sad and humiliating fact that though the population of London, one of the largest manufacturing and industrial centres in the world, is increasing at the rate of 40,000 per annum, and though the work of our hospitals in relieving this great industrial community is proportionately severe, yet in most of our leading London hospitals beds have been closed for want of funds to maintain them. It would be possible, of course, to meet the necessities of the case by compulsory legislation and to make, as in other countries, our hospitals dependent upon the rates. This would be possible. But how far more noble, far more Christlike, is the system which makes their support come mainly from the free will offerings of the people. How many an opportunity for a thank-offering for personal blessing in sickness is thus afforded. How grand the privilege of bearing in a very special manner one another's burdens and so fulfilling the law of Christ. Never may the people of England be found wanting in the fulfilment of this most sacred duty. 'There is nothing,' said the late Sir Morell Mackenzie, 'in our social organisation on which we may more legitimately pride ourselves than on the number and magnificence of our hospitals, which all owe their existence to private charity, or, it may be, enterprize, and fulfil their mission of healing and relieving human suffering without assistance from the State ..... There are few human institutions,' he said again, 'which do more real tangible good than hospitals; they take no account of creed or country or personal worth, but, like heaven, send the rain of their beneficence on the just and the unjust without distinction.' It is the cause of these institutions, the voluntary hospitals, general and special, I am pleading with you to-day, as it has often been pleaded from this pulpit before and not in vain! Nor, I am confident, will it be in vain to-day. I need not say much to commend the Hospital Sunday Fund, which to-day makes its twentieth appeal, as a most valuable and efficient channel through which your liberality may flow. Men of business will recognise the value of a method of collection which, though it amounts now to upwards of £45,000 per annum, has yet been administered at a rate not exceeding 3½ per cent. of the sums collected annually during the past nineteen years, and which thus affords the cheapest possible method of obtaining contributions, not only in large sums, such as some of you will give presently, but also in a vast number of small sums, which would not otherwise find their way to our hospitals at all. Philanthropists will acknowledge the benefit of a distribution of funds by an experienced and diligent council—a means by which not only is the best possible distribution secured, but by which also a vigilant eye is kept on the expenditure and work of the various hospitals, and so a most salutary influence is exercised on their administration. And every Christian will welcome an opportunity of doing valuable work most effectively, and at the same time in that quiet, unostentatious, anonymous way which sinks self for Christ's sake and makes an offering of love for the cause of the Master and of the suffering ones He came to relieve." The sermon closed with an earnest personal appeal.

UNION CHAPEL, ISLINGTON.

The Rev. W. H. Harwood preached from the text, "I was sick, and ye visited me" (Matt. xxv., 36). He said: "The text is suggestive of an even larger subject than its own immediate appeal—the relationship of our religious faith to questions of physical health and physical disease. The purpose of the sermon is to emphasise the fact that within the sphere of that relationship lie some of the first and highest duties of the Christian life. These duties come to us as inheritance from the past. As a matter of history hospitals and kindred movements are largely associated with religious inspirations. Without entering into any discussion of the somewhat superfluous question of the direct causes of movements intended for the relief of the sick, it is undeniable that when Christianity exalted such relief into a duty urgent upon all its disciples it gave to the most humane tendencies a great inspiration and impetus, and anticipated many generations beforehand, the best results of human progress. That the Christian Church has sometimes forgotten this duty has accounted for the supposed opposition which has unhappily grown up between ministries to the spiritual aid, to the physical nature of man. Where all the emphasis has been laid upon the spiritual nature it has sometimes gone so far that neglect of the body has been taken as a sign of greater spiritual intensity. But in the healthier ages of the Church there has been no such separation; men have felt that the two parts of the life are interdependent, and that they have not yet learned in which to look for the causes of many actions. The opposite tendency to exalt ministries to the sick at the expense of movements for man's spiritual advance is largely due to the fact that the results of the former are so much more speedy and palpable. The joy of conquering disease must appeal to every man with a human heart, but to the religious man it is simply one part of a general gospel of health. For these duties are not only an inheritance, they are closely associated with the Christian faith. The Christian principles of obedience to God and love to God and man are the parents of all kinds of health. The Christian man is bound to serve, as he has opportunity, all [illegible] which lead to health. Such matters as the [illegible] buildings, the cleansing of streets, are as sacred [illegible] in their place as are religious rites in theirs. The [illegible]

Digitized by Google

gious life is to be towards health in all directions. And the larger duty includes the nearer and more immediate duty to the sick; while seeking to secure a larger health for the coming generation, we are bound by every consideration of Christian teaching and example to help those who in this generation are the victims of disease. If all objections be allowed, there are still left enough of the poor and helpless needing the help of hospitals to make an appeal which no heart of human sympathy can resist. The preacher's own experience in the government of an admirable provincial hospital has profoundly convinced him of the unbounded blessings which such institutions confer, and their appeal comes endorsed by the highest divine authority and the urgency of the deepest human need. They who have known within their own circle during the year one case of illness, with its anxieties, hopes, and joys, must by the aid of a sympathetic imagination endeavour to realise the thousands upon thousands of such cases which have been brought within reach of the great skill and wise patient nursing of our great hospitals."

WEST NORWOOD.

The Rev. H. Cooper preached from Rom. viii., 22, 23: "We know that the whole creation groaneth and travaileth in pain together until now. And not only they, but ..... even we ourselves, groan within ourselves, waiting for the adoption, to wit, the redemption of our body." "A marked change has passed over the material creation since it issued fresh from the hands of its great Creator. All was then in harmony, but sin has introduced an element of discord. This is noticeable even in the physical world; we trace it in the volcano, in the earthquake, in the hurricane—those fierce convulsions of nature which bring ruin and devastation in their train. Again, if we glance at the animal kingdom, see how many animals live only by the death of others weaker than themselves. The bird preys upon the insect, the kingfisher upon the glistening fish, the hawk swoops down upon the dove. Every blade of grass (could we see far enough) swarms with animal life which is maintained by the destruction of others; every bucket of water examined through a microscope reveals to us the tyrant and his victim, the pursuer and the pursued. Such are the echoes in the natural world of the mischief which has been wrought in the spiritual world. For man did not fall alone. The confusion which sin had introduced in his relations towards God is re echoed in the confusion of nature's relations towards him. And if we turn to the higher sphere of human life which affects man himself, we trace still more clearly how 'the whole creation groaneth and travaileth in pain together until now.' It is as true now as it was in St. Paul's days, and will be until the end of time. Manners and customs may change, laws and languages may be modified as the generations succeed each other, but the day will never dawn upon this world of time when men shall be able to say, 'There is no sorrow.' Holy Scripture teaches the same truth. Human tales and poems often paint bright pictures and portray scenes of imaginary perfection, but the Bible dwells much on human misery. It speaks throughout of the vanity and unprofitableness of the world, its pleasures and enjoyments, and sheds a halo of sadness (so to speak) over the things of time. And does not experience teach us that, amid the brightest surroundings of human life, there is a deep under-current of sadness which every now and then comes to the surface. The music of marriage-bells gives place to the funeral knell (as we were reminded in the death of our Prince last winter). The sounds of holiday rejoicing are changed into voice of universal sorrow and lament (as we were so sadly reminded on our Whitsun Monday Festival), and the same truth is being daily experienced in every sphere of life. To this sad condition of things the only antidote is Christianity, which lightens all human ills, for it shows us the rainbow of God's mercy even in the darkest cloud and explains to us the divine meaning which underlies our earthly troubles. We must not take a pessimistic view of things. If it seem to us that suffering and death are out of harmony with the goodness and love of the Creator, let two thoughts bring us comfort: (1) That the strange arrangement by which life is evolved out of death is an 'acted parable,' as it were—a picture in the kingdom of nature of that death of Christ upon the Cross to which we owe our everlasting life. (2) That this present system of discord is only meant to be temporary, as nature suggests and revelation plainly teaches. For a day will come when universal harmony shall be restored, when there will be no wars between nations, no discord in the Church, no strife in the household. Yes, we are waiting, all of us, as the poet says, 'for some far-off divine event,' 'Towards which the whole creation moves.' This 'divine event' is described by the Apostle as the 'adoption, to wit, the redemption of the body.' When Christ came on earth He redeemed our souls; that was the first part of His work. For in this life the body is frail and feeble, liable to sickness, subject to death. But when Christ comes again, *then* will the redemption of the body take place. *Then* the whole of His work of redemption will be accomplished, when our mortal bodies shall be raised, changed, and glorified, 'according to the mighty working whereby He is able to subdue all things unto Himself.' I have chosen the subject of a 'suffering' creation to dwell upon this morning because your alms are asked to-day for the support of the metropolitan hospitals, and the strain of thought the words suggest seems especially suitable to the occasion. For when we think of the multitude of our sick and suffering brethren in this great city—not only the inmates of our hospitals, but the wider range of out-patients who are relieved thereby, and the still larger number of those who suffer in their comfortless homes because they cannot obtain admission to the wards—surely we find here an illustration of the Apostle's lament 'that the whole creation groaneth and travaileth in pain together until now.' And when we consider the varied forms of bodily suffering which exist among mankind—those acute disorders which suddenly prostrate their victim, those chronic complaints which slowly wear away the sufferer's life, that ever-increasing class of maladies which are especially produced by our highly organised civilisation and the desperate struggle for a livelihood, those accidents to which so many are liable in the ordinary work of their calling—when we think of all these, are we not reminded that the redemption of man's body is yet incomplete, and that we are waiting for our glorious manifestation as the 'sons of God' which shall more than compensate for all our sorrows here as the 'sons of men'? It is sad to feel that we can do nothing to remove this burden of suffering from our fellow-men. But we may do much to lessen it. God only can cure disease; He permits man to alleviate it. And how can we do this better than by helping to support those institutions established on purpose to minimise physical pain and distress? This year especially the hospital appeal should awaken a warm response in our hearts. Sorrow begets sympathy, and we have suffered (most of us) from the terrible visitation of influenza with which the country was afflicted last winter. Some of us were then laid low upon a bed of sickness and have been restored to health again. Some have suffered bereavement in the loss of dear ones whom we still mourn. Some of us have, in God's mercy, been spared from the dark shadow of disease and death, but in any case we owe a special acknowledgment to Almighty God for His many mercies vouchsafed to us. Let, then, your hospital offering to-day be a thankoffering to Him—let us 'comfort others as we ourselves have been comforted by God.'"

SS. MARY AND MICHAEL.

The Archbishop of Westminster, in preaching at SS. Mary and Michael's, Commercial-road, said that, although he was addressing a great congregation of working people, he called upon them to support the hospitals of London according to their means with as much heartiness as their richer fellow subjects. It was the working people who, beyond all others, benefited by these noble institutions, and he was sure they would all give a helping hand towards their maintenance. Last year the London hospitals had received 99,000 patients, and of these they had cured 44,000, while over 2,000,000 visits had been paid to out-patients. He was sorry to see that there were over 2000 beds that could not be occupied because the Sunday hospital collection fell far short of what was needed. Last year it had amounted to £45,000. The Lord Mayor was aiming at raising it to £100,000. This would meet the demand. Catholics had again and again proved their power of self-sacrifice in a good cause. The Archbishop called upon them to give proof to the whole of London that they appreciated the benefits which the hospitals afforded them by contributing every one of them

Digitized by Google

towards this great public charity, in which all shared irrespective of creed and nationality.

We may recall attention to the fact that, as stated in the letter from the Lord Mayor published in our Second Edition last week, a box for anonymous donations is placed outside the Mansion House as usual; any contributions from those who were absent from London or unable to attend a place of worship on Sunday will be gladly received and promptly acknowledged by his lordship.

ROYAL COLLEGE OF PHYSICIANS.

AN extraordinary comitia of the Royal College of Physicians was held on the 17th inst., the President, Sir Andrew Clark, Bart., in the chair. The meeting was chiefly called to consider communications from the Gresham University Commission and the report of the Committee thereon. This report was adopted with but slight modification, and on the nomination of the President the following Fellows were appointed to give evidence on behalf of the College before the Commission:—The President, the Registrar, Dr. N. Moore, and Dr. Allchin. It was stated that Mr. Hulke and Mr. Howse would similarly represent the Royal College of Surgeons.

Dr. Alfred Birch of Calcutta was elected a Fellow of the College.

The President announced that he had nominated Dr. Halliburton to deliver the Gulstonian Lectures for 1893, and Dr. C. T. Williams the Lumleian Lectures. Dr. Pavy had consented to be the Croonian lecturer for 1894.

The Rev. Dr. Wale Hicks was congratulated by the President on his appointment to a bishopric in Africa. The President's remarks were warmly endorsed by the Fellows present, and were replied to by Dr. Wale Hicks.

A letter was read from Mr. Gurner, thanking the College for their recognition of his services on the occasion of his retiring from the office of bedell.

THE RECENT RAILWAY COLLISION AT BISHOPSGATE.

THE following particulars have been furnished us of the cases, admitted into the wards of St. Bartholomew's Hospital, suffering from injuries sustained in the railway accident at Bishopsgate:—

Case 1: Age fifty-one. Scalp wound and scald; progressing favourably. Case 2: Age eighteen. Bruised and shaken; discharged. Case 3: Age thirty-two. Scalp wound and hæmatoma; discharged. Case 4: Age sixteen. Compound fracture, dislocation of right ankle, simple fracture of right femur, comminution of left tibia and fibula, scalp wounds, and suppuration of ankle-joint. Patient has rallied from the shock. Case 5: Age forty-two. Shock; discharged.

Public Health and Poor Law.

LOCAL GOVERNMENT DEPARTMENT.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

Liverpool Port District.—The past year was one of anxiety in this port, owing to the number of Russian and Polish Jews who passed through Liverpool and to the increase of small-pox. The number of vessels actually infected was 3662, of which 3294 were found in good condition; others required some cleansing or structural alterations. The various occurrences of infectious disease on board are discussed by Dr. Stopford Taylor, and it is pointed out that with a view to more efficient inspection, especially of persons landed on the quay after the vessels have been docked, an alteration in the quarantine law would be necessary. This subject has latterly received much attention in Liverpool. It is also pointed out that the arrangements under which no less than some 200,000 emigrants are annually inspected are not such as to conduce to accuracy of diagnosis, especially in the case of the early stages of infectious diseases.

Handsworth Urban District.—During 1891 the general death-rate for Handsworth was 13·5 per 1000, the zymotic rate being 1·35. The infectious hospital was used for the isolation of forty-two cases of scarlet fever, but apparently no other disease was admitted. The various sanitary circumstances associated with occurrences of infectious disease are described; and a series of typhoid fever cases is referred to in which the disease seemed to have a possible relation to the use of ginger beer from a certain house where a well-water was used which might have become contaminated by the burial of some pigs suffering from swine fever. Three other cases of typhoid fever had, however, occurred in the immediate locality during the preceding year. Water-closets are in some places being substituted for privy-middens, and other good sanitary work is in progress under Dr. J. B. Welch's supervision.

Barnsley Urban District.—Dr. M. T. Sadler records a death-rate of 26·0 per 1000 during 1891 as opposed to a mean of 22·8 for the preceding ten years, with a zymotic rate as high as 4·37, the excess being largely due to measles and whooping cough. Influenza, too, contributed to the excess in the general mortality rate. The Kendray hospital is more and more appreciated and its usefulness is gradually being extended. Amongst the new lines in which progress is being made is the abolition of privy-middens and the storage of filth consequent upon their use, together with the extension of the system of automatic flush closets attached to the dwellings of the working classes.

Dunbarton County Council District.—Dr. John C. M'Vail, well known as an authority on public health, has submitted a very complete report to the County Council and the district committees of Dunbarton, to which county he was last year appointed medical officer of health. The vital statistics are carefully studied, the climate, occupations, and other conditions tending to affect health and disease are discussed, and such subjects as water-supply, drainage, sewerage, and general sanitary administration are entered into in detail. In fact, the report very much resembles a typically complete report by an English health officer whose district covers a number of urban as well as rural districts; and it is probably the difference between the two portions of Great Britain in point of sanitary administration and duties of officers that makes this necessary. The report is well compiled and its educational value will, we trust, be considerable; at all events the material which it sets out cannot fail to be of much use to the localities with which it is concerned.

Fulham.—The death-rate for the parish of Fulham was 19·7 per 1000 last year, as compared with a rate of 21·4 for London as a whole. Amongst the cases of infectious disease coming under notice there were 78 of scarlet fever, 47 of diphtheria, and 47 of typhoid fever; and of these, 52, 23, and 18 respectively were removed to hospital for isolation purposes. Discussing the question of notification, Mr. Cooney is of opinion that measles should be made notifiable by way of experiment for two years. The experiment would probably be a wise one, but we are convinced that two years would be too short a time. What is wanted is to include at least two epidemic periods and two periods when there is but little measles. Then it would be possible to test the effect of the process by way of securing preventive measures in the case of first attacks. Two years would not suffice for this. Some five years probably would. A large number of local questions are discussed in Mr. Cooney's report; as are also certain general questions, such as intermitting and constant water services, trade nuisances and methods of refuse disposal. A considerable amount of information is also given as to local sanitary administration, and the report is calculated to excite a greater interest in the question of public health in the parish than has been manifested in some previous years.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN thirty-three of the largest English towns 7264 births and 3473 deaths were registered during the week ending June 18th. The annual rate of mortality in these towns, which had declined from 19·4 to 17·8 per 1000 in the preceding three weeks, was again 17·8 last week. In London the rate was 17·1 per 1000, while it averaged 18·2 in the thirty-two provincial towns. The lowest rates in these towns were 11·2 in Hull, 13·3 in Croydon, 13·7 in Portsmouth, and 13·8 in Bradford; the highest rates were 21·7 in Halifax, 22·0 in Preston, 22·5 in Oldham, and 22·9 in Liverpool. The

Digitized by Google

3473 deaths included 513 which were referred to the principal zymotic diseases, against 455 and 466 in the preceding two weeks; of these, 196 resulted from measles, 96 from whooping-cough, 88 from diarrhœa, 59 from scarlet fever, 50 from diphtheria, 22 from "fever" (principally enteric), and 2 from small-pox. No fatal case of any of these diseases occurred last week in Norwich; in the other towns they caused the lowest death-rates in Croydon, Derby, Swansea, and Bradford, and the highest rates in Birkenhead, Halifax, Birmingham, and Bolton. The greatest mortality from measles occurred in London, West Ham, Nottingham, Birmingham, Birkenhead, Sunderland, and Halifax; scarlet fever in Bolton; whooping-cough in Huddersfield, Sheffield, Wolverhampton, Blackburn, and Preston; and diarrhœa in Plymouth, Bolton, and Leicester. The mortality from "fever" showed no marked excess in any of these large towns. The 50 deaths from diphtheria included 34 in London, and 2 each in Bristol, Liverpool, Bolton, Manchester, Salford, and Sheffield. One fatal case of small-pox was registered in London and one in Liverpool, but not one in any other of the large towns; 69 cases of this disease were under treatment in the Metropolitan Asylum Hospitals, and 9 in the Highgate Small-pox Hospital, on Saturday last. The number of scarlet fever patients in the Metropolitan Asylum Hospitals and in the London Fever Hospital at the end of the week was 1945, against numbers increasing from 1226 to 1878 in the preceding twelve weeks; 213 cases were admitted during the week, against 215 and 207 in the previous two weeks. The deaths referred to diseases of the respiratory organs in London, which had declined in the preceding five weeks from 304 to 208, further fell to 202 last week, and were 41 below the corrected average. The causes of 87, or 2·5 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Portsmouth, Croydon, Blackburn, Norwich, and in five other smaller towns; the largest proportions of uncertified deaths were registered in Birmingham, Manchester, Salford, Preston, and Halifax.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 20·2 and 20·8 per 1000 in the preceding two weeks, declined again to 17·7 during the week ending June 18th, and was slightly below the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 11·2 in Edinburgh and 14·1 in Leith to 20·6 in Perth and 21·2 in Glasgow. The 493 deaths in these towns included 27 which were referred to whooping-cough, 27 to measles, 6 to diarrhœa, 4 to scarlet fever, 2 to diphtheria, and not one either to small-pox or "fever." In all, 66 deaths resulted from these principal zymotic diseases, against 76 and 82 in the preceding two weeks. These 66 deaths were equal to an annual rate of 2·4 per 1000, which was 0·2 below the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of whooping-cough, which had been 20 and 30 in the preceding two weeks, declined to 27 last week, of which 18 occurred in Glasgow and 3 in Edinburgh. The deaths referred to measles, which had been 32, 34, and 27 in the previous three weeks, were again 27 last week, all of which were recorded in Glasgow. The 6 fatal cases of diarrhœa showed a decline from those returned in recent weeks. The deaths from scarlet fever, which had been 7 and 6 in the preceding two weeks, further fell to 4 last week, all of which occurred in Glasgow, where the 2 fatal cases of diphtheria were also recorded. The deaths referred to diseases of the respiratory organs in these towns, which had been 123 and 124 in the preceding two weeks, declined last week to 94, and were as many as 49 below the number in the corresponding week of last year. The causes of 45, or more than 9 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had declined in the preceding four weeks from 34·6 to 24·0 per 1000, rose again to 31·6 during the week ending June 18th. During the first eleven weeks of the current quarter the death-rate in the city averaged 32·3 per 1000, against 19·2 in London and 18·0 in Edinburgh. The 212 deaths in Dublin during the week under notice showed an increase of 51 upon the number in the preceding week, and included 27 which were referred to measles, 5 to whooping-cough, 1 to diarrhœa, and not one either to small-pox, scarlet fever, diphtheria, or "fever." In all, 33 deaths resulted from these principal zymotic diseases, equal to an annual rate of 4·9 per 1000, the zymotic death-rate during the same period being 3·2 in London and 0·6 in Edinburgh. The fatal cases of measles, which had been 21 and 25 in the preceding two weeks, further increased to 27 last week. The deaths referred to whooping-cough, which had declined from 6 to 1 in the previous three weeks, rose again to 5 last week. The 212 deaths registered in Dublin last week included 32 of infants under one year of age, and 38 of persons aged upwards of sixty years; the deaths of infants showed a decline, while those of elderly persons showed a marked increase upon the number recorded in the preceding week. Six inquest cases and 4 deaths from violence were registered; and 76, or more than one-third, of the deaths in the city last week were not certified.

THE SERVICES.

BRIGADE-SURGEON W. SKUES, M.D.

WE regret to have to announce the death of Brigade-Surgeon W. Skues, M.D., Surgeon-Major, Retired List, Army Medical Staff, at Shrublands, Linden-grove, Nunhead, on the 10th inst., aged sixty-four years. He joined the Army, July 29th, 1853; became Surgeon, July 8th, 1860; Surgeon-Major, March 1st, 1873; and retired with the rank of Brigade-Surgeon, Dec. 2nd, 1881. He was Principal Medical Officer of the expedition from Aden into Arabia against the Arabs in 1865–66.

ARMY MEDICAL STAFF.

Surgeon-Major A. A. Lyle has been posted for duty to the Station Hospital, York.—Brigade-Surgeon-Lieutenant-Colonel G. Andrew has been posted to the charge of the South Station Hospital, Secunderabad, and Surgeon-Major G. D. Bourke has been posted to the charge of the Central Station Hospital, Secunderabad.—Surgeon-Captains G. B. Russell and C. A. Young, doing duty in Burmah, have been ordered to Wellington and Bungalore respectively, Madras command.—Surgeon-Lieutenant-Colonel H. T. Brown, M.D., to be Brigade-Surgeon-Lieutenant-Colonel, vice C. S. Close, retired.

NAVAL MEDICAL SERVICE.—In accordance with the provisions of Her Majesty's Order in Council of April 1st, 1881, Fleet Surgeon Henry Scott Lander has been placed on the Retired List, with permission to assume the rank of Deputy-Inspector-General of Hospitals and Fleets (dated June 15th, 1892); Fleet Surgeon Geo. Bolster has been placed on the Retired List at his own request, with permission to assume the rank of Deputy-Inspector-General of Hospitals and Fleets (dated June 16th, 1892).—The following appointments have been made at the Admiralty:—Fleet Surgeons: I. H. Anderson to Plymouth Hospital (dated June 11th, 1892); R. A. Mowll, M.D., to the *Duke of Wellington*; B. Renshaw to the *Defiance*, and R. Turner to the *Euphrates* (all dated July 8th, 1892). Staff Surgeons: H. A. W. Richardson to Plymouth Hospital (dated June 11th, 1892); H. W. D. Walsh to the *Hecla* and R. Bentham to the *Neptune* (dated July 2nd, 1892); A. L. Christie, M.B., to the *Serapis*, and T. D. Gimlette to the *Anson* (both dated July 8th, 1892); and A. C. Queely to the *Triumph* (dated June 16th, 1892). Surgeons B. S. Mends and J. L. Thomas to the *Excellent*, additional; J. C. Wood to the *Alecto*; H. W. Macnamara and H. E. L. Earl to the *Pembroke*, additional (all dated June 11th, 1892).

YEOMANRY CAVALRY.—Denbighshire (Hussars): Richd. Williams, Gent., to be Surgeon-Lieutenant (dated June 18th, 1892).

MILITIA MEDICAL STAFF.—Surgeon-Lieutenant-Colonel W. Malcomson, 4th Battalion, Princess Victoria's (Royal Irish Fusiliers), resigns his commission; also is permitted to retain his rank and to wear the prescribed uniform on his retirement.

VOLUNTEER CORPS.—*Rifle:* 1st Volunteer Battalion, the Royal Warwickshire Regiment: Surgeon-Lieutenant T. G. McLauchlan, M.B., resigns his commission (dated June 18th, 1892).—3rd (Cambridgeshire) Volunteer Battalion, the Suffolk Regiment: Surgeon-Captain W. R. Grove, M.D., to be Surgeon-Major (dated June 18th, 1892).

"Audi alteram partem.'

THE TREATMENT OF SPASMODIC TORTICOLLIS BY NEURECTOMY.

To the Editors of THE LANCET.

SIRS,—In THE LANCET of June 18th particulars are given by four different writers of cases of spasmodic torticollis treated by removal of a portion of the spinal accessory nerve. In an editorial note on one of the cases it is remarked: "It is still too early to assign its just position to this operation. ..... It is only when the after histories of the whole have been ascertained that a fair judgment of this method of treatment will be possible."

Having now performed this operation on ten occasions, I may perhaps be allowed to state that, in my experience, the results are extremely satisfactory, as in a large proportion of cases there is no recurrence of the spasm.[1] Several of my cases have been lost sight of, two have been operated upon very recently, but in four which are still under observation, where intervals varying from eight to two years have now elapsed since operation, the relief from spasm which followed its performance has been permanent.

I am, Sirs, yours faithfully,

Manchester, June 20th, 1892. F. A. SOUTHAM.

DEATH UNDER CHLOROFORM.

To the Editors of THE LANCET.

SIRS,—Enclosed is a very poor account of the case of chloroform death. I have made my house surgeon's notes as readable as I can, but I cannot personally vouch for their accuracy, except as to the order in which attempts at restoration were applied, and as to the short time—about five minutes—which intervened between the commencement of the anæsthetic and cessation of breathing. I was in the operating theatre, but scarcely saw the man until the moment of alarm. I am quite confident that the death began at the brain centre, which presides over respiration, and that the patient was *irrecoverably dead* from the moment when his breathing first ceased. The following is an account of the case.

The patient, aged fifty-two years, was admitted into Queen's Hospital on May 31st, under the care of Mr. Jordan Lloyd, for the purpose of having an exploratory operation on the right kidney for the relief of some painful malady which had disabled him from work and which had persisted for many months. He was a thick-set, muscular man, of middle height, and inclined to be stout. During his stay in the hospital his various organs were examined, and it was noted that the "heart sounds were normal, but somewhat feeble; apex displaced slightly outwards, and that there were moist sounds over the bases of each lung."

On June 11th pure chloroform was administered in the usual way, on a double fold of lint, by the house surgeon, Mr. Stead. For about three minutes the patient took the anæsthetic well, but then began to struggle rather violently. This struggling lasted two or three minutes, and the patient then began to lose consciousness. He breathed quietly and well for about another minute, when respiration suddenly ceased, and he became livid. The whole period of the anæsthetisation was not more than five minutes, and the operation had not been commenced. The pulse could be felt, and the pupils were less than a line in diameter. Restorative measures were applied for more than half an hour and in this order: inversion, artificial respiration (Howard's and Silvester's), faradisation, heart puncture, venesection, tracheotomy, and direct lung inflation. During these efforts at restoration patient gave one or two feeble gasps, the pulse was lost at wrist almost at once, and pupils dilated towards the end of the fifth minute.

The post-mortem examination of thoracic organs showed that the blood was fluid; the inferior cava and its tributaries were loaded with blood much more so than the superior cava and its branches; the heart was somewhat fatty, dilated, and flabby; tricuspid and mitral valves dilated; the aorta was healthy; the lungs both intensely congested with œdema of right base, the left base was bound down extensively by old adhesions.

I am, Sirs, yours faithfully,

Birmingham, June 22nd, 1892. JORDAN LLOYD.

[1] Brit. Med. Jour., July 11th, 1885, Jan. 31st, 1891.

COPPERED GREEN PEAS.

To the Editors of THE LANCET.

SIRS,—Are you quite sure you are correct in saying, with reference to the use of sulphate of copper in greening vegetables, that "the French Government have prohibited its use in this way so far as home trade is concerned, although they permit the adoption of the *reverdissage* process where the peas are intended for export purposes only"? I am aware that this has been suggested in expert reports, but not that it has ever been officially recognised. More especially also in 1890 I obtained from the British Embassy in Paris a copy of the circular of April 18th, 1889, issued by the French Government, withdrawing the prohibition hitherto existing as the result of the report of M. Grimaux adopted by the Consulting Committee of Hygiene of France, to the effect that "there was no reason for continuing the prohibition on the ground of injury to health." Last year I again communicated with the British Embassy to ascertain if any change in the position had taken place, and was informed that the decree of April, 1889, was the last, and was still in force. As to the present position of this question in this country, it is extremely unsatisfactory, and in my opinion there are only two remedies: either to lighten the burden of proof by making Section 3 of the Adulteration Act read, "so as to render the article dangerous or injurious to health," or by enacting *simpliciter* that no article of food shall be coloured with substances injurious to health, defining such substances so as to include the various metallic and other poisons. This is the straight and sensible method adopted by the German Empire, by the State of Massachusetts and other countries.

I am, Sirs, your obedient servant,

J. B. RUSSELL.

Sanitary Department, Glasgow, June 20th, 1892.

To the Editors of THE LANCET.

SIRS,—*Apropos* of your remarks on this subject in the current issue of THE LANCET, I would instance a case which was lately brought under my notice in which griping pain and diarrhœa were experienced after dinner and on inquiry it was found that the peas in question had been partaken of largely. But it has been affirmed by some that leguminate of copper is insoluble in the stomach and by others that the copper absorbed is so small in quantity as to be practically harmless. The latter supposition can, of course, only be true to a limited extent. Regarding the digestibility of these peas, in the careful research of Drs. Charteris and Snodgrass, to which you refer, it is clearly demonstrated that leguminate of copper is readily soluble in artificial digestants. That leguminate of copper is therefore soluble in the gastric juice is placed beyond reasonable doubt. But in these experiments the peas were (*a*) digested for one hour, and (*b*) digested alone. It might no doubt be urged that in the case of human consumption the peas are usually associated with large quantities of food and that they might thus escape the action, or the full action, of the available gastric juice during the time the food mass was permitted to remain in the stomach. Any undissolved leguminate of copper would, however, be further submitted to the action of the pancreatic juices which the above experiments have shown to be equally capable of dissolving it. It would indeed be interesting to learn how in the light of these experiments the digestibility of leguminate of copper in the human stomach can be disproved; and until such can be done, it is legitimate to regard the symptoms referred to as due to copper poisoning.—I am, Sirs, yours faithfully,

June, 1892. M.D.

RECTAL INJECTIONS OF SALT SOLUTION FOR HÆMORRHAGES.

To the Editors of THE LANCET.

SIRS,—Dr. R. F. Gill recommended (THE LANCET, Nov. 3rd, 1888), in cases of hæmorrhage, the injection per rectum of tepid salt solution at the rate of two or three

Digitized by Google

ounces every ten or fifteen minutes. Supposing all the fluid to be absorbed, it would, at this rate, take *two hours* for that quantity to enter the circulation, which is the minimum found to produce benefit in some cases of intravenous injection. There is good reason to believe that, in the collapse attending *severe* hæmorrhage, rapid absorption does not take place from the intestinal tract. Case 7 in my paper shows the superiority of intravenous over rectal injection. Nevertheless, *hot* saline fluid is a useful stimulant in some of the less grave cases.

I am, Sirs, yours faithfully,

Mansfield-street, W., June 20th, 1892. HERBERT R. SPENCER.

EPIDEMIC DERMATITIS.

To the Editors of THE LANCET.

SIRS,—It may interest some of your readers to know that the epidemic dermatitis, of which 163 cases occurred last year in the Paddington Infirmary and in the adjacent workhouse, has again visited us, though in a milder form and with fewer cases. Indeed, the cases this year would almost have passed unnoticed had we not been on the look out for it. The epidemic appeared for the first time in this infirmary about the end of May last year, and there are now some six or eight cases among the patients in the wards. All but two of these had the disease last year. The disease has exactly the same features which I have already described, and terminates as usual in profuse exfoliation of the epidermis. It is in the hope that some of your readers will do me the favour to come and see the cases, and that we may thus obtain more light on the subject, that I have ventured to trouble you. I will not trespass further on your indulgence, except to add that the disease has also, as I am informed, reappeared in a neighbouring infirmary and hospital.—I am, Sirs, yours faithfully,

Paddington Infirmary, W., June 20th, 1892. THOS. SAVILL.

MALARIA IN ROME.

To the Editors of THE LANCET.

SIRS,—In your article on "Malaria in Italy" the curious fact is quoted that the most densely peopled and filthiest regions in Rome suffer least, while the less crowded suburbs where the houses are few, well built, surrounded by gardens and apparently answering the conditions required for perfect salubrity are extremely unhealthy. It is interesting to note that in the first century of our era a similar incidence of sickness was observed. Up to the time of the calamitous fire in the reign of Nero the city was built in close, narrow winding streets and alleys, the houses usually varying in height from sixty to seventy feet (*vide* Livy and Strabo). After the fire wide streets were laid out and it was an ordinance that "every house should be enclosed by its own walls." Tacitus (Annals, B. xv.), commenting on the improved appearance of Rome, says: "These regulations, which were favourably received in consideration of their utility, were also a source of beauty to the new city; yet some there were who believed the ancient form was more conducive to health, as from the narrowness of the streets and the heights of the buildings the rays of the sun were more excluded, whereas now the spacious breadth of the streets, without any shade to protect it, was more intensely heated in warm weather." Brotier, in a note on this passage, remarks that in his time there were more patients during the hot weather in the wide thoroughfares of Rome than in the narrow places.

I am, Sirs, your obedient servant,

West Brighton, June 21st, 1892. WATKIN W. JONES.

THE LONDON AND COUNTIES MEDICAL PROTECTION SOCIETY, LIMITED.

To the Editors of THE LANCET.

SIRS,—Permit me to observe in reply to the annotation in THE LANCET of the 18th inst. that there are about 5000 medical men practising in what may be termed the London district. As far as I can judge at present over 1000 of these are of opinion that such a society having a central office and council in London is needed, and, still more, acknowledge that, admitting the necessity of such a society, there is no centre equal to London for its successful working, and that London ought in the matter of medical protection to "run second" to no other town. The protection of a member, experience shows, can be more cheaply and efficiently conducted in London. We can there, at the minimum of expense and trouble, obtain the services of a staff of experts. This to men whose time is not merely money, but spent in a great part often without fee in performing onerous and valuable public services, is important both to the experts themselves and to the suffering public. At our head, forming the legal directory, are men of the highest position in all, or nearly all, branches of the profession, and we have the active sympathy and support of others of equal eminence whose names do not appear on our articles &c., but who are ready to help us in defending any wronged and suffering brother. All roads lead to London; from personal experience I know that it is often easier and less expensive to run up to London, and down to any provincial centre, than to attempt the cross-country route, even where one exists, with its delays and other disadvantages. For London men, with their immediate neighbours, the question is a double one. If in trouble or difficulty, would you rather be able to consult in London the chairman of our Emergency Committee, who has power to at once summon a meeting of able men residing within easy reach of his house, and empowered to advise or authorise preliminary steps to be taken to defend you, or go to some distant centre for that purpose?

I am, Sirs, yours obediently,

GEORGE B. MEAD,
Hon. Sec. London and Counties Medical Protection Society.

June 20th, 1892.

CENTRAL AFRICAN THERAPEUTICS.

To the Editors of THE LANCET.

SIRS,—I read with great interest your note on the above subject, but I cannot agree that religious progress will in any way aid in expelling superstition. History tells us that just in proportion to the intensity of religious feeling in a people is the spread of superstition. Had Mr. Currie's views appeared in a reactionary journal they would not have called forth a letter; but in a scientific journal like THE LANCET they are out of place and require notice. Besides all this, are we not making too much of our superiority over African superstition? In 1863 a man was drowned at Hedingham in Essex for being a wizard, and have we not examples enough in English history of barbarities for witchcraft without resorting to Central Africa? What might be said of the murder of Ruth Osborne and her husband at Tring in Hertfordshire, Aug. 22nd, 1751? What is to be thought of the brutality with which James I. had Fian, the Saltpans schoolmaster, murdered for witchcraft, Jan. 26th, 1591? When James I. brought home his bride from Denmark thirty persons were put to death for raising a storm at sea by witchcraft whilst he was on his journey. The few persons sacrificed in Africa for witchcraft sink into insignificance when we contemplate the nine millions of victims sacrificed by Christian Europe, according to Sprengel. Space would not allow of my recounting the Rev. Cotton Mather's witch-hunting in Salem; but before leaving the subject I will just mention that the statute against witchcraft in Ireland was not repealed until 1821. As an evidence of religion promoting superstition, need I do more than mention the exorcism in Edward VI.'s "Book of Common Prayer"; the function of the "laying-on of hands" for the royal touch; the services of Lourdes and such shrines? How religion has retarded medical progress is told in the lives of the earlier anatomists, the closure of anatomy rooms in George's reign, and the hysterical outcry against vivisection and the regulation of prostitution. Medicine is promoted by the advance of science, and superstition flies from the whistle of the steam-engine and the brightness of the electric light.—I am, Sirs, yours truly,

Dublin, June 18th, 1892. GEORGE FOY, F.R.C.S.I.

THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

To the Editors of THE LANCET.

SIRS,—The nonsense written by me has one advantage over that written by Mr. Lawson Tait—inasmuch as it happens to be true, whereas in his last letter to you he

Digitized by Google

makes a statement which has not this distinction. While it is the fact that he obtained and paid for counsel's opinion on the question of appeal, it is also the fact that he afterwards wrote stating his intention of deducting the amount so paid from a sum of £100 which he had all along promised in aid of the legal costs, "provided that the case was fought out to the end," and of which sum he has up to the present time only contributed one half. It is obvious, therefore, that he did not pay for the opinion, but has made the committee do so, although they had voted against any such expenditure as being unnecessary.

I am, Sirs, yours faithfully,

June 21st, 1892. W. G. DICKINSON.

THE VENICE SANITARY CONFERENCE.

A WELL-INFORMED correspondent writes from Paris:—"Considerable doubt still prevails as to the results of the negotiations between the representatives of Great Britain and of France concerning the protocol drawn up by the Venice Sanitary Conference, and which had been accepted by all the nationalities represented with the exception of England and Turkey. The negotiations held in Paris were prolonged, and their lengthy duration gave rise to rumours of an unfavourable description. After calling upon some of the representatives present at the Paris meeting, I am able to affirm positively that there was no disagreement, and that the negotiations have been brought to a satisfactory conclusion. If the negotiations in Paris were of lengthy duration, this was not due so much to difference of opinion as to the desirability of establishing clearer definitions. Lord Salisbury, it appears, feared that if at any future time English influence in Egypt should not be as powerful as it is at present, the local authorities might interpret the clauses of the Venice protocol in a manner calculated to damage the interests of Great Britain. The English representatives were therefore anxious that the meaning of the words employed should be so clearly defined as to preclude the possibility of different interpretations. The term "suspect" was particularly open to this objection. It is now, however, clearly established that a person to be "suspect" must have been in personal contact with a cholera patient. The terms of the Venice protocol, which have already been published in THE LANCET, remain intact for ships that have neither disinfecting-stove nor surgeon on board; but modifications of practical importance have been introduced to the advantage of ships which have on board stoves where disinfection by steam under pressure can be applied and which carry a fully qualified medical attendant. For ships thus provided great facilities for transit through the Suez Canal will be accorded. The persons who have been in contact with a cholera patient may be landed at the Wells of Moses while the part of the ship they occupied and all their clothes and personal effects are disinfected. They may then return on board and remain on board during the period of observation, which is fixed at a maximum of six or seven days. But if these persons can be persuaded to remain on shore altogether, then the ship, after disinfection, may at once proceed on its journey. The "suspected" persons landed would, in that case, continue their journey in some other ship. At the suggestion of the English representatives it was agreed that, instead of landing "suspected" persons, they might be placed on board a pontoon, which would be anchored off the Wells of Moses for that purpose. As, however, such cases will only occur at very rare intervals, it is not likely that the expense of establishing a pontoon will be incurred. The negotiations held in Paris had also for object the conferring on the local sanitary authorities the right to use their discretion in not detaining for too long a period ships on which cases of cholera have occurred during the passage. The detention of such ships is never to exceed six to seven days since the occurrence of the last case of cholera. The time occupied in travelling is to be reckoned, so that a ship, for instance, having a case of cholera on board three days previously to its arrival at the Wells of Moses would not be detained under observation at this station for more than three or four days; and, as already mentioned, would not be kept longer than twenty-four hours, if all the "suspected" persons consented to land and wait for another ship. One of the most practical advantages resulting from the Venice protocol is the abolition of detention formerly imposed upon ships that came from ports where cholera prevailed. These ships will now be allowed to proceed through the Canal at once if there be no case of cholera on board. Inasmuch as in actual practice cases of cholera very rarely occur on board ship, but, on the other hand, ships frequently come from ports where cholera prevails, it will be seen that the new regulations remove the principal obstacle to easy transit through the Canal. As all these stipulations have now been accepted by the British Government, it is considered that the other powers are not likely to raise any objection, and that the protocol—as drawn up at Venice and amended in Paris—will soon be signed and have the force of law. Some surprise and much satisfaction are expressed at the willingness with which the English Government consented to the modification of the constitution of the Alexandrian Sanitary Commission, though this alteration gives England a smaller representation on the Commission. This, however, renders the Commission more international in its character, and for this reason gives greater satisfaction to the various continental powers concerned."

LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

Election of Honorary Assistant Medical Officers to the Royal Infirmary.

ON the 16th inst. the newly created Election Committee of the Royal Infirmary met for the first time in its board-room for the purpose of electing one honorary assistant physician and two honorary assistant surgeons. The committee is composed of the members of the general committee, the physicians, the surgeons of the infirmary, the two surgeons of the Lock Hospital, and a number of trustees—i.e., subscribers of two guineas and upwards, or donors of thirty guineas and upwards—annually elected, bringing up the total number to ninety-five. Of these upwards of fifty attended. For the assistant physicianship there were seven candidates; for the two assistant surgeoncies five. The election was by ballot, and, at its conclusion, the chairman announced that Dr. Thomas Robert Bradshaw had been elected assistant physician and Messrs. Geo. Gibson Hamilton and Wm. Thelwall Thomas, assistant surgeons. Mr. Hamilton's election will cause a vacancy in the office of surgeon to the Northern Hospital, which is also to be filled by an election committee. To the candidates this new mode of election is a great economy as well as free from the odious duty of canvassing trustees. The general impression appears to be that it is a very great improvement upon the former mode of election.

Declarations of Stillbirth.

The Births and Deaths Registration Act of 1874 contained a clause regulating the burial of stillborn infants, requiring the production of a medical certificate or a declaration signed by some one of a number of persons specified, and enacting heavy penalties for any breach of this law. But unfortunately there was no form of medical certificate or of declaration given in the Act or its schedules, these being left to the practitioners giving the certificates or to the persons making the declaration. This latter it must be observed is not a statutory declaration requiring the attestation, but a declaration in the same sense as that given by informants to registrars of births and deaths, or to clergymen before the publication of banns. The Toxteth-park Burial Board have provided for use, at their cemetery in Smithdown-road, a form which is in all its details very complete. This must be signed by the person responsible—i.e., the father, mother, occupier of the house, or person present at the birth. The registrar is most careful to read over the declaration and the penalty clause. This form and these precautions are examples which might well be followed elsewhere. For medical practitioners a form of certificate of stillbirth has been issued by the Registrar-General, as intimated in THE LANCET some months ago, and books of forms can be had either direct or from the registrar of any subdistrict.

Liverpool and Neighbouring Health Resorts.

Although the weather cannot be called settled as yet, many of the inhabitants of this crowded city have availed

Digitized by Google

themselves of the proximity of the many seaside resorts which are so easy of access from Liverpool. To those who can reside for some time at the seaside, New Brighton, Hoylake, and West Kirby offer many advantages, being all now accessible by rail. On the Lancashire side Seaforth, Waterloo, and Southport are favourite localities, especially the latter. To those who have little or no reason to dread *mal de mer*, the Isle of Man affords a complete change and an air almost as bracing as the deck of a steamer, while the voyage is much shortened. In addition to Douglas and Ramsey, the central and northern towns, Castletown, Port Erin, and Port St. Mary in the south, with Peel in the west, have all excellent hotels and comfortable lodgings for visitors. To those who can only afford a day's holiday at a time the sail to and from Douglas, Llandudno, Beaumaris, or Menai Straits is both health-giving and pleasurable. Monthly and season tickets can be obtained on most moderate terms, enabling those who may wish to do so to spend a considerable portion of each day at sea, sleeping in England or Wales each night.

June 22nd.

NORTHERN COUNTIES NOTES.

(FROM OUR OWN CORRESPONDENT.)

A Medical School Board Officer wanted.

THE Newcastle School Board, wishful to appoint a medical officer of their own to certify as to the health of their officers and to fulfil other duties, are about to make this appointment. It strikes one, however, that the board have not been at all "lavish" in their remuneration. The medical officer will have to examine all teachers seeking appointments under the board and visit all the staff who may be laid up with any serious illness. The board have, I believe, about 400 teachers alone. The sum offered, as pointed out by a member, is quite inadequate. It has a fine sound in "guineas"; but when reduced to vulgar and everyday sterling money it amounts to 10*s.* 6*d.* per week, or just half as much as they would probably offer to their porter or messenger. The appointment should, by right, go a long time "begging."

Municipal Visit to Newcastle.

A large deputation from the Leeds Corporation visited Newcastle on Saturday last for the purpose of inspecting the new city fever hospital. The members expressed themselves highly pleased with what they had seen, and the ex-Mayor of Leeds said they considered the hospital superior to anything they had seen. The deputation was afterwards entertained to luncheon by the Mayor of Newcastle, when it was stated that the Leeds Corporation have just acquired a very large estate, about three miles from Leeds, called Mannsfield Hall and containing about eighty acres, for the purpose of erecting a large fever hospital, and, in addition, they intend to build a convalescent hospital for patients upon the same estate.

The Newcastle Cathedral Nurse and Loan Society.

The annual meeting of this Society has been held, and the report showed a very large amount of work had been done during the past year, for 19,252 visits had been paid, and the night nurses had been out 848 times. The Convalescent Home of the Society at Shotley Bridge had proved most valuable, and the Home at Hexham was also in progress. The plans for the site had passed the local board, and the contract had been signed for the building; it is hoped that before the next report the building will be finished and in full working order. About £1000 are, however, still wanted to meet all necessary expenses.

Two Children poisoned by Hemlock.

Two little girls, sisters, aged four and nine, were unfortunately poisoned by hemlock at Newton Hall, near Corbridge, last week. The children were playing in a field where their mother was working and found the poisonous plants which were growing in a quarry hole near at hand. The younger child died the same night, and her sister the next day. The rector of the parish has written to the papers to urge the necessity of making children acquainted with the poisonous plants of their district; he considers that this instruction might be very well given in the schools.

Darlington and Cremation.

As a result of a ballot taken in Darlington as to the granting of a way leave through the cemetery to the crematorium there, the result showed 4110 votes against and 53 in favour of the granting of the way leave to the cremationists.

Small-pox at Middlesbrough.

A fatal case of small-pox has occurred at Middlesbrough. The medical officer of health, Dr. Malcomson, reported the removal of a Spanish sailor from a vessel which had arrived in the Tees from Bilbao. The man, he said, was nearly at the Fever Hospital when he heard of the case, when he should have been sent to the Small-pox Hospital floating in the river, but he did not deem it advisable to take him back through the town. Dr. Malcomson speaks of the imperfect instructions given to foreign vessels having infective diseases aboard. The crews cannot speak English, much less read it, and he very properly suggests that the code of instructions suitable for these cases should be translated and printed in the various continental languages, so that captains would understand how to communicate with the officials on shore in cases of sickness and that they must not send them on shore without authority. The man, I hear, has since died.

Carlisle and its Water-supply.

The people of Carlisle are much exercised as to their water-supply, which is at present far short of the requirements of the city and district. Fortunately, however, the sources of supply are not far distant; and further, Mr. J. G. Goodchild of Edinburgh has shown in a paper lately read the great probability of there being an abundant supply under the Penrith sandstone along the western bank of the River Eden; but it is likely that the Carlisle people will find their supply nearer to their city. At all events, it is merely an engineering question now, and not at all a difficult one.

Death of Mr. J. J. Johnstone of Brampton.

Mr. J. J. Johnstone of Brampton, near Carlisle, died last Wednesday at his residence, The Hollies, in his eighty-fourth year. Mr. Johnstone came into the district about fifty-seven years ago and had an extensive general practice; he was also a skilful operator. About twelve years ago, through failing sight and health, he was compelled to relinquish his practice. He held during his time of professional activity many appointments. Mr. Johnstone has left a widow and two daughters.

Mrs. Ostle of Birkby has bequeathed to the Cumberland Infirmary £200 and to the Royal Albert Asylum, Lancaster, £50.

The amount subscribed towards the public memorial in Berwick to the late Dr. P. W. Maclagan has now reached £100.

Newcastle-on-Tyne, June 22nd.

SCOTLAND.

(FROM OUR OWN CORRESPONDENT.)

Appointment of Pathologists to the Edinburgh Royal Infirmary.

AT a meeting of the managers of the Royal Infirmary on Monday, Dr. Robert Muir and Dr. R. F. C. Leith were appointed pathologists in succession to Dr. W. Russell, who has become an assistant-physician, and Dr. W. H. Barrett, who has gone to Belfast as lecturer on pathology. Both Dr. Muir and Dr. Leith were distinguished students, and both are teaching pathology, the former inside the University, the latter in the Extra-mural School.

Scottish Universities Commission.

The Commission resumed some time ago its sittings in Edinburgh, and has been engaged in rehearing evidence as to the place of materia medica in the five years' curriculum. So far as can be ascertained the Professor of Materia Medica does not seem to be in harmony with his colleagues on this question. In fact, it is said that the reopening of this question was a surprise to some of them. This week the Commission has been examining witnesses regarding the redistribution of chairs between St. Andrews and University College, Dundee.

The Health of Edinburgh.

The mortality last week was 52, making the death-rate 10·0 per 1000. Diseases of the chest caused 23 deaths and

Digitized by Google

zymotic diseases 3, all of which were due to whooping-cough. The intimations for the week were: typhoid fever, 2; diphtheria, 4; scarlet fever, 34; measles, 76.

Action under the Public Health (Scotland) Act.

A case has been before the sheriff of Midlothian, in which the pursuer sues one of the district committees of the Midlothian County Council. The pursuer alleged that in January last, in consequence of a case of scarlet fever being notified in his house, the medical officer of the county ordered the pursuer to close his shop in which he carried on the business of a restaurateur, and that he had done so for six weeks. The pursuer estimated his loss at £50. The defenders denied the statements as to the pursuer being ordered to close his premises, and explained that all that was insisted on was that the child should be isolated. The sheriff has dismissed the action, and in his note states that where damage has been sustained by reason of the acts or operations of a public body not authorised by the statute under which it acts, the remedy is by an action of damages at common law, and not by a claim for compensation under the statute. He, however, does not find in the Act anything which would empower the defenders or their medical officer to issue and enforce the order of which the pursuer complained, and he is therefore of opinion that the pursuer's remedy is by an ordinary action of damages if he can show that the defenders or their medical officer exceeded their statutory powers. This is said to be the first occasion on which the question has been decided in a law court.

The City Hospital, Edinburgh.

The Public Health Committee of the Edinburgh Town Council have decided to ask the Council to authorise the expenditure of £550 for the establishment of a hot-water apparatus to the hospital.

The Edinburgh University Court.

Amongst other matters before the Court last week was the continuance of the recognition of Professor Windle, Queen's College, Birmingham, as a teacher of anatomy on change of teaching rooms from Queen's College buildings to Mason's College. Dr. R. F. C. Leith was granted recognition as a teacher of practical pathology in Edinburgh.

June 21st.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

Death of Mr. William Colles, F.R.C.S.I.

By this gentleman's death a vacancy for a surgeon in ordinary to Her Majesty in Ireland has arisen. I understand that Mr. Philip Crampton Smyly, M.D. Dub., F.R.C.S.I., is a candidate for the post, and his selection would give general satisfaction. Mr. Smyly is surgeon to the Meath Hospital and a member of the medical staff to the Lord-Lieutenant. Of unsullied reputation, strictly honourable in every transaction of life, he has the respect and esteem of his professional brethren and of the community at large. No better selection could be made than the appointment of Mr. Smyly as Mr. Colles' successor.

Adelaide Hospital, Dublin.

The Hudson Scholarship, consisting of a gold medal and a cheque for £30, has this year been awarded to Mr. T. E. B. Meyler, and the Hudson prize—a silver medal and £10—to Mr. F. W. Staunton. These prizes were established in memory of the late Dr. Alfred Hudson, an eminent physician for some years attached to the hospital. The subjects for examination are numerous and the competition keen for the rewards offered by the authorities of the institution.

Dublin University Tercentenary.

The following is the amended programme for the celebration of the tercentenary of the University, which will commence on July 5th and terminate on July 8th:—

Tuesday, July 5th.—10 A.M: Reception of guests and delegates by the Provost in the Examination Hall. 11.30 A.M.: Commemoration service in St. Patrick's Cathedral, to which a procession will start from the Examination Hall; guests and delegates will be expected to attend in their academic robes or official costume. 3 P.M.: Cricket match in College Park—Cambridge Eleven *v.* Dublin University. 4 P.M: Garden party in the Fellows' Garden. 9 P.M: Performance of Tercentenary Ode by the University Choral Society in the Leinster Hall. 10 P.M.: Reception and ball by the Lord Mayor.

Wednesday, July 6th.—12 noon: Conferring of honorary degrees in the Examination Hall, Trinity College. 3 P.M.: Meeting in connexion with the graduates' memorial. 3 P.M.: Cricket match in the College Park. 3 P.M.: Garden party at the Viceregal lodge. 6.45 P.M. Tercentenary banquet in the Leinster Hall.

Thursday, July 7th.—11 A.M.: Procession in academic robes or official costume from Trinity College to Leinster Hall. 11.30 A.M.: Presentation of addresses by the delegates in the Leinster Hall. 4 to 6 P.M.: Garden party at the Royal Hospital. 8 P.M.: Dramatic performance in the Gaiety Theatre.

Friday, July 8th.—11 A.M.: Addresses to the students by certain of the University guests in the Examination Hall. 12.30 P.M.: College races in the College Park. 10 P.M.: University ball in the Leinster Hall.

The tercentenary medal to commemorate the event has on one side two heads—Elizabeth and Victoria—and the dates 1592 and 1892, with the motto "Ab Elizabetha ad Victoriam"; while on the other side are the arms of the College, and the words, "Trinity College, Dublin, Tercentenary." The medal has no raised rim, and is two inches and a half in diameter, and can be had in bronze or silver. On Saturday the Board of Trinity College received a memorial signed by 10,000 Irish ladies, asking that from the date of the tercentenary the educational benefits of the University may be extended to females.

At a meeting of the Board of Governors of the Catholic University School of Medicine, held on Tuesday, the 14th inst., it was decided to create a chair of Pathology and Bacteriology, the incumbent of which is to have a seat upon the Medical Faculty. It was also resolved that Mr. Edmond J. McWeeney, M.A., M.D., Pathologist to the Mater Misericordiæ Hospital, be appointed to the new chair.

June 21st.

Obituary.

WILLIAM COLLES, M.D. T.C.D., F.R.C.S.I.

MR. COLLES died on June 18th at his residence in Stephen's-green, Dublin, in his eighty-fourth year. He was the son of the celebrated Abraham Colles, who was Professor of Surgery, Anatomy, and Physiology in the Royal College of Surgeons in Ireland and President of that institution when only twenty-eight years of age. Mr. William Colles was educated at the Feniaiglian School, and graduated in Arts in the University of Dublin in 1831, and ten years later in Medicine. He studied at Steevens' Hospital and the School of the College of Surgeons. In 1831 he was admitted a licentiate of the College, and was President in 1863-4. Mr. Colles retained a seat on the Council of the College until the last few weeks, and held the post of secretary and librarian for twenty-seven years, having been succeeded on the 6th inst. by Sir Charles Cameron. He was a visiting surgeon for many years to Steevens' Hospital, and for some time lecturer on surgery in the medical school attached thereto. Mr. Colles resigned the post of Regius Professor of Surgery in Trinity College, which is now held by Sir George Porter, and at the time of his death was Surgeon in Ordinary to Her Majesty in Ireland and consulting surgeon to the Rotunda Lying-in Hospital.

ROYAL COLLEGE OF SURGEONS IN IRELAND.—At a recent meeting of the President, Vice-Presidents, and Council the following examiners were elected for the ensuing year:—Anatomy and Surgery: John Barton, William Stoker, Sir William Stokes, and William Thompson. Physiology, Histology, and Pathology: R. Glasgow Patteson and J. Alfred Scott. Chemistry and Physics: Robert J. Montgomery. Midwifery and Gynæcology: Samuel R. Mason. Ophthalmology: Patrick William Maxwell and Ferdinand Odevaine. Diploma in State Medicine: D. Edgar Flinn, J. Dallas Pratt, P. Crampton Smyly, and William Stoker. Midwifery Diploma: Samuel R. Mason, John J. Cranny, and Jeremiah O'Donovan. General Education: Frank J. Davys and Robert Morton.

Medical News.

SOCIETY OF APOTHECARIES OF LONDON.—The following candidates have recently passed in the subjects indicated:—

Surgery.—A. Baldwin, Edinburgh; W. R. Floyd, Cambridge and Liverpool; A. D. Howard and A. J. Russell, London Hospital; E. Howgate, Yorkshire College, Leeds; C. T. Parsons, St. Mary's Hospital; J. S. Tabb, Charing-cross Hospital; P. M. Thomas, Cleveland, U.S.A.; W. H. Waddington and J. D. Willis, Owens College; R. B. Williams, St. Thomas's Hospital.

Medicine, Forensic Medicine, and Midwifery.—C. R. Batchellor and S. D. Gill, Queen's College, Birmingham; J. N. Dobie, Cambridge and St. Mary's Hospital; W. R. Floyd, Cambridge and Liverpool; C. T. Parsons and W. F. Peacock, St. Mary's Hospital; J. A. T. White, St. Bartholomew's Hospital.

Medicine and Midwifery.—J. Edwards and A. Greenwood, London Hospital; W. Loades, Middlesex Hospital; T. E. Pallett, Westminster Hospital; S. J. Roberts, Guy's Hospital.

Forensic Medicine.—E. E. Frazer and W. K. Steele, Guy's Hospital; J. H. Hobling, St. Mary's Hospital; J. Kyffin, London Hospital.

Midwifery.—J. C. Netherton, Dublin.

To Messrs. Floyd, Frazer, Gill, Kyffin, Parsons, Steele, and Tabb was granted the diploma of the Society entitling them to practise Medicine, Surgery, and Midwifery.

PRESENTATION.—Dr. George B. Currie of Insch was presented on the 13th inst., prior to his leaving the district for British Honduras, with a gold watch by his friends and well wishers at Insch.

MATER MISERICORDIÆ HOSPITAL, DUBLIN.—At a recent examination the following prizes were awarded:—Leonard Prizes: Medical—Gold medal, J. O'Donnell; silver medal, J. Brennan. Surgical—Gold medal, J. McGee; silver medal, J. O'Donnell.

THE QUEEN has been pleased to give and grant unto Thomas Rawson Ker, Esq., and James Patrick Andrew Wilson, Esq., L.R.C.P., L.R.C.S. Edin, Her Majesty's Royal licence and authority that they may, respectively, accept and wear the Insignia of the Order of the Crown of Johore of the Third Class.

THE NEW SANATORIUM, SALFORD.—Alderman P. Keevney, the Mayor of the borough, formally opened on the 15th inst. the new Ladywell Sanatorium, or hospital for infectious diseases, for the borough, which has been erected on the Eccles New-road, near Eccles, at an outlay of £50,000.

GATES AND BARS, NORTH-WEST LONDON.—The St. Pancras Vestry has resolved to remove the gate in Gower-street, opposite University College Hospital. The vestry will purchase the roadway in Gower-street, between University College and the hospital, for £15,000. The authorities of University College are the freeholders, and this sum is to be applied towards rebuilding University College Hospital.

ROYAL (DICK) VETERINARY COLLEGE.—The new appointments in connexion with the Royal (Dick) Veterinary College consequent on the resignation of Prof. McFadyean are as follows:—Chair of Veterinary Surgery and Obstetrics: J. R. H. Dewar, F.R.C.V.S.; Chair of Anatomy and Histology: A. E. Metham, M.R.C.V.S.; Lectureship in Pathological Histology and College Assistant; S. Stockman, M.R.C.V.S. All three gentlemen are graduates of the College. Mr. Dewar was a distinguished member of Sir Joseph Lister's and other classes at the University. Mr. Metham gained the Dick Bursary for 1889, and was also first prizeman in the Fitzwygram competition for that year. Mr. Stockman, after graduation, went to Alfort and worked in Nocard's laboratory.

BRADFORD MEDICO-CHIRURGICAL SOCIETY.—The report for the past year shows a steadily maintained increase in the scope of the work of the Society. The discussions and papers read have been excellent and so numerous that a change in procedure has had to be adopted owing to pressure on the time of the Society. The following were elected office holders for the ensuing session:—President: Dr. Bell. Vice-president: Dr. Sutherland. Treasurer: Dr. Goyder. Council: Dr. Major, Dr. March, Mr. Farrow, Dr. Berry, and Messrs. Mercer and Wilmot. Secretaries: Drs. Hermann Bronner and J. J. Johnston. Librarians: Messrs. Althorpe and Pettitt. Pathologists: Dr. Major and Mr. Pettitt. Auditors: Drs. Foster and Whalley.

INCREASED DUTIES OF HEALTH OFFICERS.—In consideration of the extra duties imposed by the Public Health (London) Act, 1891, upon medical officers of health, the Vestry of St. Leonard, Shoreditch, have increased Dr. F. J. Allan's salary by £150.

BARON HIRSCH AND MEDICAL CHARITIES.—There is a great deal, says *Truth*, both written and spoken concerning the demoralising influence of racing, but as regards Baron Hirsch we have apparently a strong argument to the contrary. Baron Hirsch is just now distributing amongst the London hospitals a further large sum, the result of his winnings in the 1000 Guineas, the Oaks, and various other races, including the Derby, in which La Flèche ran second. Sums varying between £300 and £500, before these remarks see the light, will have been allotted to several deserving charities, and amongst others the Victoria Hospital for Children, Queen Charlotte's Hospital, the London Hospital, the North West London Hospital, St. George's Hospital, and the Hospital for Sick Children in Great Ormond-street will have benefited by the millionaire Baron's munificence. In future the running of Baron Hirsch's horses will be watched by the public with increased interest, seeing that his profits on the turf are apparently to be devoted to the relief of the and of the sick poor.

MEDICAL NOTES IN PARLIAMENT.

The Study of Inebriety.

IN the House of Lords on Friday, June 17th, petitions were presented by the Society for the Study of Inebriety in favour of further facilities for the reception of diseased inebriates in homes.

The Metropolitan Hospitals Committee.

In the House of Commons on Friday, June 17th, Mr. Ritchie moved that a message be sent to the Lords for a copy of the report of the Committee on Metropolitan Hospitals, Dispensaries, &c. The motion was agreed to. On the same day the message was received in the House of Lords, and it was agreed to accede to the request of the other House.

Infectious Hospitals Bill.

In the House of Lords on Tuesday, the 21st inst., Lord Thring moved the second reading of this Bill, and said it was brought in on the recommendation of the County Councils Association. The object of the Bill was to provide hospitals to which persons suffering from infectious diseases could be speedily removed, and where they would have the benefit of complete isolation. Where local application was made the County Council might provide for the establishment of an infectious hospital. It was necessary that the local application should be made by a rural or by an urban sanitary authority or by twenty-five ratepayers in any contributory place, and that this application should be supplemented by a report of the medical officer of health. The Bill provided for a local inquiry as to the necessity of hospital accommodation, and gave the district the right of appeal to the Local Government Board, a similar power being allowed as to the constitution of the hospital committee. The Bill was read a second time.

Medical Officers of Prisons.

Dr. Farquharson asked the Home Secretary whether he had received a communication from the chairman of the Parliamentary Bills Committee of the British Medical Association submitting to him a statement on behalf of the committee concerning certain hardships and disadvantages in the present duties, pay, and prospects of the medical officers of prisons; and whether he was able to say that he would take measures to give effect to the suggestions set out in the memorial so submitted.—Mr. Matthews: Yes, sir; a communication of the nature described from the chairman of the Parliamentary Committee of the British Medical Association has been received. I am well aware of the important and useful services rendered by this branch of prison officers, and any representations coming from them will meet with my most attentive consideration. It must be borne in mind, however, that the pay of the medical officers and assistants was revised and increased so lately as 1883. I do not feel able to say that I can make any recommendation to the Treasury upon the memorial referred to.

The Board of Agriculture.

A new standing order has been adopted by the House of Commons with reference to the deposit of Bills with the Board of Agriculture It sets forth that on or before Dec. 31st a printed copy shall be deposited at the office of the board "of every local Bill which relates to the drainage of land in England or Wales, or which relates to the improvement of land in England, Wales, or Scotland, or to the erection, improvement, repair, maintenance, or regulation of any market or market place at which cattle are exposed for sale, or to any matter within the jurisdiction of the Board of Agriculture, or which proposes to alter the boundary of any county, sanitary district, parish, or any other administrative area in the United Kingdom."

The Scarlet Fever Case at Fulham.

In the House of Lords on Thursday evening Lord Sandhurst called attention to the circumstances regarding this case of the girl who was removed by order of the magistrate from the Middlesex Hospital to the West London Fever Hospital under the idea that she was suffering from scarlet fever, although the child had been for six days in the Middlesex Hospital, where plenty of means of isolation were at hand. His lordship detailed the circumstances of the case, which were reported at length in the last issue of THE LANCET, and explained how Dr. Cayley, Senior Physician to the Middlesex Hospital, had gone to see the child out of pure philanthropy and with no expectation of a fee, and had determined that there were no

Digitized by Google

symptoms of scarlet fever in the case. The magistrate had taken it upon him to make some remarks upon Dr. Cayley, but he (Lord Sandhurst) did not think that the reputation of that distinguished gentleman was likely to suffer owing to the remarks of the police magistrate.—Lord De Ramsay, replying on behalf of the Government, said if the authority wielded by the Public Health Act was arbitrarily to tear children away from their parents, those children being the subject of great differences of opinion amongst doctors, then it was absolutely necessary to have the supreme control of the Home Office to keep medical officers in order. The noble lord, however, must remember that the medical officers had to be very careful in these matters, so as to take in time any cases of contagion, which might rapidly spread and cause much misery. At the same time, however, there was much difference of opinion amongst most competent men upon both sides. Then he could not but think that although the diagnosis might have been different, still it would be more advisable for the medical officer to have paused a little. The Home Secretary had not had the benefit of hearing the magistrate's views upon the case, as he was away on leave of absence and therefore he would make no remarks upon his action until he had heard what he had to say.—Lord Kimberley deprecated any arbitary administration of the Act, and said he was glad that the Home Secretary intended to get an explanation from the magistrate. If it were found that the magistrate had at all acted in the manner that the newspapers represented him to have done in this case, he hoped that the Home Office would in some way or other endeavour to prevent such vagaries in future.

The Shop Hours Bill.

The Select Committee on the Shop Hours Bill have issued their report. The Committee have amended the Bill by limiting it to the same protected classes as those to which the Shop Hours Act of 1886 applied. The proposal to extend to adult women the limitation as to hours which that Act provided only for persons under eighteen years of age is one which they do not at present feel justified in adopting. In view of the conflict of evidence, and of the limited amount of time remaining at the disposal of the Committee, they did not feel that they could at present take the responsibility of recommending the inclusion of adult women in the Bill. It appears to the Committee to be undesirable that the Shop Hours Act of 1886 should remain of doubtful and imperfect operation. They have therefore retained the clause which proposes that its provisions should be enforced by inspectors, but have modified the clause so that the enforcement should be a matter of local rather than imperial responsibility. To remove doubts domestic servants are expressly excluded, but in all other respects the law of 1886 is left as it stands, and the Committee think that the time has arrived for making its provisions permanent.

METROPOLITAN WATER SUPPLY.

EVIDENCE OF DR. FRANKLAND.

ON Tuesday, before the Royal Commission, Dr. Frankland gave evidence on the Metropolitan Water-supply. At the outset he stated that, although he appeared at the request of the London County Council, the opinions he would have to express were entirely his own private opinions and for which the County Council were in no way responsible. During the last twenty-seven years he had paid special attention to the composition of water as delivered to London. The results of the numerous inspections and analyses he had made from time to time showed that above the points where water was abstracted from the Thames for the purpose of metropolitan supply were received contributions such as the drainage of manured land, the effluents from sewage works, and even raw sewage itself. This animal matter is probably generally innocuous, though sentimentally objectionable. It may, however, at any time be accompanied by zymotic poisons, such as those of typhoid fever, tuberculosis, or diphtheria. The chance of such pathogenic germs reaching the consumer is greatly reduced by the protective measures adopted by the water companies by means of filtration. Notwithstanding these protective measures, however, there is no trustworthy guarantee, in his opinion, that the noxious ingredients are wholly removed.

Professor Dewar: Have you considered the question of the probability—I am speaking now of the mere question of probability, apart altogether from strict modern chemical or bacteriological research—of such pathogenic germs being delivered and distributed in London water?—Yes, I have taken that into serious consideration, and I am at the present time engaged in a series of observations which will, I think—I hope, at all events—throw more light upon the subject. It is a point which requires a good deal of investigation yet. Of course, if we had any process of filtration which would remove every germ from water, that would be an almost absolute safeguard; it would be a single line of defence only, but it would be an absolute safeguard.

Witness then stated the results of recent experiments upon water as it left the filters of the various London companies, drawn from the Thames and Lea. He confessed his astonishment at the result that, instead of getting hundreds of germs in the cubic centimetre, as had been the case in London water, he got in some cases only four. If, however, there was only one single germ left, of course it might multiply afterwards into millions in a very short time. And during the passing of the water through the mains of London there is no doubt the microbes multiply, and hence the difference in the results of experiments on water coming through the filters and water as delivered in London. Of course if you removed from water the many thousands or tens of thousands of microbes or their germs, with the exception of one or even four, it is extremely unlikely that amongst those four you would have one pathogenic germ.

Have you made yourself any attempt to distinguish between the pathogenic germs and the harmless germs in London water?—No, I have not, and I have been deterred from doing so from the circumstance that Dr. Klein, who is a much more experienced bacteriologist than I am, has failed himself to distinguish the pathogenic germs in London water.

Witness admitted that recent discoveries in connexion with filtration had very considerably modified the opinions given by him as to the value of filtration in the Sixth Report of the Rivers Pollution Commission in 1874. At that time a number of very remarkable outbreaks of disease had been traced to impure water.

Take the conditions of a stream when precipitation and matter in suspension are being renewed continually. Such conditions cannot, of course, be favourable to the life of a large number of these organisms, but there has been no actual laboratory observations of that kind that you can refer us to that would guide us?—No. Of course it is difficult to imitate a flowing river in a laboratory. Several important experiments lead to the conclusion that pathogenic organisms very frequently fall a prey to the harmless ones when the latter are in a great majority; they can hold their own if they are in a majority, but the harmless organisms eat up the pathogenic ones if they are only present in small quantities. That is an additional reason why one would feel some security in the non-passage of those organisms through a considerable length of flowing water, because there is always present in such water a very large number of harmless micro-organisms.

So that the continuous change in the environment, together with continual and ever-changing motion—as in a river, exposure to light, the variations in suspended matter, and precipitation going on, combined with the presence of a large number of harmless micro-organisms, are all fatal towards the life of one or two specific ones; and that, combined with filtration, adds greatly to the security that they are not likely to pass and develop after they have been properly filtered?—Yes. At the same time I would point out that it by no means excludes the possibility of such organisms finally making their appearance in the water as drunk.

It only removes the fear in the sense that the probabilities are almost infinity to one against its occurring?—Yes, they are certainly considerably stronger than the opposite.

In reply to further questions put by Professor Dewar, witness said the vast majority of microbes found in potable waters are, as far as is known, perfectly harmless, and although pathogenic bacteria have been found amongst them it has only been on rare occasions, and not in connexion with the London water-supply. Pathogenical bacteria have been found in the tanks in India used by the natives there, amongst whom frequent outbreaks of cholera occur, and the cholera bacillus or cholera spirillum has been found in the water of those tanks, and there are several other cases in which a microbe has been found; but I do not think any one of them has occurred in England, certainly not in connexion with the London water-supply. At the same time it must not on this account be concluded that they are never present. In the first place, only a very small volume of water can be submitted to examination; and secondly, several kinds of pathogenic organisms can be cultivated only in the bodies of animals, and are therefore undiscoverable by Koch's gelatine plate process.

Then I understand you to convey that the mere appearance of a microbe similar to that of a pathogenic one would not be satisfactory to you as a bacteriologist, unless its action on the living organism was clearly proved to be pathogenic?—Yes, I should certainly think that that was absolutely necessary to establish its identity. These things are so small, and they resemble each other so closely, that it would be subject to great fallacy if you were to conclude merely from the appearance of these microbes that they were pathogenic microbes.

Sir A. Geikie: Once the identity of the microbe has been established, and you know the specific form of it, you can identify it always, can you not?—You can to some extent; but these microbes resemble each other so closely that no experimenter, I think, is ever satisfied unless he gains what is called a pure cultivation. By cultivating it in a proper medium he can get it free from all other kinds of microbes, then inject it under the skin of an animal, or administer it to a rabbit or a frog or some animal, and see whether it produces its proper pathogenic result.

The point I wanted to get at was whether you considered it at all possible or likely that we should ever be able to identify those microbes without going through that process of actual infection?—I think it is not at all impossible. I may illustrate what I mean by considering what would happen if the animals in the Zoological Gardens were all microscopic animals. How very difficult it would be to distinguish between a lion and a tiger, for instance, although there is no difficulty when you have them a sufficient size. The same difficulty is met with in the case of these microbes. For instance, this cholera spirillum is so closely allied in form to microbes that exist in human saliva that many eminent bacteriologists, at the time when Koch announced his discovery, said that they had plenty of the cholera spirilla in their own mouths. But it was a mistake. There is a cholera spirillum.

The Commission adjourned until Monday next.

Appointments.

Successful applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.*

ABRAM, G. S., L.R.C.P.Lond., M.R.C.S., has been appointed Assistant House Surgeon to the Devon and Exeter Hospital.

ANDERSON, L. M., M.R.C.S., has been reappointed Medical Officer to the Hearts of Oak Medical Fund.

BAILY, E., M.B., C.M. Edin., has been appointed Medical Officer of Health for the Burgh of Oban.

BLAMEY, JAMES, M.R.C.S., has been reappointed Medical Officer for the Budock Sanitary District of the Falmouth Union.

BOOTH, DANIEL, L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Sixth Sanitary District of the Ashton-under-Lyne Union, vice J. Schofield, deceased.

BOWLAN, M. M., M.B., B.S. Durh., L.R.C.S. Edin., has been appointed Assistant Medical Officer to the Union Infirmary, St. George's-in-the-East.

BRADSHAW, T. R., M.D., M.R.C.P. Lond., M.R.C.S., has been appointed Assistant Honorary Physician to the Royal Infirmary, Liverpool.

BROWNING, G. DANSEY, M.R.C.S., L.R.C.P. Lond., has been appointed Resident Obstetric Assistant to the Westminster Hospital.

BULMAN, F., M.B., C.M. Durh., has been appointed Medical Officer of the Workhouse, Newport, Mon.

Digitized by Google

BYLES, J. B., M.R.C.S., L.R.C.P. Lond., has been appointed Senior House Physician to the Westminster Hospital.

CAMPBELL, J. M., M.B., C.M. Glasg., has been appointed Medical Officer to the Workhouse, Newtown and Llanidloes Union.

CRAIG, W. WALLACE, L.R.C.P. Lond., M.R.C.S., has been appointed House Surgeon to the Salop Infirmary, Shrewsbury.

DE RENZI, H., M.R.C.S., L.R.C.P. Lond., has been appointed Junior House Surgeon to the Westminster Hospital.

EVERED, F., L.R.C.P., L.R.C.S., has been appointed Medical Officer for the Third District of the Westbourne Union.

FIELD, E., M.B., C.M., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer to the Municipal Charities, Bath.

GIBB, G., M.B., C.M. Aberd., has been appointed Third Medical Officer, and also Medical Officer to the Western District, Oldmachar Parochial Board.

Notes, Short Comments, & Answers to Correspondents.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

All communications relating to the editorial business of the Journal must be addressed "To the Editors."

Lectures, original articles, and reports should be written on one side only of the paper.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET to be addressed "To the Publisher."

We cannot undertake to return MSS. not used.

THE THERAPEUTIC USES OF IRON.

THE tonic and hæmatinic properties of iron were well known to the ancients. The old way of administering this metal was very curious The metal being very much used in the preparation of weapons of warfare and Mars being the god of war, Mars became the patron of iron; and very frequently in old books we read of the "martial preparations," by which is meant preparations of iron, and the mode of administering them was to put a sword into a water-trough and allow it to lie there and rust, and to let the people drink of the water. Of course, it was a very mild chalybeate water that could be got in this way. But still, very mild preparations of iron, if continued for a long period of time, will produce a very marked effect; and distinct results were obtained in ancient times from this very mild way of giving iron.

Flex.—The placing an unqualified assistant in a separate house and two miles away from his principal would be very apt to be regarded by the Medical Council as "covering," even under the theoretical conditions described by our correspondent. We cannot at the time of going to press refer to the prescription alluded to.

Dr. Fred. Robinson.—For particulars regarding the conditions under which English medical practitioners are allowed to practise in France our correspondent should consult our last Students' Number, Sept. 5th, 1891.

POLICE DUTY.

To the Editors of THE LANCET.

SIRS,—I am frequently called to decide at a police-station the often very knotty question as to whether the party detained is drunk or has been drinking. The first point there is not often any difficulty in deciding; but the second, in my opinion, is not so soon ascertained. Will some of your readers give me their reasons *pro* and *con*, or refer to the title of some little work on this and other subjects, and oblige

Yours truly.

June 19th, 1892. W. Y.

AN APOLOGY.

To the Editors of THE LANCET.

SIRS,—Our attention has been drawn to the fact that in our work on Diseases of the Rectum and Anus, second edition, p. 191, Mr. Harrison Cripps' name has been omitted in connexion with our description of laminar carcinoma. It is from his work that our account has been drawn; and we beg to acknowledge our indebtedness to him, and regret at the same time the oversight which has occurred.

We are, Sirs, yours truly,

ALFRED COOPER.

June 20th, 1892. F. SWINFORD EDWARDS.

ADVERTISING HANDBILLS.

Viator sends us a specimen of a very unprofessional handbill, extensively circulated, offering, at 55, Park-road, Hornsey, advice and medicines on cheap terms, and saying that the establishment is conducted by a married, fully qualified, registered and experienced physician and surgeon, who has the discretion not to insert his name.

M.—The question is a legal one Our correspondent should see the solicitor. His claim is against A, who presumably sent for him, and A or his solicitor should have asked for his account prior to the settlement. But some patients are much more anxious about compensation than costs.

Dolphin will have the title conceded to him in courtesy by many; but we should not advise his using it on a card or plate. He is justified in styling himself "physician and surgeon."

Mr. J. Doughty should apply to the medical officer of health of the town in question.

Query has not enclosed his card.

"KILLED BY AN EMETIC."

To the Editors of THE LANCET.

SIRS,—With reference to your paragraph in last week's issue, headed "Killed by an Emetic," may I be permitted to make a few remarks in the absence of the medical gentleman who gave evidence at the inquest?

A man was found dead one morning after he had taken some poison and after common salt had been administered as an emetic. A post-mortem examination was made and I was present at it. The whole of the stomach was in a very congested state; several portions were very much softened and there were two perforations which had allowed of the escape of the stomach contents into the peritoneal cavity. The glass from which the patient had drunk the poison was given to me and in it I found a few crystals, which, on being tested, proved to be sulphate of zinc. Moreover, it came out in the evidence that that salt had been sold to the deceased. An interesting question, then, seems to be opened up. Is sulphate of zinc a safe emetic? It is hardly possible that the small quantity which had been swallowed should have alone produced such very violent effects on the stomach wall, and the theory that the chloride was formed by the addition of common salt to the solution in the stomach would satisfactorily explain the congestion and perforation. Perhaps some of your readers may have met with parallel cases.—I am, Sirs, yours faithfully,

A. L. MACLEOD, M.A., M.B.,

June 21st, 1892. House Surgeon, Macclesfield General Infirmary.

DISTRICT MEDICAL OFFICERS AND SUPERANNUATION.

To the Editors of THE LANCET.

SIRS,—I am a district medical officer of over thirty years' service and am now resigning on account of ill-health, but have not yet reached sixty years of age. Am I entitled to the two-thirds superannuation pension?

I am, Sirs, yours faithfully,

June 15th, 1892. FIFTY-SIX.

*** As superannuation is not yet made compulsory it rests entirely with the guardians whether they will recommend the Local Government Board to grant superannuation. Without such a recommendation the district medical officer has no chance, whether he has served thirty or fifty years, or whether he has reached sixty years of age.—ED. L.

The Publisher cannot hold himself responsible for the return of testimonials &c. sent to the office in reply to advertisements; copies only should be forwarded.

NOTICE.—Advertisers are requested to observe that it is contrary to the Postal Regulations to receive at Post Offices letters addressed to initials only.

An original and novel feature of "THE LANCET General Advertiser" is a special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an *additional* advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance.

Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

Terms for Serial Insertions may be obtained of the Publisher, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 66, Rue Caumartin, Paris.

vomiting and diarrhœa treated by intravenous injection of salt solution, 86
KING'S COLLEGE HOSPITAL.—Tumour of the left frontal lobe, 1240
LIVERPOOL NORTHERN HOSPITAL.—Two cases of stab-wound, with peculiar features, 1186
LONDON COUNTY ASYLUM, HANWELL.—A fatal case of abscess of the liver caused by the presence of a needle, 193
LONDON HOSPITAL.—Fracture dislocation of the second lumbar vertebra; laminectomy, recovery, 359; periostitis occurring as a sequela of enteric fever, 1079
LONDON LOCK HOSPITAL.—Case of phagedæna, with loss of entire penis, 971
MANCHESTER ROYAL INFIRMARY.—Myxœdema treated by thyroid grafting, 798
METROPOLITAN HOSPITAL.—A case of portal pyæmia; necropsy, 193; ligature of the lingual artery for hæmorrhage from epithelioma of the tongue, 471; case of enteric fever, with pulmonary complications, followed by laryngeal diphtheria; tracheotomy; death, 746—A case of ruptured extra-uterine fœtation; laparotomy; necropsy; remarks, 971—Case of diabetes mellitus; sloughing abscess of hand; carbuncles; pyæmia; death; necropsy, 1026—Case of compound depressed fracture of the skull, with replantation of bone; recovery; remarks, 1186
NEWCASTLE ROYAL INFIRMARY.—A case of poisoning by bichromate of potash, 138
RADCLIFFE INFIRMARY, OXFORD.—Interesting surgical cases recently under treatment in the wards, 23
RIO TINTO HOSPITAL, HUELVA, SPAIN.—Cases of perineal and supra-pubic drainage of the bladder, illustrating the use of glass tubes in the surgery of the urinary organs, 581
ROTUNDA LYING-IN HOSPITAL, DUBLIN.—Maternity cases, 799
ROYAL ALBERT HOSPITAL, DEVONPORT.—A case of foreign body in the bladder and urethra, 312
ROYAL FREE HOSPITAL.—Case of impaction of the gill-plate of a herring in the larynx of an infant; tracheotomy; removal of bone; difficulty in removal of tube from functional paralysis of abductors; complete recovery, 798—Case of recovery after complete paraplegia dependent on fracture dislocation in the upper dorsal region of the spine, 1242
ROYAL PORTSMOUTH HOSPITAL.—Case of hernia strangulated in the upper part of the inguinal canal; abdominal section, 1027
ST. BARTHOLOMEW'S HOSPITAL.—Acute yellow atrophy of liver; necropsy, 630
ST. GEORGE'S HOSPITAL.—Case of compound dislocation, with version, of the astragalus; removal of the bone; recovery, 689
ST. MARY'S HOSPITAL.—A case of unrecognised cervical caries; remarks, 252—Some interesting skin cases, 470—Spasmodic wryneck treated by resection of the spinal accessory nerve, 1361
ST. PANCRAS INFIRMARY.—A case of scirrhous cancer of the heart, 579
ST. THOMAS'S HOSPITAL.—Excision of the ileo-cæcal valve for carcinoma; subsequent operations for fæcal fistula; recovery, 310
SALFORD ROYAL HOSPITAL.—A case of complete extirpation of the larynx by a suicide, 972
SEAMEN'S HOSPITAL, GREENWICH.—Notes of two fatal cases of influenza, 417—Two cases of compound separation of the superior epiphysis of the humerus, 526—Aneurysm of common carotid artery; ligature of artery; recovery, 1429—Epithelioma of lip and of penis in a man aged twenty-four, 1421
SHEFFIELD PUBLIC HOSPITAL AND DISPENSARY.—Five cases of intravenous injection of saline fluid for hæmorrhage and collapse, 913
SOUTH DEVON HOSPITAL, PLYMOUTH.—Case of atrophied kidney, with perinephritic abscess; nephrectomy; fæcal fistula; recovery, 471—Two fatal cases of Loreta's operation, 87—Supra-pubic dislocation of head of femur; failure of attempts at reduction; later excision of head of femur, 194—Hydronephrosis of right kidney; nephrotomy; pyonephrosis of left kidney; nephrectomy, 580—Epileptiform convulsions following head injury; trephining; recovery, 868—Tubercular disease of right kidney; nephrotomy; removal of right kidney; anuria; uræmic convulsions; death; atrophy of left kidney, 1132
STROUD GENERAL HOSPITAL.—Amputation at hip-joint; ligature of the femoral; operation for compound fracture of the patella, 418
TIVERTON INFIRMARY.—A case of head injury, 1300
UNIVERSITY COLLEGE HOSPITAL.—Fifty consecutive major amputations, 22
WESTMINSTER HOSPITAL.—Surgical cases, 138—Enteric fever; right hemiplegia with aphasia; relapse; death, 912—Bullet wound of skull, the result of attempted suicide, 1131
WOLVERHAMPTON GENERAL HOSPITAL.—Two cases of bilateral empyema, 1299
YORK COUNTY HOSPITAL.—Cerebral abscess secondary to ear disease; trephining; death, 527

Polypus of the small intestine, associated with intussusception, 1028
Polyuria and retention, 26
Poole urban and port districts, 830
Poor, relief, 718; housing of the, and the duties of sanitary authorities, 1089; man's market, the, 1257
Poor-law extra medical work, recognition of, 816
——— medical officer, suspension of a, 1144
——— Medical Officers' Association, 47, 781; abroad, 401
Poore, Dr. G. V., the filtration of urine through earth, 19; the concentration of population in cities, 1065, 1119
Poplar Hospital for Accidents, 842, 1331
Popoff, Dr., death of, 600
Population, concentration of, in cities, 1065 1119, 1197
Portal and mesenteric veins, thrombosis of the, and of the vena cava, 91
——— pyæmia, case of, 193
Post non propter, 1168
"Post-expiration" friction sound, 1125
Postage stamps and infection, 343
Postmen's rest-houses and sanatorium, 1224
Pound, Mr. C., measurement of school children, 675
Powell, Dr. D., discussion on renal dropsy, 1081
Power, Mr. D'A., Manual for the Physiological Laboratory (review), 429
Practical Economy, a Treatise on (review), 640
——— Hygiene (review), 317
——— Medicine, Contributions to (review), 920
Practitioners' parasites, 926
Pregnancy in bicornate uterus, 1029

PRESENTATIONS.—To Mr. H. White, 66; to Mr. A. W. Stocks, ib; to the Lord Mayor, 118; to Mr. Richards, ib.; to Dr. E. Bland, ib.; to Mr. W. Francis, 174; to Mr. J. H. Gough, 330; to Mr. C. M. Brady, 449; to Mr. N. H. Nixon, ib.; to Mr. H. E. Dixon, ib.; to Mr. S. R. Lovett, ib.; to Dr. W. Main, 561; to Mr. J. M'N. O'Keefe, 272; to Mr. G. H. Butler, 781; to Dr. J. H. Bridges, 842; to Mr. C. Sims, 948; to Dr. J. Somerville, 1005; to Dr. A. M. D'Evelyn, ib.; to Sir G. Buchanan, 1090, 1106; to Mr. H. G. Croly, 1110; to Dr. C. Holman, 1145; to Surgeon Captain J. S. Riddell, 1224; to Dr. A. F. Wood, ib.; to Dr. A. Dingwall, 1279; to Mr. O. Pemberton, ib.; to Mr. C. B. Shelswell, 1322; to Mr. J. Hogg, 1394; to Dr. Worthington, ib.; to Dr. J. Hitchcock, ib.; to Dr. G. B. Currie, 1450

Preventive medicine, a lesson in, 269
Prickly heat, note on, 866
Priest, Mr. J. D., health report of Waltham Holy Cross urban district, 553
Prince Christian, accident to, 40
——— of Wales, the physicianship in ordinary to the, 436; health of the, 884
Pringle, Dr. R., what is efficient vaccination? 425; the opium question, 773; the Hurdwar fair and cholera, 1157; increase of small-pox and the interim report of the Vaccination Commission, 1217
Prismetry, 844
Prison reformatories and the increase in crime, 1042
——— surgeons, the duties of, 591
Proctorial system at Cambridge and Oxford, 1044
Profession, the enlarging numbers of the, 101; how to improve the position of the, 207; the amenities of the, 564; the roll of the, 810; shafts at the, 1169
Professional advertising, the Court of Appeal on, 701
——— ethics and the General Medical Council, 1398
Professions, overcrowding of the, in the colonies, 598
Prostate, operative treatment of enlargement of the, 1229, 1287, 1354
Prostatic obstruction, radical cure of, by the galvano-cautery, 141
Provident dispensaries, large transaction of business in, 1432
Prudential Assurance Society, 614
Psilosis or sprue, 982, 1107
——— linguæ et intestini, symptoms and pathology of, 915
Psychological museum at Florence, 167
Ptomaine poisoning, 600
Ptomaines in the urine of a patient suffering from exophthalmic goitre, 542
Ptyalism, 845, 897
Public advertisements and the Sheffield public hospital, 845
——— conveyances, scarlet fever in, 367
——— health, British Institute of, 495; and vaccination in France, 980
——— vaccinators and boards of guardians, 1063
Publicans and drunkenness, 812
Pudsey, the sanitary state of, 440
Puerperal eclampsia, cases of, 689, 796
——— mania, hyperpyrexia, death, 799
Pulmonary gangrene, the treatment of, 440; surgical intervention in, 777
——— valve, ulcerative endocarditis affecting the, 195
Pulsations and murmurs in the great veins of the neck, 740, 790
Pulse, differential, in certain heart affections, 1047
Pulvis kutnovii anti-asthmaticus, 263
Purcell, Dr. F. A., gastro-jejunostomy for pyloric cancer, recovery, 1238; death under chloroform, 1273
Pus, peptone in, 313
Puschmann, Dr. T., a History of Medical Education from the most Remote to the most Recent Times (review), 533, 619
Pustule, malignant, iodine injections in, 158
Puzey, Mr., cases of stab-wound with peculiar features, 1186
Pycroft, Mr., Sicily as a health resort, 291
Pye-Smith, Dr. P. H., an unusual distribution of secondary cancer, 800; certain points in the etiology of disease, 847, 899, 953
———, Mr. R. J., the disposal of the dead, 805
Pylorectomy, case of, 1303
Pyloric cancer, gastro-jejunostomy for, recovery, 1238
Pyo-pneumothorax, 27
Pyramidal cells, lesions of, in the cerebral cortex in chorea, 1134
Pyrexia, sarcoma and, 148

Qualification, territorial monopolies of, 1202, 1274, 1316
Quarantine, 754; French opinion on, 111; and isolation at Barbadoes, 926
Queen's birthday honours for medical men, 1200; visit to Hyères, the, 39
Quinton memorial fund, 946

Rabies, 794; in Lancashire, 113; the prevention of, 210; the epidemic of, 392; advanced, the cure of, 1254
Race-horse, the supposed poisoning of a, 1046
Racial variation in the length of the palate process of the maxilla, 1245
Radcliffe Infirmary, 397
Radius, sarcoma of, 259; fracture of the upper end of the ulna associated with dislocation of the head of the, 1356; congenital dislocation of the, 800
Railton, Dr., birth palsy, 637
Railway accidents in 1891, 221
——— carriages, missiles from, 1206
——— collision at Bishopsgate, 1382
——— servants, hours of, 1376
Rake, Dr. B., the percentage of fibrin in the blood of lepers, 83
Ralfe, Dr. C. H., the treatment of diabetes, 635; certain questions on the treatment of diabetes, 902, 959
Ransom, Dr. W. B., pyo-pneumothorax, 27
Ransome, Dr. A., on Certain Conditions that Modify the Virulence of the Bacillus of Tubercle (review), 144
Ratcliffe, Dr. J. R., uterus bicornis, 1029; perforative appendicitis, 917; cysticercus cellulosæ, ib.
Raynaud's disease, a renal affection resembling, 751
Rectal antiseptic injections in epidemic influenza and in advanced phthisis, with large cavities, 795
Rectum, excision of the, notes of a case of, 1235; topography of the, 1245; excision of cancer high up the, 1324
Red Cross, the International Congress of the, 884, 996, 1049
Redditch Nursing Association, proposed Cottage Hospital, 729
Redmond, Dr. J., perforating ulcer of stomach, 1302
Redwood, Dr. T., obituary notice of, 727
Reed, Dr. F. G., obituary notice of, 727
Reid and Carnick's preparations, 699
Reid's uterine dilators, note on, 27, 909
Religio Medici, and other Essays (review), 1137
Remittent fever, malignant, 1361
Renal cirrhosis, non-tubercular, hæmoptysis in association with, 1133
——— colic, some cases of, 16
——— dropsy, 972; the debate on, 1081, 1139, 1217
——— pathology, observations on certain disputed points in, 248
Rendall, Dr. P., guinea-worm in scrotal cyst, 121
Rendle, Dr. A., traumatic ganglion of thumb, 638; gall-stone of unusual size passed per anum, 918
Rest cure in phthisis, 431
Retina, the electro-magnet, and foreign bodies in the, 110; glioma of the, 1194
Retinal bloodvessels, 272
——— veins, congenital anomalies of the, 2490
Retro-pharyngeal abscess, 556; in infancy, and its treatment, 350
Retro-uterine hæmatocele, 274

REVIEWS AND NOTICES OF BOOKS.

International Clinics: a Quarterly of Clinical Lectures by Professors and Lecturers in the leading Medical Colleges of the United States, Great Britain, and Canada: edited by J. M. Keating, M.D., J.P., Crozer Griffith, M.D., J. Mitchell Bruce, M.D., and David W. Finlay, M.D.; vols. i. and ii., 28—A Manual of Operative Surgery: by Frederick Treves, F.R.C.S., 29—A Manual of Physics; being an Introduction to the Study of Physical Science: by William Peddie, D.Sc., F.R.S.E., ib.—Text-book of the Principles and Practice of Medicine: by the late Charles Hilton Fagge, M.D., F.R.C.P., and Philip H. Pye-Smith, M.D., F.R.S., F.R.C.P.; third edition, ib.—The Elements of Ophthalmic Therapeutics; being the Richard Middlemore Post-graduate Lectures delivered

——, Mr. H. P., the influenza, 278; continuous administration of oxygen in a severe case of broncho-pneumonia following influenza, 464
Sympson, Dr. E. M, the bearing of recent biological research on the practice of medicine and surgery, 222
Syncope during ether inhalation, case of, 579
Syphilis, certain modes of treatment which interfere with the diagnosis of, 1025; and general paralysis, 1204; suspected, the use of mercury in, 1272
Syphilitic ataxia, congenital, 638
—— reinfection, a case of, 927
Syringomyelia, cases of, 256, 408; peculiar disturbance of sensation with muscular wasting due to, 425

Tabes dorsalis, mercury, syphilis, and, 62
Table filter, an improved, 1138
Tachycardia, traumatic and gastric, origin of, 446
Tait, Mr. L., the corpus luteum, 56; uterine dilatation, 1000; the Royal College of Surgeons, 1053, 1271, 1385; alleged occurrence of ovarian pregnancy, 1364
Takaradzuka mineral water, Japan, 1086
Tanner, Dr. T. H., Index of Diseases and their Treatment (review), 365
Tartaric acid, new synthesis of, 764
Tate, Mr. W. W. H., the late death under chloroform at University College Hospital, 223; malformation of the heart, 1029
Tatum, Mr. G. R., obituary notice of, 395
Taylor, Dr. F., tracheal tugging in aneurysm of the aorta, 257
——, Dr. J. W., death of, 441
——, Dr. S., health report of Liverpool port district, 1442
——, Mr. E. W., the London Temperance Hospital, 889
——, Mr. S. J., antiseptics in ophthalmic surgery, 55, 164
Teaching University for London, 925, 981
Teeth, artificial, from a hygienic point of view, 42, 121; the extraction of, for dental irregularities, 152; of school children, 707
Teevan, Mr. A., iodoform taken internally, 1227
Temperance Hospital, 1113; ether as a stimulant at the, 698
Temperature, experiments in, 761; relative values of, 918; low, and phthisis, 1313
Temple Cloud, enteric fever at, 648
Territorial monopolies of qualification, 1202, 1274, 1316
Testicle, double acute tubercular disease of the, 800
Testis, right, sarcoma of the, secondary growths in the lumbar glands, thrombus of the inferior vena cava, embolism of the right pulmonary artery, sudden death, 688
Tetanus as a complication of ovariotomy, 139
Thames, fouling the, 33, 711
Theatres and places of public assembly, the ventilation of, 48
Themis and hygieia, 1149
Theology, Natural and Revealed, Analysis of (review), 1137
Therapeutics of certain ailments, 517; in Parliament, 1090
Thiersch's method of skin grafting, 750
Thigh, punctured wound of, 258; sarcoma of, 1135
Thin, Dr. G., the origin and spread of leprosy in Parcent in Spain, 134; symptoms and pathology of psilosis linguæ et intestini, 915
Thiry, Dr. R., death of, 1436
Thomas, Mr. G. D., Association of Members of the Royal College of Surgeons, 497; Steele v. Savory fund, 1273
Thompson, Dr. A., influenza, 388; health report of Ulverston urban district, 553
——, Mr. J. T., the electro-magnet and foreign bodies in the retina, 110
——, Mr. J. H., ice accidents, a suggestion, 121
Thomsen's disease, 546
Thomson, Dr. J, scorbutic hæmaturia in an infant, 1292
Thoracic, aneurysm, case of, 487; and abdominal aorta, the innominate and common iliac arteries, dissecting aneurysm of, 1068
Thornton, Mr. B, the influence of climate on surgical tuberculosis, 889
——, Mr. K., further cases illustrative of hepatic surgery, 851
Threadworm, treatment of, 69
Thresh, Dr., health report of Chelmsford rural district, 334; health report of Maldon rural district, 770
Thrombosis of splenic vein, associated with infarcts, 196
Thumb, pigmentation at the end of, 257; traumatic ganglion of, 638; right, avulsion of the terminal phalanx of the, 138
Thumbs, double congenital dislocation of first phalanges of, 9 8; congenital dislocation of both, associated with spinal deformity, 1416
Thyroid cartilage, congenital malformation of the, 750
—— gland, functions of the, 62
—— grafting, myxœdema treated by, 798
Thyroidectomy in the dog, the effects of, 480
Thyrotomy for malignant disease of larynx, 750
Tibia, treatment of fractures of the, more especially compound, by means of screw extension, 29
Tidy, Dr. C. M., death of, 650
Tight-lacing, effects of, 151
Tinned peas greened with sulphate of copper, experimental research on, and the physiological action of this salt on animals, 190
—— salmon, alleged irritant poisoning caused by eating, 607
Tiplady, Mr. W., a case of perityphlitis, 524
Tirard, Dr. N., some cases of renal colic, 16
Tissue or cell fibrinogen in its relation to the pathology of blood, 457, 515
Toad attacked by blow-fly larvæ, 195
Tobacco, the prophylactic influence of, 435; and depopulation, 706
Tobacco-smoking among boys, 1097
Toe, recurrent papillary sarcoma of the, 26; painful, a form of, 628
Tomkins, Dr. H., of Leicester, death of, 762; obituary notice of, 840
Tongue, tubercular ulceration of, 88; ligature of the lingual artery for hæmorrhage from epithelioma of the, 471; epithelioma of, 473; congenital cyst beneath the, 1135; a modification of the operation of partial or complete excision of the, 1291
Tongue-depressors, inflammable, 951
Tonsil, ligature of common carotid for hæmorrhage after removal of the, 976
Tonsils, emigration of leucocytes from the, 715
Topping, Mr. J. P., the Hodgson fund, 235, 343
Torticollis, spasmodic, 638, 938; treated by neurectomy, 26, 1445; operation for, 713, 1000, 1053, 1108; treated by avulsion of the central end of the spinal accessory nerve, 1360; and other spasmodic movements of the head, 1361; excision of a piece of right spinal accessory nerve, 1362
Touting with high sanctions at Cambridge, 565
Towns, health in, 1271
Toxines, elimination of, in enteric fever, 765
Toxteth Park New Infirmary, 232, 488, 1418; accommodation for, 435
Tracheal tugging in aneurysm of the aorta, 257; as a sign of aneurysm, 435
Tracts, distribution of, in hospitals, 121
Transvaal, leprosy in the, 397
Trephining, right lateral sinus, 23; for relief of intra-cranial pressure, 711; for injury to head, 868; for epilepsy, 1063; mental improvement after, 1093
Tressidder, Dr. W. E., typhoid fever, 638
Treves, Mr. F., A Manual of Operative Surgery (review), 29; the treatment of spinal and other tubercular abscesses, 1122; sarcoma of the buttock treated by ligature of the internal iliac artery, 1244
Trigeminal neuralgia, surgical treatment of, 71, 182, 295
Tripe, Dr. J. W., obituary notice of, 892
"Tropical measles," on the advisability of adopting the term, 1413
Trüg, Mr. L. J., Die Menschliche Stimme nach Charles Lunn's Philosophy of Voice (review), 807
Tubercle, prophylaxis of hereditary, 485
—— bacilli, prognostic value of, in the sputum, 530; passage of, from the mother to the fœtus, 598; identification of, in sputum, by a new and simplified process, 1116
—— Bacillus, on certain Conditions that Modify the Virulence of the (review), 144
Tubercular abscesses, spinal and other, the treatment of, 1122
—— disease of right kidney, nephrotomy, removal of right kidney, anuria, uræmic convulsions, death, atrophy of left kidney, 1132
Tuberculin, 773; at the Brompton Hospital, 41; lupus inert to, 316
Tuberculocidin, 1094
Tuberculosis, 218; with symptoms of Addison's disease, 25; cantharidates in, 47; of the iris, suspensory ligament, and retina, 314; Royal Commission on, 329, 562, 1208; localised hypodermic injection of iodoform in, 440; senile cutaneous, 694, 853; localised, the danger of counter-irritation in, 764; and its Successful Treatment (review), 807; in animals, 811
Turner, Dr. F. C., lesions of pyramidal cells in the cerebral cortex in chorea, 1134
——, Mr. G. R., congenital pulsating tumour of the forehead, syphilitic disease of both knee-joints, 976
——, Sir W., brain of ornithorhynchus paradoxus, 695
Tweedy, Mr., the physical factor in conical cornea, 637; the oath of Hippocrates, 1105
Tylden, Dr. H. J., recent researches in diabetes mellitus, 254
Tympanic cavity, note of a case where a mass of lead was impacted in the, and removed by the aid of metallic mercury, 970
Tyndall, Mr. J., New Fragments (review), 364
Tynemouth, the salt water-supply at, 60
Tyneside cyclists, great church parade of, 1275
Typhoid fever, 638; Ehrlich's test in, 989; some points in the etiology of, 1285

Ulcerative endocarditis, a rapidly fatal case of, 1421
Ulcers of the legs, a few practical observations on the treatment of, 1297
Ulna, fracture of the upper end of the, associated with dislocation of the head of the radius, 1356
Undertaker, a fraudulent, 207

TENTH YEAR. 8vo, CLOTH, 836 PAGES. 7/6, POST FREE.

The Medical Annual, 1892.

ILLUSTRATED WITH COLOURED PLATES AND ENGRAVINGS.

A COMPLETE WORK OF REFERENCE FOR MEDICAL PRACTITIONERS, BY THIRTY ENGLISH, AMERICAN AND CONTINENTAL EDITORS, BEING A

DICTIONARY OF NEW TREATMENT IN MEDICINE, SURGERY, AND OBSTETRICS.

"For its price, unquestionably the Best Epitome of useful information presented by any Year Book. It is the practitioner's *Vade mecum*. No one can afford to do without it."—*Birm. Med. Review.*

BRISTOL: JOHN WRIGHT & CO. LONDON: SIMPKIN & CO. Lim.

Just Published. 8vo. 6/- post free.

EPITOME of MENTAL DISEASES:

A Book of Reference, Alphabetically Arranged, for Practitioners and Students.

By JAMES SHAW, M.D.

Formerly Medical Superintendent and Co-Licensee, Haydock Lodge Asylum.

"Pre-eminently the most useful guide to all matters connected with Insanity which may arise in ordinary practice, and we strongly advise all our readers to buy a copy and keep it on their shelves."—*Birm. Med. Review.*

BRISTOL: JOHN WRIGHT AND CO. LONDON: SIMPKIN AND CO.

Second Edition. Price 1/-, post free. Waistcoat Pocket Size.

GOLDEN RULES OF SURGICAL PRACTICE:

For the use of Dressers and Junior House Surgeons.

By A HOSPITAL SURGEON.

"A great deal of valuable information contained in a very few pages."—*Brit. Med. Journ.*

"Some excellent rules, which, if remembered, will save many a mistake in surgical practice."—*Prov. Med. Journ.*

BRISTOL: JOHN WRIGHT AND CO. LONDON SIMPKIN AND CO.

JUST PUBLISHED. THIRD AND REVISED EDITION. 16/6, POST FREE.

PYE'S SURGICAL HANDICRAFT.

ILLUSTRATED WITH 235 ENGRAVINGS.

The Painless and Immediate Cure of HÆMORRHOIDS and PROLAPSUS.
By G. EDGELOW, M.D.
H. Renshaw, 356, Strand, W.C.

Dissection Guides. By T. Cooke, F.R.C.S., Senior Assistant Surgeon to the Westminster Hospital. Longmans & Co., 10s. 6d. "Come to the assistance of the dissector at exactly those places where help and advice are most needed. It would be difficult to overestimate the importance of the 'de fil en aiguille' principle admirably illustrated in the introductory portion of the book."—THE HOSPITAL. "Practical from beginning to end. There is no doubt that by following the directions laid down the power to dissect 'well and quickly' will be attained."—THE LANCET. "An excellent book. Its aim is to enable the dissector to make the best use of each part he dissects. The directions are such as would give the best results."—BRIT. MED. JOUR. "The author, with the enthusiasm of an accomplished anatomist, has endeavoured to rehabilitate *objective* as compared with *subjective* teaching, and to make practical anatomy what it should be, 'a fascinating pursuit.'"—MED. PRESS AND CIRC.

DR. J. COLLIS BROWNE'S
CHLORODYNE.

The Original and only Genuine.

ORIGINAL AND

ONLY GENUINE

CAUTION.—The extraordinary medical reports on the efficacy of Chlorodyne render it of vital importance that the public should obtain the genuine, which bears the words, "DR. J. COLLIS BROWNE'S CHLORODYNE" on the Government Stamp.

VICE-CHANCELLOR WOOD stated that DR. J. COLLIS BROWNE was undoubtedly the inventor of Chlorodyne, that the whole story of the Defendant Freeman was deliberately untrue.

LORD CHANCELLOR SELBORNE and LORD JUSTICE JAMES stated that the Defendant had made a deliberate misrepresentation of the decision of Vice-Chancellor Wood.

Chemists throughout the land will confirm this decision that Dr. J. C. BROWNE was the inventor of Chlorodyne.

It was proved in Court, on affidavit by Mrs. Forbes, of Paris, that the testimonial published in *The Times*, November 14th, 1865, speaking of the great efficacy of Chlorodyne in Cholera, referred to Dr. J. COLLIS BROWNE'S Chlorodyne, and that she never used any other; that she had written to the Defendant Freeman to that effect, notwithstanding which notice the Defendant publishes the said testimonial as referring to his medicine.

The Editor of the *Medical Times*, in his report on Chlorodyne, January 13th, 1866, gives information that the Chlorodyne referred to was the medicine introduced by a retired Army Medical Officer, which was Dr. J. COLLIS BROWNE; still this is published by the Defendant as testimony to his medicine.

Numerous affidavits from eminent Physicians and others were produced in Court, stating that Dr. J. COLLIS BROWNE was the inventor of Chlorodyne, and that when prescribing they mean no other.

The Defendant himself publishes that his compound is, in effect and composition, quite different from any other preparation; nevertheless, he assumes the name, testimonials, &c., of Chlorodyne.

It is now incumbent on all who purchase Chlorodyne to see that the name "DR. J. COLLIS BROWNE'S CHLORODYNE" is engraved on the Government stamp, as it is not sold otherwise. All other compounds under the name of Chlorodyne are spurious. All attempts at analysis have failed, hence the statement that the constituents of Chlorodyne are known is a misrepresentation.

Extract from "INDIAN ECONOMIST."

"We direct the attention of medical men to a fact observed some years since by ourselves, and corroborated by our subsequent experience, that Dr. J. COLLIS BROWNE'S Chlorodyne is in many cases of Low Fever immensely superior to Quinine in curative power. We cannot persuade ourselves that the true value of Dr. J. COLLIS BROWNE'S Chlorodyne is yet properly appraised in India.....It may be given with absolute safety even to a child three days old. Were medical men but to make a fair and exhaustive trial of it, we are persuaded that it would work a revolution in the treatment of two-thirds of the diseases to which children are subject. Its curative power is simply amazing."

From SYMES & Co., Pharmaceutical Chemists, Medical Hall, Simla.—January 5, 1880.

To J. T. DAVENPORT, Esq., 33, Great Russell-street, Bloomsbury, London.

DEAR SIR,—Have the goodness to furnish us with your best quotations for Dr. J. Collis Browne's Chlorodyne, as, being large buyers, we would much prefer doing business with you direct than through the wholesale houses. We embrace this opportunity of congratulating you upon the widespread reputation this justly esteemed medicine has earned for itself, not only in Hindostan, but all over the East. As a remedy of general utility, we much question whether a better is imported into the country, and we shall be glad to hear of its finding a place in every Anglo-Indian home. The other brands, we are happy to say, are now relegated to the native bazaars, and, judging from their sale, we fancy their sojourn there will be but evanescent. We could multiply instances *ad infinitum* of the extraordinary efficacy of Dr. Collis Browne's Chlorodyne in Diarrhœa and Dysentery, Spasms, Cramps, Neuralgia, the Vomiting of Pregnancy, and as a general sedative, that have occurred under our personal observation during many years. In Choleraic Diarrhœa, and even in the more terrible forms of Cholera itself, we have witnessed its surprisingly controlling power. We have never used any other form of this medicine than Collis Browne's, from a firm conviction that it is decidedly the best, and also from a sense of duty we owe to the profession and the public, as we are of opinion that the substitution of any other than Collis Browne's is a deliberate breach of faith on the part of the chemist to prescriber and patient alike.

We are, Sir, faithfully yours,

SYMES & CO.,

MEMBERS OF THE PHARM. SOCIETY OF GREAT BRITAIN,

HIS EXCELLENCY THE VICEROY'S CHEMISTS.

After these public statements in a Court of Equity, and subsequent confirmation by the trade at large, no Chemist can conscientiously use or sell any other compound for Chlorodyne without committing a breach of faith, unjust to patient and physician. The value of the remedy *alone* creates the great demand.

Sold in Bottles—1s. 1½d., 2s. 9d., 4s. 6d., and 11s. Usual Discount to the Profession.

SOLE MANUFACTURER:

J. T. DAVENPORT, PHARMACEUTIST,

33, GREAT RUSSELL STREET, BLOOMSBURY SQUARE, LONDON.

PARAF-JAVAL'S
PURE STRONTIUM SALTS.

These non-toxic salts, from which every trace of Barium has been removed, are those with which the very successful investigations were originally carried out at the Paris Hospitals, and which alone are mentioned in the communications read before the French Academy of Medicine and other learned Societies.

PURE BROMIDE OF STRONTIUM (Paraf-Javal) has the same therapeutic effects as the Potassium Salt in the treatment of various pathological conditions of the nervous system—Epilepsy, Hysteria, Chorea, &c.; and in Atonic Dyspepsia, Gastralgia, and Gastric Dilatation. *It does not, however, give rise to the troublesome cutaneous eruptions and gastro-intestinal irritation* which usually follow the prolonged administration of bromide of potassium.

PURE LACTATE OF STRONTIUM (Paraf-Javal) exercises a powerful effect on general nutrition and assimilation. It promptly reduces the albuminuria of Bright's Disease, with a corresponding improvement in the concomitant symptoms. Its use is indicated in all forms of Albuminuria, and as a prophylactic of Puerperal Eclampsia. In Visceral Congestion it gives better results than Lithia

N.B.—The Strontium Salts prepared by the process Paraf-Javal are the only pure products for medicinal use. (See Reports to the Academy, THE LANCET, March 19th, The MEDICAL PRESS, April 13th, The HOSPITAL GAZETTE, April 23rd, 1892.)

SOLUTION of LACTATE OF STRONTIUM (Paraf-Javal).
3j. to the fluid ounce.

SOLUTION of BROMIDE OF STRONTIUM (Paraf-Javal).
3j. to the fluid ounce.

PREPARED BY
P. CHAPOTEAUT,
Pharmacien de 1re Classe, PARIS.

The purity of the Strontium Salts (Paraf-Javal) and of the Solutions made by P. Chapoteaut is proved by the most delicate chemical tests instituted for traces of Barium.

These Salts and their preparations (in bottles of 4 & 8 oz. or 1 & 2 lb.) may be obtained from Dispensing Chemists.

A DIAGNOSTICAL CHARACTERISTIC OF INFLUENZA.

(By DR. DELMIS).

THE symptoms that have appeared in the greater part of the cases of the present epidemic of influenza prove once again that, although this complaint is rightly placed in the group of catarrhal affections, it nevertheless occupies in this group a perfectly distinct place, and should in nowise be confounded with the common, unimportant catarrhal epidemics to which the cold and damp seasons give rise in an almost periodic manner. Although the present epidemic, in a certain number of its forms, shows the ordinary series of symptoms that are observed in superficial inflammations of the respiratory tract, it is yet clearly distinct from them through having a much more intricate set of morbid elements, in the foremost rank of which must be placed the deep impression it makes on the nervous system, with general prostration of strength as a consequence.

It is in this action on the cerebro-spinal nervous system that the diagnosis of influenza finds its surest basis. It is evident that the nervous manifestations vary in degree and form in different epidemics and cases, and according to predispositions and to the constitution and previous conditions of health of the patients; but still, wherever there is any influenza they always exist to a certain degree.

They can be already detected during the premonitory period of the complaint, though it is usually very short, and may even be lacking altogether. During this period the nervous manifestations are approximately the same as in the majority of acute diseases: an undefinable feeling of uneasiness, frontal cephalalgia, disturbance in the organs of the different senses, and in some cases pain in the spinal column; but the feature which seems to be characteristic of influenza, and which distinguishes it from other similar acute diseases, and particularly from ordinary bronchitis, with which it has so many points in common, is a sensation of utter prostration, of weakness, and disinclination for any movement, accompanied by restlessness and anxiety. It is a fact worthy of notice that these general symptoms are entirely out of proportion with the results given by the examination of the different organs, and, at the same time, with the real unimportance of the disease, at any rate in persons who are not aged or who have not some organic lesion.

If, now, we consider the period when the disease is at its height in typical cases, we find again, even in the catarrhal and gastro-intestinal forms, in addition to the laryngo-tracheo-bronchitis or digestive troubles, this same characteristic action on the nervous system. It is here more marked than during the preceding period, having undergone the same increase as the other morbid symptoms of the complaint. Thus it is quite usual to observe precordial distress, trembling of the muscles, vertigo, disorders of the sight and hearing, even when the catarrhal inflammation has not extended to the conjunctiva or to the tympanum by the Eustachian tube. Actual otalgia is not very rare, as also a number of other forms of neuralgia, from which the patients often suffer tortures, and of which the ophthalmic branch of the trigeminous nerve is frequently the seat of predilection. The general sensibility of the body is also affected; finally the sleep is troubled, agitated, interrupted by dreams or nightmares, which are a still further cause for general weakening.

It is scarcely necessary to add that the terms "encephalic form," "nervous form," have been used to designate cases that are quite common, in which the nervous disorders of which we have spoken have so great a predominance over the other phenomena as to mask them and to make the diagnosis uncertain.

We may also remark that in some cases these characteristic nervous troubles have been known to continue even during convalescence; it is also not very rare to see, under their influence and during convalescence, a sort of recurrence of previous nervous troubles, hysteria, St. Vitus' dance, &c. It could even be said that it is to this possible recurrence of former nervous affections, or to the permanence of persistent forms of neuralgia caused by the influenza, that the so-called encephalic form owes its gravity, since, outside of these symptoms, this form has a very much lower death-rate than the other forms, although it frequently gives to the disease an alarming appearance. It is none the less true, however, that the records of epidemics of influenza show a certain number of cases of death produced by this functional disturbance of the nervous system being carried to the extreme.

It is very evident, after what we have said, that the nervous troubles connected with influenza demand the serious attention of physicians. In addition to the means used for lessening nervous depression, they should not fail to employ those which realise the following twofold indication:—

1. To calm the symptoms of pain.
2. To enable the patients to obtain quiet and refreshing rest.

In both of these respects, a medicine that has rapidly acquired a widespread and very legitimate celebrity throughout the whole world, **BROMIDIA** will almost infallibly render the most signal service. The four substances of which it is composed (Chloral, Bromide of Potassium, Hyoscyamus, and Cannabis Indica) explain very easily its great success, so that it is quite superfluous for us to go into further details on this point. Let us merely remark, a fact that has been verified by all who have used it, that **BROMIDIA** is perfectly supported by the stomach and very easy to administer.—GAZETTE DES HÔPITAUX, Paris, Jan. 28th, 1892.

To avoid any excuse for substitution, orders should be written SQUIRE'S Chemical Food.

SQUIRE & SONS,

HER MAJESTY'S CHEMISTS,

413, OXFORD STREET. LONDON, W.

AWARDED A SILVER MEDAL AT THE INTERNATIONAL HEALTH EXHIBITION 1884.

TUSON'S DISINFECTANTS.

Authorised by H.M. Board of Trade.

FLUID **POWDER.**

Used largely by the **City of London** for deodorising the wood pavements, market purposes, &c.; also by the **London County Council**, Hornsey, Beckenham, Grantham, Doncaster, and other Local Boards, St. Mary's and numerous other Hospitals, Railways, &c. No household should be without them, as they destroy, not merely *mask*, bad smells.

The Medical Officer of Health and Public Analyst for the City of London (Dr. SEDGWICK SAUNDERS, F.I.C., F.C.S., F.S.A., &c.), in an official report to the Commissioners of Sewers, as far back as 1889, states as follows:—

"During the past summer months I have found 'TUSON'S DISINFECTING FLUID' extremely valuable for watering public roadways, for which purpose a 2 or 3 per cent. solution may be used."

The Gresham Professor of Medicine, in a recent lecture on "Infection and Disinfection," made the following remarks:—

"In Professor Tuson's Disinfectants we have the union of two well-approved agents—i.e., Sulphurous Acid and Chloride of Zinc,—and so we have in a small compass what is needed for the double purpose of disinfecting the atmosphere and obnoxious fluids and solids."

NUMEROUS OTHER TESTIMONIALS.

Sold in 30-oz. and 12-oz. bottles, price 2s. 6d. and 1s.; and in Tins, 1s. each. Gallon and Half-gallon Jars at 4s. 6d. and 2s. 6d. A convenient form for household use. Fluid in bulk at 3s. 6d. per gallon. Powder in bulk at 30s. per cwt. A cheaper Powder at 8s. 6d. per cwt.—a good Deodorant. Jars, casks, & kegs extra.

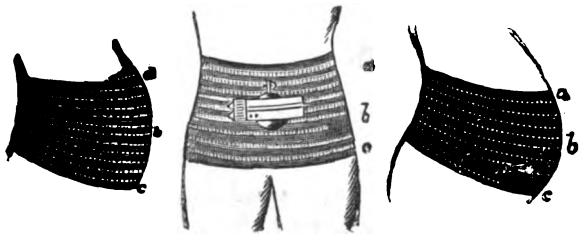
PARTURITION.

ALETRIS CORDIAL (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hæmorrhage. By its DIRECT tonic action on the uterus it expels blood-clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases it can be combined with ergot in the proportion of one ounce of Fluid Ext. Ergot to three ounces of Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.



RIO CHEMICAL CO., ST. LOUIS, U.S.A.

The above Preparation is prepared exclusively for the prescriptions of Medical Men. A Sample will be sent free to any Medical Man who desires to test it, on application to

BURGOYNE, BURBIDGES, & CO., 16, Coleman Street, London.

GENERAL DEPOT FOR GREAT BRITAIN.

HUXLEY'S ABDOMINAL BELTS,

for Pregnancy, Obesity, Umbilical Hernia, and general Abdominal Weakness

(THE INVENTION OF VALLAISE),

are made expressly in all cases, the material being selected with due regard to the requirements of each case. Made of cotton and silk, each of *best* quality only.

MEASUREMENT REQUIRED.—Circumference at *a*, *b*, and *c*, depth from *a* to *c*, stating sex and any other particulars that can be given.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

HUXLEY'S HYPOGASTRIC CEINTURE, or UTERINE SUPPORT FOR HORSEWOMEN.

Dr. R. J. MAITLAND COFFIN contributed the following letter to THE LANCET and BRIT. MED. JOUR. on Oct. 15th, 1887:—

"NEW UTERINE SUPPORT FOR HORSEWOMEN.

"Shortly after my association with the 'Wild West,' I asked the frontier girls whether the violent riding did not shake them considerably, and was told that at times they suffered a great deal of pain. I advised them to get abdominal belts to keep themselves together whilst riding; they did so, and felt great benefit therefrom. On talking the matter over with Mr. E. HUXLEY, of Old Cavendish-street, he suggested a uterine support, which consists of a peculiar-shaped pad, with two straps, which cross over the sacrum and are brought to the front and fastened with any amount of tightness the wearer may find desirable. I got him to make one for each of the girls, and they say they are such a comfort and support that they will never ride without them. I think the belt will prove a great blessing to ladies in the hunting field as well as to professional riders.

"Baron's Court, S.W." "R. J. MAITLAND COFFIN, F.R.C.P.Ed.

The marked success which has attended the use of this admirable contrivance induces me to suggest its use in many cases of uterine weakness, weakness of the abdominal walls, or cases in which distress arises from walking or riding exercise. It is invaluable in all cases of threatened hernia in either sex. Its adoption will enable ladies to resume horse exercise who have been obliged to discontinue it. Although it has been made more particularly for Ladies, it is equally adapted for the use of Men where weakness of the abdominal walls indicates a tendency to hernia, or when distress is occasioned on taking more than usual exertion.

Measures required—Circumference of Pelvis, or lower part of body, as for a truss. **Price 25s.**

EDWARD HUXLEY, 13, Old Cavendish-street, Oxford-street, W.

Post-office Orders payable at Vere-street. Professional discount 20 per cent. where not marked "net." Medical Men, being charged the lowest price, are requested to send their orders direct, as there is no margin left as a profit for Agents.

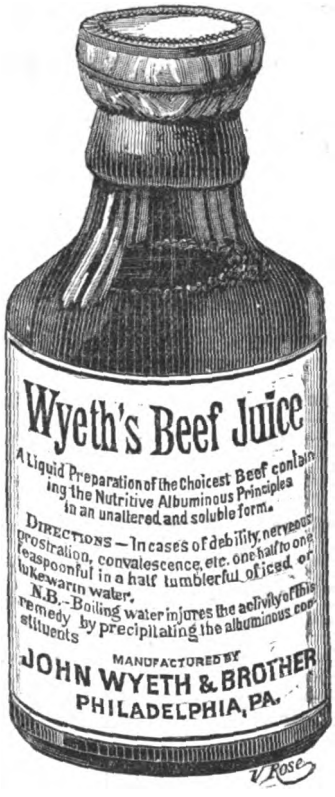
WYETH'S BEEF JUICE.



A LIQUID PREPARATION OF THE CHOICEST BEEF, CONTAINING THE NUTRITIOUS ALBUMINOUS PRINCIPLES IN AN UNALTERED AND SOLUBLE FORM.

Contains all the albuminous principles of beef in an active and soluble form.

Contains the hæmoglobin of the meat unaltered.

Possesses all the nutritive properties of the choicest beef to a higher degree than any extract of meat yet offered to the profession.

Of great value as a strengthening diet in cases of convalescence, consumption, nervous prostration, typhoid fever, debility, &c.

A FULL-SIZED BOTTLE sent Post Paid FREE to any Physician desiring to test it personally.

In cases where Wine and Alcohol are contra-indicated use WYETH'S BEEF JUICE for its pronounced stimulating properties. Possessing the nutrient and sustaining elements of food, the after depression from the use of Alcohol in any form is not induced.

Can be used in Seasickness, where ever tea or bouillon cannot be taken, and gives sustenance and strength.

Prescribed for overworked professional men suffering from mental anxiety &c., it relieves fatigue of mind and body.

CAUTION.—*Mix only with iced or lukewarm water; NEVER with boiling water, as extreme heat renders the valuable albuminous elements insoluble.*

HIGH-CLASS PHARMACEUTICAL PREPARATIONS.

SAVARESSE'S CAPSULES.

What is the best way to give Sandal Wood Oil or Copaiba? They should be *pure*, and act near the disease without nausea or stomach disturbance. SAVARESSE'S Capsules of organic membrane answer these requirements; they do not dissolve in the stomach, but generally in intestines. Mr. W. ACTON, F.R.C.S. (p. 96, "Urinary Diseases"), recommended them. They are increasing in favour with Medical Men who want *sure* results. **Sandal Wood Oil, 4/6; Copaiba, 2/6 boxes.**

EVANS' FLUID EXTRACTS.

The Perfection of Pharmacy. Made with special menstrua, they represent weight for weight of the crude drug, of which they contain the *whole* of the active medicinal properties. Always reliable; keep well. Tinctures and infusions can be immediately prepared from them, one minim representing one grain of the drug.

Full List, with Doses &c., on application.

SAVAR'S COCA WINE.

—:o:—

WHAT COCA WINE SHALL WE ORDER?

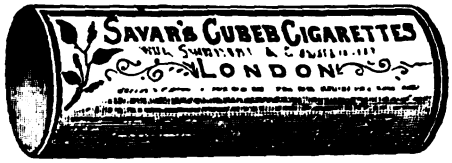
SAVAR'S, brought out in 1875, is standardised to contain ½-grain pure Cocaine in each fl. oz., and 2 fl. drachms are a dose. Many Coca Wines *cannot* be sold by Chemists without a wine licence, because so weak in Cocaine—SAVAR'S *can*. Physicians know exactly what they are doing in ordering this stimulating tonic.

Bottles 4/- and 7/-.
(3/6 and 6/- for dispensing.)

MONTSERRAT LIME-FRUIT JUICE.

True Lime-Fruit Juice is a very useful acid Drink, when diluted. The best is from the Consignee's Estate in Montserrat, W.I., of which over 100,000 gallons annually come over to the Sole Consignees. It is pure, reliable, pleasant, and a genuine anti-scorbutic.

In Imperial Pints and Quarts.



Prescribe CASCARA-HAWLEY for Constipation.

A reliable Laxative is often wanted (especially for Ladies and Children), tasteless, and that can be swallowed with ease. Nothing can be better than the B.P. fl. Extract of Cascara Sagrada, rendered tasteless by an envelope or gelatine. Each Capsule is equal to ½-drachm of fl. Extract. In Pregnancy and Habitual Constipation invaluable.

Box 20, 1/1½; 100, 4/6 per box.

SAVAR'S CUBEB CIGARETTES.

Is there any real palliative for Asthma and Chronic Cough? Cubebs smoked so as to get the effect of the resins down the Throat is always worth a trial. Here we have the effect aided by Stramonium and softened by Cannabis Indica. To be smoked through the Nose for Hay Fever.

Boxes 1/- and 2/6.

Lescher's Recent Materia Medica, 4th Edition, 500 Drugs, &c., with Doses, Formulæ, &c., 2/6.

ALL ABOVE MAY BE PROCURED THROUGH USUAL TRADE CHANNELS.

TRADE MARK. DENAEYER'S PEPTONOIDS & EXTRACT OF MEAT COMPANY LIMITED LONDON SOLE MAKERS

"The proteid stored in the animal tissues is from two sources: from that which has been absorbed unaltered, and from that formed by the regeneration of peptones.

"But what quantitative proportion do they bear to each other? How large is the portion of the proteid of the food which is peptonised in the alimentary canal?

"Schmid Mülheim tried to find an answer to this in the following way: He fed six dogs on boiled meat, killed them, one, two, four, six, nine, and twelve hours afterwards, and examined the contents of the stomach and intestines. In each case he found *considerably more peptone than dissolved proteid, both in stomach and intestine. It thus appears that the greater part of the proteid became absorbed after peptonisation.*"

TEXT-BOOK OF PHYSIOLOGICAL AND PATHOLOGICAL CHEMISTRY, 2nd Edition, 1890. Prof. BUNGE. (Translated by L. C. WOOLDRIDGE, M.D., B.Sc.)

DENAEYER'S LIQUID STERILISED PEPTONE OF MEAT. 2/- per Bottle. Contains upwards of 20 per cent. of dry matter, of which THE LANCET says: "About one-third of the whole dry matter consists of TRUE PEPTONE, and another third of ALBUMOSE, a variety of albumen which is not coagulated by heat."

DENAEYER'S POWDER OF PEPTONE OF MEAT. A soluble preparation of the Nutritive Constituents of Beef in the form of Albumose Peptone, suitable for dissolving in the ordinary food of the patient, or for Rectal Alimentation.

DENAEYER'S LIQUID PEPTONATE OF IRON. 1/6 per Bottle. A chemical union of the metal with Albumose Peptone, in order to facilitate the physiological entry of iron into the circulation. Both pleasant and delicate.

PULVIS FERRI PEPTONATIS (Denaeyer). 4/- per ounce. Soluble in water and compatible with other medicines.

PEPSINA PORCI (Denaeyer). 2/- per ounce in scale or powder. Soluble in water, free from odour and all unpleasantness. The most powerful peptogens yet available, obtained by a new and perfect process from the stomach of the pig.

CASCARA SAGRADA.

THE prominence of **CASCARA SAGRADA** among remedies prescribed for the relief of habitual constipation and the evils attending it has led to its pharmaceutical preparation in a variety of forms, which permit of its administration to all classes of patients, young and old, and as an adjuvant and corrective in all diseases in which an alterative or laxative is indicated, and as an agreeable laxative vehicle for constipating or nauseous medicines.

SOLUBLE ELASTIC CAPSULES OF CASCARA SAGRADA, two and three grains, are an acceptable method of exhibiting this drug.

For children or adults whose palates are hypersensitive we furnish **CASCARA CORDIAL**, which combines aromatics and carminatives with this drug in a most agreeable tasting preparation, the dose of which is slightly larger than the more active Fluid Extract, and which is not only acceptable to all palates, but furnishes an admirable vehicle for many medicines of disagreeable taste, completely disguising bitterness and nauseousness.

AS A VEHICLE FOR NAUSEOUS MEDICINES Cascara Cordial has become widely known to the profession. It not only effectually disguises the taste of such inherently bitter medicines as quinine, but, on account of its laxative properties, is a most valuable adjuvant or corrigent to any prescription containing drugs such as iron, the continued administration of which tends to constipate.

☞ *Physicians will please not confound Cascara Cordial (P., D., & Co.) with so-called Cascara Cordial ordinarily dispensed by Chemists. To ensure this product being dispensed, please specify P., D., & Co.*

The claims we make for the medicinal efficiency of **CASCARA SAGRADA** are fully substantiated by eminent medical authorities of America and Europe, as well as by the experience of the rank and file of the profession.

Being the first to introduce **CASCARA SAGRADA**, we will ask Physicians who have met with disappointment when prescribing other brands to specify on their orders—**CASCARA SAGRADA (P., D., & CO.)**, which is always uniform and reliable in its action.

All information desired by Physicians as to **CASCARA SAGRADA**, or our general line of standard medicinal preparations, pharmaceutical specialties, and latest therapeutic novelties and improvements in methods of medication, will be promptly furnished on request.

SAMPLES FREE TO PHYSICIANS.

MOSQUERA'S BEEF MEAL.

BEEF MEAL is a predigested powdered meat, representing in actual nutritive value six times its weight in good lean beef. It is entirely devoid of all objectionable taste and smell, and can be tolerated with ease by the most delicate stomach. As distinguished from any similar product heretofore known, it contains all the constituents of the meat, whether soluble or insoluble; while more than 50 per cent. of its substance is in a predigested form, ready for immediate assimilation. For administration, Mosquera's Beef Meal may be mixed with any soup or broth having sufficient consistence to suspend it, or added to chocolate, in combination with which it makes a delicious beverage. If a clear bouillon is desired, simply treat the meal with a little water, and strain the solution through one or two thicknesses of cheese cloth.

EXTRACTS FROM MEDICAL PAPERS.

"Two distinct preparations, Beef Meal and Beef Jelly, have been submitted to us. Both contain nourishing fibrine as well as peptone, the former being recognised under the microscope, and the latter by the well-known biuret reaction. The meal on analysis gave the following results: Moisture, 8·60 per cent.; organic matter, 87·68 per cent.; mineral matter, 3·72 per cent. The jelly results as follows: Moisture, 22·10 per cent.; organic matter, 62·46 per cent.; ash, 15·44 per cent. The meal contained over 10 per cent. of nitrogen. In the face of these results it is evident that both preparations are foods particularly rich in restorative and nourishing elements. Further, they are of excellent flavour, and the entire absence of objectionable preservatives was ascertained."—**THE LANCET, April 30th.**

"The substance is a finely divided beef powder, of a light brown colour and of very pleasant taste. It contains high percentages both of albuminous matters, which may be regarded as available, and of so-called peptones; while it has, as above implied, neither bitter nor other objectionable taste. The percentage of water is low, and the preparation keeps unchanged, apparently, for an indefinite period if properly stored. This Beef Meal may be relied upon as a well-manufactured preparation, and it will probably be found unusually useful."—**BRITISH MEDICAL JOURNAL, Jan. 2nd.**

"Various forms of powdered meats have been brought forward at different times, but they failed in nutritive value, as they largely consisted of insoluble matters. The Beef Meal contains less than 10 per cent. of water, and, with the exception of this small percentage, is composed of nutritive matter, nearly half of which is in a readily soluble form. We have given the food in several cases of extreme debility with very satisfactory results. The Mosquera Co.'s Beef Meal is a unique and valuable food."—**HOSPITAL GAZETTE, Nov. 21st.**

Cleaver's Juvenia Cream

MEDICAL TESTIMONIAL. Streatham, S.W., Feb. 19th, 1892.

Gentlemen,—Some time since you were good enough to forward me a sample of your Juvenia Cream—I at once tried it in a case of Eczema Capitis with very satisfactory results. I next recommended it to a patient who had undergone an operation for relief of constriction of the bowels some 3½ years ago, and who has since been troubled with an eczematous condition of the skin. Many preparations have been tried for the relief of this complication with very variable success, but since the use of your preparation this trouble has been kept completely in abeyance, and the patient's comfort has been very greatly increased. As a toilet preparation for the relief of chapped hands it is unequalled. I have great pleasure in testifying to the good results I have found from its use.

Yours faithfully.

MESSRS. F. S. CLEAVER & SONS. MATTHEW COATES, M.D., F.R.C.S.

Registered No. 99,335. **PRICE PER TIN, 1s., 2s., & 3s. 6d.**

THIS unique Toilet Preparation is specially adapted both for preventing and allaying Eruptions and Irritation of the Skin.

In all cases of Roughness, Redness, or Chapping of the Skin, arising from susceptibility to atmospheric changes, Eczema, Tan, Sunburn, etc., it will be found most valuable.

It becomes rapidly absorbed by, and entirely penetrates, the Epidermal surface, rendering the same soft and supple; and its continued use produces a natural and healthy action of the Skin, by enabling it to perform its proper functions of respiration.

JUVENIA CREAM should be regularly applied before retiring to rest at night.

JUVENIA CREAM will be found most valuable by members of the Theatrical Profession, as by being applied before making-up, it prevents the injurious action of the colours used.

SOLUBLE PODOPHYLLIN

Liq. Podophyllin (Hockin).

Miscible (bright), in Aqueous, Acid, or Alkaline Solutions, also with Decoctions, Ethers, Infusions, Tinctures, &c. Each Drachm equal to—Podophyllin Pur. ¼ gr. Packed (for Dispensing) in 16 oz. 7/-, 8 oz. 4/-, and 4 oz. 2/6 bottles, and Winchester Quarts, 6/9 per lb. Bottles free. Postage charged as follows:—16 oz. and 8 oz. bottles, 6d.; 4 oz. bottles, 3d.

E. G. Dutton, Esq., M.R.C.S., L.S.A., Plymstock, writes:—"With reference to the "sample of Liq. Podophyllin which you kindly favoured me with, I can distinctly "state that your preparation was vastly more efficacious than Podophyllin in the "form of pills, and I shall in future always use the 'Liquor.'"

Liq. Podophyllin et Pepsin (Hockin.)

A Soluble Preparation of Podophyllin and Pure Pepsin. Of great Digestive Power. As an aid to Digestion, when the ordinary stimuli do not excite sufficient secretion and the digestive ferment is insufficient. In all indigestion due to a sluggish state of the liver and constipation of the bowels it will be found invaluable. Its action is certain, and it has not the strong, disagreeable odour so often found in preparations of Pepsin. Each Drachm equals—Pepsin Porci B.P., 2 grs.; Podophyllin Resin, ¼ gr. Prices as Liq. Podophyllin.

John Keagh, Esq., L.R.C.S.I., L.M., Killaloe, writes:—"I have prescribed your "preparation of Liq: Podophyllin et Pepsin with great success. I consider it a most "valuable hepatic stimulant. Please send me an 8 oz. bottle, for which I send "P.O. Order."

Liq. Podophyllin et Belladonnæ c. Strychnia (Hockin).

SYNONYM.—LIQ. HOCKIN. Acts most beneficially in torpid liver from defective nerve influence, and also upon the alimentary canal. It increases the tone and vascularity of the stomach, improves appetite and promotes digestion, and in atonic dyspepsia and various chronic catarrhal affections of the gastric mucous membrane it acts as an excellent tonic, greatly increasing the muscular contractions of the intestinal tube, and counteracts constipation and fæcal accumulations. Each Drachm equals—Podophyllin Resin, ¼ gr.; Ext. Belladonnæ Rad. Alch., ⅛ gr.; Strychnia, 1-30 gr. Prices as Liq. Podophyllin.

John Morgan, Esq., F.R.C.S., Eng., L.R.C.P., Lond., Langport, writes:—"I have "tried your Liq. Podophyllin et Belladonna C. Strychnia, of which you sent me a "sample. I have found it valuable in cases of torpid liver, and shall continue to "prescribe it whenever suitable cases occur."

Liquor Jalapæ Resinæ (Hockin).

The value and use of Jalap as a purgative has been so long established that it appears almost unnecessary to refer in any way to its therapeutics, but the difficulty of dispensing it in a soluble liquid form has always been very considerable, and has necessitated its being invariably given in the form of a pill, and even then its action is by no means certain. These difficulties have induced us to prepare a liquor soluble in all proportions with water, and of a standardised strength of 2 grains to the drachm. It contains *no* alcohol, is pleasant to the taste, and will be found a thoroughly reliable preparation. Packed (for Dispensing) in 16 oz. bottles, 7/-; 8 oz. 4/-; 4 oz. 2/6 each. Bottles free.

Injectio Glycerini c. Jalapa (Hockin).

Each Drachm contains 1 grain of Jalapæ Resina, B.P. The use of Glycerine in Constipation has become during the past year or two very general, and excellent results have been obtained; but it has been found that where a decided predisposition to Constipation exists it often has no action whatever. This has induced us to combine it with Resina Jalapæ, which will be found to form an injection that seldom fails, and also will doubtless not merely act on the lower intestines as plain Glycerine does. Packed in 4 oz. bottles, 2/- each. Bottles free. Postage 3d.

Prepared only by HOCKIN, WILSON & CO.,

LARGELY PRESCRIBED AS AN ARTICLE OF DIET

IN ALL CASES OF

CONSUMPTION, WASTING, LOSS OF APPETITE, STRENGTH, and DIGESTIVE POWER.

The vast benefits resulting from the administration in Wasting Diseases of Cod-liver Oil and Pancreatic Emulsion are too widely known and acted upon to need further mention. The special advantage of Pancreatic Emulsion is that it provides the NATURAL STABLE SOLID FATS OF FOOD, predigested by the action of the pancreatic secretion, so that they can be taken without the least disturbance of the digestive functions. As it provides SOLID fat, it is well to make it alternate with a liquid fat, like cod-liver oil, even where the latter agrees, and in the many cases where cod-liver oil disagrees it may be permanently substituted with the greatest advantage, or it may be taken WITH the oil, the assimilation of which it actively promotes.

A collection of Medical testimonies as to the rapid increase in weight and health resulting from taking the Pancreatic Emulsion will be sent on application. The following brief extracts are selected:—

"In these cases cod-liver oil, which has hitherto been persistently rejected, was retained by the stomach after the emulsion had been administered for some time."

"The emulsion and cod-liver oil treatment was tried in cases of consumption, in all of which it produced a speedy and well-marked improvement in the digestive organs, and proved far superior to the oil alone."

"Found the digestion improved. A marked improvement in nutrition, with increase of weight."

"Have found it of inestimable value in general debility, atonic dyspepsia, and diabetes."

"In all cases the patients can take emulsion when they cannot take cod-liver oil."

Special stress is now laid on the great desirability of attending to the digestive functions in phthisis. We venture respectfully to remind the Profession that a very large consensus of Medical opinion points to this preparation as the only one which exactly provides both the form of nourishment required and the necessary aid to the digestive powers.

The Emulsion is of the consistence of Devonshire cream: easily miscible with fluids and quite unobjectionable in taste. It may be given in milk or water, and with the addition of a little wine or brandy if desired.

SAVORY & MOORE,

143, NEW BOND STREET, W.

A BOON TO DYSPEPTICS.

Bynin — LIQUID MALT.

This liquid preparation of **Malt Extract,** so favourably known to the medical profession for many years, while possessing all the digestive and nutritive powers of the ordinary thick extract, is so much pleasanter to handle, and easier to take, that by many persons it is infinitely preferred to the older form. The activity of the Diastase upon which the value of Malt Extract chiefly depends is very pronounced—in fact, it is greater than in the thick extract, owing to the fact that it has been subjected to heat for a shorter time. In addition to Diastase, Maltose and Dextrine are largely present, together with Phosphates and a certain amount of Nitrogenous material, all possessing considerable value as articles of diet.

CHIEF USES.—Malt Extract has been most largely prescribed in wasting diseases, and its use has been almost invariably followed by very good results, emaciation being stopped and the patient putting on flesh. It is most probable that this result is due partly to improved digestion, from the assistance given by the malt diastase to the diastase of the Salivary and Pancreatic Juices, and partly to the fact of Nitrogenous tissue-waste being saved by the Carbohydrates.

The presence of diastase clearly points to the use of Bynin in certain forms of dyspepsia due to weak digestion, and in such cases the practical experience of many medical men has abundantly proved the great value of this preparation.

For **Children** Bynin is especially useful, as its pleasant taste renders it very palatable, and digestive disorders being the commonest found amongst children, such a powerful aid to digestion and nutrition cannot fail to be of the utmost service. On this point we have abundant testimony of the most varied description.

For **Women** whilst suckling, Bynin has been given in milk, in place of Stout or Porter, with the best results, forming, as it does, a highly nutritive and easily digested food, which increases the flow and enriches the quality of the milk; and, what is of great importance, renders it more assimilable and easy of digestion by the infant.

METHOD OF ADMINISTRATION.—The *best* way to take Bynin is *during the meal.* It may be sipped slowly either by itself, or mixed with water, wine, milk, lemonade, &c., or may be taken stirred up with gruel or farinaceous puddings. It is better taken in this way than after the meal, when its action is much hampered by the acid secretion of the stomach. Nursing mothers should take one tablespoonful, in half a tumbler of new milk, three times a day *between* meals.

☞ **One FLUID ounce of Bynin represents one ounce by WEIGHT of Allen & Hanburys' ordinary thick MALT EXTRACT, which is sold in wide-mouthed jars, similar to their Bynol jars, at (retail) 1s. 6d. and 2s. 9d. each.**

THE LANCET writes: "We find that one ounce of Bynin will digest perfectly one pound of starch. This is a most favourable result, and, coupled with the fluidity and pleasant flavour, renders this preparation a most valuable one."

In Bottles at (Retail) 1s. 9d. and 3s. each; 16s. and 27s. per dozen to the Profession.

BENGER'S PREPARATIONS

OF THE

NATURAL DIGESTIVE FERMENTS

AND SPECIAL FOODS FOR INFANTS AND INVALIDS.

1.—LIQUOR PANCREATICUS (Benger). (REGISTERED.)

For the preparation of peptonised or partially digested foods, such as milk, soups, beef-tea, &c.

Simple directions for preparing these accompany each bottle.

In 4 oz., 8 oz., and 16 oz. Bottles.

THE LANCET says: "So many worthless articles of this kind have been sold that great care is required in choosing those upon which reliance can be placed. Mr. BENGER'S care has therefore been well spent."

2.—BENGER'S PEPTONISING POWDERS.

(Pulvis Pancreatus Alkalinus—Benger.)

These Powders may be used instead of LIQUOR PANCREATICUS (BENGER) to peptonise Milk, &c. They are colourless, odourless, and instantly soluble.

One powder will rapidly peptonise a pint of milk, gruel, soup, &c.

In Boxes of 12 Powders, Retail, 2s. 6d.

3.—LIQUOR PEPTICUS (Benger).

A CONCENTRATED & EXCEEDINGLY ACTIVE FLUID PEPSINE.

It is prescribed in doses of one or two teaspoonfuls in a wineglass of water, wine, or weak spirit-and-water, with meals. It is without disagreeable taste.

In 4 oz., 8 oz., and 16 oz. Bottles.

4.—BENGER'S PEPTONISED BEEF JELLY.

Glass Jars, will keep in any climate, Retail Price, 2s. each.

A DELICATELY FLAVOURED, CONCENTRATED, PARTIALLY DIGESTED, AND SOLIDIFIED BEEF-TEA.

It can be taken by teaspoonfuls, cold as a jelly, or dissolved in a little hot water, as a concentrated beef-tea. It is also used to fortify or enrich ordinary beef-tea, soups, &c. It affords to invalids, when travelling, a ready and convenient form of concentrated nutriment.

5.—BENGER'S PEPTONISED CHICKEN JELLY.

A NUTRITIVE DELICACY FOR INVALIDS.

Glass Jars, 2s. each.

It is prepared in a similar manner to the PEPTONISED BEEF JELLY above described, and, like it, contains the nutritive constituents in a concentrated, partially digested, and solidified form.

AWARDS.

GOLD MEDAL
International Health Exhibition, London, 1884.

FIRST ORDER OF MERIT AND MEDAL (Highest Award), Adelaide, 1887.

FIRST ORDER OF MERIT AND MEDAL, Melbourne 1888.

HIGHEST AWARD, Medical & Sanitary Exhibition, London, 1888.

OPINIONS OF THE MEDICAL PRESS.

THE LANCET.

"We have on a previous occasion noticed some of Mr. BENGER'S admirable preparations. Those now before us are not less satisfactory."

The BRITISH MEDICAL JOURNAL.

"Time and use have justified the claims put forward for these preparations."

The PRACTITIONER.

"All these preparations are, we think, deserving of the highest praise, and only require to be made known to the profession to ensure their extensive employment."

The LONDON MEDICAL RECORD.

"These are, undoubtedly, a great advance on any previous attempt in this direction. .... The introduction of these preparations is a distinct advance in therapeutics."

The MEDICAL TIMES AND GAZETTE

"BENGER'S preparations have deservedly a very high reputation, and are all largely used."

6.—BENGER'S FOOD *(Pancreatised).*

(REGISTERED.)

For INFANTS, CHILDREN, and INVALIDS.

In Tins, 1s. 6d., 2s. 6d., 5s., and 10s., with Directions for Use.

A great improvement on the various forms of Liebig's Food. When mixed with warm milk the pancreatic ferments render the farinaceous matter soluble, and reduce the casein to the same digestible condition in which it exists in human milk, so that hard masses of curd cannot be formed in the stomach. Experience has shown that delicate children and adults with weak digestions can enjoy and retain this food when all others disagree.

7.—BENGER'S PANCREATISED OAT FLOUR.

8.—BENGER'S PANCREATISED LENTIL FLOUR.

Tins, 1s. 6d. and 2s. 6d.

These Flours are partially cooked and impregnated with the natural digestive principles of the pancreas. They are useful as a substitute for BENGER'S FOOD, described above, where a change of diet is thought desirable, and are used in a similar manner with milk or milk-and-water.

Full directions for use accompany each tin.

9.—BENGER'S NEW ESSENCE OF RENNET.

CURDLING FLUID,

For PREPARING FRESH WHEY, JUNKETS, &c.

Bottles, 1s. and 1s. 6d.

Directions for use enclosed.

10.—PEPTONE SUPPOSITORIES (Benger).

For RECTAL ALIMENTATION.

In Boxes of 6 and 12.

BENGER'S PREPARATIONS may be obtained through all Wholesale and Retail Houses, or direct from the Manufacturers.

BY ROYAL LETTERS PATENT.

"TRITICUMINA" BREAD.

(REG.)

THE features of this process are: That (after treatment) the whole of the grain of wheat is ground for Bread-making, and a Bread obtained therefrom which does not cause the excessive irritation of the alimentary canal which is produced by the wholemeal bread of other processes, **with the important additional advantage that the greater portion of the starch of the grain is converted into dextrine.** The Bread produced has a fine, rich, home-made flavour, with a thin, perfectly uniform, and easily masticated crust.

Each Loaf has the word "TRITICUMINA" stamped on it.

4d. per Loaf.

"TRITICUMINA" FOOD.

TRADE MARK.

REGISTERED.

"TRITICUMINA" is a Malt Food. Its special value lies in the fact that, instead of employing the barley malt of the market, **the wheat is malted,** under specially ascertained conditions, with the express purpose of rendering the product most suitable for use as **a digestible food for Infants, Children, and Invalids.** It is rich in mineral matter, fine portions of the inner bran being retained.

One Shilling per Tin.

See Reports by OTTO HEHNER, Analyst, London; ALFRED GORDON SALAMON, Analyst, London; A. BOSTOCK HILL, Analyst, Birmingham, &c., in Pamphlet.

Sole Proprietors: **MEABY'S "TRITICUMINA" COMPANY, LTD.,**

IMPROVED PRODUCTS.

THE "B., W., & CO." PORTABLE PIPE CHLORIDE OF AMMONIUM INHALER.

(*As designed by* Dr. STENSON HOOKER.)

The beneficial effects of inhalations of Ammonium Chloride have been long known to the Medical Profession, and the only objection to the more extensive use has been the high cost of instruments for the inhalation of Ammonium Chloride Vapour. We have, however, at the instance of Dr. HOOKER, introduced a portable Pipe Inhaler. It is composed throughout of earthenware. The bowl of the pipe contains an inner vessel, perforated at the base, to promote combination of the vapours, and is divided down the middle by a septum. In the base of the bowl itself there is placed a sponge which, when saturated with water, thoroughly washes the fumes. This inhaler possesses the following advantages over any temporary apparatus. It is extremely portable, and not liable to get out of order easily. It may be thoroughly cleansed by washing, and is moderate in price. This inhaler may be employed by patients in any position, or while walking, sitting, or reclining.

The Inhaler, together with two stoppered bottles, containing Hydrochloric Acid and Solution of Ammonium, for use with the instrument, is supplied to the Profession at 5s. each; retail, 7s.

HAZELINE.

Witch Hazel Plant.

A colourless distilled product, containing the volatile active principles of the fresh green twigs and leaves of the Witch Hazel.

PROPERTIES.—*Hæmostatic, Anodyne, and Astringent.*

Prescribed in cases of hæmorrhage from the nose, lungs, womb, rectum, &c. Is a valuable agent in the treatment of bruises, sprains, inflammation, peritonitis, piles, fistula, anal fissures, ulcers, varicose veins, eczematous surfaces, tonsillitis, pharyngitis, nasal and post-nasal catarrh, stomatitis, leucorrhœa, nasal polypi, &c.

DIRECTIONS.—In catarrh or cold in the head, may be sniffed up the nostrils with an equal part of tepid water.

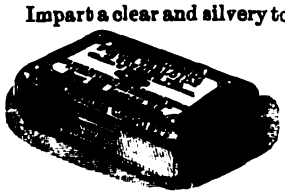
Dose for irritated or inflamed throat and lungs, half to one teaspoonful occasionally.

Supplied to the Medical Profession in ½ and 1 lb. bottles, at 1s. 2d. and 3s. 6d. each. Retail prices, 1s. 6d. and 4s. 6d. each.

VEREKER IMPROVED CHLORIDE OF AMMONIUM INHALER.

"The neutral vapour of Chloride of Ammonium removes unhealthy and offensive secretions, and restores the long diseased or weakened nasal and respiratory mucous membrane to a healthy state, so that in cases of catarrh, where thickening, induration, and irritation exist, a most decided improvement is brought about in a short time." In "throat-cough," pharyngeal irritation and relaxation and weakness of the throat, it acts as a most effective alterative and tonic to the mucous membrane.

"The best inhaler for the surgeon's study is that of Burroughs, Wellcome, & Co.; it does not require recharging at each time of using, and yields perfectly neutral vapour of Ammonium Chloride."—"Diseases of the Ear and Naso-pharynx," Dr. MACNAUGHTON JONES (Baillière).



Dr. SMYLY, Ex-Pres. Royal College of Surgeons, Ireland, says:—"It is the best Inhaler for Chloride of Ammonium I have met with."

Supplied to the Medical Profession at 5s. each. Retail, 7s. each.

VOICE "TABLOIDS."

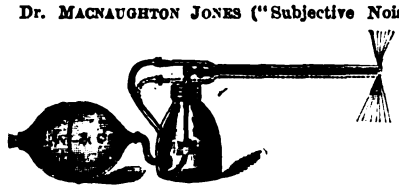
Composed of COCAINE, *Chlorate of Potash, and Borax.*

Impart a clear and silvery tone to the voice. Easily retained in the mouth while singing or speaking. Now used by the leading singers and public speakers throughout the world.

DIRECTIONS. — A single "Tabloid" may be slowly dissolved in the mouth to remove huskiness or hoarseness.

Supplied to the Medical Profession in beautifully graven white metal boxes, blue silk label, at 8d. and 1s. 4d. each. Retail prices, 1s. and 2s. per box.

THE B., W., & CO. PAROLEINE ATOMISER.



THE JOURNAL OF LARYNGOLOGY AND RHINOLOGY says: "These instruments have delighted us. We have so often asked for a spray that would throw a fine vapour of an ointment or oily solution, and those which are offered are anything but satisfactory. The sprays before us meet all our wants; no laryngologist's table will be complete without these beautiful sprays."—December, 1890.

The B., W., & Co. Naso-Pharyngeal Paroleine Atomiser, 3s. 5d. each.

Mr. LENNOX BROWNE recommends inhalations of menthol by these means in rhinitis and irritable or inflamed conditions of the naso-pharynx.

Dr. MACNAUGHTON JONES ("Subjective Noises in the Head and Ears," Baillière, Tindall, & Cox) says:—"A solution of menthol may be made by dissolving one part of menthol in Paroleine (B., W., & Co.), seven parts; this is preferable, as it does not turn rancid by keeping. This bland, neutral, and tasteless oil is a ready solvent for all essential oils—menthol, thymol, salol, iodoform, and creosote."

The B., W., & Co. Post-nasal Paroleine Atomiser, 5s. 2d. each.

Paroleine is supplied to the Medical Profession in 4-oz. bottles, at 9d. each.

BEEF AND IRON WINE.

Prepared by BURROUGHS, WELLCOME, & CO.

This preparation contains all the stimulating properties of Beef with Citrate of Iron in a pure medicinal wine. Is palatable, elegant in appearance, and can be frequently taken by patients when Iron in any other form cannot be borne. As a resuscitating agent during convalescence from acute disease, in anæmia, neurasthenia, and wherever a useful stimulant and tonic is indicated, the Burroughs Beef and Iron Wine will afford every satisfaction.

THE LANCET says: "This is a really valuable preparation, and, as far as we know, a novelty. It contains Beef Juice and Citrate of Iron in solution in Wine, and is therefore a very powerful and rapidly acting tonic. Children, as well as adults, take it easily, and, as its taste is by no means unpleasant, it can hardly fail to attain great popularity."

The BRITISH MEDICAL JOURNAL says: "It is a pleasant tonic and mild stimulant. It will be found most useful in cases where the use of a blood tonic is indicated. The ordinary dose for an adult is a tablespoonful, which should be taken in a little water between meals. Children also may take it in similar doses according to age."

Supplied to the Medical Profession in ½-lb. and 1-lb. bottles, at 1s. 10d. and 3s. 6d. each. Retail at 2s. 6d. and 4s. 6d. per bottle.

BURROUGHS, WELLCOME, & CO., SNOW HILL BUILDINGS, LONDON, E.C.

APIOLIN-CHAPOTEAUT.

The True Active Principle of Parsley, differing from so-called Apiol.

Professor Laborde's (Paris) exhaustive study of the action of Apiolin indicates that it stimulates the intestinal and genital vaso-motor system, and hence has a decided action on the utero-ovarian reproductive apparatus. The general conclusion, therefore, from a practical point of view, is that the drug is indicated in certain cases of genito-spinal atony, and especially in dysmenorrhœa.—UN. MED. MAG.

Shoemaker's Materia Medica and Therapeutics says:—

"In cases of scanty or deficient menstruation with pain &c. one capsule can be given after meals, thrice daily for a week beore the expected period, as recommended by Dr. Fordyce Barker.

℞ Apiolini, grm. iv. (about 3j),
ft. Capsule No. xx. (Chapoteaut).
Sig: Take three each day during the week preceding menstruation.

"It is especially appropriate when amenorrhœa depends upon anæmia."

Dr. R. Hill, before the Washington (D.C.) Medical Society, Feb. 16th, 1891, reported five cases of dysmenorrhœa treated by him at the Central Dispensary, and concludes the paper in these words: "Apiolin is decidedly the most reliable drug that I have yet used in dysmenorrhœa. In all the cases I have so treated, relief has invariably resulted."

In phials of 24 capsules containing 20 centigrammes of Apiolin in each.

DUSART'S SYRUP AND WINE OF LACTO-PHOSPHATE OF LIME.

Phosphate of Lime (the restorer of muscular fibre and bone) rendered assimilable by the action of its natural solvent, Lactic Acid.

These Preparations act as general excitants of the nutritive functions, ensure digestion, stimulate the appetite, and enrich the milk of ladies suckling. They are prescribed with advantage in Teething, Rickets, or tardy development of children; and in Convalescence, Dyspepsia, Wounds, Fractures, and Affections of the Osseous System. The Syrup acts as a specific in Infants' Green Diarrhœa.

DUSART'S SYRUP OF LACTO-PHOSPHATE OF LIME AND IRON.

Invaluable where any of the above cases are complicated with Anæmia.

SANTAL-MIDY.

OL: SANTAL: FLAV: (MIDY).

In gonorrhœa and all forms of urethritis *Santal-Midy* replaces, copaiba, cubebs, and the ordinary remedies, without producing eructations, offensive odour, or diarrhœa, and the discharge is reduced to a slight oozing in forty-eight hours.

In chronic catarrh and suppurating nephritis, *Santal-Midy* has a soothing action on the mucous surfaces, it rapidly diminishes the secretion of pus, it assists the elimination of urine in nephritic colic, and cures the most obstinate cases of cystitis and inflammation of the neck of the bladder.

Dr. Posner stated before the Berlin Medical Society: "Much depended on the purity of Sandal Oil, many qualities of which are found in commerce. The best form was the French preparation known as *Santal-Midy*, put up in elegant little capsules, which were easily taken and well supported."—MEDICAL RECORD.

Santal-Midy is distilled from the best Mysore sandal wood, and is dispensed in small, spherical capsules of 20 centigrammes.

Dose, 6 to 12 capsules daily. Original bottles contain 40 capsules.

THE ABOVE ARE MANUFACTURED IN THE LABORATORIES OF

RIGAUD & CHAPOTEAUT, PARIS.

London Depot: WILCOX & CO., 239, Oxford Street, W. Dispensed by all Chemists,

VALUABLE Maltine COMPOUNDS.

MALTINE with PEPSINE and PANCREATINE.

The knowledge of how nature prepares the food for assimilation has enabled the medical man to render much assistance in the matter by administering natural digestive ferments where there is reason to suspect a patient's digestive troubles arise from a deficiency of these necessary agents. It is not needful to insist upon the great importance of Pepsine and Pancreatine in this respect. "MALTINE with PEPSINE AND PANCREATINE" forms an ideal combination for the treatment of many troublesome cases of dyspepsia, and for administration during the early stages of convalescence from acute diseases.

Each fluid ounce contains fifteen grains of Pepsine and Pancreatine respectively.

MALTINE with IRON.

Each Fluid Ounce contains: Iron Pyrophosphate, 8 grains.

Pyrophosphate of Iron, one of the most efficient chalybeates, is free from disagreeable taste, and, owing to its solubility, is readily assimilated. In addition to furnishing the blood with needed elements, nutrition is stimulated, and these functions are augmented by the reconstructive and digestive properties of MALTINE, while its slightly laxative tendency counteracts the astringency of the iron. The irritating effect on the digestive organs, which is one of the disadvantages of most ferruginous preparations, is overcome in this combination.

"MALTINE with IRON" is therefore of inestimable value in the treatment of Chlorosis, Scrofula, Dyspepsia, Neuralgia, and all cases of imperfect nutrition where iron is deficient in the system. The richness of "MALTINE" in albuminoids renders "MALTINE with IRON" specially efficacious in the treatment of Chronic Anæmia, attended as it generally is with repugnance to all kinds of food. If administered in sherry wine, in the proportion of one part to three parts of wine, it will be found much superior to the ordinary iron and wine tonics.

MALTINE with LIME.

This is a combination of MALTINE with Hypophosphites of Lime and Soda and Hypophosphite of Iron in the proportion of three grains of each of the former and two of the latter. It is especially adapted for administration to children suffering from rickets; the sweetness and palatability of the MALTINE eminently adapt it for use in these cases. According to certain authorities, the malnutrition which is present in rickets is almost invariably preceded by a failure of the digestive powers; and, in view of this opinion, the expediency of giving "MALTINE with LIME" becomes self-evident. The MALTINE strengthens the digestive capacity of the rickety child, and the Hypophosphite Salts furnish it with those necessary elements of bone formation of which it appears to be so largely deficient.

In Prescribing, kindly specify, **"M. M. Co."**

ELEGANT PHARMACEUTICAL PREPARATIONS.

Liq. Euonymin et Pepsine Co.

(OPPENHEIMER.)

The medicinal virtues of the Euonymin are extracted and rendered soluble, and its cathartic, diuretic, hydragogue, and anti-periodic properties preserved. Combined with the well-known proteolytic action of Pepsine this preparation may be used in the distressing symptoms of irritative dyspepsia with atony of gastric or intestinal muscular layers, in relieving the pain accompanying gastric carcinoma, pyrosis, and in dyspepsia with water-brash. This preparation does not irritate the intestines like Podophyllin, nor does it cause depression or headache. It is a reliable remedy in all forms of flatulence and insufficiency of bile secretion.

Liq. Cauloph. et Pulsatillæ Co.

(OPPENHEIMER.)

Probably no emmenagogue yet introduced to the Medical Practitioner has created such a general satisfaction as Liquor Cauloph. et Pulsatillæ Co. (Oppenheimer). It acts directly on the utero-genital organs as a sedative and tonic, and will be found specific in all cases of Amenorrhœa, Dysmenorrhœa, Leucorrhœa, Prolapsus Uteri, and premature cessation of the menses. In "change of life," Passive Hæmorrhage, Vaginitis, Urethritis, and Hysteria it is particularly valuable, and has been successfully prescribed in atony of the uterus after parturition. It likewise prevents the tendency to repeated successive miscarriage, and by its tonic action restores the general functions of the system. It should therefore be administered continually during entire gestation where abortion is feared.

"PALATINOIDS."

(By Royal Letters Patent.)

The most perfect form of medication ever invented. Elegance, Portability, and Convenience. Embraces the following *desiderata* :—

Absolute accuracy of dosage.
Ease of deglutition.
Freedom from excipient.

Protection from atmospheric influences.
Exemption from nauseous odour and taste.
The full therapeutic effect of the medicament.
The efficacy of a mixture with the convenience of a pill.

"BI-PALATINOIDS."

(By Royal Letters Patent.)

The only reliable and practical method of administering ferrous carbonate, phosphate, and arseniate in a pure undecomposed, unoxidised state. "*A perfect Blaud's Pill.*" *Deserves the thanks of the Profession.* If the chemicals necessary for the production of these delicate iron salts be mixed decomposition must and does occur. "*We regard these 'Bi-palatinoids' as a very ingenious and marked progress in elegant and efficient pharmacy.*"—BRITISH MEDICAL JOURNAL. "*Will, as a matter of course, meet with very hearty and general approval.*"—THE LANCET.

CREAM OF MALT (OPPENHEIMER) is carefully prepared *in vacuo*, and contains in solution all the strengthening and vitalising principles of the finest winter barley. Rich in phosphates, albuminoids, and diastase. Agreeable in flavour. Palatable and of fine golden colour. Invaluable in all wasting diseases and during convalescence.

CREAM OF MALT, OIL, & HYPOPHOSPHITES (OPPENHEIMER) contains in solution the very finest Norwegian Cod Liver Oil and is perfectly free from all fishy odour and taste. A true solution of the Oil in Malt, which with water forms a very perfect emulsion, which is permanent. Portable and agreeable. Children readily take it. No nauseous eructations follow its administration.

SAMPLES AND PRICE LISTS SENT FREE TO THE PROFESSION ON APPLICATION.

OPPENHEIMER, SON, & CO., Ltd., 14, Worship Street, E.C.

MODERN PHARMACY.

KEPLER SOLUTION OF COD LIVER OIL.

THIS is, according to the BRITISH MEDICAL JOURNAL, "an ideal form for the administration of fat." It is a well-known fact that when fatty material is ingested *en masse* it to a very large extent escapes emulsification during its passage through the alimentary canal. If, on the other hand, it is mixed intimately with other foods, the disintegration process has already been accomplished and the fat is readily acted upon by the secretion of the pancreas, succus entericus, and the bile. Cod Liver Oil is no exception to this rule, and, according to recent investigations, a very large proportion of the oil taken by a selected number of patients was voided unchanged in the fæces; whereas oil given in a condition similar to the Kepler Solution of Cod Liver Oil was perfectly absorbed, and merely a trace of fat only was discovered unchanged. The Kepler Solution contains a very large percentage of Cod Liver Oil, the remaining part of it consisting of a rich and nutritious Extract of Malt. Everything considered, this preparation is one of the most perfect foods and resuscitating agents it is possible to prepare. THE LANCET reports: "It has hardly any of the taste of the oil. Many can take it who could not take the oil." The BRITISH MEDICAL JOURNAL reports: "The taste of the oil is agreeably disguised, its nutritive qualities are greatly increased, and it is rendered easy of digestion." Again, THE LANCET reports: "It is the best known and most largely used." The MEDICAL PRESS AND CIRCULAR: "The most palatable and easily digested."

The Kepler Solution of Cod Liver Oil is supplied to the Medical Profession in ¾-lb. and 1½-lb. bottles, at 1/8 and 3/- each; retail, 2/6 and 4/-.

KEPLER EXTRACT OF MALT.

This preparation contains all the essential principles of Barley Malt in an agreeable and concentrated form. It is especially rich in diastase—the digestive principle which converts starch into dextrines and maltose. Opinions vary as to whether the immense utility of Extract of Malt depends more upon the diastase than the nutritive principles contained in it. In many debilitated conditions, however, it is generally conceded that the nutritive principles of dextrines, maltose, and natural phosphates are absolutely necessary. A tablespoonful of the Malt Extract under such circumstances is equivalent to a large percentage of farinaceous foods. Undoubtedly diastase, however, is very valuable in converting starchy material into soluble conditions suitable for ready assimilation.

Kepler Extract of Malt is an excellent sweetening agent for gruels, rice puddings, &c. It is an invaluable adjunct to peptonised milk and to foods for infants. The Malt Extract prevents the milk curdling in large clots, and therefore assists materially in the digestion of the food.

VERDICT.

THE LANCET reports: "The Kepler Extract of Malt is the best."

The MEDICAL TIMES AND GAZETTE: "By far the best."

The MEDICAL PRESS: "Delicious to the taste."

The Kepler Extract of Malt is supplied in ¾-lb. and 1½-lb. bottles, at 1/8 and 3/- each; retail, 2/6 and 4/-.

ZYMINE PEPTONISING POWDERS (Fairchild).

These are so called because they convert proteids, albumens, and fats into soluble *peptones* and readily assimilable substances. Whenever it is proposed to peptonise milk only, and that continuously, the Zymine Peptonising Powders (Fairchild)* will be found the most convenient form to use for obvious reasons.

"Fairchild Peptonising Powders (Zymine):—These are very useful for peptonising milk, and especially for use in the case of infants brought up by 'bottle.'" ("Manual of Clinical Dietetics," Dr. Burnet.) In those cases, however, where strict economy is a matter of considerable moment, the plain Zymine can be used.

The Zymine Peptonising Powders (Fairchild) are supplied in glass tubes, a dozen in a box, each tube containing 5 gr. of Zymine and 15 gr. of Soda Bicarb., sufficient to predigest a pint of milk or beef-tea.

The BRITISH MEDICAL JOURNAL, referring to the value of predigested food by the ZYMINE method, says: "It has proved useful in many hands in *uræmic vomiting, gastric catarrh, pernicious anæmia, gastric ulcer, pyloric and intestinal obstruction.* ITS INTRODUCTION HAS PROBABLY DONE MORE THAN ANY OTHER THERAPEUTIC MEASURE TO LESSEN INFANT MORTALITY."

IMPORTANT NOTE.—*A complete list of recipes for the preparation of peptonised foods is supplied with each box of the powders, or will be sent post free to any medical man on request.*

ZYMINE PEPTONISING POWDERS (FAIRCHILD) supplied to the profession in boxes containing 1 doz. tubes, at 1/2 each; retail, 1/6 per box.

ZYMINISED MEAT and MILK SUPPOSITORIES for Rectal Alimentation.

Physiologists are unanimous in condemning GELATINE as a basis for peptone suppositories, for this mixture is one of the best culture-media for BACTERIA, therefore we have prepared these suppositories with pure peptones and COCOA BUTTER; they are easily introduced, perfectly absorbed, never cause intolerance, and ARE PERFECTLY STERILE.

The ZYMINISED MEAT SUPPOSITORIES were thoroughly tested clinically by Dr. Barlow in cases after surgical operations, gastric ulcer, or when for any reason it was found desirable to rest the stomach; in every case the suppository was perfectly absorbed, and afforded excellent results. Mr. Bowreman Jessett (THE LANCET, Oct. 24th, 1891) records the successful operation of combined pylorectomy and gastro-enterostomy when the patient was fed with *zyminised meat suppositories.*

Zyminised Meat and Milk Suppositories are supplied to the Profession in boxes of 1 dozen, at 1/10 per box.

* Beware of imitations of these Peptonising Powders—always see that the name FAIRCHILD is on the package, as substances of an entirely different character are being sold in the market under the name of Peptonising Powders.

MALTO RICINE (Kepler).

Castor Oil has long been considered a valuable laxative, especially for parturient women and children, and although much dreaded on account of its nauseating character, was nevertheless most effective in producing a comfortable relaxation of the bowels. Taking as our guide the Kepler Solution of Cod Liver Oil, wherein the oil is rendered palatable through being dissolved in Extract of Malt, we performed similar experiments with Castor Oil, and in the Malto Ricine the repugnant odour and flavour of the oil are thoroughly hidden; moreover, the aperient action is enhanced by the laxative effect of the Extract of Malt. It is palatable, and therefore readily taken by children or fastidious patients. The demulcent, mild, aperient, and soothing properties of the Malt Extract render it especially adapted for mixing with and masking the disagreeable properties of Castor Oil, thus rendering it agreeable to those unable to take the clear oil.

Malto Ricine is more reliable in effect, since the whole of the oil passes into the intestinal canal and readily excites peristalsis. It never excites nausea or vomiting.

Malto Ricine is supplied to the Medical Profession in ¾-lb. bottles, at 1/8 each. Retail, 2/6.

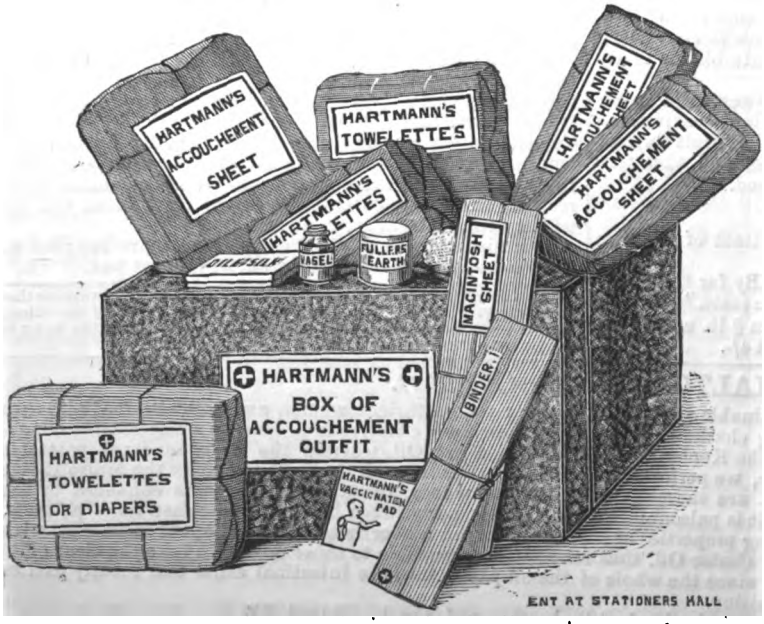
HARTMANN'S
Patent Wood Wool WADDING

HARTMANN'S
Patent Wood Wool TISSUE

Absorb all kinds of discharges. They give perfect drainage to wounds, frequent change of dressing is avoided, and therefore the greatest economy attained. They are thoroughly antiseptic, as they consist of 85% Pine Wood. **On a wound** they will be found to thoroughly suck up and absorb all discharges, and they will not **stick** to the wound, nor will they **heat** like cotton wool and other dressings.

INVALUABLE FOR SUPPURATING AND CANCEROUS WOUNDS.

But the **most convincing proof of all** is the fact that all the leading hospitals use these dressings to the extent of **125,000 lbs. ANNUALLY.**



ADOPTED IN H.M. GOVERNMENT HOSPITALS AND BY THE BOARD OF TRADE.

ANY SURGEON who by chance has not yet tried these Dressings should write for SAMPLE PACKETS Gratis and Post Free.

HARTMANN'S

COMPLETE

GUINEA OUTFIT FOR ACCOUCHEMENT.

It contains all the necessary Hartmann's Absorbent Wood Wool Sheets, Sanitary Wood Wool Diapers, Binders, Safety Pins, Carbolised Vaseline, Thread, Pads, Fuller's Earth, Oiled Silk, Mackintosh Sheeting, &c.

It affords great cleanliness and comfort to the patient, and diminishes the risk of puerperal fever.

Too much attention cannot be given in selecting the best articles for use during confinement; and in the interest of their patients we ask Physicians to recommend Hartmann's Complete Guinea Accouchement Outfit.

REDUCED PRICES TO DOCTORS AND NURSES.

The above box will be sent, carriage paid, to any Medical Man or Nurse on receipt of 19s.

To the Medical Profession.

BEST FOOD FOR INFANTS.
BEST BARLEY WATER.

Doctors are continually being asked by mothers who cannot or will not "nurse" their babies—"What artificial food do you recommend?" Then comes the difficulty, there being so many foods, all professing to be the best.

Will the readers of this journal kindly advise the use of

Nearly 70 years' Reputation.

Robinson's Patent Barley

Nearly 70 years' Reputation.

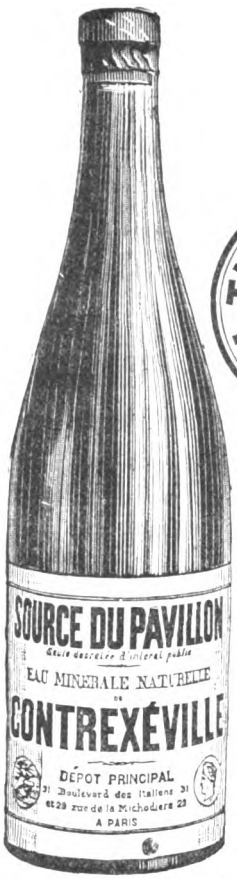
(Made from the Finest Scotch Barley),

which has been used with success for 69 years for rearing babies by hand, partly or wholly?

Dr. PYE H. CHAVASSE, in "Advice to a Mother," says:—"ROBINSON'S PATENT BARLEY is the best Infants' Food." (*Answer to Question 44.*)

Dr. JOHNSTONE, F.R.C.S., F.C.S., reports:—"Used with milk it forms an agreeable, highly nutritious, and easily digested Infants' Food."

BARLEY WATER should always be made from ROBINSON'S PATENT BARLEY. Easily and quickly made.



Sold in 1-lb. and ½-lb. Tins by Grocers, Chemists, &c.

VINACOCA

TONIC WINE.

EMBRACING THE THERAPEUTIC PROPERTIES OF THE COCA PLANT, BLENDED WITH THE BEST MADEIRA.

COCA FOR TROUBLESOME THROATS.

Testimony is not wanting from specialists in diseases of the throat, and dramatic and lyric artists, to show that Coca has a wonderfully invigorating effect upon the voice. The preparation in most common use is the Wine of Coca, which, in order to yield the characteristic effect, must be made "upon honour." To be of any decided value it must be made from the Coca Leaves. Very much of the Coca Wine on the market is merely a solution of cocaine, which cannot be too severely condemned. Hence, those with troublesome throats who desire to use this tonic should be exceedingly careful in purchasing, patronising dealers only of known reliability.

The VINACOCA is carefully prepared from the best COCA LEAF ONLY (no addition of Cocaine).

Many Medical Men prescribe its use in preference to quinine or any bark wine. *It is a direct stimulant of the most active kind*, supporting life in a manner almost miraculous without disturbance of the vital functions. For the voice, a wineglassful before any ordeal is sufficient. It is of great value to Public Speakers, Professional and other Singers, and Lecturers. **Sold in Bottles at 3s. 6d. each, or 40s. per Dozen.** *COCA is prepared in various forms:—*

COCA LOZENGES, COCA TABLETS, COCA ELIXIR, COCA TOBACCO,
COCA TEA, COCA CHOCOLATE, STAMIN (Coca & Beef Extract), **&c. &c.**

All the FRENCH HYGIENIC SOCIETY'S Preparations of COCA are from selected Leaves, and only the very choicest ingredients are used in their Specialities, which are very highly recommended by the Medical Profession.

DUNCAN, FLOCKHART, & CO., EDINBURGH.

CHLOROFORM. (Duncan's.)

PREPARED FROM PURE AND METHYLATED SPIRIT. Also Blue Label CHLOROFORM.

CHLORIC ETHER. (Duncan's.)

This is a special preparation, quite different from Spir. Chloroformi P.B., perfectly miscible with water, and always of the same strength

CASCARA SAGRADA CAPSULES.

Each Capsule equal to ½, ¼, or 1 teaspoonful of Fluid Extract of Cascara Sagrada. They can also be had in combination with ½ or 1 grain of EUONYMIN.

BLAUD'S PILL CAPSULES.

In 3 Sizes, equivalent respectively to 1, 2, or 3 Blaud's Pills.

These Capsules differ from all others, and have advantages which no others possess. They are made from Pure Unoxidised Carbonate of Iron by a special process. They are so prepared that, while they retain indefinitely the full efficacy of fresh Blaud's Pills, they have no tendency to become hard and insoluble by keeping, as the pills often do. They are small in size. Owing to the special process adopted by D., F., & Co., the 3-pill Capsule is hardly larger than a single Blaud's Pill. They are soft and flexible, and much more easily swallowed than pills. They can be had in combination with Arsenic, Nux Vomica, &c.

EASTON'S SYRUP CAPSULES.

Each Capsule equivalent to 20, 30, or 60 minims of Easton's Syrup.

SYRUP. HYPOPHOS. COMP. (Duncan's.)

Some time since we had several samples of well-known SYRUP. HYPOPHOS. COMP. analysed by Mr. D. B. DOTT, F.R.S.E., F.I.C., Ph.C., and in no one case did he find so large a proportion of the active constituents as is found in our preparation by a precisely similar analysis—which analysis is an absolute proof that the proportions of the different ingredients which we state are in our Syrup ARE ACTUALLY PRESENT. We, therefore, submit that from the use of our Syrup the best results may be confidently anticipated.

In proof of our statements we subjoin the report of Analysis referred to.

NOTE.—Our Syrup will darken in colour by lengthened keeping; and so must every Syrup which contains a similar proportion of FERROUS Hypophosphite.

In prescribing please say: SYRUP. HYPOPHOS. COMP. (Duncan's).

"Analysis of SYRUP. HYPOPHOS. COMP. (grains per drachm)."

—	DUNCAN'S	No. 1.	No. 2.	No. 3.	No. 4.

INTERNATIONAL & UNIVERSAL EXHIBITION, LONDON, 1884—FIRST-CLASS CERTIFICATE and GOLD MEDAL; also CALCUTTA EXHIBITION—FIRST-CLASS CERTIFICATE and SILVER MEDAL, for the superiority of our Pharmaceutical Preparations.

LIQUOR SANTAL FLAV. c. BUCHU et CUBEBÆ (Hewlett's).

Since we introduced this elegant preparation, it has been largely employed, and with the happiest results. It is so much superior to copaiva, as it does not interfere with the digestive organs. The disagreeable eructation which follows the administration of copaiva is not experienced, and the unpleasant copaiva rash (*Urticaria*) has not been noticed. It is especially indicated in the advanced stages. If it be given in the beginning, before the inflammation has fully developed, it may sometimes succeed in abating the attack; but if it fail to accomplish this, it had better be suspended, as it may aggravate the symptoms during the inflammatory stage. In other inflammatory affections of the genito-urinary mucous membrane, such as pyelitis and chronic cystitis, when the disease is of a subacute or chronic character, the liquor santal may be employed with great advantage. Santal Oil has been the remedy of some eminent surgeons, but in combination with buchu and cubebs it is much more efficacious. The great difficulty in its administration was its suspension in mixtures, but this trouble is arrested by a beautiful pharmaceutica process, and our preparation will be found perfectly miscible in water.—DOSE—3j to 3ij in water. *Price 10s. 6d. per pound (which must bear our signature).*

From Dr. GOURLEY, F.R.C.S., Senior Surgeon, Hartlepools Hospital.

"I have found your 'Liq. Santal Flav. cum Buchu et Cubebâ' invaluable in several cases, and more particularly in gleet. I consider it one of our best remedies in this frequently tedious complaint. It forms a nice mixture, and is quite free from the symptoms produced by copaiva."—S. GOURLEY, M.D., F.R.C.S., Senior Surgeon to Hartlepools Hospital.—To Messrs. C. J. SLINGER'S NUTRIENT SUPPOSITORIES,

Consisting of nearly pure Peptone and Extractive from the Artificial Digestion of Meat. Five Suppositories contain the Extractive of 20 ounces of Meat, in addition to the Peptone. R. H. BOUCHIER NICHOLSON, Esq., Hull Infirmary, in a case of Gastrostomy, says:—"The beef suppositories (made by SLINGER & SON, York) were of much benefit, the man saying he felt great comfort from their use. The man was saved the pangs of starvation, from which he was fast sinking, when I first saw him." Manufactured only by SLINGER & SON, Wholesale Druggists, York. Wholesale Agents: Messrs. NEWBERY & SON, 1, King Edward-street Newgate-street, London, E.C.

DINNEFORD'S FLUID MAGNESIA.

The most Efficacious Antacid and Mild Aperient for delicate constitutions, Ladies, Children, and Infants.

ALL WHOLESALE DRUGGISTS.

Dr BELLOC'S VEGETABLE CHARCOAL.

Either in powder or in pastilles, is one of the remedies which render the greatest service in *dyspepsia*, *gastralgia*, and *nervous maladies of the stomach*. The Academy of Medicine of Paris, after numerous experiments made by a Commission appointed to this effect, has approved and recommended the employment of the charcoal of Belloc for the treatment of these maladies which, said the Commission, « often cause the despair of patients and doctors. » Most frequently the good effects are felt after the first doses.

It is in virtue of its *antiseptic* properties that the charcoal of Belloc was employed with success against infectious maladies, such as dysentery, diarrhæa, cholerine, cholera, typhoid fever. It is one of the best agents for *Intestinal Antisepsy*.

Nota. — The medicinal Charcoal of Dr Belloc possesses qualities of diffusion which the ordinary charcoal of the pharmacies has not, and which depends on its mode of preparation. It is sufficient to plunge them comparatively in water to ascertain this fact.

Dose: from 2 to 6 table spoonfuls of powder per day, with a little water, before or after meals. 4 to 12 tea spoonfuls, or the same number of Pastilles. Exact the signature and stamp of Dr Belloc.

Manufactory: the firm of L. Frere, A. Champigny & Co, succrs, 19, rue Jacob, Paris, and to be had in all pharmacies.

WHOLESALE DEPOT IN LONDON: F. NEWBERY & SONS, 1 ET 3, KING EDWARD'S ST., LONDON E. C. HENRI CHURCHILL, 57-58, EAST STREET, BRIGHTON.

CHANDLER'S PATENT TEAPOT, INFUSER, AND STRAINER.

The only perfect method of Infusing Tea—i.e., without extracting the Tannin.

FIG. 1.

The quantity of tea required is placed in the patent receptacle (Fig. 1), and after five minutes' infusion is raised above the liquid into the lid (Fig. 2), and there fixed by means of the patent knob at top, thus entirely preventing the extraction of the poisonous tannin so harmful to the nervous and digestive organisation.

IT IS ADOPTED BY THE MOST EMINENT TEA EXPERTS, and entirely embodies the recommendations of the highest medical authorities.

PRICES.

(TWO PINT SIZE)—Best Britannia Metal, 21s.; Best Electro-plate, 31s. 6d. Carriage paid.

WHEAT PHOSPHATES NOURISH BRAIN and FRAME.
WHEAT PHOSPHATES STRENGTHEN BONE and MUSCLE.
WHEAT PHOSPHATES ENRICH the BLOOD.

"FRAME FOOD" JELLY

Is made of the "FRAME FOOD" EXTRACT OF WHEAT PHOSPHATES and Pure Cane Sugar, and is therefore

MOST NOURISHING.

"FRAME FOOD" JELLY is an excellent substitute for EXTRACT OF MALT, being CHEAPER, NICER, and MORE NOURISHING.

"FRAME FOOD" JELLY costs only 7d. per pound; MALT EXTRACT costs 3s.

"FRAME FOOD" JELLY is DELICIOUS, and may be eaten as JAM on Bread.

DR. F. ARNOLD LEES, M.D., M.R.C.S. Eng., L.R.C.P. Lond., says:
"Young Children grow very fond of the Jelly, spread on bread-and-butter, and grow heavier and stouter when using it in a ratio out of all proportion to the weight of the Jelly eaten, showing that it not only nourishes, but assists assimilation of other food."

Sold by Chemists and Grocers in 1-lb. Jars at 7d. Sample Jar sent free to Medical Men and Professional Nurses.

☞ THE PERFECTION OF CLEANLINESS, UTILITY, AND SIMPLICITY.

TWYFORD'S "UNITAS,"

COMBINING

W.C. BASIN & TRAP, URINAL, & SLOP SINK.

No Wood Fittings are required except a hinged seat, which, being raised, the basin can be used as a Urinal or a Slop Sink, the "wetting," so objectionable in Closets having permanent seats, being avoided. Free access can be had to all parts of the Basin and Trap, so that everything about the Closet can be easily kept clean.

MADE IN FINE EARTHENWARE, PLAIN OR DECORATED, AND IN STRONG FIRECLAY.

The flushing arrangements are so perfect that, with a flush of two gallons of water, it is guaranteed that all the soil and paper will be completely removed from the Basin and through the Trap, the whole of the inside being thoroughly washed, and with the aid of the Patent "After Flush" Chamber, the full quantity of water required to receive the soil is left in the bottom of the Basin.

The ONLY BASIN of THIS TYPE made with PERFECT FORMATION of TRAP.

For Prices and Catalogues, apply to **Twyford, Cliffe Vale Pottery, Hanley, Staffordshire.**

UNIVERSAL TUBULAR WATER AND AIR BED

Prize Medals Sanitary Congress, 1878. Industrial Exhibition, York, 1879. Certificate of Honour Sanitary Congress, 1879.

Brighton, 1881. International, 1881. Kensington, 1882.

POCOCK BROTHERS,

Patentees and Sole Manufacturers, 235, SOUTHWARK BRIDGE ROAD, LONDON.

Consists of a series of separate and distinct cylinders, any diameter and suitable length, made of Waterproof material either for Water or Air, fitting into a case which keeps them side by side, but slightly apart.

1. In cost it is less expensive.
2. It is warm and light, and well adapted for a camp or field-bed, being waterproof.
3. It is quickly filled and easily adjusted.
4. It admits of ventilation in the space between the tubes.
5. It can be regulated so as to relieve pressure from any part required.
6. By the addition of tubes it will raise one part of the body higher than the rest.
7. By the temporary removal of one or two tubes it affords room for the introduction of a bedpan.
8. It can be inclined to any angle (even when filled with water) to suit the condition of the patient.
9. It is free from noise and surging, so disagreeable to the invalid on changing his position on a water-bed.
10. In case of injury to a tube it can be withdrawn, and a fresh one substituted at a trifling cost, and without loss of time; whereas the ordinary water-bed, if injured in any part (from being in one compartment) is rendered useless.
11. In the treatment of invalids, especially the insane, who are paralysed and have no control over their evacuations, they cannot lie in a pool of wet, the fluid passing away between the tubes.

ITS ADVANTAGES OVER ORDINARY WATER OR AIR BEDS ARE AS ABOVE.

An Address will be delivered by the retiring President, Mr. George Brown. All medical men in general practice are invited to attend.

W. E. DAWSON, Hon. Sec.

11, Adam-street, Strand, W.C., June 15th, 1892.

NATIONAL ORTHOPÆDIC HOSPITAL,

234, Gt. Portland Street, Regent's Park, W.

THIS Hospital is specially intended for children and adults suffering from Deformities of the Spine or Legs and Feet. Many patients who were well-nigh hopeless cripples, cured by the surgical skill and timely aid of this charity, are now earning a livelihood.

A New Wing has just been opened, at a cost of £7000, to accommodate forty more patients. Donations towards this amount are urgently solicited.

The Committee of Management very earnestly appeal for help, that the benefits of the charity may be continued and extended.

Bankers—SIR S. SCOTT, Bart., & Co.,
1, Cavendish-square, W.

Secretary—Mr. WILLIAM TRESIDDER, at the Hospital.

FOUNDED 1871.

ANATOMY, PHYSIOLOGY, SURGERY, And all PROFESSIONAL SUBJECTS. Recognised (see Prospectus) by the Conjoint Board and other Examining Bodies. Application to Mr. THOMAS COOKE, F.R.C.S., Senior Assistant Surgeon to the Westminster Hospital, 40, Brunswick-square, W.C. *Thoroughly dissected parts always available for study. Resident students have the advantage of private evening classes of anatomy and physiology without extra charge.*

OPERATIVE SURGERY *Recognised by Conjoint Board.*

Mr. Cooke's Tablets of Anatomy, price 7s. 6d. (Longmans), contain "in the fewest words and plainest language, and in about one-tenth the space, the matter which is found in the most accredited standard works."—THE LANCET.

Aphorisms in Applied Anatomy and OPERATIVE SURGERY. Price 3s. 6d. "Information no candidate can do without."—BRIT. MED. JOUR. "Should be in every student's hand."—MED. PRESS AND CIRC.

Scholarships at Cooke's School and DISSECTION DEMONSTRATIONS, with *exceptional advantages* for *practical* work in Anatomy and Physiology. Demonstrations in improved Dissection-methods based upon the "Dissection Guides" (see advertisement page 6), and calculated to benefit *intelligent and earnest workers*. Of those attending and doing good work, one or two (who should have passed, or be preparing for, the Prelim. Sci.) will be selected for the Scholarships. The Scholarships confer free admission to all Lectures, Demonstrations, Dissections, &c., required during the two first years of the medical curriculum for the London University and the Apothecaries' Hall.—For particulars apply to Mr. THOMAS COOKE, F.R.C.S., 40, Brunswick-square, W.C.

West-end Hospital School of ELECTRICITY AND MASSAGE,
78, WELBECK STREET, LONDON, W.
LECTURER AND DEMONSTRATOR ON ELECTRO-THERAPEUTICS AND MASSAGE:
J. FLETCHER LITTLE, M.B., M.R.C.P.

Persons of both sexes receive instruction in the skilled application of Medical Electricity and Massage. When properly qualified such persons will receive a certificate of proficiency.

Terms for the course and all particulars may be obtained of the Secretary at the Hospital.

Mason College, Birmingham. QUEEN'S FACULTY OF MEDICINE.

On the 1st of October next the new SCHOOL OF MEDICINE AND DENTISTRY, in connexion with Mason College, will be opened under the teaching of the Professors, Lecturers, and Demonstrators associated with the Queen's College, the School of which Institution will cease to exist before the above-mentioned date. The new School, now in process of erection, will contain large dissecting-room, theatres, museums, class-rooms, &c., fitted with every modern improvement and appliance.

Students of the Queen's College will be transferred to Mason College, without any further payments than may be, at the time in question, due from them to the former College.

Full information respecting Medical and Dental Fees, Scholarships, &c., may be obtained from Professor Windle, Dean.

R. S. HEATH, Principal.
GEO. H. MORLEY, Secretary.

College for Daughters of Medical MEN.

Pelican House College (in connexion with Pelican House School), Grove-park, Denmark-hill, S.E., for the Education of the Daughters of Medical Men, at fixed, inclusive, and moderate terms, varying according to age, as at the Epsom College for Boys.

The educational advantages are equal to those at the best high schools; but as the Daughters of Gentlemen only are received, the further desideratum of suitable companionship is offered. Scholarships are attached.

For prospectus, apply to the Secretary, Major Pead, 14, Victoria-road, Upper Norwood, S.E.

The Annual "Garden Party," and DISTRIBUTION of PRIZES in connexion with Pelican House College, Grove-park, Denmark-hill, will take place in the College grounds on Saturday, the 16th of July. Old pupils cordially invited to attend. Medical men and their families admitted on producing their cards. 3.30 to 7 P.M.

Borough of Scarborough.—Medical

OFFICER OF HEALTH.—The Town Council of the Borough of Scarborough as the Urban Sanitary Authority require a Medical Officer of Health for the District of the Borough.

The Officer will be required to devote the whole of his time to the duties of his office, and to reside within the district.

The appointment will be made subject to the rules and regulations for the time being of the Local Government Board, and the duties of the Officer will be those prescribed by such rules and regulations, and by the Public Health Acts, the Scarborough Improvement Act, 1889, the Housing of the Working Classes Act, 1890, and any other Acts from time to time in force within the district, and by the Sanitary Authority, and will include the attendance on patients at the Sanatorium or Hospital for Infectious Cases.

The salary in respect of the aforesaid duties will be £325 per annum.

The Officer will also be required to act as Surgeon to the Borough Police Force, including all necessary medical attendance on persons apprehended or detained at the Police Station, and as Public Analyst, and to take and prepare such meteorological observations and charts as may be required by the Sanitary Authority, at a further salary of £25 per annum.

A list of the duties can be obtained on application to the Town Clerk.

The Officer must be a duly qualified Medical Practitioner, and must also be registered in the Medical Registry as the holder of a Diploma in Sanitary Science, Public Health, or State Medicine.

The appointment will be made for one year, subject to the right of the Sanitary Authority to terminate it in case of neglect or misconduct, and will be made subject to the approval of the Local Government Board.

Canvassing any Member of the Town Council will be a disqualification.

Applications, stating age, which must be not less than twenty-five or more than forty years, length of practice, previous appointments, if any, and date of registration under the Medical Acts, accompanied by not more than six testimonials, must be sent in to me on or before the 4th day of July next.

JOHN E. T. GRAHAM, Town Clerk.

Town Hall, Scarborough, June 16th, 1892

THE SCHOLASTIC, CLERICAL, AND MEDICAL ASSOCIATION, LIMITED.

MEDICAL DEPARTMENT.

This Association was established in 1880 as a Limited Liability Company under the direction of professional men, its object being the creation of a RESPONSIBLE and THOROUGHLY TRUSTWORTHY Agency. The Medical Department has met with so great success that it has been found necessary for one of the Managing Directors (Mr. G. B. Stocker) to devote his whole attention thereto; and he has the assistance of an experienced Medical Accountant and a large staff of clerks. Further, a Board composed entirely of gentlemen of high standing in the Medical Profession has been appointed, and to them matters of dispute and complaint are referred.

The Association undertakes the SALE of PRACTICES and PARTNERSHIPS; the Introduction of LOCUM TENENS and ASSISTANTS; MEDICAL ACCOUNTANCY (by a duly qualified Medical Accountant); INVESTIGATION and VALUATION of Practices, &c.; POSTING BOOKS and sending out Bills, &c. &c.

A Pamphlet relating to the Medical Department, with the names of the "Directors" and "The Medical Advising Board," and terms, will be sent on application to—MR. G. B. STOCKER, MANAGING DIRECTOR, 8, LANCASTER PLACE, STRAND, W.C.

MEDICAL PARTNERSHIP AND CONVEYANCING AGENCY,

1, ADAM-STREET, ADELPHI, W.C.

The SALE of PRACTICES and PARTNERSHIPS NEGOTIATED. Trustworthy LOCUM TENENS and ASSISTANTS can be had at a few hours' notice.

N.B.—No charge made to Purchasers.

Notice.—Mr. J. C. Needes, with an experience of over a quarter of a century, is in an exceptional position to give intending Purchasers independent information concerning most PRACTICES and PARTNERSHIPS. Those Investments in the following List marked with an asterisk are well known to him, having been purchased through his Office by the present Incumbents years ago, and in many other cases an Introduction can be given to Gentlemen who have taken charge of the Practices during the absence of the Incumbents.

£1100 to £1200 a year.—The oldest established PRACTICE in a thickly populated South-Western Suburb offers for negotiation. About £400 per annum taken in ready-money fees. The work is not heavy. A Dispenser kept, but a horse not required. About 100 cases of Midwifery yearly; nothing under a guinea. Good house available. An introduction given to meet wishes of purchaser. Premium one year's purchase.

PARTNERSHIP.—MODERATE PREMIUM.—A suitable Gentleman can succeed to a SHARE (yielding over £600 a year) in an established Practice situate in a fashionable and increasing town about sixty miles from London. Premium one and a half year's purchase.—Further particulars on application.

*LONDON.—Moderate premium.—Appointments £450 a year. The PRACTICE is very old established and the total income over £500 a year. Visiting fees 2s. to 7s. 6d. About 100 cases of Midwifery. The house contains twelve rooms, with large garden attached; rent £60. Premium £600, £400 down and balance at end of introduction. This Practice is specially suitable for a Gentleman with a limited amount of capital requiring a transferable and lucrative Practice yielding a good income.

PARTNERSHIP.—Guaranteed Income.—The Incumbent of an old-established and increasing PRACTICE is desirous of meeting with a suitable partner, to whom he would guarantee (for two years) an income of at least £450 per annum. The Practice is situate in a pleasant town with over 20,000 inhabitants, thirty miles south of London. Premium £950.

SOUTH-WEST COUNTY.—An old-established COUNTRY PRACTICE, worth at least £500 a year, £200 of which is derived from transferable appointments. No opposition within four miles. Large detached house (four sitting-rooms, seven bedrooms, &c.), standing in its own grounds, and held on lease at a very low rental. Good hunting, fishing, and shooting.

SOUTH COAST TOWN.—£900 a year.—A rapidly increasing PRACTICE for immediate Disposal, owing to the ill-health of the incumbent. The greater part of the income is received in ready money. Expenses very light; neither horse nor assistant required. Well situated house, at low rental. The Practice would prove a very safe investment to an energetic Gentleman.

*SOUTH.—An absolutely unopposed and exceedingly easily worked COUNTRY PRACTICE, worth about £400 a year, including Union and Club Appointments of £130. Patients: gentry, clergy, farmers, &c. About thirty Midwifery cases yearly. Excellent house, with large garden, paddock, &c., attached. Premium one year's purchase. Facilities for sport of all kinds.

*SUBURBAN.—£1000 to £1100 a year.—An old-established PRACTICE averaging the above amount situated in a pleasant district ten miles from London. Transferable appointments held worth £160. Midwifery 1 to 5 guineas; about 100 cases yearly. One horse is sufficient for the work, and an assistant is not kept. Capital family residence, standing in its own grounds, with stabling &c. attached; rent £70. A partnership introduction of six months given, and part of the premium can be paid by instalments.

*WESTERN COUNTY.—In an exceptionally beautiful district an old-established COUNTRY PRACTICE worth about £500 a year. Nearest medical man resides five miles distant. The fees are good—10s. 6d., 7s. 6d., 5s., and in a few rare cases 3s. 6d. No Midwifery under 1½ guinea; only twenty cases yearly. Good hunting and fishing. Premium one year's purchase. An efficient introduction.

PARTNERSHIP.—MIDLANDS.—The incumbent of an old-established PRACTICE, worth about £1400 a year, is desirous of Disposing of the Half Share of the same to a suitable Gentleman. The expenses are light, one horse being sufficient to work the entire Practice. Fifty cases of Midwifery yearly. The town is a good one, containing about 30,000 inhabitants, and the neighbourhood is mixed residential, agricultural, and manufacturing. The usual premium of two years' purchase required.

*PARTNERSHIP.—£2000 a year.—In a pleasant district twenty miles west of London, an opportunity offers for a well-qualified Gentleman to be admitted as PARTNER in a very old established Practice of £2000 a year. The Third Share can be negotiated at once, with increase to the Half, and ultimately succession to the entire Practice in three or four years. Premium for Third Share £1400.

Apply to J. C. NEEDES, 1, Adam-street, Adelphi, W.C.

Locum Tenens and Temporary ASSISTANTS.—Practitioners requiring the above can immediately obtain thoroughly reliable qualified Gentlemen upon application to 1, Adam-street, Adelphi, W.C. Every Gentleman engaged by the Office in either of the above capacities is personally known to Mr. J. C. Needes.

68

[Established 1874.

Mr. Percival Turner

(Son of a well-known Practitioner),
4, Adam-street, Adelphi, London, W.C.
(close to THE LANCET Office).

Telegraphic Address—"EPSOMIAN, LONDON."

Practitioners seeking Partners or Successors can be immediately introduced to suitable candidates by Mr. Turner, he having always very many more purchasers than vendors on his books, thereby enabling him to carry out the arrangements, if desired, without the delay and publicity of advertising.

PURCHASERS supplied with details of Practices for Disposal free of charge on application.

LOCUM TENENS or ASSISTANTS free of expense to Principal. Only those known to be reliable introduced.

BOOKKEEPING, DEBT-COLLECTING, ARBITRATIONS, INVESTIGATIONS of PRACTICES for Purchasers, &c.

Nucleus.—West of England.—A rapidly increasing Nucleus in Suburbs of a large Town, at present doing about £200 a year, including a transferable appointment of £80, will be sold on moderate terms. Good house in rising suburb. Ample scope.—Apply to Mr. Percival Turner.

***Partnership.—£1400.—Partner** wanted to purchase Half Share and ultimate succession to a good General Practice of £1400 a year, in a large residential town in North Midlands. Personally visited by Mr. Turner. Usual terms.

***£1200 a year, Cash.—In a favourite** residential suburb of London, a rapidly increasing better-class CASH PRACTICE, combined with a superior Retail, separately worked by qualified Chemist, will be Sold for less than one year's purchase. Net profit about £700 a year after paying every outgoing. Residence not essential. No night work.—Apply to Mr. Percival Turner.

***£800 a year.—Near London.—A** good increasing GENERAL PRACTICE, offering excellent facilities for increase, and believed to be entirely transferable, will be Sold for two years' purchase, with good partnership introduction. Good house &c.—Apply to Mr. Percival Turner.

***£800 a year.—West County.—** Immediate.—A very safe Country PRACTICE, including appointments of £200, in a pretty district, is for Sale under exceptional circumstances for £900. Good introduction given, and every facility for investigation. Suited to a young married Practitioner desirous of settling down in Practice.—Apply to Mr. Percival Turner.

***Midlands.—A money-making Prac-** TICE, safely transferable, and returning over £1100 last year, will be Sold on moderate terms to a prompt buyer. In a large manufacturing town. Fees to a great extent ready money.—Apply to Mr. Percival Turner.

***Partnership.—Suburban.—£1500 a** year.—Junior Partner wanted in a good-class non-dispensing suburban Practice of £1500. Must be well qualified, experienced, and with necessary capital.

Midlands.—In a large Town, a Prac- TICE of £400 a year will be Sold for £275. Middle class; appointments £150. Expenses very low. Ample scope.—Apply to Mr. Percival Turner.

Kent.—A middle-class increasing transferable PRACTICE of £300 a year, in a town. An active Gentleman commencing Practice could make a large Practice. Fees mostly cash, and from 1s. upwards. Midwifery 21s.

Practices and Partnerships wanted.— Mr. Turner has at present an unusually large number of applicants for Practices and Partnerships in all parts of England, and will be happy to hear in confidence from Practitioners contemplating any change. All transactions are conducted by Mr. Turner personally.

Locum Tenens now disengaged.—Mr. TURNER has several qualified Locum Tenens prepared to act for his clients during the summer. Satisfactory references.

TO PRINCIPALS REQUIRING LOCUM TENENS.—Mr. Turner cannot engage any gentleman at less than the recognised fee of £3 3s. a week, as no qualified gentleman of any standing or experience will accept less during the busy season. No Agency Fees to principals.

***Mr. Turner is personally acquainted** with, and has visited, the Practices marked with an asterisk.

MEDICAL TRANSFER OFFICES.

19, Craven-street, Strand, W.C.
Established 1868.

Mr. W. T. Peacock, Medical Transfer and PARTNERSHIP AGENT, informs the Profession that he has special facilities for introducing Successors and arranging Partnerships; that if Members who are desirous of Disposing of their Practices will forward him full particulars (and which will be received in strict confidence) an immediate Transfer will probably be effected.

Gentlemen requiring Practices or Partnerships can, on application, select and obtain full particulars of those on Mr. Peacock's books which are open for negotiation.

ASSISTANTS and LOCUM TENENS, with satisfactory testimonials as to sobriety and general abilities, can be engaged at very short notice.

No charge made to purchasers or for inquiries.

Office hours from 10 to 5; Saturdays, 10 to 2.

£900 a year, including £250 from appointments. — An old-established and virtually unopposed PRACTICE situate within an hour of London is for immediate Disposal. Large good house, with stabling &c.; rent £50. One horse sufficient. Excellent railway service. From a prompt purchaser £800 will be accepted, and a short but efficient introduction given.

Apply to W. T. Peacock, 19, Craven-street, Strand, W.C.

Western County. — An excellent NUCLEUS, situate in a rapidly increasing suburb in a large Cathedral City. Receipts, including a transferable appointment of £80, were upwards of £200 last year, and steadily increasing. Capital house, good garden &c.; rent £38; and to effect an immediate transfer a very small premium will be accepted.

Apply to W. T. Peacock, 19, Craven-street, Strand, W.C.

Midland.—Hospital Town.—An old- established good-class PRIVATE PRACTICE of £1200 per annum, with scope for great increase. Visiting fees 3s. 6d., 5s., and upwards. Midwifery from £1 10s. to £5 5s. Large good family residence, situate in one of the best leading thoroughfares, with garden, stabling, &c.; rent moderate. No assistant kept. Premium £1250. Everything is open to the strictest investigation.

Apply to W. T. Peacock, 19, Craven-street, Strand, W.C.

London, S.E.—A thoroughly well established CASH PRACTICE, which has been held by present incumbent several years. Receipts, including appointments of £30, are upwards of £500 per annum. Small house, best suited for a bachelor; rent £35. Premium from a prompt purchaser £350, with an efficient introduction.

Apply to W. T. Peacock, 19, Craven-street, Strand, W.C.

Locum Tenens.—Mr. W. T. Peacock has now selected a staff of fully qualified, experienced, and thoroughly reliable Gentlemen for the ensuing Summer Season, and can send a suitable Gentleman to any part of Town or Country immediately on receipt of letter or telegram.

Telegraphic address—"Hornibrook, London."

Medical and Professional Agency,

17, BLOOMSBURY-STREET, OXFORD-STREET, W.C.
Mr. WILLIAM HORNIBROOK

Has special facilities for introducing Successors and arranging Partnerships. No charge is made to Purchasers or to Gentlemen making inquiries.

Locum Tenens and Assistants introduced on the shortest notice. The greatest care is taken in introducing Assistants and Locum Tenens to a Practice, and no gentleman is sent without inquiring into his character and suitability. Reliable and experienced Gentlemen always on the books.

All matters connected with the Transfer of Practices, Partnerships, Arbitrations, and Valuations promptly arranged, in strict confidence.

Wanted to Purchase, a Practice of from £400 to £800 a year or thereabouts, unopposed preferred, and with a fairly good house and garden. The purchaser has had several years' experience in General Practice, and is prepared to make immediate arrangements.

Partnership wanted in a good-class PRACTICE, with a share bringing in from £500 to £1000 a year. Purchaser is accustomed to good-class patients. Has ample means to purchase, and will give full price.

Mr. MORRIS, F.S.A.A., 8, Lancaster-place, W.C.

MEDICAL TRANSFER AND PARTNERSHIP AGENCY.
82, Ludgate-hill.

Messrs. Orridge and Co., Medical Transfer Agents, Referees, and Valuers, in offering their services to the Profession, have pleasure in referring to the fact that for ABOUT HALF A CENTURY the name of Mr. ORRIDGE has been known in the advertising columns of the leading medical journals, and that a very large proportion of the Medical Men throughout the kingdom have confided their interests in the adjustment of PARTNERSHIPS and TRANSFERS to their care.

Purchasers who will communicate (confidentially) the NATURE and EXTENT of their wishes regarding investment can be apprised of appropriate opportunities as they occur.

On occasions where ADVICE is required in forming a correct conclusion as to the worth or eligibility of a Practice, Messrs. ORRIDGE & Co. trust that their familiarity with the various contingencies that govern value will be found of considerable service to those by whom they are employed. N.B.—No charge is made to purchasers.

THE NORTH OF ENGLAND Clerical, Medical, and Scholastic AGENCY (Established 1890).
